**North Surrey.**—This Society held its first meeting of the winter session on the 20th inst., Mr. J. Morrish, the President, in the chair, when a programme was arranged. Prints on the Eastman P.O.P. were handed round by a member, and met with the general approval of those present, and the merits of gelatino-chloride paper generally, and of the new developer Amidol were discussed.

**South London.**—Ordinary meeting 19th inst., the President, Mr. F. W. Edwards, in the chair. A large number of prints from negatives made from samples of Paget's plates were handed in for competition for the President's award for the best picture. The President, who was assisted in the judging by Mr. Walter Woodbury, of The Paget Prize Plate Company, awarded the prize, a fine 12 by 10 platinum print of Shanklin Chine, to Mr. C. H. Oakden, and stated that Messrs. Buckle and Kelly followed close behind him in merit. Owing to illness at home, Mr. W. Groves was unable to read his paper on "Photography in Natural Colours," and his place was filled by Mr. Mark Boxhall, who in the course of his remarks dealt with all the recent discoveries which by some were calculated to attain the desired end. In the end, the lecturer, in his usual characteristic style, declared that all the inventors were on the wrong tack, and stated that if photography in natural colours was attained at all, in his opinion it would be through the agency of some of the tar compounds. Mr. Boxhall's remarks were strongly criticised by several of the members present. By the courtesy of the importers, samples of Amidol were distributed among the members, who were to report their experiences of its properties to the next meeting.

## To Correspondents.

All communications for these columns are to be addressed to **The Editor, "Amateur Photographer," 4, Greed Lane, Ludgate Hill, London, E.C.**

### RULES.

1. Write clearly and distinctly on one side of the paper only.
2. Write each Query or Answer on a separate sheet of paper.
3. Write the name and address legibly on the back of each communication, and sign all Queries and Answers with name or *nom de plume*.
4. All matters for these columns MUST be received by TUESDAY MORNING'S POST.
5. The Editor does not undertake to answer questions by post.
6. In answering Queries, correspondents are requested to mention, in every instance the number and full title of the query referred to.

### QUERIES.

5821. **Moonlight Scenes.**—Can any reader give me suggestions as to the best papers on which to print moonlight scenes?—MOONLIGHTER.

5822. **Egypt.**—Can anyone give me some information as to photography in Egypt? Is exposure more rapid than England? Is there any dark-room at Cairo and Luxor? Can chemicals, plates, etc., be bought there? Would Fitch's films be suitable to take, and can a concentrated developer, easily carried, be recommended for these? What gelatino-chloride paper keeps best in hot countries? Is Powell's concentrated toning bath in tubes good for this paper?—LUXOR.

5823. **Hydroquinone Developer for Lantern Slides.**—Will some kind reader recommend to me a good developer as above for lantern plates, as I have used Ilford Universal developer, and always

found the film to entirely strip off the plate, although using every precaution to mix developer as stated, and used as cold as possible? The plates I use are Ilford special rapid. Is it the fault of the plate or developer? Any hints will oblige.—SURPRISED.

5824. **Pizzighelli Paper.**—Should this paper be printed first and steamed after, or *vice versa*? If steamed before printing, would it not stick to the negative? How are the prints developed and fixed?—H.

Correspondents not seeing their queries inserted are requested to look for the same under "Editorial."

### QUERIES UNANSWERED.

- Sept. 2nd.—No. 5801.  
 ,, 9th.—Nos. 5808.  
 ,, 16th.—Nos. 5818, 5814, 5815, 5816.  
 ,, 23rd.—Nos. 5817.

### ANSWERS.

5807. **Instantaneous Plates.**—The Ilford Red Label, Imperial extreme rapidity, Paget's xxxxx, Edwards' instantaneous Iso., and the new Lightning plates are all good. Try them, and stick to the brand you have chosen. I believe plates are especially packed in air-tight boxes for India, and keep just as well with care. Surely "Rix" does not go to the unnecessary trouble of coating his own plates when such excellent plates are to be had at a minimum of cost.—A YOUNG SNIPE OF THE PLAINS.

5809. **Positive Appearance.**—I believe fixing the negative in daylight is the cause of the positive appearance. Perhaps the muddy appearance on the negatives is caused by over-developing or by fogging, through an unsafe light. Your negatives might be improved with the following clearing solution after development:—

Alum. . . . .	1 oz.
Citric acid . . . . .	5 "
Water . . . . .	5 "

—A YOUNG SNIPE OF THE PLAINS.

5818. **Hymn Slides.**—This question was answered in the AMATEUR PHOTOGRAPHER, February 26th, 1892, p. 173, and March 18th, p. 227, except that part relating to lens. "Puzzled" must use one of shorter focus.—EXPERT.

5819. **Seaside Exposures.**—In my experience these should be much shorter than others, as almost

- Oct. 4.—BIRMINGHAM.—"Manipulation of Gelatino-Chloride Paper." Mr. E. Underwood.  
 ,, 4.—CANTERBURY.—Exhibition of Holiday Pictures.  
 ,, 4.—HACKNEY.—Open Night.  
 ,, 4.—NORTH LONDON.—Lantern Night.  
 ,, 4.—BLACKHEATH.—Annual General Meeting.  
 ,, 6.—LEEDS.—"The Education of an Amateur Photographer," Mr. S. A. Warburton.  
 ,, 6.—OXFORD.—Annual Meeting.

The **Formby Camera Club** has been wound up in consequence of the majority of the members, including the President and Secretary, having left the town.

The **Thornton-Pickard Manufacturing Company** have removed to larger and more extensive premises at Altrincham, near Manchester, their business having increased so rapidly that the old premises would no longer suffice.

**Mr. Walter D. Welford**, as a hand-camera worker, affects street life and scenes. He has just received recognition of his work from Her Majesty the Queen of the Belgians, who specially instructs her secretary to express her admiration of the Belgian street scenes.

The pupils of the high school of Salem, Mass., are preparing an interesting memorial of that ancient town for the World's Fair. The amateur photographers of the school are engaged in the preparation of a series of views of the many points of historic interest in which the town abounds. These are to be finished by the pupils themselves, and are to form the illustrations of a handsome album. The descriptive letterpress of the book, also the work of the pupils, is to be neatly written on a typewriter, so that the whole volume will be literally the handiwork of the children of Salem.

every object at the seaside reflecting light is blue or white, rather than red or yellow, except, perhaps, the sand, but even this, being generally wet or glistening with salt, etc., reflects white light.—EXPERT.

5820. **Blackening Stops.**—Aspinall's black enamel will not do for stops, it reflects the light. Try a bath of sulphate of copper and carbonate of ammonia, followed by the application of heat. The tin division in the dark-slides can be easily coated with a dull black by applying a mixture of French polish and gas black or vegetable black, using just enough polish to make the black adhere without a gloss appearing.—EXPERT.

### EDITORIAL.

**SPECIAL NOTICE.**—We are very pleased to find that replies in this column are so much appreciated, but we should be very grateful if those requiring advice would send their letters to us BEFORE TUESDAY MORNING'S post if possible. The time occupied in replying in this column is very considerable, and owing to the often late receipt of letters, many matters have to be left over each week. This we much regret.—ED. AM. PHOT.

D. W. F. M.—We should say that your prints were from negatives developed with hydroquinone or eikonogen.

LAURENCE S. SMITH.—You give us no information as to the toning bath used. Probably the fault lies in not carrying the toning far enough, or it may be due to the fixing bath being acid. Will you write again and let us know exactly how you work.

A. J. GARWOOD.—You will find that the Thornton-Pickard shutter would fit the  $\frac{5}{8}$  in. Optimus with the hood on, and the  $\frac{7}{8}$  by 5 without its hood.

ROBIN.—The best mountant is a gelatine mountant made by soaking 200 grains of soft gelatine in 6 oz. of water for half an hour, then melting by the aid of a gentle heat, and adding gradually  $\frac{1}{2}$  oz. of methylated spirit, and one or two drops of carbolic acid. When required for use liquify by the aid of heat. We will see if we can insert criticism.

J. ROBERTSON.—Aug 12th, 19th, and 26th are the numbers you require.

R. H. M.—If you will turn to our issue of 23rd inst., p. 219, at the head of second column you will find a solution of wax recommended which will prevent all your trouble. (2) The answer to this would be too long for this column. If you have back numbers turn to October 23rd and 30th, 1891. (3) To copy an old photograph set it up, outdoors preferred, square with the lens—then move your camera back—

OUT OF POSTAL UNION .. " " 7s. 9d..... " " 15s. 8d.

**TRADE ADVERTISEMENTS** are received up to Tuesday morning.

**PUBLISHING DEPARTMENT.**—All letters containing Subscriptions, Orders, Remittances, SALE AND EXCHANGE Advertisements, or other business matters for the AMATEUR PHOTOGRAPHER are to be addressed to the Publishers, HAZELL, WATSON, AND VINEY, LD., 1, CREED LANE, LUDGATE HILL, LONDON, E.C. SALE AND EXCHANGE Advertisements (at the charge of Three Words for One Penny) must be received by Tuesday evening's post to ensure insertion in the same week's issue.

In accordance with our announcement last week, the judges, Messrs. Blanchard, Cembrano, and Wellington, attended at our offices on Monday, the 3rd inst., and the slides were passed through the lantern with the following results:—

*Class I., Landscape, Sea Pieces, and River Scenery, with or without figures.*

Silver Medal	..	..	J. E. Austin.
" "	..	..	J. A. Hodges.
" "	..	..	W. B. Post.
Bronze Medal	..	..	S. Francis Clarke.
Certificate	..	..	J. O. Arnold.

In this class the judges were unable to differentiate between the first three competitors, and also they did not feel disposed to award gold medals.

*Class II., Portraiture and Figure Studies, to include indoor or outdoor pictures.*

Gold Medal	..	..	Edgar G. Lee
Silver Medal	..	..	Mrs. S. F. Clarke.
Bronze Medal	..	..	Alfred Stieglitz.
Certificate	..	..	J. D. Lysaght.

In this class the gold medal slides are of very fine quality, and it would probably have been a much closer thing, only Mrs. Francis Clarke's slides were a little too hard and chalky in the lights.

*Class III., Architecture, interior or exterior.*

Gold Medal	..	..	J. W. Wade.
Silver Medal	..	..	F. W. Burton.
Bronze Medal	..	..	J. Shaw.
Certificate	..	..	S. L. Coulthurst.

The premier position was undoubtedly won in this class by the exquisite soft results obtained. Many of the slides in this class were too hard and too brilliant.

*Class IV., Instantaneous Work, limited to slides from 5 by 4 negatives and under.*

Gold Medal	..	..	Withheld.
Silver Medal	..	..	" "
Bronze Medal	..	..	H. N. Cooper.
Certificate	..	..	C. S. Cobb.

This was undoubtedly the weakest class of all, and if, as was probably the case, the slides were from negatives taken in hand-cameras, they showed that the users were content to take anything and everything without much regard to artistic composition, a striking contrast to the work of

**Amateur Photographer" Monthly Competition, No. 41.**—"INLAND SCENERY WITH AND WITHOUT FIGURES." Latest day, Oct. 24th.—*Prizes:* Silver and Bronze Medal, with ribbon and clasp. One mounted print only to be sent in. Entry forms, etc., on receipt of stamped envelope. Address: Editor, AMATEUR PHOTOGRAPHER, 1, Creed Lane, E.C. (Prizes will be announced and photographs reproduced and criticised in the AMATEUR PHOTOGRAPHER Supplement, November 11th.)

Mr. E. G. Lee, who takes the gold medal in Class II. with figure studies taken in a hand-camera.

WE are glad to state that, notwithstanding the fact that the judges withheld some of the medals, they expressed themselves very well satisfied with the slides as a whole, the standard being decidedly high. Most of our competitors may congratulate themselves on the fact that, even though not medalled, their work was good, the proportion of inferior work being decidedly small. It is no easy matter to turn out ten slides, all of excellent quality, both technically and artistically; and next year we shall certainly reduce the number of slides required, as many men can turn out five or six almost perfect slides when ten of the same class would be too many.

WE would remind our readers that the last day of this month will be the latest date for sending in prints to the "Optimus" Competition.

THE Pall Mall Exhibition—which by the bye has been, we hear, exceedingly well patronised, the total number of visitors for the week ending October 1st being 1,654—has been reviewed in most of the daily papers, sometimes favourably and in others unfavourably. The picture which seems to have attracted most attention is No 404, which is a photograph of Mont Blanc, taken with Dallmeyer's Telephoto lens at a distance of fifty-six miles. This, however, has a scientific interest.

THE artistic pictures, if we may say so, seem to be Col. Gale's, B. Gay Wilkinson's, W. Bedford's, Karl Greger's, and last but not least, Elliott and Son's carbon enlargement of Mr. Birt Acres' "Wave Study." It is curious to note that most of the pictures mentioned in the papers are those which we have selected for "Photographs of the Year."

THE *Star*, however, if not favourable, is at least honest and straightforward, as the critic starts with an outspoken admission:—

"There are days, and this is one of them, when I think honesty the best policy even for the art critic and the 'Artist Unknown.' Let me, therefore, state frankly at the outset that I know nothing of the mechanical, chemical, and scientific processes at work in the production of a photograph. I must be counted among the philistines who pull the button and let the Kodak people do the rest."

After noticing one or two prints, the critic goes on to say:—

"But there is one thing which the camera cannot do—make a picture. Photography is not art; the two things are as wide apart as north and south poles, and never will or can be identified. But this the photographer refuses to understand. He has his own sphere of usefulness, but he is for ever seeking to soar above and beyond it. He must be the artist he loves to call himself. He makes elaborate compositions and groups, turns his camera upon them, and dignifies the results as pictures; the effect is deplorable. We have sick-bed scenes in the manner of Mr. Fildes, rural scenes suggesting Mr. Macbeth, interiors with figures that for detail would put Dr. Seiler to the blush. The British public love a story; therefore the photographer must vie with the artist in the telling of it. We have the story of a cloud, and the story of a child blowing bubbles; when one man makes a photograph of Trafalgar Square, it becomes 'Fishing in Preserved Waters'; another, who has studied his Royal Academy catalogue, is not content until he has found the appropriate line of poetry for title. All this can serve no purpose, unless it be as warning to the painter who has set up the painted photograph as his standard."

We hardly think this fair, but how would some of our friends receive this dictum?

WE are glad to be able to state that the following are the pictures, permission to reproduce which, for "Photographs of the Year," we have kindly received:—

- "Quiet Life." By Karl Greger.
- "The Silver Strand." By Gay Wilkinson.
- "Flatford Bridge." By Col. J. Gale.
- "The Foot Bridge." By F. P. Combrano, jun.
- "The Love Letter." By A. Burchett.
- "Portinscale Bridge, Keswick." By T. M. Brownrigg.
- "A Sluggish River, Choked by Sedge and Flag." By George Lamley.
- "A Portrait." By F. Muller.
- "In the Pool." By L. C. Bennett.
- "Worn Out." By J. E. Austin.

The letterpress will be written by Mr. Horsley Hinton, so well known for his artistic work and writing.

As the edition will be limited, we would ask our readers to immediately send their orders to our publishers, an order form for which purpose will be found on p. xiv.

THE *English Illustrated Magazine* for October contains an article by Mr. Alfred Watkins entitled, "A Summer among the Dovecotes," which is illustrated by pen and ink drawings from the author's prints. Interesting in itself, the paper presents a very good example of specialisation in photography. So many amateurs use their cameras as a means of obtaining pictures and bits, when if they confined their attention to one particular branch or subject they would turn out far better work. The paper by Mr. Watkins possesses also a great archaeological interest, as many of these old dovecotes are, like their former occupants, becoming things of the past.

THE Hackney Photographic Society will hold their annual exhibition in the Morley Hall, Hackney, on November 15, 16, and 17, the judges being Captain Abney, Col. Gale, and Mr. R. W. Robinson, and the awards are on a much more liberal scale than last year, and consist of a large number of gold, silver, and bronze medals of special design, besides other prizes. Lantern exhibitions will be given in the evenings, and the committee have struck out a new line in offering a novelty in the shape of a comic opera entitled "Amateur Photography, and what Came of it." The following are the classes:—

MEMBERS' WORK.—(Class A) For any picture taken *since* last exhibition, except animals, portraiture, and genre. (Class B) For any picture taken during membership, but *prior* to last exhibition, except animals, portraiture, and genre. (Class C) For any picture taken at a Club outing *since* the last exhibition. (Class D) For portraiture and genre. (Class E) For set of four lantern slides taken *since* last exhibition (still life excluded). (Class F). For set of six hand-camera pictures. (Class G) For best picture of animal life. (Class H) For set of six stereoscopic slides taken *since* last exhibition.

OPEN CLASSES.—Entries in these classes may be priced for sale at the option of the exhibitor.—(Class I) For set of six lantern slides. (Class J) For set of six stereoscopic slides. (Class K) For any picture except portraiture and genre. (Class L) For portraiture and genre.

MESSRS. ELLIOTT AND SON have written us with regard to our critic's remarks on their enlargement which won a gold medal at the Pall Mall show, and we publish their letter with pleasure, because we think they have mistaken our ideas on the subject. Certainly we never intended to impute dishonesty to them. We shall, however, have more to say on this subject next week, as their letter was received very late for this issue.

## Chit-Chat.

GENTLY, gently, good masters! I pray you to remember 'tis but a "Chatterbox" whose prattle calls forth your indignation. Let me reply first to Mr. Horsley Hinton's courteous letter by saying that I cordially acquiesce in every sentiment which finds expression in it, and I sincerely trust that the writer will acquit me of any intention to include him within the category of those to whom I applied the epithet to which he takes exception. To honest criticism of the character to which he refers, I offer not a word of protest, nor was it against such that my strictures were addressed.

So far, Mr. Hinton, I confess, I feel more difficulty in dealing with a gentleman who tells me, as "Meter" does, that out of eighty-four consecutive exposures, under varying conditions, he obtained eighty-two negatives "as nearly perfect as possible," two being fogged by error in manipulation. Perhaps, if he and I were to compare notes, it might be found that our opinions upon technical perfection in negatives were slightly different. Be that as it may, if he, or any other amateur, finds the use of an exposure table a better guide to correct exposure than the exercise of his own judgment, by all means let its use be continued, but notwithstanding, my advice to beginners is, learn to cultivate judgment in estimating exposure. But this question to be argued to demonstration needs more space than the Editor will allow me, in this column. I may on a future occasion go more deeply into the matter.

There remains Mr. Turnbull, whose fame as a skilled manufacturer of apparatus is, of course, well known to me. I confess, however, that I have but a hazy recollection of his film-slide. If he will be good enough to send one for my inspection to the Editor, I shall, if it really fulfils the conditions which I enumerated, be only too pleased to acknowledge the fact here. Being still "far from the madding crowd," or, in other words, on holiday-making intent, I cannot at present express any opinion upon the show at Pall Mall. I hear, however, that the exhibits exceed in number those of last year, which would seem to indicate that the confidence of exhibitors has not been very materially shaken.

THE "scientific gentleman" on the staff of the *Daily Chronicle* seizes the opportunity of airing his photographic knowledge by informing his readers that "the most startling thing is the decadence of the silver print," and in the next sentence tells them that it is replaced by Obernetter paper, gelatino-chloride paper, Soltype, etc. Verily, "a little knowledge is a dangerous thing."

I AM not a member of that venerable institution, the P.S.G.B., nor, indeed, am I likely to become one whilst it continues to hold its meetings so near the sky. "Those dreadful stairs" are, I am informed, largely responsible for the very scant attendance at its technical meetings.

I HEAR rumours of a proposal to form another central photographic society, and I am informed that several well-known and influential workers have expressed their willingness to co-operate and assist in its organisation. The Camera Club subscription is too great a tax upon the pockets of many, and in the opinion of some people more attention latterly has been paid to the social than the technical attractions of that institution. Without venturing an opinion upon the matter, I certainly incline to the belief that there is room for a new central society if it be run on approved lines. Its head-quarters must be in some convenient and accessible position; the annual subscription should not exceed £1 1s.; its chief object should be to afford the

means of discussing technical, artistic, and scientific matter, pertaining to the practice of photography, rather than to cater for the purely social wants of the members; the sale of wines and spirits should not be permitted; and, lastly, it should promote and organise an annual exhibition, a special feature at which should be collective society exhibits. These are some crude ideas upon the subject. Will my readers refine them?

THE use of the hand-camera, it appears, is still subject to abuse. Last week's AMATEUR PHOTOGRAPHER, I notice, contains a report of a lecture given by an amateur photographer, illustrated by lantern-slides, among which, we are informed, were "snap-shots of passengers overcome by *mal-de mer*." Such subjects, I do not hesitate to say, are unworthy the attention of any photographer possessing the ordinary instincts of a gentleman.

MR. THOMAS makes a good suggestion, but I suspect many of the smaller suburban societies would find some practical difficulty in joining in the scheme which he proposes, owing to their lack of dark-room accommodation. In this respect many provincial societies are far ahead of the smaller London societies. This condition of things is the reverse of commendable. The main object of a society is, or should be, practical instruction, and efficient means of imparting it should be a primary consideration.

CHATTERBOX.

## Letters to the Editor.

### CAMERA FITTINGS.

SIR,—In reply to "G. T. W.'s" letter which appears in last week's AMATEUR PHOTOGRAPHER, I beg to state that I have my reasons for not stating where to obtain the fittings, one of which is, I do not believe in giving any one firm a free advertisement to the exclusion of all others; and another, I find that it pays best to go to different firms for different articles, and having found out (as I think) where to obtain them cheap and good, surely it is better not to mention names at all. I am perfectly willing to obtain them for any and everyone, and have already done so for several. And if "G. T. W." likes, I will for him, but I must decline to mention the name of any firm, for the above reasons, and others of my own.

I have written many articles during these last few years, and this is a rule I always stick to, and shall continue to do so, even though it might perhaps be to my own benefit to advertise some particular firm on the cheap, but there is far too much of this done.

I cannot tell where aluminium fittings can be obtained at present, but if I can get them I will give prices in an early number of the paper.

Trusting that "G. T. W." and other readers will not think me uncourteous for not complying with his request, I am, yours faithfully,

H. J.

[We noted in our last issue that Messrs. Platt and Witte were supplying aluminium fittings.—EDITOR.]

\* \* \* \*

### MEDALS AT PALL MALL.

SIR,—Perhaps the most interesting cases which those who make a special study of mental disorders have to deal with are those in which the patient is sane and hard-headed enough upon all ordinary matters, but is incapable of exercising reason upon some particular subject. It is impossible to consider such insane, and, except where the mental aberration takes the form of a mania for destroying life or property, personal restraint is neither necessary nor politic. It has been said that no one is free from monomania of some kind, but whether this is true or not, it is certainly a fact that many are liable to outbursts of temper which, while they last, render them incapable of acting with discretion. "Anger is temporary madness" is a favourite motto in the copybook, and it is a more truthful proverb than most.

In the photographic word there is one phase of temporary

madness which comes frequently to our notice. It attracts disappointed exhibitors at our exhibitions, or disappointed contributors—those whose pictures have been hung but not medalled, whose pictures have not been placed in the prominent places their authors expected, and those whose works have been rejected. The complaints of these in your correspondence columns and those of your contemporaries are too familiar with us.

He who has been hung but not medalled usually writes under his own name, in which case he is studiously mild and courteous in language and sorrowful in tone. He complains of no injury or injustice to himself. Indeed, he is careful to make no reference to himself or his works, but his sympathy with the wrongs of others is unbounded. He deprecates the appointment of judges utterly incapable of appreciating true art; he deprecates the incompetency of the hangers; and he deprecates the general mismanagement of everything connected with the exhibition and with the affairs of the society holding it. He is moderation itself, but his moderation is too transparently artificial to deceive anyone.

He whose pictures have been rejected adopts a different tone. He is ashamed to acknowledge his identity, and writes under a pseudonym. He fears not to display his rage, and directly charges the judges, hangers, and everyone connected with the exhibition with venality, favouritism, fraud, and any other crime that suits the occasion. He lays great stress on the point that so many bad examples have been hung. You may always recognise the rejected contributor by the comparison that is obviously running in his mind between the very bad pictures that have been hung and his own which have been rejected. He is outspoken in his condemnation of the awards, and constitutes himself an authority above the judges. I should like to know, says he, why was such and such a picture medalled, when there were at least forty better pictures passed over? I should like to know why was this or that?—anything his thoughtlessness or stupidity suggests. Poor fellow! He is a donkey masquerading in a lion's skin. His roar is but a bray, feebly disguised.

Fortunately, little harm is done. No one believes that honest men become scoundrels, or that business men lose their cunning directly they associate themselves with an exhibition. Mistakes doubtless occur, for no man is infallible, but the vindictive criticism of self-interested parties will neither mend nor prevent them.—Yours faithfully,

F. J. TOLLIE.

\*\*\*  
AMIDOL.

SIR,—I notice the questions asked in various photographic papers respecting the use of Amidol, and also statements to the effect that it is no good for lantern slides, producing a slight veil. This is not so when used in conjunction with ferrocyanide of potassium (yellow prussiate of potash). Dilute the stock developer as instructed with twice or three times its bulk of water, and add 20 minims of a 10 per cent. solution of the ferrocyanide to every ounce of diluted developer.

Develop until the image looks very black and shows on the glass side. Fix as usual. Using Mawson's plates I get absolutely clear shadows, without the use of a clearing bath, such as I have found it impossible to obtain with any other developer. Your readers can soon satisfy themselves on the point by exposing a slide, cutting it in half, and developing one part in the plain solution, the other with the addition of the ferro. With some plates pretty good results can be obtained without the addition, but these results are inferior. The main thing seems to be to secure sufficient density, which is not difficult.

I shall be glad to hear the results of experiments made. Perhaps you will find time to try it yourself. I send you three plates, half of which are developed with, the other without the potash.—I am, yours, etc.,

B. DAVIDSON  
(Lewisham Camera Club).

[The slides sent by our correspondent prove very conclusively the advantages to be gained by the use of ferrocyanide. We have not yet had time to try this.—EDITOR.]

#### TRUTH ON THE AMATEUR.

SIR,—I read this week's AMATEUR PHOTOGRAPHER with great amusement, especially those letters that appeared in *Truth*. I am going to ask your opinion on the subject (mind, kind sir, I am not a "snap-shottist"). Don't you think if people objected to being photographed in attitudes so prevalent at the seaside, that they would behave themselves as decently as you would see them in London? If people don't like their friends to see the atti-

tudes that they put themselves in at the seaside, what do they want to do it for? You know the old saying, "Do nothing that you wouldn't wish your friends to know." I have seen girls at the seaside, well, to say the least, extremely *decolletée*, paddling about with the utmost unconcern, but these very same girls would squeal and almost faint if they saw the same thing done in the town or place of amusement. Hope I have not wasted too much of your valuable time about these grumbling people.—Yours truly,

A CAMERIST (TRIPOD).

\*\*\*

#### TRANSPARENT MARKINGS ON GELATINE NEGATIVES PRODUCED DURING WASHING.

SIR,—Can you or any of your experienced correspondents enlighten me as to the cause of the transparent markings on the accompanying negative, of which I also enclose a print? This plate is one of about eighty exposed this season in Scotland, of which a considerable number were good, but many, after being placed in the washing tank, became affected like the specimen, which is not by any means the worst. Up to the washing all went right, and the plates appeared spotless, but after some hours' washing in running water under a tap the defects complained of appeared and proved fatal to at least thirty. In order that you may be able to judge of the cause, you should know the mode of procedure.

The plates were Edwards' extra-rapid, some isochromatic; developer, Tondeur, made up with distilled water, was used, and I may say that I have been using this developer with success for the last three years. The hypo bath was the ordinary one, after which the plates were immersed in an alum bath.

The washing tank was that known as the Godstone, and is made of zinc. In all the operations (except the developer) the tap of the Kent Waterworks was used; this is considered the purest water in the neighbourhood of London, but very hard.

I apprehend that "the usual explanation of these holes or pinholes as they are called, being dust on the plate," as you put it in a recent number, is not available on the present occasion, for every possible means were taken each time of using to remove dust from the camera and the slides, and from the plates both before and after exposure. You will notice that the holes are not circular like "pinholes" or air bubbles, but elongated and somewhat in the shape of a comma straightened, and that they take a course across the width of the plate, the largest part of each defect presenting itself (as I imagine) on the highest point of the slanting direction in which the plate was placed in the washing tank. I therefore suppose the zinc washing tank is to blame.

How am I to remedy these defects in the future? Further photographic proceedings are stayed until the means of prevention are discovered, and for these I appeal to the AMATEUR PHOTOGRAPHER.—Yours, etc.,

C. OF A.

[Our correspondent has made one error in his procedure, viz., the use of an alum bath immediately after fixing. We are not prepared to state, however, that this has anything to do with the mishap complained of, although it might have, which is in no way the fault of the plate, but due to excessive washing. We have met with this misfortune on no less than four different brands of plates this summer, and it is probably due in some degree to the heat of the weather.—EDITOR.]

#### A WARNING.

SIR,—As one who has suffered terribly through the gross carelessness of a photographic firm of chemists, and now that the lantern season has opened, I wish to give you some particulars of a fearful explosion, in the hope that you will warn your readers who make their own oxygen gas for the lantern, and that none of them shall ever have my awful experience, which has left me broken down in health and spirit, all through a chemists' blunder.

I ordered from a photographic firm of chemists six pounds of oxygen mixture, viz., four parts chlorate potash, two parts black oxide of manganese. The parcel came by parcel post, labelled *oxygen mixture*. I weighed out 1½ lbs. of the mixture, put it into the retort (a safety one), placed it on a small fire in my studio, and in less than one minute a fearful explosion occurred.

How I escaped Providence alone knows. The roof and side of my studio were blown to pieces, skin and flesh were burned off my left hand from the finger nails to the elbow; my right also; my face and throat were one mass of cuts, and my eyes were so terribly inflamed that the doctor thought I should be blind for life. The retort was made pieces of and twisted in all shapes. The bars of the fire-grate entered in the cement wall opposite (11 ft.) to the depth of half an inch. The report was heard at a great

distance. I think I must have been in a stooping position at the time, and the side and roof of my studio being nearly all glass gave way at once; otherwise very likely I should not be alive to pen this letter.

After the explosion, blind and bleeding as I was, I made for the doors (there were two), and I succeeded in gaining the open air. Another second I should have been suffocated. The feeling after the explosion was fearful. The fumes given off were like so many sharp knives cutting the throat inside. I was quite exhausted; the moment I reached the open air I fell.

I shall not dwell on my sufferings during the past three months. Before the explosion occurred I was eleven stone weight, now I am only eight stone eleven pounds. I had to undergo two operations for my eyes, and one eye, I fear, will never be the same again.

I got the mixture analysed, and what do you think this photographic firm of chemists sent me, after stating distinctly that I wanted the oxygen mixture to make oxygen gas for a lime-light lantern?

They sent me a mixture of chlorate of potash and sulphide of antimony, which has left marks and tokens on me that I shall take to the grave.

As I am bringing an action against them I do not mention the name of the firm.

My principal reason for sending you this letter is, as I said before, that you may warn your readers that they get the proper mixture if they make their own gas. I have 4½ lbs. of the mixture still.

Any further information I can give you you are welcome to, or if you wish to enquire about the explosion the police here can give you all particulars, as they were on the scene ten minutes after the occurrence, and I believe made a note of all that happened and were witnesses to my awful condition.—Yours, etc.,

THOS. B. WALSH.

\* \* \* \*

#### THE CHICAGO EXHIBITION.

SIR,—May I have the use of your columns to give a "hint" to those who contemplate visiting Chicago next year. It is this: The steamship companies have held a convention, and have mutually pledged themselves to *book no passages in advance for the dates during the World's Fair*. This means that the rates next year are going to be "fancy." Messrs. Cook and Gaze "have not yet been able to complete arrangements." The Polytechnic has secured some 2,000 passages during the summer, can now secure no more, and has applications for far more than that number. I have been fortunate in obtaining from them the refusal, for a few days, of ten berths in the Guion liner *Alaska*, sailing July 1st, and ten in the Guion liner *Arizona*, sailing July 15th. The former is the best trip for those who want to join in the photographic meetings, and who can give five weeks to the round trip. Here is the bald outline:—Leave Liverpool July 1st, New York arrive July 8th, in New York two days, Philadelphia one day, Washington two days, Chicago arrive July 15th. Meetings of the Photographers' Association of America, July 18th to 21st. Meeting of the World's Congress on photography a week later. Sail from New York July 29th.

For those who can only give a fortnight ashore, I may be able to secure berths in a vessel sailing a week later. In this case, if they wished to attend the photographic meetings, they would have to sacrifice some of the other part of the journey.

The Polytechnic fare, for return steamer, second saloon, rail from London to Liverpool and back, first-class fare over route as above, hotel accommodation, and board all the time, and carriage driving at Niagara, where almost a full day is allowed, is 26 gs. for a fortnight on land. Those who spend three weeks, putting in the extra time at Chicago, will be charged about 50s. or £3 more.

To secure a berth you must pay £4 4s. 2d. If you cannot go, you will forfeit this amount, unless you can transfer your ticket to someone else, in which case you forfeit a transfer fee of 10s.

It is likely that passages will be at a high premium, so that there is no likelihood of difficulty in transferring, but I only want to book the few passages at my disposal to photographers who have a *bona-fide* prospect of going. I can give further particulars if required (stamp enclosed for reply), and in a few days the Polytechnic will issue a "Descriptive and Illustrated Guide," price 1s. 3d., or in cloth 2s. 3d., post free.—Yours, etc.,

H. SNOWDEN WARD.

#### THE P. S. G. B.

SIR,—Being an ardent lover of photography I have been sorry to see the unpleasantness which has sprung up and "grown" in and about the parent society. Photography is nowadays a most lovely pastime, and it is unfortunate to have contentions therein. I would say to the contentious ones, shake hands and be friends—each man has a right to enjoy his own opinion. I was particularly grieved to find one gentleman's (Mr. A. Horsley Hinton) pictures "absent" from the Pall Mall Exhibition, as I think "all" persons were most delighted with his very beautiful work last year.—I am, yours, etc.,

A. W. GOTTLIEB.

\* \* \* \*

#### TODMORDEN EXHIBITION.

SIR,—Owing to the numerous applications I have received asking for entry forms for our forthcoming exhibition, I should be glad if you would state in your next issue that there will be no competitions in connection with the Exhibition, our society being only a new one and not in a position to give prizes.

However, the Council will only be too glad to receive any picture fit for exhibition, and will feel indebted to any one sending anything with a view to help us to make our first exhibition a success.—Yours faithfully,

JOHN T. BINNS

(Hon. Sec.)

3, Garden Terrace, Todmorden,  
October 3rd, 1892.

\* \* \* \*

#### ELLIOTT AND SON'S MONTHLY PAPER.

SIR,—Since issuing the first number of our little paper we find that we have adopted a title that was already in use by Messrs. George Mason and Co., the well-known dealers in photographic materials of Sauchiehall Street, Glasgow. We therefore tender Messrs. Mason our apologies, and beg to inform your readers that we have modified the title of our paper, which will henceforth be known as "The Photographer's Record," which will, as before stated, be sent post free, and supplies forwarded, carriage paid, to secretaries of societies and dealers in photographic goods, for distribution.

Apologising for trespassing on your space, we are, yours, etc.,  
Barnet, Herts, October 3rd, 1892.

ELLIOTT AND SON.

\* \* \* \*

#### ELLIOTT AND SON'S PICTURE AT PALL MALL.

SIR,—We note your remarks on our exhibit at Pall Mall exhibition, and although, no doubt, you have a right to express your opinion as to the colour (which, however, is entirely at variance with all the other criticisms both in the general and photographic press), we consider your remarks as to what you call an attempt at misleading the public not only in very bad taste, but entirely uncalled for. We refer your readers to the opinions of the Press which we include in our advertisement in your paper this week.—Yours truly,

ELLIOTT AND SON.

\* \* \* \*

#### THE HACKNEY SOCIETY EXHIBITION.

SIR,—Will you please allow me to apologise to those gentlemen who have applied for forms in the forthcoming exhibition of our Society. The applications have been somewhat numerous, and it was found necessary to amend the forms somewhat.—Yours faithfully,

W. FENTON JONES (Hon. Sec.)

\* \* \* \*

#### MEDALS AT PALL MALL.

SIR,—Your correspondent "Spectator," in asking "Why the medals at the Pall Mall Exhibition are awarded each year to a favoured clique, irrespective of whether their work is best or not," assumes incapacity or dishonesty in the judges, an assumption which reasonable people will not take for granted upon the mere authority of an anonymous writer, who may, so far as the reader can judge, be either an exhibitor disappointed of a position or medal to which he considered himself entitled, or be writing under the inspiration of those who, being denied special privileges, have done all that they can to revenge themselves by endeavouring to deter exhibitors from sending to Pall Mall, by circulating attacks on the Society, and threatening to organise rival schemes.

The appointment of judges is by election by members of the Society, and since the events of last year, when the executive

decided to allow no special privileges to any exhibitor, it may fairly be said that any cliquism has been stamped out, and that criticisms which at one time might have had some justification are now quite misplaced.

It is satisfactory to know that the entries for the exhibition were, in spite of the efforts before alluded to, of ample number, although, owing to the much greater strictness of the scrutiny by the judges and hanging committee, the number of exhibits actually shown is smaller.

The photographic and the general Press, with one notable exception, the personal animus of which has been pointed out by several of the photographic papers, have almost unanimously declared the present exhibition to be the best that has been seen for several years. The Society and its Exhibition ought not to be prejudiced by anonymous attacks on the judges who have been openly elected, and whose work is on the whole endorsed by competent authorities in the Press.—I am, yours, etc.,

NOT AN EXHIBITOR.

\* \* \* \*

#### EXETER AMATEUR PHOTOGRAPHIC SOCIETY.

SIR,—The dates fixed for our exhibition are November 24th to 26th. There will be four classes for members, and four which are unreservedly open to all. Full particulars and entry forms may be had from the Hon. Secretary. There will also be a show of photographic apparatus, inquiries as to which should be made to the Hon. Treasurer, Mr. J. Hinton Lake, 41, High Street, Exeter. The lantern slides exhibited will be shown on the screen each night, while, on the 24th, Mr. Welford will give an address on hand-camera work, illustrated by a large number of his well-known slides.—I am, yours, etc., JNO. SPARSHATT  
(Hon. Sec.)

## Photographic Procedure.

By E. J. WALL.

(Author of the "Dictionary of Photography.")

### SECTION VI.

#### DEVELOPERS AND DEVELOPMENT.

(Continued from page 171.)

*Pyro and Ammonia*—*Developing Under-exposed Plates.*—Whilst we recognise the fact that under-exposure may be of two kinds, there is not the slightest doubt that, use what developer we may, we cannot fetch out of a plate what is not there. Many operators recommend the soaking of an under-exposed plate in a solution of ammonia, with a little bromide, and while this may be useful to reduce contrast it certainly will not fetch out more detail. The only thing to do is to use a developer which is fairly strong, and with the full quantity of ammonia, at once; this is if we know the plate has been under-exposed.

When, on the other hand, on developing a plate in the manner suggested above, that is by the gradual addition of ammonia, we find the shadow details will not put in an appearance, then the best method of procedure is to throw off the developer used, and apply one strong in ammonia, which may be compounded from our stock solutions as follows:—Pyro solution, 60 minims; bromide solution, 60 minims; ammonia solution, 60 minims; water to 2 ounces, and apply this to the plate, and continue development as long as possible. Some plates, it must be noted, will not stand as much ammonia as this without showing fog, but fog need hardly frighten anyone, as it is so easy to reproduce negatives without any fog showing.

*Developing Over-exposed Plates.*—It is not a difficult matter to correct over-exposure with pyro and ammonia, provided the same be known beforehand, and it is not even

an impossible matter when, ignorant of the exposure, the plate has been treated as one normally exposed.

If over-exposure is known to exist, then we can modify our developer by increasing the pyro and bromide, and reducing the ammonia, so that for an over-exposed plate our developer would be compounded of pyro solution, 80 minims; bromide solution, 80 minims; ammonia solution, 30 minims. But instead of applying this to the plate it would be advisable to proceed as was first suggested, that is to say, by adding the ammonia by degrees.

*Developing Plates exposed on Subjects with great Contrasts.*

—The development of plates exposed on subjects with great contrasts is one in which many a worker fails, if we may judge from some of the prints sent into our competitions. Yet it is a very easy matter, provided we know how to set to work.

We may wish to increase or preserve the contrast as far as possible, as in copying line drawings, and let me at once state here that for this work special plates must be chosen, such as Mawson or England's photo-mechanical plates, or even, in the absence of these, the ordinary slow lantern plate as prepared for black tones will give good results, such as Edwards', Verel's bromide transparency, or Imperial, or any other make. I merely mention these because I have used them for this work, not with any special idea of recommending these specially.

Given the exposed plate we must alter our developer slightly, and it is far better to add a little metabisulphite to it for this work, to which we shall refer later on, or the following may be used:—

	No. 1.	
Pyro .. ..	64 gr.	
Citrate of ammonia .. ..	20 "	
or Citric acid .. ..	15 "	
Distilled water .. ..	4 oz.	
	No. 2.	
Ammonia .880 .. ..	2 drm.	
Bromide of ammonia .. ..	180 gr.	
Distilled water .. ..	4 oz.	

For use mix in equal parts.

This formula, which was suggested by Mr. B. J. Edwards, will be found of very great use for copying or lantern work or for any purposes where we wish to increase contrasts.

In cases when we wish to reduce contrast, such as chalky or white-washed cottages against dark trees or snow-capped mountains, we must reduce the pyro and bromide and increase the ammonia. But possibly I may be permitted to introduce an article from the Year Book of 1888 by Mr. Edwards, from which article the above formula was extracted:—

Among the multitude of developers of various kinds now in use, or proposed from time to time, the original alkaline developer—pyro and ammonia—still holds its own for general utility, and, except for a few special purposes, is found by experienced workers to best meet their requirements. Not the least among its many advantages is the fact that by simply altering the proportions of the ingredients it is easy to produce at will any desired quality in the negative, from the soft and delicate detail in a portrait negative, to the opaque density and clear glass shadows so desirable in a copy of a line engraving. Moreover, by having at command the two forms of developer, giving such widely different results, the latitude which may be allowed in exposure is enormously increased.

For studio work, or where the exposure is known to be correct, the normal pyro and ammonia developer will usually be all that is needed; but when it is required to develop a number of outdoor negatives, taken at different times, and under varying conditions of light and exposure, some modification will often be required, otherwise it will be found that the same treatment, which will give perfect negatives in some cases will produce hopeless failure in the others. For instance, over-exposed negatives will usually come out flat and wanting in contrast, or if development be long continued the shadows will be too much buried to give brilliant prints.

In order to meet this difficulty it has hitherto been the usual practice, when developing a series of landscape negatives, to feel the way, as it were, by commencing each with a developer containing a minimum quantity of ammonia, or an excess of pyro, as a safeguard, in order to secure sufficient density in case of over-exposure.

This plan is, however, only partially successful, inasmuch as in the case of plates which do not happen to be over-exposed by the quality of the resulting negatives cannot fail to be seriously deteriorated, owing to the employment of an unsuitable developer at the commencement; it is too late to remedy the defect by altering the developer after the first action on the film has taken place.

By adopting the plan now proposed (which is exactly the reverse of the method above indicated), much difficulty is avoided—correctly exposed plates are developed as they should be—while good printing negatives are easily secured on plates which have received as much as eight or ten times the normal exposure.

In the collodion process the universal practice was invariably to first bring out the detail in the negative by means of an energetic iron developer, and then, after washing the film, to re-develop or intensify with pyro and silver to the required printing density.

A somewhat similar method of intensification, or re-development before fixing, will be found to work perfectly with gelatino-bromide plates. The *modus operandi* the same in both cases, except that washing will seldom be needed between the two operations.

The following method of working has been fully tested in practice, with excellent results.

The development of an exposed plate (correctly timed or not, as the case may be) should be commenced with a developer of the usual normal strength, containing, say, about two grains of pyro to each ounce of solution, with ammonia and bromide in proportion to suit the plates used, when working under ordinary conditions. After pouring on this developer the result should be carefully watched. It will soon be seen whether the exposure has been correctly timed, in which case no alteration will be needed, the negative being completed with the required density and detail in one operation. If, however, the plate should appear to be over-exposed (which will be shown by the way the details come out without any apparent increase in density), the normal developer must be thrown off at once, and the thin image flooded (without stopping to wash the plate) with the pyro redeveloper; intensification will now rapidly take place, the further development of excess of half tones being checked at the same time. This second development should be continued until the required density is obtained, after which the plate is washed and fixed in the usual way. The redeveloper consists of a concentrated solution of pyro and ammonia, well restrained, so as to give great excess of density in the most exposed parts of the negative. The following will be found a good formula:

## No. 1.

Pyro	...	...	...	...	64 gr.
Citrate of ammonia	...	...	...	...	20 "
Or citric acid	...	...	...	...	15 "
Distilled water	...	...	...	...	4 oz.

## No. 2.

Ammonia (.880)	...	...	...	...	2 drs.
Bromide of ammonia	...	...	...	...	180 gr.
Distilled water	...	...	...	...	4 oz.

For use mix equal parts of No. 1 and No. 2.

The mixed redeveloper may be used for several plates in succession; it may also be mixed with the ordinary developer in any desired proportion to suit special subjects, while alone it forms a capital developer for reproduction in black and white or for lantern slides, and transparencies on ordinary bromide plates.

By the above system of modifying the development, so as to harmonise with the actual exposure given, much time is saved, and far more uniform results can be obtained than by the ordinary method, care being taken that all negatives, as far as possible, are sufficiently exposed so as to avoid failures from under-exposure. With under-exposed plates very little can be done; they will never make good negatives. Perhaps the best plan in case of under-exposure is to dilute the ordinary developer to about half strength, and wait patiently for the detail, and then finish with the normal developer or the redeveloper, as above, before fixing. It is useless to attempt to force out the image by the use of a large access of ammonia.

Pyro-developed negatives should always be treated after fixing with a clearing solution containing sulphate of iron. This has the effect of removing all stains, and changing the colour of the deposit; it also renders the negatives absolutely permanent, so that they will not change afterwards by the action of light.

This is the method also recommended by Captain Abney for the same purpose, and from practical experience I can strongly recommend it.

(To be continued.)

## Holiday Resorts and Photographic Haunts.

TO ARCADIA WITH A CAMERA.—III.

BY LIEUT. G. HARVEY.

THE present paper will for many reasons form one of the most interesting photographic tours described under the above heading, for, apart from the great beauty of the surrounding district, we have here relics of great historical and architectural interest. Mayfield is  $52\frac{1}{2}$  miles from London Bridge, has its own station, and is on the L.B. and S.C.R. The photographer must not omit to take with him a set of lenses (wide angle is in constant requisition), and a plentiful supply of plates, as if he runs short of the latter, he will be unable to renew his stock without great inconvenience and loss of valuable time. The village of Mayfield possesses in its palace a relic of past grandeur and architecture. It dates from the year 900, and was a favourite residence of the Archbishops of Canterbury from the time of St. Dunstan (died 988), until Cranmer, who alienated it to Henry VIII. It is now a Roman Catholic nunnery, and the photographer may gain admission any day between 3 and 4 p.m. by ringing at the great gateway. Most important apartment now remaining is the great hall, measuring internally 68 ft. long, 38 ft. wide, and 50 ft. high. Notice especially the three fine supporting arches, and their massive external buttresses. Some stone diaper work at the far end of the hall indicated the throne of the Archbishop; this has been moved into the ante-chapel. The hall was dismantled during the last century, and was only recently restored. It is now the chapel of the establishment. Don't miss the ante-chapel, and in it you will see the anvil and tongs of St. Dunstan, a cannon cast in the vicinity, and the Gresham sword. The great dining-room has a very fine hooded chimney-piece, of stone, with an iron chimney-back dated 1663. Of course the great hero of Mayfield was St. Dunstan, and you will hear much interesting matter concerning him. Mayfield Church is not of very great interest, beyond the Early English tower, and the mural tablet to T. Aynscombe (1620). Visit Eridge Park (Marquis of Abergavenny). The views are many and exceedingly fine. Footpath through the wicket gate by side of the little church at Eridge gives access to Eridge Rocks, which are about a quarter of a mile up the private road running in N.W. direction. They are surrounded by trees, and with judicious treatment make most bold pictures. Make for Crowborough Beacon, 796 ft. View in any direction very grand and imposing, but only advisable to expose on a very clear day. On summit is the observatory (C. Prince, Esq.). At Heathfield there is also a very fine subject for the photographer, but be sure and look south. Heathfield has many historical associations which space prevents me from mentioning. The famous Jack Cade was a native of this place, and the hamlet of Cade Street, near Heathfield, derives its name from this gentleman. Do not fail to journey to Warbleton ( $2\frac{1}{2}$  miles south), for there is much to do, and should upon no account be missed. The church is of great interest. Notice in chancel the brass and portrait of Dean Prestwick (1446), with beautiful crocketed canopy. Expose on the elaborate marble monument of Sir John Lade (1740) in north aisle. See the old chest; it is very curious and deserves a plate. Outside of the south wall is a somewhat uncommon feature—a rounded arch, probably designed to cover a tomb. The church stands at N.E. corner of, and partly within, a Roman earthwork, which one may trace and photograph. Visit the Augustinian Priory (Henry IV.); existing remains rather scanty, and is now portion of a farm house. In one of the rooms are preserved two skulls, and in adjoining room there are stains of human blood, which cannot be effaced. You can see these on application, and I advise exposure for the interest attached to them. While you are thus far, a journey to Dallington will well repay the fatigue and trouble, for a more picturesque parish it would be difficult to imagine. Go to the church, ascend the tower, note the staircase, and secure a view, which is most artistic. The snap-shot man should not fail to be in Hailsham on a market day. It is a cattle market, and is held fortnightly. I omitted to mention that in Mayfield main street there is a fine timbered house bearing the date of 1575, which is well worth a little trouble.

# How to Make a Set of Photographic Apparatus.

By H. J.

## CHAPTER IX.

### ENLARGING APPARATUS—(Continued.)

As I mentioned in my last chapter that I would give instructions how to make the bellows, I will proceed to do so, as they can be made much cheaper than bought, and it is really very easy to make them, if you only set about it in the right way, and though my way is different from any that I have seen published, yet I was quite astonished at my success in making the first which I attempted, and which I would not be ashamed to show against many of the bought ones. But to proceed to business. The first thing to decide on is the length of the bellows.

FIG. 72.

For the largest, or those fixed to body of camera, I should recommend an extension of 42 in., and for the others 30 in. will be sufficient. As the same instructions will do for both, I shall in regard to size, etc., mention the larger ones only. For these procure some stiff cartridge paper (or even brown paper will do, but it had better be in a roll to save joining); cut out a piece 54 in. long, and the same width at one end as the body of camera is high inside, and a trifle over half the width at the other end; the taper must be equal on each side, as in fig. 72. Now rule off an inch at each end, and divide the space between into equal parts of about an inch, crease these lines with the back of a knife, so that they will fold easily in the creases, then draw a pencil mark parallel with each edge, the same distance off same as it is between the creases, as dotted lines in fig. 72. Now cut out a notch the width of two creases as shown in drawing, leaving two square at the end (not reckoning the inch ruled off), then a notch, then another two square, and so on to the end. There will be a great many more than shown in the drawing, but that is sufficient to show the proper way. Another piece of paper must be made exactly the same as this in every way, and then two more pieces, the wide end of which is the same as the width of camera body inside; these must also be creased, the places for the creases being found by putting the edge of one of these to the edge of one of the former ones, and marking them from it, when it will be found that they come a trifle closer together. After these two latter are creased they must be notched in the same way, with this difference, *that where the former were left square, the latter must be notched.* A glance at figures 72 and 73 will make it clear. Each piece should now be folded in the creases, alternately in and out, taking care to start so that the short creases formed by the notches, and the middle crease in each square, fold inwards, the remainder of course folding outwards. Now having procured some good black twilled calico as wide as possible, lay it flat on

FIG. 73.

a table, and place the prepared cartridge paper on it edge to edge, keeping the ends level so that the creases intersect; they must be laid down, first a large one, then the smaller, then another larger, and lastly the other small one.

The twilled calico can now be cut all round about an inch outside the cartridge paper, after which another piece can be cut like it, as one is wanted for the inside of bellows and one for the outside. One piece of the twill can now be laid flat again, and then paste one piece of the cartridge paper well, and lay it pasted side down on the twill, leaving about 6 in. of the latter projecting beyond the former; paste the other pieces in the same way, and lay them on the twill,

FIG. 74.

each touching its fellow within about an eighth of an inch, and keeping the creases together, so as to follow in continuous lines. It will be found on laying on the last piece of cartridge paper that its edge projects over the twill, which is as it should be. Now paste over the four pieces of paper, and lay on the other piece of twill, allowing it to overlap the paper at the opposite side to which the other piece does, and when you have pressed them well together, bring one end over to the

other, so that they intersect in the same way as the others do; press them well down, which is easily done, as they will still lie flat; and when in perfect contact, open out and stand the square pyramid, which it now represents, up on end to dry. This may not seem quite clear on paper, but it is really very simple, as will be found by all who try it. The bellows have yet to be folded, and this is best done before the paste is dry and hard, say about four hours after they are put together, as it will be found that they work then very easily, starting at the bottom and gradually working up, pinching the corners as you go. A bellows body of the size mentioned would cost at least 25s., while if made at home they will not cost above a quarter of the amount, and they can be made in four hours. As the others will be made in the same way, I will suppose them finished, and proceed to fix them. This will be done in the same way as I recommended them to be fixed in Chapter I.; and close back the edge of camera body, the bottom of bellows being fixed to the cross piece M (see fig. 66, in Chapter VIII.) The small end of long bellows will be fixed to the middle part by small strips of wood screwed to it inside, which will hold them by pinching the piece A, fig. 72, between the two pieces of wood.

FIG. 75.

The smaller bellows will also be fixed in the same way to both middle piece and front, the strips in the former case being of such a width that they will leave an opening the right size to take the front of ordinary camera, so that the lens need not be detached from same every time it is required for enlarging, but will only require placing in the middle piece, and be held there by turn-buttons. By this method it can be transferred from camera to enlarging apparatus, and *vice versa*, instantly.

We now come to the dark-slide. The back of this is shown in fig. 74, a section through side in fig. 75, and a section through top in fig. 76. To make it, proceed as follows. Make a frame of 2 in. by  $\frac{1}{2}$  in. stuff to fit closely round body

of camera; this is shown at B, figs. 75 and 76. A groove must be run round at  $\frac{3}{8}$  in. from the edge before putting together, for the shutter to slide in, and this groove will have to be cut through the top piece to enable the shutter to be drawn; see fig. 76. When this frame is made fix another frame inside it close up to the groove, as C, figs. 75 and 76. The size of this is  $\frac{5}{8}$  by  $\frac{3}{8}$  in., the rabbet being  $\frac{1}{2}$  by  $\frac{1}{8}$  in.; this frame

FIG. 76.

must be fixed to the outer one by screws from the inside. A door must now be made and hinged to the bottom of the frame, as shown in fig. 74. This can be made from  $\frac{1}{2}$  in. stuff, but it had better be "clamped;" that is, a strip of wood about an inch wide glued and nailed on the end of the wider piece so as to prevent the latter from warping; these "clamps" are shown at DD, fig. 74. This door shuts inside the frame, and is fastened by two small turn-buttons at the top. The shutter is best made of "three-ply" fret wood, this being made up of three pieces, the grain of each crossing the others. It will always keep true, and it will only need cutting to the right size to slide easily in the grooves, and to project about an inch above at the top, where another piece of the same material can be glued and screwed on at each side, to prevent light from entering through the slot.

The shutter can be hinged in the same way as shown in my paper on dark slides, so as to fold down when drawn, or it can be allowed to stand up, though the former is decidedly the better plan, and not much trouble to do.

The board to which the paper is fixed for exposure can be made next. I make this up of a series of frames rabbetted so as to fit one in the other, as shown in fig. 78, and fastened, as shown in fig. 77, by small turn-buttons at the back. This enables any size of paper to be stretched tightly, by placing it on its corresponding size of frame, and pressing the others over it, thus forcing the edges of the paper into the joints. It will be seen that it is necessary to make the frames about a quarter of an inch smaller than the stock sizes of paper; any size can then be fixed at once, and much better than by using drawing pins, and other makeshift methods.

The outside of the exposing frame must be rabbetted, as shown in figs. 75 and 76, at E, where it is in position for exposure. It will be a good plan to make this of the three-ply fret-wood as well, though plain wood will do. The rabbets can be cut out with a sharp chisel.

The focussing screen is the next part to be made. It is a square frame, as shown in fig. 80, the ground-glass being fixed in with small brass corner pieces, and the

FIG. 77.

FIG. 79.

exposing board pressed up to their rabbets, four springs must be fixed to inside of door of dark slide similar to fig. 79; they are simply fixed with one screw through the middle, so that explanation is unnecessary.

The dark slide is now finished, but I should have mentioned that the bottom part of it must only come down level with bottom of cross piece M (fig. 66, in Chapter VIII.), as when closing up the apparatus the sliding pieces which carry middle piece and front will project under it, and they should now be pushed through as far as they will come, and hinged so as to fold up behind the dark slide; the whole will then fold into a thickness of about 14 in.

FIG. 80.

Small strips F, figs. 75 and 76, must now be screwed round body of camera,  $\frac{3}{8}$  in. from edge, to form stops for dark slide, and two small hooks and eyes put in on each side to hold it in its place. And this I think completes the camera as far as necessary for use. It can be stained or polished, to suit the

maker's fancy, and, if preferred, leather instead of twill could be used for making the bellows, which would no doubt make it look better, and also make a more durable article, but with ordinary care it will last a lifetime, as I have described throughout, and I think no one will ever regret the time and money spent in its making. I myself consider this the most useful paper of the series, not only of those already published, but of those to come, and I expect more of my readers to be making this apparatus than any of the others. In the dark-slide it must be noticed that the focussing screen and exposing board both fit in one rabbet, and after focussing, the screen must be taken out and placed at the back of exposing board; when the door is closed the whole will be tight together. I have arranged it in this way so that there shall be no loose parts when the whole is packed up, and all the difference it makes is about a quarter of an inch in depth of dark slide:

Below is a list of fittings required to complete the apparatus, in addition to those given in Chapter VIII. :-

	s.	d.
Two pairs of hinges for sliding parts of baseboard ..	0	8
One pair of hinges for door of dark slide ..	0	4
One dozen turn-buttons for exposing board, door of dark slide, and lens ..	0	9
Eight brass strips to hold ground-glass and negative ..	0	8
Four springs fixed to door of dark slide ..	0	4
Black twill for bellows, 1 yd. wide .. per yard	1	4
Imperial leather for ditto, 1 1/4 yard wide ..	2	0

#### DESCRIPTION OF FIGURES.

## Stereoscopic Photography.\*

BY GEO. A. THOMASON.

It is with a feeling of diffidence that I address myself to this subject this evening. In the first place, the last time it was discussed before the Society I found myself totally opposed to it, and it is a somewhat anomalous position to place one's self in, to be found advocating, at a meeting of this sort, the very thing one had opposed previously. In the next place there are gentlemen in the room who know far more about the subject than I do, and who are better qualified to speak upon it than I am. The difficulty the Council had, however, when I was selected to read the paper was this, that no matter how diffident I might be they were still more so; and that must be my apology for any shortcoming which may appear in my treatment of the subject.

Some of our members have obtained a great deal of amusement out of this subject by chaffing those who advocate its popularity. One gentleman, for instance, avers that it is as dead as Queen Anne. He, however, is careful not to say to which Queen Anne he alludes, because it is very evident that stereoscopic photography is not dead. I am reminded of a line or two from a song lately very popular, "It may have been asleep, but it's not dead yet." On the contrary, its claims are being urged more every season, and I venture to predict that it will yet become the most popular form of amateur photography. Another joke made at its expense is, that in instantaneous pictures made by its aid moving figures are so tantalising that a man in the act of walking presents such a realistic appearance that one feels a desire to drop a penny in the slot to make him move, or even to take more drastic measures still. Well, gentlemen, I claim that that is an additional charm to the stereoscopic worker, viz., to depict nature as it really is, or, shall I say, as we really see it. I hope to prove to you before I finish my paper, that it is impossible to see an ordinary photograph adequately represent any subject. A friend who is present remarked a short time ago in the club-room, that we got our results by means of a trick, and that it was not a genuine representation. Well, gentlemen, it is for me to prove that it is not a trick, but the most correct and the only truthful way of delineating a view or picture upon a plane surface. If you wish to produce in a natural manner several planes, there is, so far as I know, no other way of obtaining the result than by stereoscopic photography. If I hold a book in my hand at arm's length edgewise, and close one eye, I see the edge of the book only, but if I open the other eye, still holding the book in the same position, I see not only the edge, but also a portion of the side of the book, which proves that with two eyes two distinct pictures are formed, which, however, coalesce either by a mental act, which is the most likely theory, or from some connection between the nerves of the retina, which at present has not been discovered; many theories exist, but as they all differ it is no part of my duty to trouble you by discussing them. It seems to be upon the whole considered most probable that the power of forming a single idea of an object from a double impression conveyed by it to the eyes is the result of a mental act. If you hold up one of your index fingers close to the eye and one farther off, you will see that by looking at the one farthest away with both eyes, you really see three fingers. In the same way looking at the nearest one you still can see three fingers; i.e., by bringing the optic axes to bear upon the near finger the one farthest away is brought to a different part of the retina in each eye, and two fingers are seen behind the one which is really in focus. These experiments might be repeated in numerous ways, but I think I have established the fact that binocular vision produces two different impressions which by a mental operation give rise to only one sensation. Now, if we look with both eyes at an ordinary photograph, i.e., taken with one lens, it is evident something must be wanting to adequately represent the subject to us, and will agree that there is in every photograph so taken an appearance of flatness which can only be overcome by aerial perspective; and so when the distance is almost obliterated by atmosphere, and first a dim sensation of the mountains or trees or whatever may be at the background of the picture presents itself, it is seized upon as a triumph of photographic art, often by the very men who have done all they can by the use of isochromatic plates and yellow screens to overcome what they know perfectly well is not a representation of nature in its best aspect, but which is the best result they can accomplish. The fact also that to look at a photograph with one eye only, and then preferably either through a tube or shaded by the hand will give a partially stereoscopic effect, all goes to prove that for either the most correct representation or to afford the greatest pleasure to our friends or ourselves, the use of the stereoscope is not only not a trick, but the only legitimate way of showing or looking at our pictures when done. You may ask, "If then all you say is true, how is it the instrument is gone so much out of fashion?" or, as I

put it in commencing, "been asleep." That is easily answered. There is no doubt that great care is necessary in mounting the pictures, which, to an amateur, is only increasing his pleasure in the work and an incentive to excel, but which the tradesman who gets the work done in the cheapest manner possible accomplishes by employing probably young persons who think but little and care still less as to how the slides will look when placed in position. It is not fair to the art to judge of it by its past history. For years I could never look with any pleasure through a stereoscope, because, in order to make the pictures overlap or combine, I had to strain my eyes almost out of my head, and the consequence was that after looking at about half-a-dozen views, I had such a headache that I was compelled to give up looking at any more. A few months ago, an American called upon me with a new form of stereoscope, and I found that it was a wonderful improvement on any I had ever seen before, but still there was a slight strain, and I found at last that it occurred more with some pictures than others, and, in fact, with some there was no strain at all; and upon measuring the distances they were mounted apart, I soon found out the reason. More strain was occasioned by those mounted 3 in. apart, and some were even over this, which made it worse. I soon found that those at 2½ in. were quite normal and easy to look at. I believe that 2½ in. is better for many people, but as I can see 2½ in. views quite easily, I prefer that width, as, of course, I can get by means of the ¼ in. a larger picture and more subject. Perhaps at this stage it would be well for me to illustrate by a diagram what the action of the lenses in the stereoscope is. I should say that the form of instrument as now used was invented by Professor Brewster. A double convex lens is divided across the middle, and the two halves are set with their edges in juxtaposition. In the "Stereoscopic Manual," by Chadwick, which is very interesting and useful to all workers in this branch, he points out that it is possible to construct a stereoscope without lenses at all. He says in considering the size of the pictures and the dimensions of the box, "When we look at a tree in nature a mile away, we view it with so little convergence of the optic axes as to be termed practically parallel vision, for it must be remembered that if we observed the tree with a greater convergence of the optic axes, we should not estimate it at its true distance, but at a nearer distance, and as our eyes are only 2½ in. apart, it is clear that the image of the tree in the two photographs must not be more than 2½ in. apart. This dimension, then, settles the size of the photograph at not more than 2½ in. each in width.

With normal vision we cannot conveniently observe anything distinctly at a nearer distance from the eye than 8 in., and the box must be at least 8 in. long in order to accomplish this. It was pointed out the last time the subject was discussed in this room, I think by Mr. Griffiths, that even this simple form of stereoscope was unnecessary, and that with practice it was possible to get the effect by holding the pictures in the hand, and by diverging the eyes until parallel vision was obtained. This I tried at for a long time, and at last succeeded in getting the effect, but I thought there was too much strain upon the eyes, and no doubt there was, and for this reason; if we wish to obtain the best result from a photograph as to the natural size and perspective, whether large or small, we should view them at a distance from the eye equal to the focus of the lens we have used in taking the view, and it is for that reason that most people prefer whole-plate size, as the lens usually employed is about 10 in. focus, which may be considered the normal focus of the eye. Now, as it is necessary to use a lens of about 5 in. focus for stereoscopic work in order to get in the usual angle of view, and by that I mean about the same amount of subject as that obtained with an ordinary quarter, half, or whole plate lens, it becomes necessary to get the assistance of a lens in order to procure the correct proportion, because it is evident that if the picture is produced by a 5 in. focus lens, and we observe the print at 10 in. from the eye, it would only appear one-half its true diameter. So far as I can see, the object in placing the lenses in this position is to give parallel vision as well as to magnify the print to its proper size. You will see by the diagram which I have prepared, that the ray of light is caused to slightly diverge, and thus place the optic axes in the same position as when looking at the view itself; for this reason the lenses should be mounted not more than 2½ in. apart from centre to centre, as the normal distance between our eyes is approximately 2½ in., and, consequently, if the lenses are farther apart, as is the case with many stereoscopes, only the thin edges of the glasses are used and the diverging lines are proportionately more acute, and, consequently, the true distance is not appreciated and objects in the picture convey the impression of something much smaller than is really the case. While this objection may also be urged, I think that the more the lenses converge, or, as they are used in the stereoscope, diverge, the greater the strain will be upon the eyes. We may now leave the theoretical for the more practical part of the subject, and I first call your attention to the convenience of this work over ordinary photography. Most of you will, I think, agree with me that quarter-plate work is too small for

\* Read before the Birmingham Photographic Society.

any purpose except lantern-slide making, snap-shots in the hand-camera, or carte-de-visite portraits. Half-plate work is very little better. The views are too small to frame for pictures and too large to mount in a scrap album, and, in consequence, the majority of the prints are left to tumble about until they are spoilt. With whole-plate work it is different. You may with this size view decorate your walls with pictures worth looking at, but at what a cost—plates, paper, chemicals, mounts, and frames, besides the hard labour entailed, and then after carrying the apparatus five or six miles and finding nothing worth exposing upon! That is one of the pleasures of whole-plate work. Now take the stereo camera. You can use a small and lightly-made camera, a light stand, you can use only one lens if desired, and take a quarter-plate picture for a lantern slide, or if you wish to get a half-plate picture you have only to adapt one lens and remove the dividing screen, and you have with your 5 in. lens a wide-angle picture, or you can carry a 7½ in. lens and place in your camera a front for an ordinary view. But why take all that trouble? Suppose you see a nice bit and you want to get a lantern slide or quarter-plate size for a pocket album, or a stereoscopic view for the drawing-room table, you have it all at once in the one negative. But I can carry you still further. Suppose you think you would like a half-plate picture framed for the breakfast-room or nursery walls, or a whole-plate or 12 by 10 for the drawing-room. All you have to do is to enlarge the subject on bromide paper and you have it. Now I ask you, Mr. Chairman and gentlemen, can any other camera give you all these advantages? and I am sure you will agree that it is impossible to get the same results in any other way. There is nothing for you to re-learn or to forget before you can produce satisfactory stereoscopic slides. The negatives require a full exposure to prevent chalkiness, and in mounting the slides you have to transpose the pictures from left to right in order when looking at the view you may place the right-hand side picture as taken before the right eye, which, it will easily be seen, would not be the case unless transposed, from the fact of the pictures being taken inverted. As I mentioned before, I take some object at the middle distance and measure 2½ in. from centre to centre, carefully cut the two pictures top and bottom before dividing them, and with ordinary care in mounting, a perfect result is obtained. I place a straight line across the mount as a guide both for the centre and also to keep the prints upright. I have not thought it necessary to demonstrate at any length before you, because, as I said before, there are no new dodges to learn in order to assist you to success. I hope I have succeeded in removing any prejudices which may have existed in your minds against the subject in discussion, and also in setting forth a few of the pleasures which we who follow it enjoy. I have only to say in conclusion that I do not think any one who has followed it has ever grown tired and given it up entirely. I think all will agree that a stereoscopic picture properly taken, mounted, and viewed is indeed a thing of beauty and a joy for ever.

### PHOTOGRAPHIC SOCIETY OF GREAT BRITAIN.

#### SECOND NOTICE.

IN various parts of the exhibition there are examples of portraiture by the aid of the single lens, and there cannot be a doubt that for large heads the effect is more artistic than can be gained by most of the portrait lenses in use, for, instead of the sharp focus on one

plane, there is no real focus anywhere. Of course, the rectilinear lens gets over this difficulty, but even with the full aperture it is too sharp and the definition frequently too great for the best effect; and the larger the head the more is this felt. E. Lambert exhibits three men's heads taken with the single lens, which has been stopped down considerably, for they appear perfectly sharp. They are skied, but though near inspection is not possible, there is evidence of undue retouching. This objection cannot be urged against the work of J. T. Bergheim, several of whose heads are among the most artistic productions in the gallery. They are evidently produced by a single lens not very much stopped down, for, though there is no sharpness, there is, on the contrary, no fuzziness. In fact, there is all the sharpness a painter would desire in a 4 in. head. They are simple in treatment and most effective in light and shade and the rough paper on which they are printed still further heightens their artistic effect. The "Circassian Slave" is a fine model, well posed, but the diaphanous drapery is far too scant and appears plastered on the figure. "A Daughter of the Nile" is gracefully posed, and happy in the lighting, but the palm leaves have a spider-like effect in the background and take away somewhat from the repose of the figure. The whole of this gentleman's work is ambitious and evinces strong art feeling.

Karl Greger has departed from the red tones he usually employs, and his work, to our mind, has gained immensely by the change. He still depicts pastoral subjects, and sheep are again his very good friends. His *mise-en-scène* is usually of the simplest, and the hour best loved by him for his work is when the sun is far through his daily course. The clouds are always well selected and introduced into his pictures with great technical skill. The "Marsh Idyl" is a good illustration of his power in this direction. The subject is of the simplest—a flat country, a small bending water-course, and a flock of sheep, backed up by a cloudy afternoon sky. The clouds make the picture, for their perspective carries the eye through the picture to its most distant parts. Without the sky the picture would be tame; with it the picture is perfect. "Homeward" is a picture of sheep slowly trudging along a lane. The air in their immediate vicinity is filled by dust or steam from their heated bodies, and the detail of the hedges and trees is blotted out just where the flock is moving along. "Sunset on the Lower Thames" is a very effective picture, but the water in the foreground is too white for sunset, and with the sun so low down there must have been a cast shadow from the crumbling bank on to the water; the picture, however, is very striking, and few people will discover this slight discrepancy. The series of pictures by this very earnest worker have justly earned a medal.

P. Ennis has sent some gelatino-chloride pictures, not calculated to advance the process in the estimation of the public. Several of them are well chosen, but all are marred by foxy-toned and most ghostly shadows.

F. Hollyer's very striking series of portraits of men distinguished in arts or letters demand careful inspection. They are small—not larger than half-plate—but are made important by flat frames of darkish wood relieved by bands of gold. These are placed just below the line, and form a long row, and they are well relieved by the dull red cloth below them. The pose in every case is quite unconventional, and as a rule they are very simple in treatment. In no way do they resemble the conventional work turned out by the every-day photographer; but then Hollyer could not do this regulation sort of work if he tried.

B. Gay Wilkinson has this year surpassed himself. A thoughtful and earnest worker, his pictures have always commanded attention, but we think it must be conceded that in the present exhibition his work shows a great advance in art quality. The pictures of this year are printed on rough paper, the texture of which aids in the production of some of his effects; and in one of them the paper is abraided apparently to still further them. On observing to a friend that in letting his art betray itself he had missed his mark, we were assured by one who knew, that it was an accident, due to the chafing of the paper during washing. We are glad to believe this, for the photograph is so beautiful that it did not need any artifice to make it better. It is a picture made up of the slenderest materials—only a sluggish river in the distance, and a marshy expanse in the foreground, evidently buried by every high tide, for here and there it is covered by rank vegetation. The happy chance of a glorious evening sky has made the picture, for fanlike rays stream out in every direction from under a heavy cloud, and touch with golden tips the marshy distance, and the sandy mud is lit up in various places by the strong reflexion of the sun-lit clouds. "The Estuary of the Blyth" shows a half-sandy, half-muddy shore of a shallow Essex river, with a long line of fir trees in the distance—not very striking material for a picture, might reasonably be said. A beautiful evening sky dappled with mackerel clouds, however, completes the scene and puts all harmony. One of the greatest charms in Mr. Wilkinson's work to a lover of truth in art is due to the fact that the sky absolutely belongs to the scene, and is not printed in from a separate

negative. The lights and shadows, therefore, are always in their right places. The medal picture, "Westminster," is a daring attempt that few would have hazarded. He has succeeded, however, and the result well deserves the award. The setting sun is behind the Victoria Tower, which looms up black and gaunt against the evening cloudy sky; in fact, there is no detail in the whole gigantic block. The Thames expresses unceasing motion, and there is a weird palpable atmosphere pervading the scene. Perhaps the best illustration of what may be done in picture making out of slight materials is shown in "The Peaceful Evening Hour." It is made up of a house with no pretension to beauty, and a clump of fir trees. The picture is a narrow, long one, for an uninteresting foreground has been cut away. The setting sun, accompanied by long horizontal clouds, makes up the rest. The repetition of the horizontal lines, and the emphasis given to them by the long proportions of the picture prove Mr. Wilkinson to be one of the most advanced artistic photographers of the day.

F. Boissonnas exhibits a picture he calls a "Sunset Study." It is a picture of considerable dimensions, and the catalogue announces that it is a direct photograph on an orthochromatic plate. Surely with such an aid to correct rendering of colour values into monochrome, it ought not to have been necessary to work more or less all over the picture, with fine hatching of light pigment, apparently to kill blackness. The photograph is striking. A group of women at work in a roughly furrowed field, and one of them with rake in hand stands out sharply against the setting sun, and the clouds are busily engaged in the important business of putting him to bed. All the figures are dark against the evening sky, and of necessity there is little detail. The picture is low in tone, and the inspiration has evidently come from Millet's "Angelus."

W. Bedford has made a striking departure from the well-known work of past days. All his pictures are in sepia, and the brown colour is still further intensified by the brown wood frames. There is a small band of gold to separate the brown frames from their brown contents, but the first impression is that the pictures are too gloomy. There is evidence enough, however, on examination that several of them are taken in bright sunlight. The remarks on framing in last week's notice apply with force here. All the pictures in the neighbourhood are killed. The Norfolk rivers and broads have supplied the materials for the series. The well-known wherries, with their gigantic sails, are well rendered. The most perfect of the series is the one with the dense bed of rushes for a foreground. The almost cream tints of the lighter portions of the clouds would have been helped by an india tint, and the white margin beyond would have better helped to separate each picture from its companion, and then the pictures in the neighbourhood would not have suffered so severely.

There can be no doubt that rough paper helps very materially to lighten and give transparency to shadows; let all credit therefore be given to Gale, whose pictures prove that he can hold his own without the aid of this well-known art method. "The Incoming Tide" is a little gem. A marshy foreground, and a line of stakes here and there half covered by tangled weed and a distant river; but with the evening sky all is made calm and reposeful. Indeed, it is a picture of perfect harmony. "An East Country Quay" just misses being a very perfect picture. The long shadows thrown on the water by the boats make striking effects of light and shade; but the black mass in the immediate foreground is so out of harmony with the rest that it misses its purpose, and the beholder can only with difficulty get his eyes away from the black buoy in order to enjoy the more beautiful parts of the picture. "Afternoon Repose" is another example of Mr. Gale's well-known effects. A herd of cattle occupy the middle distance, and are ruminating, apparently thinking of nothing in particular. The hill ranges which fill in the scene are veiled and mysterious. "Flatford Bridge" is an artistic study of light and shade. This bridge is well known for its picturesqueness, and has been frequently photographed, but this picture by Gale is by far the best we have seen.

W. M. Warneke's "Landscape" is distinctly fresh in treatment. It is of large dimensions, and the birches and bracken are given with quite a painter's touch. The photographer's sharpness of rendering is not here, but there is no out-of-focus fuzzy effect for all that. It is a pity, with all else so good, that the hill-line arrests the eye with its undue sharpness. "A Corner of the Farmyard," by E. Spencer, is a simple, unpretentious subject—a small pond backed up by farm buildings, and a congregation of ducks and ducklings.

H. J. Godbold has more than once photographed domestic scenes in which a crippled ship has played chief part; but we think never such a striking one as his present picture called "A Rocket to the Rescue." A ship is ashore, and though the storm has apparently subsided, the long rollers are still potent for mischief. That it is still blowing a stiff gale is shown by the action of the dark figures on the beach, for most of them put their shoulders to the wind. The point of interest is the rocket, with line attached, speeding its way on an errand of mercy. The whole scene is dark and gloomy, and the air heavy with the salt spray.

## Reviews.

*Die Photographische Camera und die Momentapparate.* By Dr. J. M. Eder. Published by Wilhelm Knapp, Halle a/S. Price 10s.

This work forms part five of vol. i. of Eder's famous *Ausführliches Handbuch der Photographie*, and is the most complete work yet written on photographic apparatus.

The author describes the various leading commercial forms of instantaneous shutters, the method of estimating their speed; the various forms of cameras for ordinary and special work; detective cameras for all kinds of different purposes; and gives a complete description of the various apparatus used by Marey, Muybridge, Auschutz, etc.

This is the most complete work of its kind yet written, and is illustrated by nearly 700 woodcuts in the text, and three process blocks from work done with the telephotographic lens. The book is well printed, and forms a handsome work of over 700 pages.

*The Telephotographic Lens.* By T. R. Dallmeyer, F.R.A.S., M.R.I., etc. Published by J. H. Dallmeyer, Ltd., 25, Newman Street, Oxford Street, W. Price 1s.

In this brochure of thirty pages Mr. T. R. Dallmeyer has collected all the useful and interesting matter relating to his telephoto lens, and the whole forms a very clear and useful handbook to the use of this particular lens. Six very good collotypes show the advantages to be gained by the use of this lens over the ordinary in the magnification of distant objects and the truer rendering of distance.

*La Photographie en 1892.* By MM. Niewenglowski and Reyner. Published by Ch. Mendel, Librairie de la Science en Famille, 118, Rue d'Assas, Paris.

This little volume, which is dated 1893, forms a brief resumé of the leading advances made in photography during the current year. The international exposition of photography held at Paris gives the authors the text for the chronicles of the advances made. The statutes of the Union Nationale des Sociétés Photographiques de France are given and a list of French photographic publications.

*The Hand-Camera, and How to Use it.* By Walter D. Welford. Published by Iliffe and Son, 3, St. Bride Street, London, E.C. Price 1s.

This work is practically a reprint of articles which have appeared in one of our contemporaries. The author discusses the various principles adopted in the construction of commercial hand-cameras, and although of course his own views are strong on this point, he states the pros and cons of each particular device fairly and honestly. Some very useful and practical hints on the use of a hand-camera are given, and the work is illustrated by several process blocks of snap-shots, and of these one, "When the red sun sinks to rest," is utterly false and untrue, and would be far more suitably described by some such claptrap title as "Moonlight," or "The sable garments of the night," for it is about as black and unlike a sunset as it is possible for anything to be. On the subject of developing some very good hints are given, and the author comes to the conclusion "that, up to the present, there is nothing to touch pyrogallol acid for the development of hand-camera shots."

In several places in the book some curious statements are made, and one in particular on p. 27—when discussing the pros and cons of double *v.* single lenses—struck us as requiring elucidation. Mr. Welford says, "The single combination will not only be quite quick enough, but will probably give truer renderings of nature. It gives a much flatter field, and therefore the alteration of perspective and angle, which the stopping down of a doublet to obtain the same degree of sharpness generally leads to, is avoided." It will be noted that we have here one given sized plate, and we must confess we were not aware that stopping down a lens altered either the perspective or angle still we live and learn.

*The Practical Photographer's Label Book.* Published by Percy Lund and Co., Memorial Hall, Farringdon Street, E.C. Price 6d.

This is certainly the best label book which has yet been issued. It contains sixteen pages of gummed photographic

labels for all the leading chemicals, printed in clear, distinct type and varnished, an improvement of great practical value. On all the labels for poisonous chemicals is printed in small characters the antidotes for the same. A few blank pages are also included for any special or out-of-the-way labels.

## Apparatus.

### SCOTT'S DARK SLIDE.

MR. W. I. CHADWICK, of 2, St. Mary's Street, Manchester, has sent us a sample of Scott's patent dark slide. This is a single slide of extremely light construction, with pull-out shutters. On pulling up the slide, the bottom of the slide turns back to allow of the insertion of the dry plate.

Like most of Mr. Chadwick's specialities, this is at once practical and efficient, and will be of great service to all workers and hand-camerists especially.

## Societies' Meetings.

**Hackney.**—Meeting held on 27th ult., Mr. Walter Potter presiding. The Hon. Secretary announced that the judges in the forthcoming competition would be Captain Abney, Colonel J. Gale, and Mr. Ralph W. Robinson. Work was shown by Messrs. Pollard, Nunn, Dean, and the Hon. Sec. From the question box:—Does bromide paper lose rapidly with age? Mr. Barker had used some two years old with little loss of rapidity. Mr. L. J. Beckett had used some four years old. Another question was, Can I use amidol without bromide, and can I over-develop with it. The Hon. Sec. said he had used it without bromide, and had found it work satisfactorily. Mr. Sodeau said it was possible to over-develop with amidol. A third question was: Should chloride of gold be kept alkaline in solution? Mr. Sodeau said: Be slightly acid, but it was rarely ever done. The Hon. Sec. then gave a lantern lecture on his holiday in the Isle of Man (in conjunction with Mr. Dando), during which over eighty slides were shown.

**Harlesden and Willesden.**—A meeting took place on the 26th ult., J. Naylor in the chair. A lengthy and interesting discussion took place upon printing processes for various negatives. Those members who had received samples of the Paget Prize plates distributed at the last meeting spoke in very high terms of them. The President commented upon their high sensitiveness in dull weather. An excursion to Windsor was arranged.

**Liverpool** (Am. Phot. Assoc.)—The monthly meeting was held on the 29th ult. The President, Mr. W. Tomkinson, occupied the chair, and there was a very large attendance, attracted, no doubt, by the announcement that Mr. George E. Thompson would deliver his new lecture, entitled "Hill-top Cities of Etruria," illustrated by lantern slides from negatives taken by the lecturer during the spring of this year. Mr. Thompson holds such a high position in the estimation of the members, both as a lecturer and as a photographer, that he is always sure of a crowded audience. After the election of seven new members and a report by the President upon the recent excursion to Shrewsbury, Mr. Thompson commenced his lecture, of which the following is a synopsis:—"Orvieto, its famous cathedral, its old gates, and precipices. Viterbo, ancient walled town, fountains, buildings, and monastery of La Quercia, grand old garden. Excursion to Caprarola. Montefiascone, and down to Lake Bolsena, basaltic columns, old town. Orte, on the Tiber. Narni, ruined bridge quaint streets. Segni, on its crags. The monastery of Monte, Cassino. Corneto, Etruscan tombs 2,400 years old, museum, sarcophagi, Etruscan pottery. Carrara, marble quarries, grand scenery of the marble mountains, a marble Venus come to light." The lecture was most interesting and instructive throughout, and the slides were of the highest quality, calling forth frequent bursts of applause. This was particularly noticeable when the pictures of the Carrara marble mines were being shown. The enormous extent of these considerably surprised most of the members, and the beauty of the marble mountains was expressed in the photographs with wonderful realism. At the close of the lecture, Mr. B. J. Sayce proposed a hearty vote of thanks to Mr. Thompson, and this was carried with acclamation. On the motion of the lecturer a cordial vote of thanks was also given to Mr. F. Anyon for the admirable way in which he had worked the Society's new lantern. It is a matter for congratulation and was much commented on, that although the large room was crowded for about two hours, the temperature and atmosphere were most comfortable and agreeable throughout, thanks to the efficient ventilation and the electric light.

**Liverpool** (Camera Club).—The usual meeting was held on the

28th ult. in the rooms 128A, Mount Pleasant, Mr. W. Haywood in the chair. The subject for the evening was "Hints on the Manipulation of the Lantern," by Mr. T. Edwards. Mr. Edwards had kindly brought his own lantern, which he fully described, and showed many little improvements which the lecturer's large experience had suggested. Mr. Edwards then proceeded to explain the working of the lantern, describing every particular and conveying many useful hints to the members. The lecturer afterwards passed through the lantern a number of slides brought by various members. The first smoking concert of the winter session is to be held on Wednesday, 12th October.

**London and Provincial.**—At a meeting held on the 29th ult., Mr. John Barker in the chair, Miss C. W. Barnes was duly proposed as an honorary member. The following question was found in the box:—Will anyone give a reliable formula for a rapid emulsion, the best method of breaking the same up and washing it in large bulk? the answer to which was deferred to the next meeting. Mr. Haddon said that he thought it was the duty of every member to correct statements made in the journals, and drew attention to a paper by Cadett in Cadett and Neal's *Dry Plates* on "Ammonia," and after referring to the loss of bulk on mixing alcohol and water, said that ammonia and water, when mixed, did not condense but increased in bulk, and that Cadett's statements, therefore, required alteration. Mr. H. Snowden Ward showed five very fine studies sent to him by Shapoor N. Bhedwar, which represented the initiation of his son as a Parsee priest, and which were correct in every detail of the ceremony. The Secretary then read a paper by Mr. G. T. Harris on "Gelatin Plates for Lantern-Slides," which will appear shortly in our columns. Mr. Barker showed some very fine negatives made by the albumen process over thirty years ago. A desultory conversation then took place on drying cupboards.

**Leigh.**—The annual meeting was held on 29th ult., the President presiding. The balance sheet was passed unanimously with a good balance in hand. Mr. Stephens was again elected President, with Messrs. James Ward, B.A., R. B. Mawson, T. L. Syms, Vice-Presidents, Messrs. J. Battersby, J. Berry, W. Crouchley, W. Hampson, T. G. Hirst, and R. Leigh Council, with Mr. Haddock Treasurer, and Mr. W. R. Moore Secretary. The winter programme was arranged, and Messrs. Miles Burrows, A. E. Bennett, and T. Peters were nominated members.

**Phot. Soc. Great Britain.**—A technical meeting was held on the 27th ult., Mr. W. England in the chair. The Chairman announced that the business of the meeting was the exhibition of the apparatus on view in the Exhibition. Messrs. Watson and Son exhibited a new studio stand for large cameras, the back and front of which could be raised or lowered together or separately, by one handle. It could be fixed in any position, moved easily and smoothly on castors, and levelled for an uneven floor. They also showed an improved form of studio camera, with axial swing back, side swing, and special repeating back and dark-slides; a 10 by 8 Acme camera, with aluminium fittings, weighing about 4½ lb. Mr. W. Sanders exhibited his Photoscope, an opera or field glass, which could be converted into a photographic camera containing twin photographic lenses and finder, time and instantaneous, metal roll-holder for twenty-four exposures, focussing screen and glass, the only projection being the trigger of the shutter. By using one tube of the marine glass as a finder the object could be focussed and the picture taken while still visible through the glass, the time of exposure being regulated at the moment of viewing the picture, the shutter being always ready either for time or instantaneous exposures. Mr. J. D. England showed his film carriers, in which the iron ends were replaced with aluminium. He also placed before the meeting some specimen negatives on photo-mechanical plates. Mr. S. H. Smith (Smith and Son) exhibited and described his patent plate washer, which was provided with a sloping bottom, the plates being washed films downwards; the arrangement of the water inlet, he claimed, insured a thorough circulation of the water. There were also exhibited Messrs. Morley and Cooper's long-extension half-plate camera, with Smith's patent shutter springs, Messrs. Newton and Co.'s aluminium sliding-leg tripod, fitted with Elmer's patent levelling head. Mr. W. Goode explained the action of his self-adjusting tripod head. Mr. Tottem (Messrs. G. Houghton and Son) showed the Shuttle hand-camera, Dewe's patent photo-chromoscope for exhibiting transparent photographs, a combination pocket-knife and diamond, and a rotating table with clock-work arrangement for vignetting. He also showed an interchangeable leaf album, the covers of which presented the appearance of an ordinary album, no button or tapes being visible. Mr. J. R. Gotz exhibited his new changing-box for films, with special dark-slides for use with same, and passed round negatives which he had taken with his apparatus. He showed the method of changing the films, which is effected by introducing the hand into the interior by means of slides. He also displayed a whole-plate central swing camera, fitted in aluminium, Atlas-pattern tripod and Constant and Bijou shutters, with diaphragmatic fittings, both the ordinary pattern and the twin form for stereoscopic use. Mr.

Sinclair, representing Messrs. Adams and Co., exhibited their Lighting camera stand, the Vesta camera, the new Adams changing-box, and also their Pantascope, for viewing transparencies. Messrs. B. and J. Beck's exhibit included the Frena hand-camera and Bynoe printing-frames; also celluloid dishes, with a receptacle at one end to hold the developer when the dish is held vertically to examine the negative. There were also shown Messrs. Archer and Son's Ideal optical lantern, Taylor, Taylor, and Hobson's Standard lens fittings and adapters, Nameit, for producing titles, etc., on prints, the Dresser hand-camera, the shutter on which works between the lenses, and a case of lenses by Messrs. Swift and Son. A vote of thanks was passed to those exhibitors who had explained their apparatus, and the meeting terminated.

**North Middlesex.**—On 26th ult., Mr. J. C. S. Mummery in the chair, one new member was elected, and about forty members were present. The Chairman introduced Mr. E. J. Wall, who discoursed on the "Life of a Dry-Plate." He started with the making of gelatine and the properties of bromine, the making of an emulsion, the necessity of bromide being in excess, the advantage of an iodide, and the method of increasing rapidity by adding ammonia and by cooking. The qualities of a good plate were discussed and the advantages of colour-sensitive plates. He then gave a recapitulation of the theories which had been advanced to account for the action of light upon a plate, and followed on with a consideration of the qualities of the numerous developers in use. He strongly advised beginners to leave hydroquinone alone, and to trust to pyro and ammonia. In looking over prints sent to the AMATEUR PHOTOGRAPHER Competitions he had selected 1,200 prints, as showing the faults usually given by the use of hydroquinone, and on reference to the details given by the competitors had found that in over 1,000 instances his judgment was correct. When hydroquinone was used he advocated the abolition of sulphite of soda, and advised the use of ammonia or carbonate of potash with ordinary table salt as the restrainer, when one was necessary, in place of bromide of potassium. He considered that sulphite of soda was used in excessive quantities, even with pyro. If negatives free from stain were required, they could be had by the use of the acid fixing bath. He referred to the theories of development advanced by Messrs. Hurter and Driffield, and mentioned the misunderstanding that had arisen in consequence of these gentlemen using the word density in a sense different from that in which photographers applied it. Having giving a caution on the subject of thorough fixing, Mr. Wall boldly attacked the question of which intensifiers to use according to the nature of the negative and the subject. In the conversation which followed, many other questions were raised, which Mr. Wall fully answered. The competitions of views taken at the last two outings of the season to Higham Park and the Rats' Haunt, Palmer's Green, were held. Mr. A. J. Hewson was declared the winner in the former. The Bynoe printing frame was shown, and price lists of the Hill-Norris dry collodion plate, of new lenses, lists of chemicals from local dealers, etc., for which the Secretary tenders his thanks, were distributed. The next meeting will be held on October 10th, when Colonel J. Gale will address the society on technical points on picture-making, illustrated by the optical lantern. Visitors welcome.

**South Manchester.**—The first annual meeting of this society was held on 26th ult., Mr. W. I. Chadwick in the chair. Messrs. Holmes, Hunt, and Norris were elected members. The Hon. Secretary then read his report for the past session. The officers have to congratulate the members on the progress made by the society since its formation in February of the present year, the number of members now enrolled being thirty-three. The financial position of the society was very satisfactory, there being a substantial balance to its credit. The report then went on to describe the meetings and the various papers read, amongst them being "Photography by Artificial Light." This was followed by a practical demonstration, "Platinum Printing," by the Hon. Secretary (Mr. W. Thompson), "Magic Lantern Matters," by the Chairman (Mr. W. I. Chadwick), etc. A good deal of attention had been devoted to stereoscopic work, and some very beautiful transparencies were shown at several of the meetings. Discussions had also arisen from questions asked as regards developing, printing, toning, etc. At the popular meeting held in March, a paper was given on "Holiday Reminiscences, including a Trip to the Isle of Wight," by Mr. W. I. Chadwick, which was very well attended by the members and their friends. The outdoor rambles had been fairly successful, those which have been held being well attended. The Hon. Treasurer's balance-sheet was then presented and passed. The election of officers for the ensuing year followed, and after a short discussion was decided as follows:—Chairman, Mr. W. I. Chadwick; Vice-Chairman, Mr. W. Linnell; Hon. Treasurer, Mr. E. N. Bowden; Hon. Secretary, Mr. W. Thompson. The meeting then adjourned to the large lecture hall, when the Hon. Secretary gave a short paper on "Picturesque England," illustrated with some eighty slides specially selected for the paper. The places visited included the English Lake District, the Old Abbeys of York-

shire, the river Thames, Devonshire, Cornwall, Derbyshire, concluding with Shakespear's country. At one part of the lecture some miscellaneous slides of cloud and water effects, snow scenes, etc., were introduced. Frequent applause showed the appreciation of the audience when some well-known or very beautiful view was thrown on the screen.

**Warrington.**—In lieu of the ordinary monthly meeting, a conversazione and flower banquet was held, on the 27th ult., about 200 members and friends being present. Mr. T. J. Down, the President, in opening the proceedings, said on looking round the room so tastefully decorated with coloured lanterns, fairy and pyramid lights, flowers, and such a profusion of luxurious fruit so temptingly arranged on the tables, all tended to prove the interest those members manifested in bringing about its success, which could only have been the result of much labour. He said the object was to let the people of Warrington know of the existence of the society, which he believed had done and was still doing a good work in promulgating the popular science of photography, which afforded innocent and profitable pleasure and recreation to all those who practised it. He hoped one of the results of the gathering would be an increase in the society's membership. On declaring the banquet open, he gave all a hearty welcome, and invited them to partake of the fruits of their choice, given by various members. There were also three exhibitions of lantern slides of twenty minutes' duration, Mr. H. N. Haughton and Mr. Harding being the lantern manipulators.

### SOCIETIES' FIXTURES.

- Oct. 6.—LEEDS.—"The Education of an Amateur Photographer," Mr. S. A. Warburton.
- " 6.—OXFORD.—Annual Meeting.
- " 6.—LONDON AND PROVINCIAL.—"Various Printing Processes," Mr. B. Foulkes Winks.
- " 8.—LEYTONSTONE.—Discussion, "The Eastman Paper and Paget Plates," opened by Mr. F. Waites.
- " 10.—NORTH MIDDLESEX.—Lantern Slides, and Address, by Colonel J. Gale.
- " 10.—LANTERN SOCIETY.—The Slides going to America will be shown.
- " 11.—LIVERPOOL (Fairfield). — Practical Demonstration, Chloride Lantern Transparencies, by Mr. G. E. Thompson.
- " 11.—BIRMINGHAM. — "Self-Help for Amateurs," by Mr. W. B. Osborne.
- " 11.—HACKNEY.—Members' Lantern Night.
- " 13.—BIRKENHEAD.—AMATEUR PHOTOGRAPHER 1892 Prize Slides.
- " 13.—BARROW (Naturalist). — Lantern Lecture on the Holy Land.
- " 13.—LONDON AND PROVINCIAL. — "Practical Demonstration on Retouching," by Mr. Redmond Barrett.
- " 15.—LEYTONSTONE.—Lecturette: "Hand-Cameras," by Mr. D. G. Riddick.

**Mr. Lyd. Sawyer**, of Singleton House, Newcastle, has been awarded the diploma d'honneur at the Paris Exposition Internationale de Photographie, held in the Palais des Beaux Arts, Champ de Mars, from April to September. The exhibition has been on a very elaborate scale, well-known photographers from all over France being very much in evidence. The diploma was the highest award given by the jury, and it says a great deal for the character of Mr. Sawyer's art that he should have been selected for this honour. His pictures were "The Boatbuilder," "The Castle Garth," "In the Twilight," "Waiting for the Boats," "The Smoky Tyne," "The Ha'penny Ferry," "The Last Rehearsal," and "Reflections."

**Watkinson and Co.**, of Leeds, have now moved into a large three-storied building, comprising over 600 square yards, in Merriion Square, North Street, and have laid down new and improved machinery for the manufacture of all kinds of cameras and tripods. They are still keeping their place in Harrison Street, and are having it fitted up as a show room, with dark-room, enlarging, and reducing apparatus for the use of their customers.

**The Council of the East London Photographic Society** have decided to hold their second annual exhibition in the lecture hall of the New Tabernacle, Old Street, E.C., on Monday and Tuesday, October 24th and 25th. Last day for sending in prints for "open class" competition, October 18th. Messrs. E. J. Wall and A. Horsley Hinton will adjudicate prints on Tuesday, October 25th. Entry forms and full particulars of open class competition may be had from the Hon. Secretary, Mr. M. A. Wilkinson, 28, Shacklewell Lane, Kingsland, N.E., on receipt of stamped addressed envelope.

## To Correspondents.

All communications for these columns are to be addressed to **The Editor, "Amateur Photographer," 1, Creed Lane, Ludgate Hill, London, E.C.**

### RULES.

1. Write clearly and distinctly on one side of the paper only.
2. Write each Query or Answer on a separate sheet of paper.
3. Write the name and address legibly on the back of each communication, and sign all Queries and Answers with name or *nom de plume*.
4. All matters for these columns **MUST** be received by **TUESDAY MORNING'S POST**.
5. The Editor does not undertake to answer questions by post.
6. In answering Queries, correspondents are requested to mention, in every instance the number and full title of the query referred to.

### QUERIES.

5825. **Local Reduction.**—What is the best way of reducing portions of negatives which are too dense, e.g., distant mountains, etc.?—**SKELOS.**
5826. **Enlarging.**—Would any reader inform me if it is possible to enlarge from a quarter-plate negative with a Lancaster's Instantograph? Any help will greatly oblige.—**JOHN PEEL.**
5827. **Transferring Albumen Prints.**—Can anyone tell me how to transfer albumen prints to china?—**TIM.**
5828. **Lifting Plates.**—Can any kind reader give me directions how to lift plates into a changing bag for hand-camera?—**AMATEUR.**
5829. **Writing on Prints.**—Can any amateur inform me of an easy method of writing or putting the name of a view on a print, without spoiling negative?—**J. LESTER.**
5830. **Exchanging Prints.**—Does any amateur wish to exchange a few prints? If so, send address.—**J. LESTER, Church Street, Old Bedford.**
5831. **New Platinotype Process.**—Does any amateur know anything about the new Platinotype process, and a good, reliable formula for developing the Imperial plates by hydroquinone?—**J. LESTER.**
5832. **Calais and Boulogne.**—Where can views of Calais and Boulogne be obtained?—**F. G. R.**

Correspondents not seeing their queries inserted are requested to look for the same under "Editorial."

### QUERIES UNANSWERED.

Sept. 30th.—Nos. 5821, 5822, 5823.

### ANSWERS.

5808. **Developing Tent.**—Davenport and Co., 32, Parkhouse Street, Camberwell; Fallowfield, 146, Charing Cross Road; and Adams, 81, Aldersgate Street, all have cheap and good developing tents of various kinds.—**EDITOR.**
5813. **Mounting.**—The best method of mounting chloride prints, whether matt or glossy, is with waterproof paper and plain starch paste. The query is a little unintelligible as it now stands.—**EDITOR.**
5815. **Herzheim's Paper.**—The address of this firm is Gebrüder Herzheim, Duren, Rheinland, Germany. The formula we are not quite sure about, but believe it to be:

Water	...	500 parts.
Sodium hyposulphite	...	250 "
Ammonium sulphocyanide	...	30 "
Acetate of lead	...	10 "

#### II.

A'm	...	8 parts.
Citric acid	...	8 "
Nitrate of lead	...	10 "
Water	...	500 "

When dissolved, mix I. and II. and add 1 per cent. sol. chloride of gold ... 40 parts. Allow to stand 48 hours before use.—**EDITOR.**

5816. **Fungus.**—The cause of the fungus is due to organic or nitrogenous matter of some kind finding its way into the solution.—**EDITOR.**

5817. **Platinotype Printing.**—The Platinotype Company's new cold bath paper; address, 29, Southampton Row, Holborn, W.C.—**EDITOR.**

5824. **Pizzighelli Paper.**—A successful way of damping this paper is to steam the pad of the printing-frame, by means of a kettle; but there are many other ways, such as leaving the paper in the cellar for an hour. I prefer the first method: of course, the

negative must be varnished. There is no development, as the process is a printing-out one; the prints are fixed by being soaked for about five minutes at a time, in a weak solution of hydrochloric acid, one part acid to sixty of water, changing the solution two or three times; the acid is afterwards washed out by a few changes of clean water. The paper prints best, I think, in a good actinic light.—**J. G. P. VEREKER.**

### EDITORIAL.

**SPECIAL NOTICE.**—We are very pleased to find that replies in this column are so much appreciated, but we should be very grateful if those requiring advice would send their letters to us BEFORE TUESDAY MORNING'S post if possible. The time occupied in replying in this column is very considerable, and owing to the often late receipt of letters, many matters have to be left over each week. This we much regret.—**ED. AM. PHOT.**

**CARELESS.**—(1) Professionals either use cardboard fastened on to the front of the printing-frame with a hole out in the card, or else they use the ordinary commercial vignetting glasses, which may be bought from any dealer. (2) You will find the note you require on toning Solio paper on p. 224.

**J. W. TURNER.**—Adams and Co., 81, Aldersgate Street, or E. H. Fitch, 34, Angell Road, Brixton, will supply you with matt celluloid sheets; the price we do not know. We could not give you a complete index every week; we do include "contents" now.

**H. D.**—(1) The faults with this are that the hands and face are too white; the print wants an inch cut off each side, and it is over-toned. (2) The negative wants intensifying, we think, although you have flattened it by printing in the sun. (3) The perspective in this is horrible, the horse's head is as big as the man; it also wants clouds. (4) Too flat and over-toned, wants clouds. Never print in the sun, do not over-tone, and let us see some more work soon.

**E. E. S. (Nunhead).**—We should advise a rapid recilibrator by Crouch, Taylor, Beck, or Perken, Son, and Rayment.

**F. S. J.**—(1) This possesses one of the usual characteristics of hydrokinone development. The negative wants intensifying, otherwise very good. (2) Utterly without interest now; print in some good suitable clouds, and you might make a picture of it. (3) Flat, and wants clouds; would probably be improved by intensifying negative. (4) Ditto. (5) Ditto. This is by no means a bad little bit. All your prints show careful work, but a little want of art principles, and all are too flat. Try intensifying your negatives, or else print in a weaker light. Let us see some work again.

**O. A. CAYLEY.**—Neutralise your gold by adding 30 grains of bicarbonate of soda to it, before adding to the sulphocyanide; there should be no smell from the bath. The red spots are, we believe, due to your not neutralising the gold.

**J. RAWLINS.**—J. Turnbull, 6, Rose Street, Edinburgh, will supply you with any number of the film carriers.

**E. B. G.**—(1) Collotype, Woodbury-gravure, Woodbury type, and photogravure—but no other ordinary process. Probably chloride prints toned with platinum are more permanent than albumen prints; that they are absolutely permanent cannot be stated. (2) The carbon process gives quite as sharp detail as ordinary silver paper when properly manipulated.

**B. C. CREASY.**—(1) Good class photographers certainly take apprentices; the premium varies from £25 to £100, according to standing of firm, and whether in or outdoor. (2) Any one may have a copy of "Photographs of the Year" by paying 7s. 6d. before publication. All our queries are answered gratis.

**G. ROBINSON.**—The simplest tests for water are: (1) Put half pint of the water into a decanter, shake up violently and then smell, when, if there is any offensive odour, sewer gas is present. (2) In a perfectly clean wine-glass, pour a little water, add two drops of sulphuric acid and enough solution of permanganate of potash to give it a very faint pink tinge, cover the glass with a plate, and if after fifteen minutes the pink tinge is visible, the water may be used. It is always advisable, however, to boil all water, and then filter through a spongy iron or charcoal filter.

**J. F. NISBETT.**—We know of no one who gives lessons, but you might try Redmond Barrett, 1, Cumberland Street, Eccleston Square, S.W., or A. H. Bool, 93, Harwood Road, S.W.; or A. Underhill, 32, Clarendon Road, W. Croydon.

**M. A.**—You have run back too far. The article you want appears on p. 233, April 8th, 1892, where you will find a Belge lamp used. Use a sheet of frosted glass, not your single lens. Always glad to help you.

**R. H. METER.**—(1) The streaks are due to your not polishing with waxing solution enough. Apply your solution with a flannel, and then polish well with another pad. (2) The black specks are not of much moment unless they are very numerous. Have you unscrewed the combinations and dusted the inside surfaces. (3) We do not understand this query. What do you want to know, exposure, distances, or what?

**H. PARKER.**—(1) Very poor, figures utterly out of place, and definition bad. (2) Spoilt by halation and curious marking on right side of print. (3) Without any interest whatever, and spoilt by halation.

**H. JONES.**—Your letter was held over till we could actually test your sample. The salt sent seems to be a mixture of bicarbonate and carbonate; probably it is the former which has deteriorated. The easiest method of distinguishing between the two is to dissolve some of the salts in distilled water, and add to some solution of sulphate of magnesia in distilled water. The carbonate gives a precipitate at once and the bicarbonate only on boiling.

**STUART.**—(1) Permits to photograph for six months, Sundays excepted, in Hyde Park, St. James's Park, and Kensington Gardens, may be obtained from H. W. Primrose, H. M. Board of Work, Whitehall, S.W. (2) We are always glad to see visitors; Mondays from 2 to 5 is the regular visiting day, but if you can write, making an appointment, we will see you any day but Tuesday.

**H. L. S. R.**—Your best plan is to spot out the holes on the negative. Mix sepia carmine and vandyke brown with a little weak gum water, and use a fine camel's-hair brush, and stipple the colour on the holes in little spots.

**W. TODD.**—We have tried Amidol with good results. You will find notes on the same in our issue of Sept. 2, 1892, p. 182. A letter appears in our correspondence column of this week which gives a very good hint on its use. We shall be very glad to see prints at any time.

**L. S. SMITH.**—Do not use ammonia, but add  $\frac{1}{4}$  oz. of carbonate or washing soda to hypo bath.

**ARINAS.**—(1) The percentage of salts varies, but approximately the following are correct. Sulphocyanide of ammonium 50 per cent., nitrite of potassium, 50 per cent., uranium nitrate, 70 per cent., ferric chloride, 90 per cent. (2) Obernetter's process or Lichtkupperdruck; we are not aware of any detailed description of this process ever having been published. Briefly the process is as follows:—From a negative a positive is made on a film very rich in bromide of silver, the positive being developed up rather dense; after fixing and washing, the image is converted into chloride of silver by a mixture of ferric chloride and chromic acid, well washed and stripped. It is then laid on a copper plate, and is decomposed by a voltaic current, the chlorine uniting with the copper to a degree varying with the amount of chloride of silver in the image. This is inked and printed from just like a copper plate. (3) Portrait lens. The old Lerebours lens will answer perfectly for enlarging or ordinary portrait work. Get your diaphragm slot cut at a distance from each lens in proportion to the focal length. There is no need to use so small a stop; only to obtain definition you might open out the aperture of your stops to nearly, if not quite, full aperture of lens.

**TRIX.**—(1) The admission to P.S.G.B. is 1s. for daytime, and 6d. in evening. Tickets may be had at the Gallery, 5a, Pall Mall, East, or pay at the doors. If you will call upon us when in town, we will take you round. (2) Inserted in query column. We do not think it impossible.

**J. BLACK.**—(1) If you will turn to Photographic Procedure, p. 244, of this issue, you will find exactly what you want—a properly graduated negative is obtained. (2) Chrome alum is superior to ordinary alum for hardening and clearing negatives. (3) Starch is to be preferred when mounting as you suggest. (4) Actually so much soda is not required for 2 gr. of gold, but we have always got finer tones than when a smaller quantity is used; it also obviates any chance of sulphur toning from the carrying into the toning bath of any organic preservative acid. (5) Probably intensification would help your flat negatives. We could hardly recommend any particular intensifier without seeing negative and print. Try Monckhoven's silver cyanide intensifier. (6) The chrome alum bath may be used over and over again. (7) Use a rapid plate and preferably an isochromatic, as large a stop as will give you sufficiently good definition, about  $\frac{1}{16}$  sec. exposure, and develop with pyro and ammonia, so as to get thin negatives. Always glad to help you; never mind the number of questions, the more the merrier.

**H. RIDGE.**—The stains look very much like splashes of some chemical having got on the paper. Write to the makers.

**STUDENT.**—The fixing bath used for fixing the paper may be used for fixing negatives.

**H. BUCK.**—We never give our correspondents' or prize-winners' addresses, but we have sent your letter on to the lady in question, and she will therefore do what she thinks right in the matter.

**K.**—Thanks for your letter, which puts us in a far happier state of mind. We think you are a little hard. The text-book stuff on light is merely the preliminary center to a series of papers on isochromatic work which we hope to make interesting and instructive. With regard to the chemistry, it is useful to some, and the camera-making has, judging from letters we receive, pleased many. You like our articles well; we will meet you, and try and put a portion in every week, but then unfortunately we have a lot to do, and it is utterly impossible sometimes to get it written in time for press. Will not our Monthly Supplement satisfy you? You hardly think of the cost of new illustrations every week, though we do not consider that as a rule. Now we have plenty of old blocks we could use, but would they be of any interest? We have tried to meet you so far. Give us in black and white

what you want in the shape of articles, suggesting past ones as examples, and we will see what can be done. We want to please everybody if we can.

F. H. ASHTON.—You will find in our issue of last week, p. 224, a letter on "A New Use of Solio Paper" which will tell just what you want to know.

F. PARTRIDGE.—The prints sent into our competition have unfortunately been loaned, and we cannot therefore find yours. Let us see a duplicate.

C. T. PYKE.—By all means use portrait lens and rapid plates for studio work, and R.R. for groups and portraits out of doors.

F. W. WALTER.—The addition of more sulphite certainly affects the density of the plate. You might increase the hydroquinone, and thus get out of your difficulty as to density, but then the solution would keep no better than at first. We have had good results from the following:—

I.		
Hydroquinone ..	..	150 gr.
Sodium sulphite ..	..	1 oz.
Sulphurous acid ..	..	60 min.
Distilled water to	..	10 oz.
II.		
Sodium carbonate ..	..	1,300 gr.
Caustic potash ..	..	154 "
Distilled water to	..	10 oz.

For use mix in equal parts, and dilute with three times the quantity of water. Try the Imperial or Barnet plates; these have the particular character you want.

## Sale and Exchange.

### RULES.

**CHARGE.**—Twelve words or less for Fourpence.

Every additional three words, one penny. The name and address of the sender must be paid for. (A single figure, or group of figures undivided by letter, space, stop, or words, counts as one word; compound words count as two words.)

**DEPOSITS.**—The money for goods forwarded on approval may be deposited with the Publishers of the **AMATEUR PHOTOGRAPHER**, who will hold the amounts deposited until they are satisfied that the transaction has been completed to the satisfaction of buyer and seller.

**ADDRESS.**—All advertisements (which can be received up to Tuesday mid-day) and other communications having reference to the "Sale and Exchange" column, must be addressed "Sale and Exchange, **AMATEUR PHOTOGRAPHER**, 1, Creed Lane, London, E.C."

**COMMISSION.**—A charge of 2½ per cent. will be deducted from all deposits whether a sale is effected or not. Minimum charge 1s.

**PAYMENT.**—All payments are to be by cheques or Postal Orders, made payable to Hazell, Watson, and Viney, Ltd., 1, Creed Lane, London, E.C.

**CARRIAGE** must be paid on all apparatus sent for report, and they will be returned carriage forward.

**ADVERTISEMENTS** can be inserted under a number, the name and address being registered, and letters forwarded for a fee of 8d. to cover postage.

**PAYMENTS** should be made in Postal Orders or Postage Stamps.

**REPORTING.**—Apparatus may be sent to the EDITOR, **AMATEUR PHOTOGRAPHER**, 1, Creed Lane, London, E.C., who will report upon the apparatus to the buyer for a minimum fee of 2s. 6d., or a commission of 2½ per cent., upon the sale price of the apparatus.

**Cameras, etc.**—Whole-plate landscape camera, never used, cost £7 10s., will take £4 10s., or exchange for hand-camera.—Sewell Brady, Portsmouth Road, Long Ditton, Surrey.

**Cameras, Lenses, etc.**—Whole-plate camera, Lancaster's Special, in good condition, splendid rectilinear lens, three double dark slides, and leather case, price £8, carriage paid.—No. 337, office of this paper, 1, Creed Lane, E.C.

Fallowfield's half-plate bellows studio camera, rack adjustment, dark slide, and splendid portrait lens, price 70s., lens alone worth double; also quarter-plate ditto, double slide, fine portrait lens, price 40s.; approval.—C. Boardman, 39, Coal Exchange, London.

**Hand-Cameras, etc.**—Griffith's quarter-plate hand-camera, in perfect condition, selling to get larger size, 38s.—Ajax, 24, Upham Park Road, Chiswick.

Kodak, new, cost 26s., cash 19s.; Stirn's Vest camera, 12s. 6d.—B., 24, Bilston Street, Wolverhampton.

Kodak for sale, as new, takes pictures 4 by 3½, price £2 10s.—Address, M. D., 1, Hungerford Villas, Long Ditton, Surrey.

Fallowfield's Facile, cost 5 guineas in July, faultless, splendid R.R. lens, sunk finder, rotating stops, two shutters, £4, bargain.—Pearsall, Eaville Street School, Stourbridge.

**Lantern, etc.**—Russia iron lantern, three wicks, brass fronts, with sliding carrier, nearly new, cost £4, for £2 10s.—H. Bell, Elwalton House, nr. Nottingham.

**Lenses, etc.**—Rapid rectilinears! French make, special value, 5 by 4, 5½ in. focus, 11s. 6d.; 7 by 5, 7½ in. focus, 14s.; 9 by 7, 11 in. focus, 20s., complete with hood, flange, cap, and set of Waterhouse stops, largest aperture f/8; three day trial allowed.—Dorey, Lester and Co., Kilburn, London.

Ross's 10 by 8 view lens, cost £7 10s., cash £4.—Coates, 71, Ludgate Hill, E.C.

1891 Instantograph half-plate lens and shutter, with mahogany mount, a very good lens, in excellent condition, 17s.—MacIvor, Shotley Bridge, Durham.

**Oxygen Cylinder.**—Oxygen cylinder, 40 ft., price 30s.—No. 343, office of this paper, 1, Creed Lane, E.C.

**Sets.**—7½ by 5 Watson's Premier camera, with turntable, four double backs, tripod stand, two bags, Ross's 8 in. P.S. lens, Thornton-Pickard shutter, etc., camera and lens mounted in aluminium, £24; new this spring.—Francke, St. Saviour's Road, Jersey.

Bargain! Studio camera, cabinet size, with legs, dark slide, printing frames, dishes, etc., lot £5 10s.; approval on deposit.—H. D. B., Albion Works, Salford, Manchester.

Half-plate camera by Morley, three double dark slides, tripod and case, Hockin lens, splendid condition, £5 10s.—No. 336, office of this paper, 1, Creed Lane, E.C.

Half-plate leather bellows camera, all movements, two dark slides, lens, stand, and case, in splendid condition, cost £7, take £4; also Jeffries' perfect washer for prints and plates, cost 16s., take 10s.—No. 344, office of this paper, 1, Creed Lane, E.C.

**Shutter.**—Place's blind shutter, nearly new, cost 8s. What offers?—Pratt, County School, Dereham, Norfolk.

### WANTED.

**Cameras, etc.**—Wanted, whole-plate camera, complete, Shew's preferred; exchange grand St. Bernard puppy.—F., care of Mr. Mathews, 156, Loveridge Road, Kilburn, N.W.

Wanted, 10 by 8 or 12 by 10 camera, no lens, cheap.—G. M. Forrest, Brechin, N.B.

**Hand-Cameras, etc.**—Hand-camera wanted. Lowest terms to Sewell Brady, Long Ditton, Surrey.

**Lantern Slides.**—Wanted, lantern slides, sets or any of general interest, cheap and good, no rubbish.—Mitchell, Northgate, Blackburn.

**Sets.**—Wanted, good half-plate camera, long extension, all movements, with arrangements for taking stereoscopic views, three double slides; also 5 by 4 camera, lens, three double slides, stand, and case, price 40s.—Address, Miss Morris, Elm Villa, Manna-mead, Plymouth.

Wanted, 12 by 10 camera, three slides, brass fixings, strong tripod, inner frames for all sizes down to half-plates, Ross' No. 3 cabinet portrait lens, and Ross' 18 in. portable symmetrical lens.—Address, terms, X, 7, Batoum Gardens, West Kensington.

**Studio Accessories.**—Studio accessories and posing chairs, good condition, cheap.—Pyke, Rainham, Kent.

**Bargains in Lenses.**—Dallmeyer portrait lens, c.d.v., grand definition, Waterhouse stops, finest order, 63s.; Swift portable symmetrical, No. 3, as new, rotating stops, 35s.; Fallowfield's portrait lens, rack focussing, Waterhouse stops, 21s.; Ross' No. 2, c.d.v., portrait lens, Waterhouse stops, rack and pinion, take £4 5s.; 7 by 5 Optimus rapid rectilinear, Waterhouse stops, as new, 42s.; Ross' half-plate rapid symmetrical, Waterhouse stops, as new, 75s.; Wray's 5 by 4 rapid rectilinear, Waterhouse stops, as new, 37s. 6d.; 15 by 12 rapid rectigraph lens, Silver Ring, iris stops, grand definition, take £5 12s. 6d., quite new; whole-plate Optimus rapid landscape lens, rotating stops, quite new, take 35s.; whole-plate Lancaster wide-angle lens, rotating stops, best order, 15s.; half-plate Optimus, 7 by 5 rapid rectilinear, Waterhouse stops, fine definition, 42s.; half-plate Desideratum landscape lens by Hockin, 10s. 6d.; Wray's landscape, Casket lenses, 5 in., 7½ in., and 10 in. focus, iris stops, quite new, take 70s.; Ross c. d. v. portrait lens, rack and pinion, finest condition, 35s.; Shew's c. d. v. portrait lens, Waterhouse stops, rack and pinion, as new, take 21s.; quarter-plate Optimus rapid rectilinear, by Perken, Son, and Rayment, Waterhouse stops, covers 5 by 4, focus 5½ in., quite new, take 27s. lowest. All above lenses are warranted as described.—On view, City Sale and Exchange Rooms, 54, Lime Street, corner Leadenhall Street, City (late Goy's Medium). Every description of apparatus bought, sold, or taken in exchange.

**Bargains in Hand-Cameras.**—Hand-Cameras by Collins, quarter-plate, covered in morocco, fitted 5 by 4 Wray lens, iris stops, Thornton-Pickard time and instantaneous shutter finder, direct focuser, patent changing box for 12 plates, Eastman's roll holder, and 6 double slides, quite new, £8 17s. 6d., cost double; Rouch Eureka quarter-plate, rapid rectilinear lens, blind shutter, 12 plates, in case, £3 17s. 6d.; Lancaster's quarter-plate, omnigrap, as new, carries 6 plates, good lens, 16s. 6d.; Rouch's Eureka, size 5 by 4, rapid rectilinear lens, carries 12 ¼-plates, finder, bag changing and case, as new, take £4 17s. 6d.; C ordinary Kodak, quite new, 24 films, 25s. 6d.; Samuel's hand-camera, 9 by 12 centimetre, rectilinear lens, time and instantaneous shutter in case, quite new, take 32s. 6d.; Book Camera, London Stereoscopic Co., size, quarter-plate, Optimus rapid rectilinear lens, time and instantaneous, three double slides, in solid leather case, quite new, take £2 12s. 6d., cost £7 7s.; Luzzo's hand-camera, Robinson, Regent Street, quarter-plate R.R. lens, instantaneous shutter, carries 100 films, solid leather case, quite new, £4 17s. 6d.; Kodak, No. 4, size 5 by 4, new spool of films, warranted finest condition, in leather case, take £7 17s. 6d., cost £11 7s. 8d.; Adams' Ideal hand-camera, twelve quarter-plates, finest rapid rectilinear lens, time and instantaneous shutter, as new, £5 15s.; Fallowfield's Facile, fitted rapid rectilinear lens, carries twelve quarter-plates, as new, £3 17s. 6d. Optimus magazine hand-camera, covered leather, carries 12 quarter-plates, finest Optimus rapid rectilinear lens, two finders, shutter, etc., as new, take £5 5s.; Talmer hand-camera, carries 12 plates, fine lens, two large finders, time and instantaneous shutters, as new, take 65s.; Griffiths' best quality hand-camera, carries six ¼-plates, two sunk finders, good lens, pneumatic shutter, take 30s., cost 42s.; quite new, all above are warranted as described. On view, City Sale and Exchange Rooms, 54, Lime Street, corner of Leadenhall Street, City (late Goy's Medium). Second hand apparatus bought, sold, or taken in exchange. Inspection invited.

**Bargains in Cameras and Sets.**—Lancaster's quarter-plate 1889 instantograph, finest order, all latest improvements, including camera, lens, iris stops, two double slides, stand and case, 37s. 6d.; Lancaster's 1889 instantograph, best order, all improvements, half-plate lens, iris stops, shutters, two slides, folding stand and case, 65s.; half-plate camera, reversing back, and rapid rectilinear lens, works f/8, both by Dollond, Ludgate Hill, double slide and folding stand, as new, take £4 4s.; 12 by 10 camera, finest mahogany, double extension, leather bellows, wide-angle movement, rising and falling front, etc., double dark slide, as new, £5 5s.; 5 by 4 best quality camera, by Robinson, Regent Street, leather bellows, rising, falling, and cross front, wide-angle movement, three double slides, fine rapid rectilinear lens, by Robinson; Newman's shutter and Eastman's ¼-plate roll holder, quite new, £5 17s. 6d.; Optimus whole-plate camera, leather bellows, reversing back, etc., Optimus 9 by 7 rapid rectilinear lens, Waterhouse stops, Thornton-Pickard shutter, three double dark slides, three-fold stand and case, £11 5s.; whole-plate; 7½ by 5 long-focus camera, by Gutz, wide-angle movement, leather bellows, reversing back, rapid rectilinear lens, and folding stand, set complete, £5 15s.; half-plate Underwood's Instanto wide-angle movement, double extension, fitted rapid rectilinear lens, slide, and folding stand, £3 17s. 6d.; half-plate camera, by Houghton, all latest movements, grand article, fitted three double slides, rapid rectilinear lens, and double folding stand, £6 10s.; quarter-plate Lancaster's Mervilleux set complete, 15s.; quarter-plate aluminium Instantograph set complete, quite new, camera, lens, slide, shutter, and stand, 50s.; quarter-plate Instantograph camera, lens, shutter, slides, and folding stand, 32s. 6d. All above guaranteed finest order. On view, City Sale and Exchange Rooms, 54, Lime Street, corner Leadenhall Street, City (late Goy's Medium). Second-hand apparatus bought, sold, or taken in exchange. Inspection invited.

**Cameras! Cameras! Cameras! Lenses! Lenses! Lenses!** and photographic apparatus of every description.—We are agents for all the first-class makers and can supply any set upon the best possible terms, either for cash, by easy payments, or by exchange. Every description of apparatus taken as part payment for new. Cameras and sets lent on hire, by the day, week, or month. Lists free by post. Prompt attention, best discounts, approval by arrangement, and a guarantee given with every article to be genuine in every detail.—City Sale and Exchange Rooms, 54, Lime Street, corner Leadenhall Street, City (late Goy's Medium). Second-hand apparatus of every description bought, sold, or taken in exchange. Inspection invited.

**PUBLISHING DEPARTMENT.**—All letters containing Subscriptions, Orders, Remittances, SALE and EXCHANGE Advertisements, or other business matters for the AMATEUR PHOTOGRAPHER are to be addressed to the Publishers, HAZELL, WATSON, and VINEY, LD., 1, CREED LANE, LUDGATE HILL, LONDON, E.C. SALE and EXCHANGE Advertisements (at the charge of Three Words for One Penny) must be received by Tuesday evening's post to ensure insertion in the same week's issue.

### mateur Photographer" Monthly Competition, No. 41.—

"INLAND SCENERY WITH AND WITHOUT FIGURES." Latest day, Oct. 24th.—Prizes: Silver and Bronze Medal, with ribbon and clasp. One mounted print only to be sent in. Entry forms, etc., on receipt of stamped envelope. Address: Editor, AMATEUR PHOTOGRAPHER, 1, Creed Lane, E.C. (Prizes will be announced and photographs reproduced and criticised in the AMATEUR PHOTOGRAPHER Supplement, November 11th.)

POSSIBLY many of our readers, with a tendency for astronomical studies or an inkling of this science, have noticed the alleged discovery of a fifth satellite to Jupiter by Professor Barnard on September 9th, at the Lick Observatory. Jupiter, as is well known, had already four attendant satellites, and now the discovery of this fifth moon is causing no little stir in the astronomical world. That the actual existence of the new moon, which appears to be only 100 miles in diameter and of the thirteenth magnitude, should be doubted is, of course, only natural.

THE question is who is to decide for or against, and what are to be the means to be taken to convince everybody? Photography, it is suggested, is the best judge, and it is said that if the part of the sky in which Jupiter and its new moon happened to be at the time of the alleged discovery be photographed, and the resulting negatives examined to see whether there is a thirteenth magnitude star there, and if so—well, the deduction would be somebody had blundered.

WE are quite sure all our readers will congratulate the Manchester Amateur Photographic Society on the fact that all the awards in Class III., Architecture, of our Lantern-slide Competition go to members of that society. This speaks well, we think, for the high standard of work attained by this society.

WE had the pleasure of showing the Prize Slides at Pall Mall on Saturday last. And our competitors will be glad to hear that the attendance was greater than at any previous lantern-night, and the high quality of the slides was commented upon by all.

THE following is the list of places and dates for which our 1892 Slides are booked. We have, we are glad to say, been able to reduce the bulk of the box carrying the same to 11 by 10 by 13 inches, and the weight is about one-half of the clumsy, unwieldy case of last year:—

1892.	Nov. 9 Kendal
Oct. 13 Birkenhead	" 14 Ulster
" 14 Shrewsbury	" 15 Belfast
" 18 Birmingham	" 18 Preston
" 21 Burton-on-Trent	" 22 Rodley

" 7 Newcastle	" 21 Glasgow
" 8 Durham	" 28 West London

WITH regard to Messrs. Elliott and Son's picture at Pall Mall, and their letter of last week, in which they take exception to our remarks, we must say that in reading over the notice of the same, we fail to see any imputation of an "attempt at misleading the public." Certainly no one can do less than admire the commercial enterprise which led to the production of this enormous picture, and with regard to its colour, that, of course, is merely a question of personal taste. Our contention is that owing to its immense proportion the harmony of the principal wall of the gallery is upset, and that the pictures in the neighbourhood suffer in consequence. This is not Messrs. Elliott and Son's fault, but that of the Hanging Committee. The picture has undoubtedly attracted an enormous amount of attention, and it would, we still venture to think, have shown up far better on an easel or screen by itself. It certainly was not our intention for one moment to impute any dishonesty to Messrs. Elliott and Son.

OF the many uses to which photography has been put, probably that of using it as a means of forming an illustrated diary is the most novel. It is said that a certain millionaire is always accompanied by a quiet-looking man who carries a small square case, and hovers around in a seemingly suspicious way. But he is a most important individual, and receives a handsome salary for his services. It is his duty to take a series of instantaneous photographs, showing how his employer has passed the day. There is no posing or anything of the sort, and the photographer has to use his own judgment in choosing which moments to represent.

WE need hardly point out what possibilities this opens up, and really a most interesting and instructive history of a man's life could thus be formed. It is true not all of us can afford to employ a photographer to take us about a dozen times a day, but if we ourselves carried always a hand-camera and shot off at things and places of interest which we came across in every-day life, we could make an interesting record which in years to come would be of value if only to remind us more vividly of the past.

AS we announced a few weeks back, the winter session of the Camera Club will be opened on Monday, October 17th, with a smoking concert and a private view of an invitation exhibition of pictorial photographs selected from contri-

butions made by the leading artist photographers at home and abroad. The exhibition will be opened free to visitors from 10 a.m. to 12 a.m., and 2 p.m. to 4 p.m. daily, till December 8th, on presentation of cards, which may be obtained from exhibitors, members, or the Hon. Secretary. The exhibition will consist of selected pictures produced during the past year.

THE Hon. Sec. of the East London Society requests us to remind our readers that the 18th inst. is the latest date for receiving entries. Full particulars may be had from M. A. Wilkinson, 288, Shacklewell Lane, Kingsland, N.E.

THE arrangements for our portfolio "Photographs of the Year" are now complete and the reproductions well on the road to completion, and we hope to be able to announce the date of publication very shortly. The pictures finally selected are:—

- "Quiet Life," by Karl Greger.
- "The Silver Strand," by B. Gay Wilkinson.
- "Flatford Bridge," by Col. J. Gale.
- "Foot Bridge," by F. P. Cembrano.
- "A Portrait," by F. Muller.
- "How's That?" by R. H. Lord.
- "In the Pool," by L. C. Bennett.
- "Worn Out," by J. E. Austin.
- "The Love Letter," by A. Burchett.
- "Portinscale Bridge," by T. M. Brownrigg.
- "A Sluggish River," by G. Lamley.
- "A Woodland Pasture," by J. Kidson Taylor.

PHOTOGRAPHIC societies are waking up to serious work now, and each week brings us notice of exhibitions all over the country. Unfortunately, many will take place just about the same time, when if there are open classes it makes it difficult for would-be exhibitors to send to all. The Tunbridge Wells Am. Phot. Soc. will hold their sixth annual exhibition on November 23rd, 24th and 25th. Entry forms, etc., may be obtained from Mr. Jos. Chamberlain, 14, Calverley Park Gardens, Tunbridge Wells.

WE are informed that the P. S. G. B. Exhibition has been again well patronised this week; 1,610 visitors passed the turnstile, making a total of 3,264 since the Exhibition, opened to the public. The lantern evenings especially seem very popular, the average attendance being from 80 to 90 per cent. more than last year.

WE publish a letter in our correspondence columns on photographing at the Chicago Exhibition, but at the moment of going to press we hear that hand-cameras will be admitted to the grounds provided a licence has first been obtained, for which a charge of two dollars per day will be charged.

THIS permission it is said has been caused by the pressure which has been brought to bear upon the Chicago Executive. But surely unless they expect every photographer, both amateur and professional, to be a millionaire, they might just as well have not given permission at all. Some of us probably will not feel inclined to pay about 8s. per day for taking a few snapshots.

PHOTOGRAPHY and photo-mechanical processes find numerous applications, and one of the finest and certainly one extremely interesting application is the reproduction of old manuscripts and books. To such perfection has this been brought now, that really one has almost to hesitate on giving an opinion as to the original or copy.

An extremely striking example of the fidelity of reproduction is that sent us by A. Brothers, of Manchester, which is Luther's Catechism for the people, pastor, and preacher, with Holbein's illustrations. Our detailed notice of this is unfortunately crowded out this issue.

Now that colour-sensitive or orthochromatic plates can be prepared and obtained commercially, which are practically sensitive to all colours, a very large field of work in this direction has been opened up. It is well known that old books and old manuscripts are sometimes so yellow by age as to present enormous difficulty in photographing the same. The colour-sensitive plate gets rid of this difficulty.

THE application of colour-sensitive plates too for copying objects containing numerous colours is slowly extending, but we were much astonished to find that a photographer employed to copy a very fine and old Persian carpet had used an ordinary plate. A print from a negative was shown us side by side with the carpet, and at our suggestion another negative was taken on a colour-sensitive plate with a deep yellow screen. The result was so different that even the professional photographer was astonished. In such work as this there is a very wide field for amateurs during the winter months, because artificial light may be used with almost better results.

WE are so accustomed to see "Made in Germany" on everything, and to hear that the Germans are beating us everywhere, that it really is refreshing to find that in New South Wales, according to the German Consul's official report, that although chemicals, albumenised paper, and cardboard of German origin are principally used, all other articles are obtained from England, and English dry-plates stand in special high favour both as regards quality and price. English photographic apparatus is also preferred on account of its neat and practical get up, whereas the German apparatus used there is not of the right size to take the English dry-plates. They are also much dearer than the English article.

OCCASIONALLY, it is said, difficulties occur in identifying persons committed to public asylums should death take place whilst the patients are incarcerated. To obviate this the London County Council through its Asylums Committee have now given directions that each patient should be photographed on arrival. This, of course, means yet another chance for the professional, and at Colney Hatch a studio is being built, and an official photographer has been appointed.

Not content with taking the portraits of patients on entering, cured patients will also be photographed on leaving. And we have thus another possible chance for scientific research. What will be the difference between the two portraits of a person at one time sane and at another insane? And will this teach us anything on the subject? This subject has already been taken up, we believe, by Dr. Wernhold, of Vienna, and in Eder's "Jahrbuch" for 1891 he gives the results of his work in this direction.

## Chit-Chat.

IT must be both gratifying and reassuring to the Council of the P.S.G.B. to note that the entire photographic press, and, with one exception, the general press, is unanimous in praising the Exhibition as a whole, and in condemning the action of the few malcontents who have done their petty best, or worst, to make it a failure,

THE *Times* critique has, naturally, excited a great deal of not unreasonable indignation against its writer, the identity of whom, in the absence of any denial, your readers may fairly assume stands revealed in the person of Mr. Maskell. If this be so, I cannot help expressing my surprise that the duty of criticising the photographs should have been entrusted to one of a small section which for some time past has been doing its best to thwart the endeavours of the executive to make the exhibition a success.

To my mind, however, the most contemptible feature in the article in question is the attempt which is made in it, by a mis-statement of facts, to attribute the alleged split in the Society to "a difference of opinion which has manifested itself between the pictorial and the scientific schools of photography." That such difference of opinion may exist is doubtless true, but Mr. Maskell's grievance against the Society, as everybody in photographic circles well knows, is a purely personal one, and dates from a certain episode which occurred during the hanging of the pictures last year. Whether the article in question be an emanation from Mr. Maskell's pen or not, it certainly exceeds the limits of honest criticism, and instead of being a fair review of the merits or demerits of the pictures, is simply an offensive diatribe on the internal management of the Society.

WITH two notable exceptions, the awards do not appear to me to admit of hostile criticism. I cannot, however, discover anything, in the very conventional Swiss views of Mrs. Main, beyond good technical work, to justify their being awarded a medal. Nor can I understand why Mr. Dresser's very mediocre work should have been alike distinguished, when one of the finest landscape studies ever executed by photographic means—"Limestone Rocks in Derbyshire," by Mr. Tolley—has been passed by without recognition.

I THINK I like Mr. Gale's landscape even better than his genre work—higher praise I cannot bestow. Mr. Greger's pictures, notably the Welsh ones, are charming, yet several of them he has found in a district which is, perhaps, more photographed than any other. This is evidence of rare skill in avoiding a topographical rendering of the subject. Mr. J. E. Austin's "Worn Out," and "To Account Rendered," from both an artistic and technical point of view, show the possibilities of simple methods in capable hands.

I AM wont to flatter myself that my photographic library is a fairly complete one, but I confess that "Wall's Dictionary of Chemistry," which a contemporary informs us Mr. Haddon referred to at the last meeting of the London and Provincial, does not find a place upon the shelves. Has the Editor of that paper a copy to lend me, or is it possible that "Watts' Dictionary of Chemistry" is the work to which reference was made?

MR. TURNBULL has been good enough to forward me one of his film slides, and I think, as he says, that it fulfils all the conditions which I laid down, except, perhaps, in the matter of weight. This, however, might be greatly reduced by substituting for the metal division, one of stout card or sheet vulcanite.

CHATTERBOX.

THE Birmingham Photographic Society will hold their annual exhibition and prize competition in the spring of 1893. There are no less than twenty-four classes. The competition is devoted entirely to members' work.

## Letters to the Editor.

### THE "A. P." LANTERN-SLIDE COMPETITION.

SIR,—As a competitor in your recent Lantern-slide Competition—and I feel I am writing also on behalf of other competitors, therefore I hope you will publish this letter.—I wish to be enlightened on the following point, one of vast interest to competitors in your competition:—Mr. J. E. Austin has taken the highest awards you can possibly award him in *all* your competitions (I *may* be wrong, but I don't think so), therefore he is palpably disqualified from all your present and future competitions, as per your rules. This same remark applies to two or three other successful ones, whom I will not name. It is decidedly unfair for anyone to enter year after year, as some do, being always sure of a medal. This is the opinion of many of my friends.

I shall think twice in future before entering your Slide Competitions, if the awards are to fall into the same hands year after year, especially as, in my opinion, three or four should certainly be *disqualified*. Your idea is a good one regarding number of slides. Ten is a terribly hard test, and six is ample, I think.

What explanation can you give to above letter? Some is required, I take it, and I am not alone in holding this opinion.—Yours truly,

PUZZLED.

[With regard to this matter, we can only state that there seems to be no regulation as to past prize-winners being debarred from again carrying off the medals, and whilst this is a matter of regret to us now, for we quite recognise the fact that it may be discouraging to younger workers, we shall provide for such a contingency occurring in the future.—ED.]

### THE NEW TONING BATH.

SIR,—I have given this bath a trial, and find it entirely successful. There is no uneven toning, and the colour is good. The printing need not be much beyond the desired depth, as it does not lose much in fixing. It should, however, be carried so far that you would consider the print too dark if it were mounted in its then state. Toning is rapid and similar to other sulphocyanide baths in appearance. The absence of necessity for washing is a great boon and makes it the simplest process imaginable. A good red-blue is obtained by stopping the toning in about three or four minutes. I have had a bath going for some days, and it is still quite clear and effective. My thanks are due to Mr. Mason for a process I shall certainly not abandon.—Yours, etc.,

ISIS.

### THE CHICAGO EXHIBITION.

SIR,—For the benefit of those who intend visiting the Chicago Exhibition I append an extract from a letter just received from my uncle, who is on the Exhibition executive:—"We have passed a measure whereby photography is strictly prohibited, both in exhibition and grounds. All offenders will be dealt with accordingly." I am, yours, etc.,

GRAHAM HARVEY

(Lieutenant).

\* \* \*

### TRANSPARENT MARKINGS ON GELATINE PLATES PRODUCED DURING WASHING.

SIR,—Replying to your esteemed favour on the 4th inst., the cause of the markings on the negative you send for our inspection is primarily the use of an unsuitable developer. It evidently contained far too much alkali, and has so destroyed the gelatine in the film that the film itself has been partially washed away in places by the running water. It might be avoided by washing for a shorter time, but the moral is plainly to use a developer suited to the plate. It is perhaps rather a pity in the interest of the users of dry plates generally that it so seldom seems to occur to them that as it is of vital importance to the makers of plates that the users should get the best possible results from them, therefore the makers would be naturally sure to issue with their plates the formula best adapted for their particular make of plate.—Yours, etc.,

B. J. EDWARDS AND CO.

\* \* \* \*

SIR,—Referring to my letter under the above heading which appears in your issue of the 7th inst., I had before that date made some further experiments with the zinc washing tank which I think show that the metal is the cause of the markings in the negatives. I thoroughly rinsed the vessel and dried it.

I found it covered, and in some places thickly, with a whitish substance (which I presume to be oxide of zinc), and this was not removable except by scraping. I then filled the tank with water, and let it rest a few hours, when I noticed there were floating on the surface of the water large numbers of minute bright metallic particles. I emptied the tank, refilled it, and again let it rest; this was several times repeated, and each time the same metallic spots were visible. I then filled the tank with dilute sulphuric acid, and left it for an hour, when the surface of the solution was covered with a thick layer of dirty-looking froth. I poured away the contents and gave the tank a good swilling under the water tap. Shortly afterwards I placed some negatives in it, and set it working as usual for three hours, when all the negatives were removed and dried in a satisfactory condition. I used the tank for two days with good results, but on the third day one of the negatives had in a slight degree the markings complained of. There was then some slight reappearance of the oxide, and I noticed the metallic spots on the surface of the water—part of the apparatus which I did not use after immersion in the acid was covered in a few hours with oxide. It would therefore seem that this "rust" falling on the gelatine must be the cause of the trouble, the oxidation taking place more rapidly in warm weather—moisture accelerating the action, and exposure to the air when the tank was not in use helping the process. The remedy is to keep the zinc out of contact with the air by means of some thick varnish, or else use a glazed earthenware vessel instead of metal.

I am obliged by your note at foot of my letter, but with regard to the "one error" of using the alum bath after fixing, I adopted that plan after some consideration. Like others, I for some time used pyro, and treated the negatives so developed with the alum bath before fixing. I, however, found the single bottle developer I mentioned—which consists (as is said) of a concentrated solution of hydroquinone and eosine—far more convenient. I continued to treat the plates as I had done when using pyro, but many negatives, when taken from the washing tank, had on them at the edges and sometimes in the centre, a white froth leaving a sediment which I could not remove, for it was in the substance of the gelatine. I then thought that perhaps hydroquinone required different treatment to pyro, and so, not without misgivings, I fixed the image before using the alum bath and I have never since been troubled with that white sediment. Another advantage was that after fixing, the negative could be removed from the dark-room for the final operations.

I understand that the use of the alum bath is to harden the negative and remove any stains caused by the developer. I have not had stains to remove, and the gelatine is as horny as need be.

I had not read the directions for using this developer till after my alterations in the process, and I then found that the prescribed method of development was exactly that which I had adopted. I enclose the directions which accompanied the developer.

This "one error" led me to-day to look up the formulæ for development sent out by some of the leading plate manufacturers. Of these I enclose four—all say alum after fixing, and one gives special warning *not* to use with hydroquinone the alum bath *till after fixing*. The results I have obtained incline me to persevere on these lines.—Yours, etc.,

C. OF A.

October 8, 1892.

### A WARNING.

SIR,—Our unfortunate friend Mr. T. B. Walshe has had a terrible experience, but a little caution would have saved him a lot of suffering. If he had placed about a salt-spoonful of the mixture on a shovel and placed it on the fire, he would have been warned of its true character. This should *always* be done with a fresh batch of oxygen mixture. Again, it is not necessary to use black oxide of manganese for its catalytic action, as fine sand does just as well, and the risk of having black antimony supplied for black oxide of manganese is avoided. This same mistake has been made before with fatal results, and if my memory serves me it happened in Ireland.

JAMES WOOD.

### MEDALS AT PALL MALL.

SIR,—Surely it should be open to any one to criticise either the awards or management of an exhibition without receiving such a torrent of sarcasm and abuse as your correspondents "F. J. Tollie" and "Not an Exhibitor" seem to consider equivalent

to argument; it would have been more to the point had they endeavoured to refute the statements that I put forward. I must ask Mr. Tollie, too, not to misquote; I said nothing about "at least forty better pictures, etc."

—It is satisfactory to find that I am supported by the photographic press in taking exception to some of the awards. You, Sir, say of one exhibit that it is difficult to understand why it has received a medal, and your criticism of another medalled picture has called forth the wrath of the exhibitors, while your contemporary the *British Journal of Photography* calls attention to the technical defects that mar another exhibit that has been honoured by a medal.

My contention is that medals should be given as they are supposed to be, for *artistic merit alone*, with this important rule, however, that no technically imperfect work should receive an award. Further, that no enlargement should be medalled unless the negative is the work of the exhibitor, as all the pictorial qualities are due to the producer of the negative, who in an award to an enlargement only is ignored. In an enlargement showing a 'decided advance in its process or method, a medal could be given, but then it would be for technical progress and not as a picture.

In the matter of favouritism, it was alleged last year that this had existed, and if certain men have special favours again this year it is at least noticeable.

I have no wish to prolong this discussion, but your correspondent's remarks as to the "disappointed exhibitor" do not apply to my case, and it is only natural in matters where personal feeling may show itself so discourteously as in this case, that a writer should prefer to take shelter under a nom-de-plume—Yours truly,

SPECTATOR.

\* \* \* \*

#### CRESCO-FYLMA.

SIR,—I have for some time used the "Cresco-Fylma," and find it transfer the increased film to a new support safely; but in the first instance I must remark that the image is very much fainter than in the original size. This, of course, you will say may be put to rights by intensification. There is, however, another point, that is the facility with which the film will slip away as you lift the new support to take it out of the water. If you have an irregular-shaped support on which you wish to fix the enlarged film, the difficulty of doing so becomes tenfold greater, and if at last you are successful in lifting it out, you find that it is out of the perpendicular, or not in the place that you wish it to be. After many attempts, I thought of a way that may be of use to others. I placed the intended support resting on disused negatives in an iron dish. In centre of the bottom of dish I make a small hole, and from underneath stop it up with a pointed lucifer. When I wish to remove the support with the film thereon, I pull out the lucifer, and the water drains out very slowly. With a small sable brush I keep the film exactly where I want it; touching very lightly first one corner and then another, and so at last do what first seemed to me almost impossible—get my enlarged film exactly in the place I want it, and perfectly upright.—I am, etc.,

H. F.

#### STRIPPING GELATINO-CHLORIDE PRINTS.

SIR,—From some cause or other your issue of 30th ult. only reached me to-day. Kindly allow me a word to reply to Mr. Craig. Your contributor in his article did not deem the minutest detail unworthy of notice, but now gives us some further details re the above, which may enable the operator to use the same glass plate "for ever."

Mr. Craig first tells us how to use the knife so as to avoid marking the glass, and then, conceding the possibility of scratches, tells us how to use the plate although damaged in this way.

Mr. Craig says with ordinary care one piece of glass is sufficient to enamel at least two dozen prints; I say, with his directions it is good for two thousand or more.

Enamelling is not recommended for portraiture, consequently the prints are likely to be of various sizes, and I pictured the operator fixing several prints of assorted sizes on, say, a whole-plate.

Mr. Craig is too good; I am not quite up to the "average amateur," having on hand not a few spoiled negatives.—Yours faithfully,

J. A. FORRET.

Edinburgh, Oct. 10th, 1892.

#### THE EXPANSION OF AMMONIA SOLUTION.

SIR,—My attention has been called to Mr. Haddon's criticism of my article on "Ammonia," in *Dry Plates*, the monthly magazine of the firm of Cadett and Neall.

Let me begin by saying that I am quite ready to learn from those who know better than myself, and if Mr. Haddon is right, I can only offer him my best thanks for his correction.

I would, however, first point out the disclaimer in my paper, where I mention that the statements are not original with me. I have simply done what Mr. Haddon himself has done, and quoted from tables by chemists of repute, and accepted their statements as correct, without any personal proof.

I am at disadvantage in taking Mr. Haddon's criticism from the abridged reports of the journals, as I was not at the meeting; he must, therefore, kindly make allowance in what I am going to say, in case I am under any wrong impression.

My authority for the statements in my paper is the late Mr. John Joseph Griffin, F.C.S., in his work, "The Chemistry of the Non-Metallic Elements"—the tenth edition. Of course, the work is rather out of date, but, considering that many of the latest books quote from tables much older, I need not make apology on this score. Mr. Griffin was—and the firm still is—the maker of the ammonio-meter. Thousands of these have been sold, and are in use all over the world. Mr. Griffin gave considerable personal attention to the testing and analysis of ammonia in a large commercial way, and he gives directions in his book for—

Determination of the chemical strength of liquid ammonia.

Determination of the strength of ammonia by the ammonio-meter (hydrometer).

Preparation of liquid ammonia of particular degrees of strength for testing and other purposes.

Now, no human being is infallible—I know that personally very well—but I may, I think, be forgiven for taking an authority who perhaps had the greatest experience in the commercial testing of alkalies and acids in the United Kingdom, and I must confess that until I have tested personally Mr. Griffin's tables, or have had further evidence that his statements are wrong, I shall not lightly surrender him as an authority.

Though, until now, I have never doubted Mr. Griffin's statement, "Ammonia has the remarkable property of possessing the same bulk in all its combinations with water," I have always been aware of the great discrepancy between various authorities in specific gravity tables of all kinds, and I have often wondered at it, but doctors will never agree, even in matters one would suppose to be simple facts.

I have not Watts' Dictionary, but I presume that the statement that liquid ammonia of a specific gravity of '884 containing 36 per cent. of real ammonia, is from Carius.

It must not be forgotten that Carius was at variance with Roscoe and Dittmar on the important question of the amount of absorption of  $\text{NH}_3$  at various pressures, and therefore his S. G. tables may be open to question.

Mr. Haddon has very kindly (and I am sure we all thank him) taken the trouble to put the expansion question to practical test, but he left one important part undone; he did not verify or question the S. G. tables in Watts'; neither did I question Griffin's table, so we may shake hands on that point. Let us now turn to the practical side of the matter.

An expansion of 0.37 per cent. (as per the journals) is for all practical purposes a very small matter indeed, and if Mr. Haddon makes his curve on the data of his experiments, he will be close enough to a straight line to satisfy any photographer's faith in the ammonio-meter. The so-called 20 per cent. error in reading strength is purely one of variance in specific gravity tables, and whether right or wrong does not in any way affect the relative testing with the ammonio-meter to an appreciable degree. If dilution to the extent carried out by Mr. Haddon only gives 0.37 per cent. expansion, how much less must be the expansion between samples of ammonia high in strength. It becomes mere straining at a gnat. I do not say that Mr. Haddon is wrong, but as he makes the expansion so little, it would be well for him to test the question again under most careful conditions as to temperature. Surely a curve made on the results of his experiments would scarcely agree with the specific gravity tables in Watts. I will, when not so busy, put this matter to practical test. Griffin's specific gravity tables give for specific gravity '884 a percentage of 31.9 at 62 deg. Fahr., against Watts' 36.

Someone, please say who is right. There surely should be tables up to date. However, from a practical point of view, I do not find sufficient reason from Mr. Haddon's experiments to prevent photographers from testing their ammonia, as recommended in my paper. They will not in any case be more than a small fraction per cent. in error, one that they would hardly notice in measuring.

An article by Mr. Haddon on ammonia would be much appreciated by us all, and not the least by yours faithfully,  
JAMES CADETT.

\* \* \* \*

#### A CORRECTION.

SIR,—I have to thank a correspondent (Mr. A. W. Hunt) for calling my attention to an oversight in the hand-camera which I described a week or two since. Instead of the back of exposing frame being solid, it should have a sliding door formed in it in the same way as the other doors are made, so that the lid will draw down through the bottom when focussing with the ground-glass. Otherwise, as A. W. H. says, the image would have to be seen through a solid piece of mahogany. You will oblige me by inserting this explanation.—Yours etc.,  
H. J.

\* \* \* \*

#### LANTERN SLIDES.

SIR,—Doubtless those readers of your paper who make lantern slides will by this have commenced to use their negatives taken during this summer for that purpose, and these I would like to ask for any old or spare slides, which will, in the natural course of events, be replaced by the newer material.

I am in charge of the C. E. Mission amongst 700 or 800 men employed in the construction of a new tunnel here, and wish during the winter evenings to provide entertainments for them. Any slides that your readers can spare will be most welcome. The subjects that I think best for them are—Views of interesting places at home or abroad, or should any have some astronomical lantern slides to illustrate some simple lectures in astronomy, already promised, they would prove most helpful.—I am, yours, etc.,  
W. H. HOLT.

Green Bower, Marsden, Huddersfield.

## Photographic Procedure.

By E. J. WALL.

(Author of the "Dictionary of Photography.")

#### SECTION VI.

#### DEVELOPERS AND DEVELOPMENT.

(Continued from page 245.)

*Pyro and Ammonia—Developing Plates Exposed on Subjects with Poor Contrasts.*—It often happens that we expose a plate on a subject which is naturally flat or wanting in contrast, and we may desire to increase the same, and whilst this is by no means a difficult matter, personally, for such a subject, I prefer a soda developer; but for those who wish to develop entirely with pyro and ammonia, I give the following suggestions. To increase contrast, increase the pyro and bromide and lessen the ammonia, and a typical developer for this work will be:—

10 per cent. sol pyro..	..	40 to 50 minims.
10 " " " bromide ..	..	40 " 50 "
10 " " " ammonia ..	..	20 " 30 "

to every ounce of developer required; and it is advisable to add the alkali gradually.

*Pyro and Ammonia with a Preservative.*—Hitherto we have been talking about the use of plain pyro and ammonia, and whilst this will give us particularly harmonious and soft results, many operators, especially ladies, have a very strong objection to it because it stains their fingers. In many cases the quality of a negative is sacrificed to this craze for clean fingers, and whilst I myself do not like to see my fingers like those of the street vendor of fresh-shelled walnuts, I have never found the slightest difficulty of keeping them or getting them clean. When I have a great many plates to develop and wish to use plain pyro, I always keep on the developing sink a dish full of a weak solution of sulphuric acid and water, and immediately after dipping my fingers into the developer, they are placed in the acid and well rinsed under the tap. When only one or two negatives are to be developed, I do not trouble till all work is finished, and then the fingers are cleaned with pumice stone and acid.

However, to return to our subject, the desire of clean fingers and also the convenience of keeping a stock solution of pyro, have led to the use of preservatives in developers.

These may be either an acid, as already noted, or a sulphite, or some compound of sulphurous acid. Mr. B. J. Edwards has suggested (1880) glycerine and alcohol, and a stock solution of pyro prepared in this manner will keep a very long time if well corked. I have some which has been made at least eighteen months, which is now only a faint brown colour. The formula I use, which is merely Mr. Edwards' made up to a 10 per cent. solution, is as follows:—

Pyrogallol (1 oz. bottle)	..	..	437½ gr.
Glycerine .. ..	..	..	10 dram.
Methylated spirit, to ..	..	..	9 oz.

I am not quite certain, but I believe Mr. Edwards has since recommended the addition of citric acid 40 gr. to this formula, and with this addition it will keep even better.

Sulphites were first suggested by Berkeley, and possibly his formula for the so-called sulpho-pyrogallol has never been surpassed. It is:—

Pyrogallol .. ..	..	..	1 oz.
Sodium sulphite ..	..	..	4 "
Citric acid .. ..	..	..	15 gr.
Hot distilled water, to	..	..	10 oz.

Dissolve the sulphite in 7 oz. of water, add the citric acid, and pour on the freshly-opened pyro, and make the resulting solution measure 10 oz.

A word of caution may not be out of place here as to the sulphite of soda. None but the pure recrystallised should be used, and it should be fresh and not have been exposed to the air.

Messrs. Mawson and Swan were the first to introduce, I believe, the acid salt, metabisulphite of potash, as a preservative, and the particular formula they recommend is:—

Pyrogallol .. ..	..	1 oz. avoirdupois.
Ammonium bromide..	..	½ " "
Metabisulphite of potash	..	1 " "
Distilled water, to make	..	11 " "

Dissolve the metabisulphite and bromide in some of the water and pour on the pyro.

I may as well note here once for all that this is the only correct way to make up a stock solution of any developing agent, namely, dissolve the preservative in part of the water, pour on the developing substance, and make up to the required quantity.

Within this last year or two we have had a great increase in the use of acid sulphite of soda. This may be obtained on the Continent in the form of a yellow solution, smelling strongly of sulphurous acid.

But whether this particular kind may be had in England I am not aware. Marion and Co. have placed upon the market a solid acid sulphite which they call Theonine, and this has great preservative power. This salt may well replace the old sodium sulphite, and a good formula is—

Pyrogallol .. .. .	1 cz.
Acid sulphite or Theonine .. .. .	1 "
Distilled water .. .. .	to 9 "

Mix as suggested above.

It must be noted that as both the metab'sulphite and acid sulphite of soda have a strong acid reaction, rather more alkali is necessary when using the same.

In 1885 Eder recommended the use of ammonium sulphite in preference to the sodium salt, and having made some of this—for I could not obtain it in England—I have found it work very well. The specific formula recommended by Eder is as follows:—

I.	
Pyrogallol .. .. .	10 parts.
Ammonium sulphite .. .. .	2½ to 3 "
Distilled water .. .. .	100 "
II.	
Ammonium bromide .. .. .	5 parts.
Ammonia (sp. gr., 0.91) .. .. .	50 "
Distilled water .. .. .	150 "

Immediately before use mix 100 parts of water, 4 parts of Solution I., and 4 parts of Solution II. The image appears quickly in this developer, but still there is quite sufficient time to watch the progress of development. If it is desired to protract the duration of development, one need only add 150 instead of 100 parts of water in the above developer. The negatives also are softer in the diluted developer.

If more vigour or greater contrasts are desirable, a few drops of a 10 per cent. solution of bromide of ammonium should be added. The ammonium sulphite developer yields very good brilliant negatives, which reproduce the high lights well, and yet produce full details in the shadows. It imparts to the negatives an agreeable dark faint brown colour, which is more pleasant than the yellow brown of the glycerine or potash developers.

An alum bath, prior to fixing, acts well, but is not really required, but a saturated solution of alum, without any acid, should certainly be used after fixing and washing.

The ammonium sulphite keeps the pyro solution far better than the soda salt, and with most emulsions it keeps the negatives more free from fog. Unfortunately, it cannot be used with potash or soda, since sulphite of soda or potash and carbonate of ammonia are formed, and the ammonium carbonate has a very poor developing power with pyro on gelatino-bromide plates.

Many operators strongly object to the use of pyro and sulphite with ammonia, and certainly there is a great deal to be said on this point. The use of sulphite is said to give weak shadows, or to "cut the shadows," whilst with some plates it certainly has a greater tendency to give green or iridescent fog.

Mr. J. Pattison Gibson, who is so well known for his artistic work, has arranged a series of ten lectures upon the Tyne and Northumberland, with lantern slides from his well-known pictures, though in one he acknowledges the assistance of such well-known workers as Messrs. Auty, Laws, Lee, Parry, and Lyd. Sawyer. Terms and syllabus of each lecture may be had on application to Mr. J. P. Gibson, Hexham.

## General and Photographic Chemistry. — X.

By E. C. CONRAD, F.C.S.

### THE NON-METALLIC ELEMENTS AND THEIR COMPOUNDS.—(Continued).

#### IODINE (I=127).

Oc.: Iodine is not found free in nature but widely distributed in combination with potassium, magnesium, and calcium, in sea water and marine plants and animals. M.: In the northern parts of Scotland, the adjacent island, and in some parts of Ireland, the collection of seaweed is an established industry. The weed is collected and burnt in kilns, or iron retorts, at a low red-heat. Gases composed of various hydrocarbons, ammonia, and aqueous vapour are given off, and charcoal, phosphates, and salts of chlorine, bromine, and iodine remain. The mass is then extracted with water, potassium sulphate and chloride separate out, and the remaining liquid, which contains all the bromides and iodides, is mixed with oil of vitriol (crude sulphuric acid) and transferred to the iodine still, an iron pot set in brick-work and provided with a lid and lead delivery pipe. After the introduction of the liquor the lid is fitted on and some manganese dioxide introduced through a suitable opening, and the fire made up. The iodine distils over and is collected in a number of receivers. When all the iodine has come over, more manganese dioxide is introduced and the bromine is collected in a separate set of receivers. The iodine is partially purified by resublimation, but always contains some chlorine, bromine, and cyanide. The above is an outline of the commercial manufacture of iodine from kelp; to obtain it in the laboratory, a similar method, and one corresponding to those already given for the preparation of chlorine and bromine, is adopted; thus on heating any iodide with manganese dioxide and sulphuric acid, iodine will be given off as a violet-coloured vapour, and can be condensed in a cool receiver. Eq.:  $\text{MnO}_2 + 2\text{H}_2\text{SO}_4 + 2\text{KI} = \text{K}_2\text{SO}_4 + \text{MnSO}_4 + 2\text{H}_2\text{O} + \text{I}_2$ . P.: Iodine is a solid, and occurs crystallised in rhomboid plates of a greyish-black colour having a considerable lustre. Its S. G. is 4.95, and it melts at 107° C. and boils at 175°, but slightly volatilises at all temperatures. Its vapour is the heaviest known, being equal to the atomic weight of the element and therefore eight and a half times heavier than air. Iodine is very slightly soluble in water, but readily dissolves in alcohol, ether, carbon bisulphite and solutions of the alkali iodides. The solutions of iodine do not bleach, iodine is liberated by chlorine or bromine from its combinations. Iodine is a powerful poison if taken in quantities. U.: Iodine is used in medicine as a tonic, and also to absorb swellings. In solution with potassium iodide it is used in analytical volumetric estimations. U. P.: In the preparation of iodides for emulsions. Test.—Iodine forms with starch a characteristic blue colour; the smallest trace of iodine can be detected by this reaction.

HYDRIODIC ACID, HI=128.—M.: Iodine and hydrogen combine together on heating, but this acid is more conveniently prepared by one of the following methods. (1) On passing a stream of sulphuretted hydrogen gas through water containing finely divided iodine in suspension, a solution of the above acid is obtained. Eq.:  $\text{H}_2\text{S} + \text{I}_2 = \text{S}_2 + 2\text{HI}$ . (2) The acid can be obtained in a gaseous form by decomposing phosphorous triiodide with water. Eq.:  $\text{PI}_3 + 3\text{H}_2\text{O} = \text{H}_3\text{PO}_4 + 3\text{HI}$ . Red phosphorus and iodine, both dry, are introduced into a flask and the mixture gently

heated, when combination at once takes place; the water is carefully introduced drop by drop, and the hydriodic acid gas collected in a cool receiver. P.: It is a colourless gas of an acid reaction, and fumes strongly in the air. It is incombustible. By the application of cold and pressure, it can be condensed to a liquid, or solid. Chlorine or bromine at once decomposes it. This acid is very soluble in water, and its strongest solution has a S. G. of 1.67 and boils at  $127^{\circ}\text{C}$ ., fumes in air, and gradually turns brown through separation of iodine. The iodides of silver, mercury, lead, copper, gold, and platinum are insoluble in water. With the exception of the alkaline iodides, most of the salts of this acid are decomposed by heat, forming an oxide of the metal and liberating iodine. The iodides of gold and platinum leave the metal on heating. U.: A solution of hydriodic acid is useful in chemical research. U.P.: To form iodides. *Tests*.—An iodide heated with copper oxide in a bead of microcosmic salt in the inner blowpipe flame colours the other portion of the flame an emerald green colour. (2) Silver nitrate gives with a solution of the acid or a soluble iodide a yellow precipitate insoluble in ammonia solution. (3) Mercuric chloride gives a bright scarlet precipitate. (4) Iodides are decomposed like the chlorides and bromides on heating with manganese dioxide and sulphuric acid, and the liberated iodine can be recognised by its reaction with starch. It will be noticed that silver nitrate gives a white precipitate ( $\text{AgCl}$ ) with a solution of a chloride or hydrochloric acid, soluble in ammonia; with a bromide or hydrobromic acid, a yellowish-white precipitate ( $\text{AgBr}$ ), soluble with difficulty in ammonia; and with an iodide or hydriodic acid, a yellow precipitate ( $\text{AgI}$ ) insoluble in ammonia. In a solution containing all three, the  $\text{AgI}$  is precipitated first, then the  $\text{AgBr}$ , and lastly the  $\text{AgCl}$ ; so that by acidulating the mixture with dilute nitric acid and carefully adding silver nitrate, a rough separation can be brought about. Chlorine water and starch solution added to the mixture would at once give a blue colouration in the presence of iodine.

**THE OXY-ACIDS AND OXIDES OF IODINE.**—There are probably several of these acids with their corresponding oxides, but the only ones that have been satisfactorily isolated are iodic acid  $\text{HIO}_3$ , periodic acid  $\text{HIO}_4$ , and the anhydride of the first, iodine pentoxide  $\text{I}_2\text{O}_5$ .

*Iodic Acid,  $\text{HIO}_3$ .*—Oc.: A salt of this acid, sodium iodate, occurs mixed with Chili saltpetre. M.: By passing chlorine through water containing iodine in suspension. Eq.:  $\text{I}_2 + \text{Cl}_2 + 6\text{H}_2\text{O} = 10\text{HCl} + 2\text{HIO}_3$ . It can also be obtained by the oxidation of iodine produced by the action of strong hot nitric acid. P.: Iodic acid forms transparent six-sided crystals which dissolve readily in water. It forms a series of salts of which the alkaline iodates are only soluble in water; they are all decomposed by heat-forming iodides or oxides. Silver iodate,  $\text{AgIO}_3$ , is a white crystalline compound insoluble in water, but readily in ammonia. U.: This acid is used as a test for morphine, that alkaloid decomposing it with liberation of iodine.

*Iodine Pentoxide,  $\text{I}_2\text{O}_5$ .*—M.: By heating iodic acid to  $170^{\circ}\text{C}$ . P.: It is a white crystalline substance, which dissolves in water, forming iodic acid, and is decomposed on heat into its elements. This oxide combines with some of the iodates.

*Periodic Acid,  $\text{HIO}_4$ .* M.: A salt of this acid is produced by passing chlorine through a solution of an iodate in caustic alkalis. Eq.:  $\text{KIO}_3 + 2\text{KHO} + \text{Cl}_2 + 2\text{KCl} + \text{H}_2\text{O} = \text{KIO}_4$ . P.: The acid is obtained in colourless crystals associated with two molecules of water. On heating to  $160^{\circ}$ , the corresponding anhydride is said to be formed, *Iodine heptoxide,  $\text{I}_2\text{O}_7$* ; on further heating, the pentoxide and free oxygen is formed. Many of the periodates have

complicated formations; thus there are three silver salts known, viz., the normal silver periodate  $\text{AgIO}_4$ , and the tetra and penta argentic periodates  $\text{Ag}_4\text{I}_2\text{O}_9$  and  $\text{Ag}_5\text{IO}_6$ .

**IODINE AND NITROGEN.**—These elements combine together in various proportions, producing a series of black powders which explode on being touched.

**COMBINATIONS OF THE HALOGENS WITH ONE ANOTHER.**—Bromine absorbs chlorine, forming an orange-coloured liquid which easily decomposes. Iodine also combines with bromine and chlorine to form a series of unstable compounds of variable composition.

#### FLUORINE (F=19).

This element is widely distributed, but has not at present been isolated. It exists in the bones, teeth, blood, and milk, in plants, etc., also in several minerals mentioned below. Fluorine combines readily with hydrogen and silicon, but no combinations with either oxygen, nitrogen, or carbon are known.

**HYDROFLUORIC ACID,  $\text{HF}$ =20.**—Oc.: Found as the calcium salt as Derbyshire or fluorspar  $\text{CaF}_2$ , and with aluminium in the minerals cryolite, topaz, etc. M.: By heating calcium fluoride with sulphuric acid in a lead or platinum retort. Eq.:  $\text{CaF}_2 + \text{H}_2\text{SO}_4 = \text{CaSO}_4 + 2\text{HF}$ . P.: It is a colourless gas which fumes strongly in the air and has an intense affinity for water. The gas and its solution rapidly attack glass or any material containing silicon. (*Note*.—This acid must be used with care, as it produces painful and dangerous wounds if allowed to touch the skin). Hydrofluoric acid readily attacks most metals, forming fluorides, of which some form volatile, corrosive liquids, and some are gaseous. The majority, however, are solid, and of these the most important soluble salts are those of silver and mercury, and the insoluble are calcium, barium, lead and copper, etc.

The most important compound of hydrofluoric acid is its combination with silicon, called silicon tetrafluoride, or silicon fluoride,  $\text{SiF}_4$ , formed whenever the acid comes in contact with any substance containing silicon, or its oxide, silica. Eq.:  $4\text{HF} + \text{SiO}_2 = \text{SiF}_4 + 2\text{H}_2\text{O}$ . Silicon fluoride is a heavy, colourless fuming gas which dissolves in and is partially decomposed by water, throwing down silica in a gelatinous condition and forming silicofluoric acid. Eq.:  $3\text{SiF}_4 + 2\text{H}_2\text{O} = \text{SiO}_2 + 2\text{H}_2\text{SiF}_6$ .

*Test for Hydrofluoric Acid.*—By its etching glass. The most convenient way to see this is to cover the convex side of a watch glass with a thin layer of wax, and trace some design with a metal point through the wax covering. On placing a glass prepared in this way over a platinum crucible containing the substance to be tested, and some strong sulphuric acid, on the application of heat, hydrofluoric acid will be evolved if any fluoride is present, and the exposed portion of the glass will be etched by its action. A lead dish can be used instead of the platinum vessel, but this should be heated over a water bath. It is as well to fill the concave side of the watch glass with water to prevent the wax melting. (*Note*.—Hydrofluoric acid should always be kept in gutta-percha bottles). U.: For etching glass (the gas gives a matt surface, and the solution a bright etching). The calcium salt is used as a flux, and the ammonium salt to decompose silicates. U.P.: For stripping gelatine films from their glass supports. A dilute acid solution (one of acid to eight of water) is quite strong enough; this must be used with caution, and it is better to cover the hands with gutta-percha gloves while operating with the acid. Porcelain or glass dishes covered with paraffin or beeswax will resist the action of the dilute acid for some time.

(To be continued.)

## ILLUSTRATED SUPPLEMENT,

## Monthly Competition, No. 40, "Portraiture and Figure Study."

## CLASS I.

SMALLRIDGE, C. (Ivy Bridge).—"The Last Nail." Optimus R. R.,  $f/16$ ; cap off and on, September, good light, 2 p.m. "Haze on the left side of picture produced by smoke issuing from doorway." A very pleasing subject and a nice soft print; it might possibly have been improved by leaving out the old man on the right and making the boy on the left lean over the woodwork.

ASHTON, E. R. (Tunbridge Wells).—"An Arab Household, Tunis." Ross' rapid rectilinear,  $f/16$ ; 5 sec., April, dull and raining, 3 p.m. "The pointed head-dress is worn by the married women, and the eyebrows are heavily painted. The dark costume is that of a Bedouin woman." There is, we think, no call for the third figure bearing the water jar. The two in the doorway would be quite sufficient to complete this.

ROCHE, A. (Cork).—"Contemplation." French R. R. lens,  $f/11$ ; 4 sec., March, diffused light, mid-day. "The photograph is of a Dominican friar in his cell, hence the title." A good picture, well thought out, and beautifully soft and delicate. We should much like to have a rough sepia print of this.

CROSSE, S. (Burslem).—"A Crack Shot." French R. R. lens,  $f/16$ ; 2 sec., August, good light, noon. A very happy and very natural bit of grouping; every face is intent on the result of the knuckle down.

CARRUTHERS, G. A. (Liscard).—"The Foster Mother." French half-plate R. R.,  $f/16$ ; shutter, May, bright sunshine, 6 p.m. The scene is a natural one, no posing. "The kittens were found in one of the outhouses and saved from a watery grave by request of the bairns." The only thing at all offending in this is the rather too white apron of the figure on the right; the idea is very good.

HARDING, G. (Wordsley).—"A Morning Polish." Single lens,  $f/16$ ; 2 sec., September, good light, 9 a.m. Rather too many straight lines, and the print is flat and overtone.

WYNNE, G. F. (Wrexham).—"Good Morning." Ross rapid rectilinear,  $f/8$ ; 1 sec., August, diffused light, 11 a.m. "The picture was taken in an angle of the house and a high wall; the background, a curtain hung over a clothes-horse and the top light shaded with a carriage umbrella." A beautifully soft rendering of white drapery, and would have taken a higher place but for the lines of the cot.

EDMONDSON, W. B. (Oldham).—"Good Morning." Optimus R. R.,  $f/22$ ;  $1\frac{1}{2}$  sec., August, rather dull, 1 p.m. In this, although the idea is good, the figures are so small as to play but a secondary part in the picture.

ORB, F. HARMAN (Kingstown).—"Playing at Afternoon Tea." Dallmeyer quarter-plate portrait lens, about  $f/4$ ; 1-10th sec., June, bright light, and out of doors, 1 p.m. "Taken in an ordinary sitting

room near window." The print is a little too crowded with figures, but otherwise it is beautifully soft and delicate.

KNOWLES, J. F. (Wallasey).—"Leisure Moments." Swift 8 by 5 Paragon,  $f/32$ ; 3 sec. in the shade, May, bright light, 4 p.m. "Developed with hydroquinone." Too harsh and brilliant; a far better result could have been obtained on a rough-surface paper.

ELKINGTON, E. M. MISS (Wolverley).—"The Village Blacksmith, Oberammergau." Watson's R. R.,  $f/16$ ; 10 sec., August, bright light, 2 p.m.; Iso film. "The shirt was blue. There was no sun on the subject, it being behind the workshop." The shirt in this is a great deal too white and clean, and the man should have been

looking at his work.

VAUGHAN, W. F. (Torrington).—"Companions" (two children reading). Single lens,  $f/11$ ; 3 sec., May, bright diffused light, 11 a.m. "Taken in an ordinary room through an open window. Printed deeply to throw reclining figure well into relief." An exquisite little bit of child portraiture, which could have been cut down with advantage.

JUDSON, T. B. (Worcester).—"Portrait of a Lady." Optimus R. R.,  $f/8$ ; 4 sec., August, good light, arranged, 5 p.m. "No head-rest was used." An unusually good bit of amateur portraiture, and if this competitor had but cut out the curtain on the left he might have taken a prize. We would suggest cutting the film of this right off the negative.

ARCHER, H. F. (Clapham).—"Interested."

Hockins' portrait lens,  $f/22$ ; 10 sec., August, hazy light, 3 p.m. "The picture was taken in a room with one window, the sitter being four feet away from same. A white sheet was used on the shaded side. Exposed for shadows." Another delicate soft-lighted result spoilt by the vignetting.

SEARS, H. G. (Birmingham).—"A Cottage Door Conference." Optimus R. R.,  $f/16$ ; 4 sec., July, good light, but no sun, 4 p.m. Rather too palpably posed, and we do not see why the old man should have his eyes shut. Technically a good print.

LEACH, T. (Rochdale).—"Industrious." Taylor, Taylor, and Hobson's R. R.,  $f/11$ ; 1 sec., July, fairly bright, but no sunshine, 4 p.m. A soft little picture, which would have looked better without quite so many bricks and spotty flowers in the background.

NICHOLL, A. C. (Cheltenham).—"Supper Time." Zeiss' lens, Series IV.,  $f/12\frac{1}{2}$ ; 3 sec., August, taken in shade, 4 p.m. "Taken in stable yard, sheltered from direct sunshine by buildings." The competitor has missed his picture, the material for which is to be found in the old man's face; too much is shown. It could be cut down with advantage.

TIMS, J. (Ewell).—"A Tiller of the Soil." Optimus Euryscope,  $f/32$ ; 6 sec., September, sunshine, but taken in shadow. "I have tried to suit the tone of print to the occupation of the individual." A fearful colour, and the white spot in the left of picture is offensive,

No 1.]

"SHOEING THE GREY MARE."

[C. Smallridge.

SILVER MEDAL.

POLLARD, A. M., MISS (Cheltenham).—"Portrait of Myself, taken by myself without any assistant." Ross' R.S.,  $f/16$ ; 1 sec., July, cloud over sun, noon. "This was taken in a garden, and after focussing something placed on a chair, I held the pneumatic ball of the shutter in my hand, sat down on the chair, and exposed." A very soft portrait, though we should have liked it better if printed a little deeper.

STOREY, P. G. (London, N.W.).—"Thumbs Up." Single lens,  $f/8$ ; 3 sec., June, bright light, 10 a.m. "Last Whit Monday my friend was 'taking off' some characters, and I offered to take his portrait, to which he agreed." Rather flat, but tells its own tale well.

MAYSTON, A. E. (Dublin).—"Type of Irish Beauty." R.R. lens,  $f/15$ ; 3 sec., in open air, July, good light, noon. A very delicate print, but would have been improved by a plain background.

## CLASS II.

ALCOCK, F. (London).—"Portrait." Single lens,  $f/11$ ; 12 sec., August, 3 p.m.; platinotype cold bath; half-plate. Rather under-exposed, but a happy bit of lighting.

BARBOUR, T. M. (Bury).—"A Few Fresh Oysters, Sir!" R.R.,  $f/20$ ;  $\frac{1}{2}$  sec., September, strong sunlight, 4.35 p.m. "I was photographing on Blackpool sands when this boy asked me if I would like a few fresh oysters. I thought he would make a good figure. What say you?" Well, so he does, but the print is flat, and the background spoils it.

BREMNER, R. G. (London).—"Bargaining." R.R.,  $f/32$ ; 1 sec., September, good light, 11.30 a.m. The dress of servant is too white, and the three fish all of a row immediately attract the eye.

BROOK, STANLEY (York).—"Polly." R.R.,  $f/22$ ; 1 sec., noon, diffused light. A very pleasing, soft print, but we should have liked to have seen a plain background.

CLARKE, A. (Basingstoke).—"Scissors to Grind." Single lens,  $f/16$ ;  $\frac{1}{2}$  sec., July, sunshine, 11 a.m. By no means a bad little study, but a little too heavy in the shadows.

DART, W. B. (Torrington).—"Fancy Dress." R.P.,  $f/11$ ; 5 sec., August, fair light at 4 p.m. This figure would have looked far better against a plain white background; the natural one is not suitable.

—DAVIE, S. R. (London).—"Mending the Lines." R.R.,  $f/16$ ; instantaneous exposure, August, bright sunshine, noon. "High wind blowing at time; the man kept on with his work the whole time." This may be, but both he and the old lady are staring hard at the camera.

DUNNE, M. J. (Co. Meath).—"Washing Day." R.R.,  $f/12$ ; September, noon, platinotype. Too evidently made up, and none of the figures are suitable, or really engaged in their work.

DYMOND, C. F. (Saltash).—"The Gardener's Daughter." Single lens,  $f/22$ ; 2 sec., September, diffused light, 4.40. "My first attempt at figure study." We were strongly tempted to put this in the first class, but it is too formal; the pot on each side, the arch of creeper and the figure in the middle. The face and drapery are so beauti-

fully soft that it deserves enlarging and cutting out from its surroundings.

EARLES, Miss A. F. (Enfield).—"Finishing Touches." Single lens,  $f/24$ ; 15 sec., August, dull, 7.20 p.m. The first thing to strike one about this picture is the exceedingly uncomfortable way in which the artist holds his brush. It is nice and soft, but rather crowded up with too many alligators, etc.

FOSTER, P. S. (Halifax).—"Tea Time." R.S.,  $f/11$ ; 3 secs., July, good light, 11 a.m. A Japanese fancy dress, well carried out so far, but the surroundings are not in keeping. Print soft and delicate.

GREENALL, C. E. (Kendal).—"I see not Afraid." R.S.,  $f/11$ ; good light, 5 p.m.; platinotype. Wants cutting down badly, and a great deal too black and white, but a pretty idea.

KEY, T. (Grantham).—"The Village Cobblers." Single lens,  $f/30$ ;

12 sec., bright light, September, 4 p.m. "First time of competing." Rather too hard, and spoilt by the box in the front.

LORD, R. S. (Eccles).—"A Boatman." R.R.,  $f/8$ ;  $2\frac{1}{2}$  sec., September, sunshine, noon. Print flat, and over-toned.

MICHEL, R. H. (Hamilton).—"Crossing the Stream." R.R.,  $f/8$ ;  $\frac{1}{2}$  sec., noon, bright light, June. Too black and white, and more properly classed as landscape with figures.

NEWLAND, A. G. E. (Assam).—"The Field Hospital." R.R.,  $f/25$ ;  $\frac{1}{2}$  sec., diffused light, 4 p.m. A clever bit of grouping, which comes all the way from Assam.

ROBINSON, J. W. (Lewes).—"Air Balls, 1d. Apiece." Single,  $f/9$ ; September, sunshine, noon. A good subject spoilt by the vignetting and shape.

SALMON, P. R. (Cambridge).—"Potato Peeling." R.R.,  $f/16$ ; half sec., August, bright, 3 p.m. Print a great deal too hard, on matt-surface, rough sepia; it might look better.

TEVERSHAM, R. K. (Kilburn).—"The Rivals." R. S.,  $f/16$ ; 2 sec., 11 a.m., July. A good subject, but there was no need to cut off the elbow, and printed too deep, and a hideous pink tinge.

TIMMINS, C. A. (Runcorn).—"Pleasant Pastimes." R. R.;  $f/11$ ; 12 sec., July, diffused light, 5 p.m. Too black, and too much in it.

UDALE, F. (Uttoxeter).—"The Horn Dance." R.R.,  $f/22$ ; 2 sec., September, diffused light, 8 p.m. We hope to be able to reproduce this print in a later issue, as it is a curious old custom.

• WESTLAKE, G. W. (Sheffield).—"The Peddler." July, noon, very dull light, R. R.,  $f/16$ . A good study, but rather over-printed.

WOOD, L. J. (Botcherly).—"Children Wading." Single,  $f/20$ ;  $\frac{3}{4}$  sec., August, sun, noon. Too much unnecessary matter in it, and figures too stiff.

No. 3.]

"AN ARAB HOUSEHOLD."

BRONZE MEDAL.

**New Application of Photography to Litho Printing.**—A method has just been patented in the United States, says *Paper and Press*, for producing photographs, images and pictures on hard surfaces, as glass, metal, porcelain, etc. The invention consists in applying to such a surface a coating of a solution of guaiaretic acid or of the guaiaretate of a metal or organic base, and submitting the so coated surface under a photographic negative or a transparent positive of the image to the action of the light, whereby the parts of the coating exposed to the light through the unaffected parts of the negative or transparent positive become hard and insoluble, then developing the coated surface, and finally applying to the film a suitable acid, whereby the picture is etched into the surface. The hard portions of the film which are not affected by the acid are then removed. Dr. Jacobs has found that the guaiaretic acid ( $C_{12}H_{10}O_6$ ) or its metallic salts, or those made of guaiaretic acid with organic bases, by exposure to light change their properties as to solubility and as to resistance in oxidising agents. The guaiaretic acid, as well known, is, freshly prepared, soluble in alcohol, ether, bisulphide of carbon, chloroform, acetic acid, benzole and other substances; but by exposure to light it becomes less or entirely insoluble in these substances, like asphaltum or resistance—that is to say, the salts of abietic acid ( $C_{20}H_{30}O_2$ ). As far as his researches go,

guaiacetic acid ( $C_{12}H_{10}O_6$ ) is formed by this action, which latter is still more oxidised by certain likewise acting substances. A similar effect takes place by exposing the salts of guaiaretic acid with metals or organic bases, also the chlorine, bromine, and iodine substitution products or the corresponding salts to the action of the light. Certain colours—for instance, aniline violet, magenta-red, safranin—when combined in minute quantities with guaiaretic acid or salts accelerate the action of the light—i.e., they act as sensitizers. He furthermore found that a thin coating of this acid or its salts laid upon a hard surface and exposed to the light for a certain time becomes impermeable by dilute mineral or organic acids. These properties of guaiaretic acid or its salts, as aforesaid, render them useful for the production or reproduction of pictures, photographs, ornaments, etc., by means of the actinic rays. In carrying out his invention to produce a photograph, picture, image or ornaments on a hard surface, as metal, porcelain, glass, lithographic stone, etc., he first dissolves 100 parts of crystallised guaiaretic acid, or, to obtain a more sensitive film, 120 parts of dry amorphous guaiaretate of silver, or of a corresponding quantity of the zinc, lead

or magnesium salt (which latter, are less sensitive than the silver salt) in 500 parts of pure benzole. He may use the salts coloured with three to four per cent. of aniline-violet or another aniline colour or colours. He then prepares a rubber solution by dissolving 74 parts of dry caoutchouc to 500 of benzol. He may also use a collodion solution instead of rubber, the collodion solution containing one to two per cent. of nitro-cellulose; but he prefers the above-described composition of rubber. Both solutions are then thoroughly mixed together and the well-cleaned surface on which the picture is to be produced is carefully coated with the mixture thus obtained in the dark. Then the so coated surface is exposed under a negative or transparent positive to the action of light, a ten to twelve minutes' exposure to direct sunlight being sufficient to harden the exposed parts and to render them insoluble in the developing bath, and the best he found to be composed of a mixture of one part of benzole and five parts of spirit or turpentine. Of course, other developers can be used. The parts of the film which are not affected by the action of the light are thereby removed and the picture appears on the surface. The plate is then dried and etched by appropriate acids, according to the nature of the surface to which the sensitive film is applied; or it may be printed from directly with lithographic ink. The guaiaretic acid which he uses is prepared in the following way:—Two parts of guaiacum

CERTIFICATE.

are dissolved in ten parts of alcohol, filtered and concentrated to a thin syrupy solution. Then it is mixed with a warm concentrated solution of one part of potassium hydrate. After twenty-four hours' standing it forms a mass of the consistency of pulp and is pressed through a filtering cloth. The remainder is thoroughly washed first with alcohol and then water and crystallised from a medium of dilute alcohol.

The following gentlemen have kindly consented to act as judges at the South London Photographic Society's Exhibition to be held on the 24th, 25th, and 26th November, 1892, at the Peckham Public Hall, viz., F. P. Cembrano, jun., A. Pringle, and L. Warnerke.

Mr. F. W. Levett, Hon. Secretary, Brixton and Olapham Camera Club, requests us to notify the change of his address, which is now 11, Corrance Road, Acre Lane, Brixton, S.W.

The Stanley Cycle Show, which will be held at the Royal Agricultural Hall, Islington, N., from November 18th to 26th, inclusive, will include a section devoted to photographic apparatus. Entries close on November 5th, and full particulars may be obtained from H. E. Smith, 29, Finsbury Pavement, E.C.

## American Work and Workers.\*

By MISS CATHERINE WEED BARNES.

IN speaking on a similar subject before the recent Edinburgh Convention, I could only venture on a very general treatment of it, so that when your kind invitation to address you was received, I decided to speak further on what camera workers are doing in the United States. We draw the lines quite as sharply as in Europe, and have as various species of the genus "crank," but, after all, little really progressive is ever accomplished in the world without the workers being looked upon as mentally unbalanced, to state it mildly, by those not possessed of a like enthusiasm. The devotees of the camera must bear their share of this experience, for, in spite of all proof to the contrary, the uninitiated are still unwilling to believe that the results of photography are not due to luck, or, at least, a cleverly managed trick. We can well afford to smile at this view, however, realising as every genuine worker does the higher position it is constantly assuming among the world's actively beneficent forces. With us, as more than once stated, the camera is too often considered only as a means to kill time, and the fact is then lost sight of that the so-called "snap-shooters" possess in their ever-ready instrument a wonderful though too often abused power. But they should not claim for it perfect equality with tripod work. My own preference for the latter is mainly that, as more care is usually given to it, the results are better than hand work, but it seems also as if the former admitted of greater latitude in composition, to say nothing of subsequent treatment of the negative (which when well done is perfectly legitimate from an artistic standpoint), and, I say it advisedly, the greater choice as to selection of subject it places in the workers' hands. This is without detracting from the use of hand-cameras, which form a department of their own covering an important field, and which should not necessarily conflict with tripod work. In the hands of any one who has gained large experience with the tripod, the hand-camera is a valuable power, but with us the latter is usually considered as being easier to manage than the former. It is, therefore, preferred by beginners, and its results cannot justly be compared with stand exposures.

There is a very amusing amount of ignorance in the land on the subject of shutter exposures, and the idea seems prevalent that instantaneous work (I dislike the term) is the result of some occult power residing in and solely due to the instrument, having nothing whatever to do with the operator. I was asked lately on the shore of Loch Katrine, where my 8 by 10 tripod camera was being used, "Does your camera take instantaneous pictures?" "That depends on how you use it," was my reply, which seemed to puzzle my interlocutor. With us, as well as here, the camera army is divided into what might be termed "tripods, and anti-tripods," but we seldom use one to the exclusion of the other except among those who do little if any really serious work. As long as the average user of a camera is satisfied with playing at photography, he will never consider it is worthy special respect. It should be stated in strict justice that, as a whole, American clubs offer finer working facilities than those of any other country, and are imbued with a progressive spirit which readily embraces every new improvement. Americans are, and I claim it without undue self-praise, not only able

but willing to learn, where they make up their minds the game is worth the candle, and a really good idea is certain sooner or later to find general support. We do not hold on to any method or opinion because of proper respect for age, or welcome it because it is young.

One point which to my knowledge has never been considered is, that camerists have widely differing gifts in the photographic field. Some do best in the studio, some with architectural subjects such as interiors, and others with hand-cameras. Very few can or should undertake to do all these with hope of equal success. I think one fault with us is that we are apt to attempt this all but impossible task. Let me emphasise one point in favour of American methods, or rather, instruments, which is to some extent being introduced in England, the question of lighter plate-holders. Englishmen claim that with them bulk is as great a consideration as weight, but to me the point does not seem to be well taken. Our holders may not be as ornamental in appearance as the smoothly polished ones so general here, but they serve the purpose of keeping out light just as well, and the slides are not nearly so inconvenient as the permanent ones which project beyond the camera, any moment liable to cause vibration or to be broken off by a sudden movement of the operator. I must also endorse having the word "exposed" printed on one side of the slide, which if the operator takes care to replace

correctly, positively prevents double exposure. Their use, like most of the other mechanical appliances, requires a certain amount of brains—otherwise common-sense. The tripod I am now using, and have for several years, is easily and quickly adjusted, and packs into a small compass; as does the camera, which closes in on itself, thus protecting the lens, if a wide-angle one; and the hinged ground-glass is discarded in favour of one which permits being held back so as to let the plate-holder take its place, and when the holder is withdrawn the glass slips back into position. The tendency is growing to have as few projecting screws or

other parts as possible, and those recently made are particularly noticeable in this respect. Opinions differ as to the advantages of front or back focus, being slightly in favour of the former except in the studio and with enlarging or reducing work. Few if any of our cameras are made to have the tripod top permanent in the instrument, but it does save room, and the idea is therefore good. We are in serious danger of making our instruments, especially the cheaper grades, altogether too light, but the demand is for portability combined with cheapness, and this leads to an enormous sale of small size instruments. I have one camera in my large collection which cost hardly twelve dollars, camera, tripod, plate-holder, lens, and carrying case complete, and it does very tolerable work. For some insurmountable reasons, the small prints in our exhibitions are called the English size, although I noticed in the various excursions at Edinburgh, very few even whole-plate cameras. With you, as with us, the reason is usually given that enlargements are always available, but my preference is always for direct prints. It would seem to be a fitting matter for international arrangement, the coming to some agreement for uniform sizes of plates. Our favourite size, notably for hand-cameras, is 4 by 5, and 5 by 7 has superseded 5 by 8 as giving a better proportioned picture; and from thence we go through 8 by 10, 11 by 14, up to as high as 18 by 22, but even the most ambitious seldom venture beyond 8 by 10. Before we made such excellent cameras we were dependent on

foreign makers, and those of us who were not natural mathematicians were often annoyed by what we considered inconvenient numbers, those with fractional additions. The reason given us for retaining these latter has been that the glass thus cuts to better advantage, but I fail to see why it is not possible in the first place to make the sheet of glass of such dimensions as to cut evenly into any size plate desired. I have found it difficult to get 5 by 7 plates in England, though not 8 by 10.

We are taking great interest in lantern exhibitions, and it is an encouraging sign of comradeship that so many sets are being exchanged between English and American workers. If each, however, will insist on retaining a different size plate the carriers at least should be international so as to hold either size conveniently. We are to some extent using the arc light at these exhibitions as well as for enlarging and making slides, but it is so much more powerful than the oxy-hydrogen, that the slides should be made with that point understood, or they will show weak on the screen. Our manufacturers make excellent negative and lantern plates, and I have been taken to task more than once somewhere, for saying ours are more rapid than the English, often a very questionable advantage, but actual experiment has proved to me that with two representative makes of lantern plates, I had, under precisely similar circumstances, to give the English three times the exposure of the Americans to gain the same result. We are giving increasing attention to the nature of the subject in matting and mounting our slides, and the old circular or even uniformly round cornered mats are now seldom seen. I must mention that in one of the New York societies the slides are thrown from behind on the screen, which is transparent, giving a charming ground-glass effect. One amateur having a private lantern, projects his slides on a heavy ground-glass placed between two parlours and framed by curtains. The effect is excellent. With my own oxy-hydrogen apparatus I use a heavy linen screen but-toned on a framework like an old fashioned quilting-frame set on rollers. This is thoroughly wetted and then stretched out. The light is powerful, and every slide I send out is thus tested before mounting. My mats are all cut from special designs, and sometimes a dozen will be tried on one slide, and the same slipped into my lanternscope for examination before a choice is made. We have what are called test nights in two of the New York societies, when one or more of the lantern committee attend and give a final decision before the slide is considered suitable for a general audience, though the meeting is very informal and members feel perfectly free to express individual opinion, to the pleasure or otherwise of the respective slide makers. In one society, if desired by any member, the meeting room is at his or her disposal for an entertainment, and one of the lantern committee will attend to manage the slides. Films in place of glass seem to make their way slowly among us, in spite of their undeniable merit of lightness, and I can speak feelingly on the subject considering the quantity of 8 by 10 plates I have to carry home in October. Films have certain defects which make me as yet prefer glass, but demand always creates supply, and I expect to see them eventually almost supersede the latter. One of our leading firms making photo-gravures urges me to copy all my valuable negatives on celluloid, as a precaution in case of injury to the original. The idea is a good one, as experience showed when one of my 14 by 17 negatives were smashed on its way back to me from the reproducers

through careless packing. He made me a negative, original size, from the small transparency he used, but the qualities of the original would have been far better preserved by the method above mentioned. Coming to the question of development, there is much divergence among ourselves, and what little developing I have done in England has shown me that this is especially marked when compared with English methods. We are not given to using 10 per cent. solutions as is much done here, for many of our workers are skilful chemists and have a great liking for experimental work both in development and printing, studying the scientific theory as well as practice. Some workers have fitted up laboratory attachments to their developing rooms; I must say, though, that it is not always those who have the greatest number of well filled shelves and shining weights who actually accomplish the best scientific results. The use of acid sulphite is quite general, and though in the club dark-rooms the hypo solution is ordinarily kept in stock, home workers prefer to make it up fresh, graduating its strength as desired. My own custom is to partly fill my fixing dish with water and

then put in a handful or more, as judgment dictates, of hypo crystals, and a little acid sulphite to keep the bath clear; even then I do like to dip the negatives or lantern slides in a bath of saturated alum and sulphuric acid, either before or after fixation. When pyro, which is still first with a large majority of our workers, is used with ammonia or soda, it has for a long time been my custom, many times suggested to others, to make up solutions of sulphite and carbonate of soda in large quantities by hydrometer measurement instead of weight, the pyro being always made up fresh one to twelve, and old developer never being kept under any circumstances.

Then, with a little, very little, saturated bromide of potassium, not ammonium, and plenty of water, the operator usually has only himself to blame for failure. It seems a little strange that English workers prefer ammonia to soda as an alkali, and Mr. Bothamley in his Edinburgh paper gave a very clear idea of the action of each, which to my mind seemed rather in favour of soda. I was asked in London by a scientific expert which side of photography was my "particular vanity," as Sam Weller would say, and on my describing the advantages of my developing room was triumphantly told

No. 5.]

"THE FOSTER MOTHER."

[G. A. Carruthers.

that such was practically acknowledging photography science, not art, a dictum to which I promptly and positively demurred, claiming that each had its own special standing alike worthy, thereby proving the length and breadth of the photographic field.

We are turning more and more towards matt-surface prints, largely platinum and kindred processes, such as Kallitype No. 2, and plain salted paper, but we make a number of bromides, especially in sepia tones, which are considered a refreshing change. The Manhattan paper admits of several tones according to development, and prints also made on celluloid as transparencies are likewise very effective. These latter processes are quite slow. The paper sent out by the Eastman Company seems to fulfil the promises made for it, and can be utilised for either glossy or matt-surface prints. It is to be hoped that our workers will after a while give carbon printing the place it should occupy among us. We admit its beauty, but only a few use it, though an effort is being made now to encourage amateurs to try it. Two or three of our leading manufacturers are making the tissue, but the heat of our summer renders its use mostly confined to

the winters when the light is poor. We trust that every year, we, the two English speaking nations, will grow into closer accord and each learn from the other of its best characteristics. There should be only a healthy spirit of rivalry, enough to bring out the latent energies of each nation, and thus continually advance the work in which we are mutually interested. It is growing rapidly among us, constant improvements are being made, new apparatus and methods of work invented, new societies formed, and besides the regular photographic journals the daily press gives space to all especially interesting meetings, and purely literary magazines more and more are utilising the art science in their pages for illustrations, and in the shape of articles. Photography has a great future among us, and he would be indeed a prophet who could reveal it, but we never will make lasting and steady progress without keeping thoroughly informed on the work being done this side of the ocean. We should mutually take part in each other's exhibitions, and can in no better way realise our deficiencies and gain courage from our evidences of progress.

## Glycin.

### A NEW DEVELOPER.

DR. EDER gives the following report in the current number of the *Photographische Correspondenz* of the new developing agent glycin, which was discovered in the chemical laboratory of Hauff in Feuerbach, the maker of amidol and metol. Glycin is oxyphenyl-glycin, and has the formula of  $C_6O_4HHNHCH_2COOH$ , and is prepared by the action of chloroacetic acid on amidophenol.

It is a very light, shiny, powdery mass, which only dissolves in water on the addition of an alkali (caustic) or alkaline carbonate to a nearly colourless liquid, which will keep in the presence of sulphite and acts as a vigorous developer.

The following formula will be found satisfactory for the preparation of a developer for gelatino-bromide plates:—

#### 1. Glycin-potash Developer.

Glycin	...	...	5 parts.
Sodium sulphite (crystal)	...	15	"
Carbonate of potash	...	25	"
Water	...	...	09 "

This concentrated solution is mixed with three or four parts of water before use. The image appears gradually when using this developer, first the light lights and then the half-tones. The colour of the silver deposit is a pleasing greyish black, the gelatine film itself remaining free from any stain. The sensitiveness is somewhat less than when using metol, amidol, hydrokinone, or pyrogallol, but the negatives are characterised by an absolute freedom of fog.

Addition of bromide of potassium acts as a restrainer, also dilution with water, just as with other developers.

2. Glycin-Soda Developer.—The glycin-soda developer possesses a lower reducing power, but still gives clear negatives. A developer, which is at once ready for use, may be prepared as follows:—

Glycin	...	...	3 parts.	Sodium carbonate (crystal)	22 parts
Sodium sulphite	...	15	"	Water	...
					200 "

The solution may be used at once, and will keep for a long time unchanged in well-stoppered bottles.

This developer gives very clear and delicate negatives. By reducing the proportion of soda the negatives become still more transparent; dilution with water acts in the same way. By the use of bromide of potassium considerable over-exposure may be compensated for.

Glycin may be designated as a slow and fogless acting developer, which cannot be reckoned under the head of rapid developers (e.g. metol, etc.), but is noteworthy as it gives very clear transparent and slow developing negatives. Glycin is therefore destined to render very good service for many purposes in photography.

## Holiday Resorts and Photographic Haunts.

### COUNTY DOWN.

By C. E. S.

THOUGH the adjoining county of Antrim must certainly be awarded the palm for varied and beautiful scenery in the North of Ireland, County Down is well worth a visit, and will give the amateur photographer lots of work to do. As for County Antrim, Belfast (which lies partly in each county) forms the best starting place for trips. If the tourist has from ten days to a fortnight at his disposal, I should advise him to spend four or five days in making day trips from Belfast, and the remainder at Newcastle or Rostrevor, as a centre for the southern and most beautiful part of the county.

*First Day.*—Take an early boat or train to Bangor, about ten miles from Belfast. On the way the hand-camera man is sure to get some good shots at shipping if he goes by boat. Take a look round Bangor, then walk over the hills about six miles to Newtownards, visiting on the way Helen's Tower. This is a tower erected on the highest hill in his estate by Lord Dufferin, in memory of his mother. The interior is worth seeing, as on the walls of the principal room two poems are inscribed, one by Lord Tennyson, and one by Robert Browning. A short way out of Newtownards is another tower, Scarborough Tower, which may be seen many miles away. It was erected to the memory of the third Marquis of Londonderry. As the view is very extensive from it, it is worth visiting, and a good photograph of it may be got from the west side. From Newtownards the train may be taken back to Belfast.

*Second Day.*—A return ticket to Newtownards should be taken, and from there the "long car" (particulars of which are to be found in the Belfast railway guides) to Grey Abbey, on the eastern shore of Strangford Lough. This is one of the most beautiful ruins in the country, and half a dozen plates may easily be expended on it. The Abbey was founded in 1193 by the wife of John de Courci, and destroyed in 1641 during the rebellion. If a long day is devoted to this excursion, Portaferry, about ten miles further from Newtownards, may also be visited. It is a

little fishing village picturesquely situated on the narrow channel connecting Strangford Lough with the Irish Sea. In places it is wooded down to the water's edge, and reminds one of the Kyles of Bute. The hand-camera man should look out for groups of children, as many of the little country urchins along this coast are remarkably pretty.

*Third Day.*—At least one day should be spent in the heart of the country, and no better place can be chosen to give one a good general idea of its character than the Spa, near Ballynahinch. County Down is often compared to a basket of eggs, and the comparison is by no means inapt. For miles one may not see sufficient level ground for a cricket pitch, and yet no high hills, just a succession of small rounded hills, which may not unfairly be compared to magnified eggs.

The train is taken to Ballynahinch, and from there a 'bus runs to the Spa, as "truly rural" a spot as one could find in the United Kingdom. There are two medicinal springs, from which

No. 6.]

"A MORNING POLISH."

[G. Harding.]

few people drink now-a-days, though they used to have considerable reputé, and are really as beneficial as some English and Continental waters to which invalids flock in crowds. After a look at the springs (and of course a drink of the waters), the tourist should walk or drive past the small lake to Slieve Croob, a hill four miles from the Spa, rising to a height of 1,755 ft. From its summit a magnificent view is got, and on the road to it a number of pretty bits for the camera will be found. If the visitor chooses to walk back from the Spa to Ballynahinch, he may go through the beautiful demesne of Montalto without lengthening his journey.

The Giant's Ring, four miles from Belfast, should certainly be visited to see a good example of the ancient cromlechs, or Druidical altars, 366 of which are said to exist in Ireland. This one is fairly typical, six large rough stones placed on end in a circle, with a seventh larger covering stone resting on them. The peculiar feature from which it derives its name is a circular earthwork, about one-third of a mile in circumference, surrounding it. A short way beyond it, at Drumbo, is a ruined round tower. Both may easily be visited in a few hours' drive, and a great deal may be seen if one goes out by the Malone Road, crosses to the County Down side of the river by Shaw's Bridge, and after visiting the Giant's Ring and Round Tower, returns to town by Newtonbrea and Ballynakeigh, and through the Ormeau Park.

Having seen the northern part of County Down, the visitor should now go south, taking the train to Newcastle, nearly forty miles from Belfast. On the way he passes through Downpatrick, the oldest town in Ulster. The Cathedral, beside which St. Patrick is buried, may be seen from the train, but is hardly worth stopping to visit.

Newcastle, the terminus of the line, is a large village lying on the sea shore at the foot of Slieve Donard, the highest mountain in the North of Ireland (2796 ft.) Several courses are open to the tourist on arriving here. If ready to spend some money, he may put up at one of the two good hotels, the Bellevue or Annesley Arms, and from Newcastle as a centre take drives in the surrounding country and climb the mountains from the sea-front. If one is prepared to pay less and walk more, he will see the country best by staying first at the good little inn at Bryansford, and then at a similar inn at Kilkeel, the former being at the northern boundary of the Mourne range, the latter at the southern. Both are reached by car from Newcastle, Bryansford being about two and a half miles inland, and Kilkeel about twelve miles along the coast to the south. If one stays at Newcastle, one can make the following excursions partly by car. Bryansford lies between two private parks, both abounding in subjects for the camera.

Castlewellan, the residence of Lord Annesley, should be first visited, as from it one gets splendid views of the whole range of the Mourne mountains. The grounds are only open to the public on certain days of the week, but Lord Annesley is an enthusiastic amateur photographer, and is pretty certain to give leave to anyone applying for it by letter to photograph on any day. The best views are got from the north side of the lake, along the margin of which a road runs. What can the amateur photographer want to make him happy more than a lovely lake, studded with islands, and swarming with water-fowl in the foreground, and a splendid range of mountains rising up beyond? Those interested in botany will note the number and variety of fine trees, many of rare species, each one having the specific and generic names on a label at its base, in a way seldom seen out of Kew Gardens. The best work will be done here on a very clear day with a long-focus landscape lens.

Tollymore Park, the residence of Lord Roden, is an equally charming place, but of a different character. Here the chief attraction is the glen of the Shimna River, a lively little trout stream. The "bits" on its banks are simply endless, but for many of them a rather wide-angled lens is required, and a perfectly calm day and backed plates are desirable, on account of the overshadowing trees. In autumn Isochromatic plates will also be useful.

Slieve Donard may be attacked from Bryansford, ascending the landward side. It goes without saying, however, that the bare slopes of the mountains offer few attractions to the photographer, his best hunting ground being on the "foot hills" and in the valleys. The Shimna river should be followed up to its source, and will afford a delightful day's work; above Tollymore Park it is freer from overhanging foliage, and abounds in small waterfalls. The rocks over which it flows are granite and

lend themselves particularly well to good photographic composition. At Newcastle the hand-camera man will, on the golf-links, get many chances of good shots at the golfers with the fine background of mountains. From here the grounds of Donard should be visited, and if there has been rain recently, a very respectable waterfall is to be seen. The shortest route to the top of Slieve Donard lies through this demesne, and the whole ascent takes about two hours to accomplish. The best of all the excursions in the mountains is that beginning at Annalong on the coast, which may be reached by car from either Newcastle or Kilkeel, as it lies nearly half way between the two. It should only be undertaken by pretty vigorous walkers and in clear weather. Starting from the coast, the small Annalong River is followed up to its source in the Blue Lake, and continuing past this, the pedestrian crosses the water-shed between the Annalong and Kilkeel rivers, and then sees before him at his feet the Happy Valley, through which the latter stream flows. The valley here is walled in by mountains over 2,000 ft. in height, rising in steep slopes of heather and great granite precipices. Often not a living creature is in sight; the scene is one of lonely and savage grandeur not soon forgotten. If staying at Newcastle, the tourist should now ascend to the head of the valley, and passing round the west flank of Slieve Donard, return to Newcastle by Donard Lodge demesne. If, however, he is staying at Kilkeel, he may follow the Kilkeel river down the valley to the sea, a longer but easier walk. In all these excursions among the mountains, most delightful baths may be taken in the pools hollowed out in the granite by the water of the numerous streams.

Rostrevor, a quiet little watering place in a most sheltered position on Carlingford Lough, should be visited after Kilkeel. The Mourne Hotel here is one of the best hotels in the county, and is much frequented by invalids in winter and spring, on account of the mild climate of the place. Good lodgings can also easily be obtained.

From Rostrevor one may return to Newcastle by the coast road, or by the inland road through the mountains, or he may take the tramway to Warrenpoint, and thence go by rail to Belfast or Dublin.

NOTE.—The routes given in this, and the former paper on County Antrim, can be best seen on the maps of the separate counties published by George Philip and Sons, 32, Fleet Street, at one penny each.

## Photography in Meteorology.

THE Second Report of the Committee, consisting of Mr. G. J. Symons (Chairman), Professor R. Meldola, Mr. J. Hopkinson, and Mr. A. W. Clayden (Secretary), appointed to consider the application of photography to the elucidation of Meteorological Phenomena (drawn up by the Secretary), stated that the work has been continued during the past year along the lines laid down in the Report for 1891.

Considerable additions have been made to the number of observers from whom assistance may be expected, in spite of the removal of several names from last year's list.

The total number of photographs received up to July 23 was 361, representing a variety of phenomena, but chiefly illustrating the results obtainable in cloud photography by various methods. This number, however, does not adequately represent the progress made, for many other photographs have been promised, and will in all probability be received in a few weeks.

The adoption by the majority of the International Meteorological Congress at Munich of the classification of clouds, proposed by Messrs. Hildebrandson and Abercromby, suggested to your Committee that it would be well to adopt it also, at least provisionally. They cordially agree with the action of the English delegates at the Congress in opposing the acceptance of a system which is entirely empirical; but since the great majority of foreign meteorologists have determined to employ it, your Committee consider that they should adopt it provisionally. They consider it will be well to follow the example set by other countries until the further study of cloud-forms, and their relation to one another, renders it possible to make a more scientific code.

Arrangements have therefore been made for the cataloguing of the collections of meteorological photographs in the possession of the Royal Meteorological Society and of the Chairman of your Committee.

## PHOTOGRAPHS OF LIGHTNING.

Very few new photographs have been sent in as yet, but from Mr. J. H. Bateman two of great interest have been received. Following the suggestions in the instructions issued last year, two cameras were employed, the first being stationary, and the second moved rapidly from side to side. The plate exposed in the fixed camera shows four flashes, while the one which was moved shows six. A flash which is single on the fixed plate is resolved into three on the moving plate, showing that the flash did consist of a series of discharges along much the same path. The absence of reduplication in the others points to the conclusion that they were single. Two of these single flashes occupy exactly the same relative positions on the two plates, showing that they must have been simultaneous.

Your Committee regret that there should have been no opportunity of carrying out any further experiments upon the phenomena presented by lightning photographs. However, recent discoveries concerning high-tension discharges ought to elucidate the subject. Thus it seems highly probable that the hazy continuous luminosity shown by many photographs may be due to the flame of burning nitrogen.

Before leaving the subject of lightning, it may be pointed out that in Mr. Bateman's photographs the narrow ribbon structure in each flash is no more pronounced in the moving photograph than in the one which was stationary.

The Royal Meteorological Society has received several new photographs of lightning. They all show the narrow ribbon structure; one shows reduplication of the images of some chimneys as well as the flash, while another shows a bright flash and several dark ones. Of this last Mr. Robert Law, who took the negative at Melbourne, remarks that there were two flashes, the second reversing the image of the first.

## METHODS OF CLOUD PHOTOGRAPHY.

The information at the disposal of your Committee does not, as yet, seem sufficient to enable them to pronounce definitely in favour of any one method as the best. They have made some progress in ascertaining the methods adopted abroad, and also in experimental work at home. The subject divides itself naturally into two sections, dealing respectively with cumulus or heavy clouds, and cirrus, or other light clouds.

*Cumulus*.—With all heavy clouds it is certain that admirable results may be obtained with a little practice in adjusting the stop and length of exposure. So far as the quality of the results obtainable is concerned, there does not seem to be any manifest advantage in the use of a coloured screen, of a black mirror, of specially slow or of orthochromatic plates. Nevertheless, it is quite certain that results of a given excellence are more easily obtained on a slow plate with a strong developer considerably restrained. It is equally certain that the use of the coloured screen, or of the black mirror, renders the process easier still.

With correct exposure and careful development it should not be necessary to resort to intensification of the image. If some such treatment should be required, inexperienced observers should be warned that in the use of mercurial formulae it is well to keep the plate in constant movement while in the mercury bath, in order to avoid undue granulation of the image.

*Cirrus*.—Those who have made a special study of the photography of thin clouds appear to be agreed that in order to bring out all the details of their structure some special device must be adopted.

By extremely nice adjustment of the exposure and subsequent intensification of the image, very fair results can be sometimes obtained; but the process is difficult and only practicable in experienced hands.

Dr. Rizgenbach, who first described the black mirror device, recommends that exposure should be so arranged that the sky leaves practically no impression on the plate, while the thin image of the cloud must be brought out by means of Schlippe's salt (sulphantimoniate of soda).

M. Angot, in a report presented to the Meteorological Society of France, remarks that a black mirror is only advantageous when the cloud is about 90 degs. from the sun. In theory this is of course correct, but the Secretary to your Committee has found that there is a manifest practical advantage in its use for all parts of the sky, including even the immediate neighbourhood of the sun itself. M. Angot then goes on to say: The best results are obtained by coloured screens, yet the ordinary screens are insufficient. The following formula, due to M. Léon Vidal,

gives every satisfaction. In a small glass trough with parallel faces there is placed a solution made with the proportions—sulphate of copper 175 grams, bichromate of potash 17 grams, sulphuric acid 2 cubic centimetres. These are dissolved in 100 to 500 cubic centimetres of water, according to the thickness of the trough and the results to be obtained. The sulphate of copper arrests the red rays, and the bichromate the blue and violet. The plates used were Lumière's orthochromatic, and the exposure from '5 to '8 second.

Your Committee regret that they have not yet received any illustrations of the results obtainable by the above means, but it is hoped that an exhaustive trial of the method may be carried out in the course of the coming year.

The Secretary to your Committee has continued the comparative trial of slow and ordinary plates with or without a black mirror. He reports that ordinary plates and direct exposure may often give satisfactory results when the background of sky is a clear deep blue. If, however, it is at all hazy the correct exposure becomes extremely difficult. With slow plates, however, such as Mawson and Swan's transparency plates or photo-mechanical plates, it is fairly easy to obtain results of high excellence.

With the black mirror ordinary plates give excellent results; but here again, unless the clouds are moving with unusual rapidity, or unless the light is very bad, there is a great advantage in the use of slow plates. It is, indeed, easy to obtain a fairly dense image of any cloud, however luminous and however thin, by the combined use of mirror and slow plate. Such means give abundant detail and full gradation of light and shade even when the sun is actually in the field of view. Exposure would

vary from about '2 to about '8 second with an aperture  $\frac{f}{11}$ .

The developer used in all these experiments is the familiar formula with pyrogallol and sulphate of soda considerably restrained.

Special attention should be drawn to the admirable series of cloud studies presented to the Committee which were taken by Signor Mannucci at the Vatican Observatory under the direction of the Revd. Padre Denzya, S.J. These show what can be done by direct exposure, Signor Mannucci recommending a slow plate for the more difficult subjects. The pictures taken by the Secretary to your Committee in a similar manner show the value of the slow plate and black mirror.

## MISCELLANEOUS PHOTOGRAPHS.

With regard to miscellaneous photographs of meteorological interest, your Committee regard with some satisfaction the number of pictures they have been able to secure which show the violence and severity with which the great blizzard of March, 1891, visited the south-west of England. They believe it is of great importance that fairly complete pictorial records should be kept of all such abnormal events.

They are also pleased to be able to report that several of the photographic periodicals have recently manifested considerable interest in the work, one paper, the "Practical Photographer," having just offered a series of prizes for the best meteorological studies, the editor having offered to present any competing pictures to your Committee. Several photographic societies are also taking the matter up, and your Committee hope that the effect of such powerful aid may rapidly make itself felt, both by increasing their collection and by adding to the number of contributors.

In order to show the widespread interest already taken in the subject, the catalogues of the three principal collections are appended.

In conclusion, your Committee ask to be re-appointed with a grant of £15, in order to follow up properly what they regard as a satisfactory start.

"The Optical Magic Lantern Journal," edited by J. Hay Taylor, and published at 56, Chancery Lane, E.C., appears this month about double the usual thickness, with some good practical articles by practical writers.

The Blackfriars Photographic and Sensitising Company have been appointed sole London agents for Messrs. Walter Griffiths and Co.'s detective, enlarging, and lantern-slide cameras. In view of the close approach of the lantern season, this firm intend also to specially cater for the same.

## Apparatus.

### ENGLAND'S FILM CARRIERS.

J. Desire England, of 21 to 24, Charles Street, Royal Crescent, Notting Hill, London, W., has sent us a sample of his aluminium-mounted film carriers, which are made of stout Willesden paper or black millboard with aluminium ends, which hold the ends of the film down, the sides being kept flat by the rebate of the dark slide. After practical trial of these we can strongly recommend them as efficient and cheap.

### THE "LOTHIAN" OPTICAL LANTERN.

Mr. A. H. Baird, of 15, Lothian Street, Edinburgh, has introduced a new form of optical lantern as seen in the figure, which is adaptable either to oil or lime light. As will be seen from the illustration, it has a special bellows front, which has a range of from five to fourteen inches, thus enabling lenses of varying foci being used. This bellows front is removable, allowing the demonstration of any physical or other experiments. A special jacket

## The "LOTHIAN" OPTICAL LANTERN.

fitting is provided for the objective, so that lenses may be inserted without unscrewing. The whole strikes us as a well-thought-out and capable instrument, useful alike for lantern work of all kinds as well as enlarging.

### THE B. W. AND CO. PHOTOGRAPHIC "TABLOIDS."

Messrs. Burroughs, Wellcome, and Co., of Snow Hill Buildings, E.C., have sent us samples of the above, which we have submitted to actual test. This firm is so well known for the quality of its medical "tabloids" that we need not comment on the excellence of their manufacture. That they are reliable and convenient we have proved by our trials, and they will be found very useful, not only for tourists but also for those who prefer to use dry pyro, and do not want the trouble of weighing out for each lot of developer.

Both quinol and pyro "tabloids" may be obtained, and with the former liquor potassæ is suggested as the accelerator, and for pyro a special accelerator tabloid is prepared.

### MAXOTINTS.

MR. D. MCNAE, of 10, Markham Square, Chelsea, S.W., has submitted to our notice some coloured prints which he has given the above title. The preparation of the colours and surface of the prints to receive the same will be kept a secret, but the

colours are all chemicals and applied hot to the print and may be obtained either transparent or opaque.

The results obtained by this process are really very natural, and one is almost led to believe that we have at last attained photography in colours. The great advantage of Mr. McNae's process is that there is no chance of altering the likeness in the case of a portrait. No dull marks are visible on the surface of the prints, and the surface of the prints may be rubbed, washed, or even burnished after colouring. The process is applicable either to portraits or landscapes, and the colours withstand enamelling and hot gelatine, and last but not least, the expense is considerably less than usual.

### SWIFT'S LANTERN LENSES.

Messrs. J. Swift and Son, of 81, Tottenham Court Road, London, W., have sent us three of their "Paragon" lantern lenses for trial, of 5 in., 6 in., and 7 in. focus. The lenses are mounted in well-finished brass work, and are actuated by a rack and pinion, which works very smoothly.

Testing the lenses on a very severe subject, a photographic slide of a page of type, we found it reproduced absolutely sharp to the margins and no distortion.

One of Messrs. Swift's Paragon lantern lenses was also used at Pall Mall on Saturday last, when our Prize Slides and others to the number of 200 were shown, and the excellence of definition could not be excelled.

### VITREOGRAPHINE.

Thos. Haddon, of 2, Maitland Street, Edinburgh, has sent us a sample of the above, which is an ink specially made to write on glass, and it answers this purpose perfectly, without any previous preparation, and without blotting or running.

All that is required is a perfectly clean bit of glass and a clean pen, and, after shaking the bottle well, it will be found that a diagram or sketch may be copied with the greatest of ease.

We have tried this, and prepared a set of lantern-slides by copying on cover glasses some diagrams from a work on optics, and have not found the slightest difficulty in using the same.

This ink will be found of very great value for all lecture purposes with the lantern, and may obviously be used to copy hymns, sketches, or any other subject. The ink may be had either in black, which gives a very good opaque colour, which shows up perfectly opaque on the screen, or it may be had in transparent colours.

## Catalogues.

R. LECHNER, 31, Graben, Wien.

This price list forms quite a handsome volume of over 100 pages, and contains a very complete list of all the leading apparatus for which this firm is famous.

Special cameras for photo-micrographic or photo-grammetric work are included, besides numerous well-known English and foreign articles. It is conveniently divided into several sections, which deal with the utensils necessary for the various operations.

MR. FRANK F. WEEKS, 21, Thorpe Road, Forest Gate, London, E.

Mr. Weeks sends us his price list of optical lantern slides and special artistic sketches for the same. He has long been known for his artistic work, and is very successful in preparing designs of all popular and scientific subjects for lantern work.

We have frequently had queries asked us as to where to obtain artistic and floral border designs for hymns and mottoes, and these Mr. Weeks is prepared to supply to any amount.

G. W. WILSON AND Co., 2, St. Swithin Street, Aberdeen.

Now that the lantern season is so near at hand, the catalogue of photographic lantern slides by this well-known firm will come in very handy. Messrs. Wilson's work is so well known for its artistic quality as to require no praise from us. Their sets of slides include most of the best known and most picturesque places both in England and Scotland.

## Exhibitions.

### PHOTOGRAPHIC SOCIETY OF GREAT BRITAIN.

#### THIRD NOTICE.

F. P. CEMBRANO again this year gives us a series of pictures marked by his strong individuality. In other days he loved the full blaze of a southern sun, and we cannot readily forget the faultless *technique* of his Alhambra series. Evidently he is now fascinated with the gloom and mystery of late evening, and one at least of the pictures was taken after sunset. "The Western Sky" shows half-formed, dappled clouds, and the sun is dimly seen struggling to get through them. The dark hull and mast of a boat help immensely in giving point to the scene. Perhaps the best of the series is "An October Morning on the Thames." There is palpable mist on the river, and here and there a few figures stand out in sharp contrast against the prevailing grey. This well-known effect is frequently painted by French artists, for the Seine can match the Thames in supplying the material. There are few photographers, however, daring enough to attempt this *tour de force*, for the monochrome of the photograph still further increases the difficulty; the greater credit therefore to Mr. Cembrano, for his courage and efforts have been crowned by success. "The Couch-grass Digger," by L. C. Bennet, is a very effective picture, though the material is of the simplest—a figure bending to his work with foot on fork, and a rough furrowed foreground, but with a sky that puts all in harmony. "In the Vale of Keswick" there is ample material for the camera, and Mr. Leslie Selby has made the most of it. There are haycocks in the foreground, and though the middle distance is dark, the light on the squat tower of a church in the distance gives relief to the scene, and the distant mountains melt into the sky and complete the picture. "A Sunset on the Upper Rhine," and "The Boden See" are two pictures remarkable for their fine clouds rendered with unusual delicacy of detail, and yet they belong to the pictures and are not the result of double printing. There is perfect harmony, and one only regrets that they are spoiled by the framing, for the oak flat intensifies the very cold grey of the tone, and they are altogether overweighted by the frames. A lesson may be taken from Mr. Cembrano for the benefit of future exhibitions. G. W. Ramsay has shown artistic skill in his Thames picture. By cutting away an uninteresting mass of water, he has concentrated the interest, and the long proportions of his picture specially suit his subject. His "Sunset" is a very striking picture, and the contrast offered by the setting sun nearly touching the mast of a boat and the long reflections and shadows travelling side by side through the picture, must demand the attention of those interested in unusual sunset effects.

C. R. Whiting exhibits two very artistic pictures, both of which demand more than a passing glance. The one called "Early Morning, Hastings," is probably the most effective view of the older and more picturesque portion of this well-known health resort yet produced by photography. It is low water, and the boulders in the foreground which once formed the foundations of the pier that dated back to the time of Elizabeth, and long since swept away, furnish effective light and shade. There is an eager group on the beach some distance away, and probably the usual Dutch auction for the sale of fish is going on. The morning sun is behind a heavy cloud, and is drinking his way through its vapour, for there is a bar of bright sunlight away out to sea, and the fishing boats are dotted about, and give life and animation to the scene. In the other picture,

called "Waiting for the Tide," some fishing boats are hard aground; but the welcome tide bespangled by the rays of the morning sun is rapidly advancing to their rescue. Both these pictures admirably illustrate the artistic uses of rough paper, for though the contrasts of light and shade are strong, there is complete absence of blackness in the shadows. W. R. Cassels has been very successful with his two landscapes taken in the land where the olive grows. Our knowledge of them is confined to well-bottled specimens of the fruit, but we were under the impression the foliage was very heavy. It is apparently spring, however, for there is light and sparkle on the foliage, but the photographic spottiness of shining leaves is absent for all that. Probably the rough paper has been here a useful aid to artistic effect.

J. Harold Roller has made his mark by his portraits taken in ordinary rooms. The first in order on the walls is larger than the others, and is an effective portrait of a lady reclining on a couch, whose profile comes dark against light. The pose is very easy and quite free from the conventionality of the studio, and the light and shade broad and effective. The tapestry background is perhaps just a little disturbing, but the treatment of the whole is very original. On another wall the same artist exhibits a frame of several pictures, all fresh in treatment, but there is one that stands out from the rest from its superior artistic merit, and it well deserves the medal it has gained. A lady, in light drapery, is reclining in a Voltaire chair of ample proportions, and one arm rests negligently on the side of the chair. A lead casement occupies the extreme left corner of the picture, and immediately beneath is a spider-legged table covered by prints, flowers, and *bric-a-brac*, some of which help to break the formality of the window. There is great delicacy of detail in all the lights, and though the picture is forcible in chiaroscuro, there are no black shadows anywhere. In another of the series, where a lady is engaged in removing a volume from an old-fashioned book-case, the pose of the hand on the book demands special notice.

A. R. Dresser has taken a medal for his view of Aylesford, and well deserves it, for it is one of the most effective landscapes in the Gallery. It is full of incident, for there is a river bank on which are gathered a group of boys, and there is a boat a short distance from the shore, whilst still further away are bridge, church, and houses. The clouds are soft and harmonious, and the picture full of atmosphere—so much so that it scarcely looks like a photograph. And a painter would say this is high praise indeed. This picture is so good that it is a pity Mr. Dresser sent the one near it called "Evening." It might be called "Night," for the clouds are so black and heavy on the side of the picture that the landscape seems crushed in by them. Indeed, there is a complete want of harmony, and, unfortunately, the same may be said of several others exhibited by this gentleman.

H. Yeo is a large exhibitor of portraits, mainly of children. His series called "Blowing Bubbles" shows a child engaged in this well-known infantine occupation; and the progress of this airy nothing, from its first creation from the breath of the child to its final extinction, has been well shown. A medal has been awarded to the series. There are twenty-five different exhibits sent in by this most indefatigable worker, and all exhibit ability of a very high order. Indeed, one rarely sees so much variety in the work of one man. A medal has been given to F. Muller for the head of a man of strong Jewish type. The face is rugged and white-bearded, and the eyes leer out from under bushy eyebrows. The head can scarcely be taken as a type of manly beauty, and the expression can hardly be called agreeable, but the texture of flesh is wonderfully rendered, and particularly noteworthy is the high light on greasy skin of the man's forehead. There is no retouching, and it is undoubtedly a striking picture. H. Little has produced a very fine enlargement from a technically faultless negative. Every detail of the decorations in the grand salon of the Vatican Library is marvellous in fidelity, and the picture is more agreeable to the eye than a print from a direct negative of the same proportions. The "Musselburgh Fish Wives" do credit to T. Scotton as well as to themselves. Stalwart and short-skirted, they seem proud of the strong individuality of their costume, and appear quite able to take care of themselves. The sitting figure of the old woman is most natural in pose, and the long coat line and wet sandy shore furnish the proper accompaniment to the whole. The "Story of a Cloud" is well given by Birt Acres in five acts, for in each photograph the potency of the wind is strikingly shown. In the first picture the cumulus cloud is complete in all its grandeur, but each succeeding one clearly indicates the rapid decrease in importance until the last scene, which shows the cloud shorn of its glory and torn into shreds.

In these latter days, when platinum, carbon, and gelatino-chloride are so much to the fore, it is interesting at least to have such a fine example of silver printing on albumenised paper before our eyes, and "A Grecian Girl," by W. J. Byrne, forcibly shows that old methods sometimes take some beating, and it must be conceded that for force, combined with delicacy, there is no known photographic process which could furnish a finer example than the one under

review. "Langdale Pikes from Blea Tarn" is a good solid landscape by R. J. Fry; and there is another of large dimensions by A. Kapteyn which is very harmonious. The clouds on close inspection show traces of manipulation, but their reflections are faintly given on the water in the most natural manner, and at a distance the effect is very artistic.

H. Stevens has been most successful with his animal studies, but the one he calls "Tired Out" is perhaps the most artistic. A complacent terrier has consented to become a cushion for the head of an equally complacent tabby cat. They are evidently very good friends, and the expression of complete contentment on the face of pussy is almost comic, and one can almost hear it purr. The "Pack of Beagles" is full of life, and the light in the eyes of the dogs and the long shadows indicate that the sun is low. It was well to announce that this picture is untouched, for the eyes absolutely sparkle. Both in these animal pictures and the studies of flowers there is the same faultless technique, and the medal is well earned. "In the Pool," by L. C. Bennet, is an example of bold chiaroscuro, which reminds one of the work of W. Whyllie. Two steam colliers stand out black against a sun-lit sky, and the water is jewelled by the sparkle of the sun. One of the ships is getting up steam, for black smoke dims the brightness of the sky where it trails its sinuous course. The colour of the print is, however, scarcely well chosen, for the tint is too warm for the subject.

J. E. Austin, in his "Worn Out," has scored a big success, and the medal is well bestowed. A knowing clock doctor is peering into the well-worn works of a very old eight-day clock which have evidently reached the last stage of slow consumption, if one may judge by the puzzled hopeless expression on the face of the would-be healer. The pose is natural, and the accessories are of the simplest; and broad masses of light and shade in the background help to give effect to the figure. The texture and detail in the flesh of the sinewy arms, and also in the simple checked shirt, are so perfect that we may safely predict a run on spectacle lenses for photographic purpose during the next twelve months.

#### SOUTHSEA AMATEUR PHOTOGRAPHIC SOCIETY.

The annual exhibition of this society opened on the 10th inst., and must be pronounced a decided success. Entries numbered close on 200, and the work generally was characterised by the judges (Messrs. Alfieri, Symonds, and West) as of unusually even merit. This opinion was endorsed by the numerous visitors who patronised the exhibition. On Monday evening the competition slides were thrown on the screen by Mr. Arnaud, of Ryde, who kindly lent his own biennial lantern. Interspersed with music, this part of the exhibition appeared to be thoroughly appreciated, loud applause greeting the winning slides. The classification and awards were as follows:—

**CLASS I, Landscapes.** Thirty-one entries, and platinotype to the fore. Gold medal, Dr. Ticehurst, "The Old Home," a picture in every way. Silver medal, Major Bruno, "On the Test," and "A Summer's Day," which the judges considered of equal merit. Bronze medal, Dr. Ford, six well-selected views on the Thames. Hon. mention, R. Leventhorpe, "Seraglio, Corsica."

**CLASS II, Seascapes.** Six entries. Here again Dr. Ticehurst secures the gold medal for "Whitby Harbour." Second, Lieut. Cottingham, R.M.A., Yacht "Diamond."

**CLASS III, Architecture.** Thirty entries. Gold medal, Commander Gladstone, R.N., series of 12 by 10 interiors of Westminster Abbey, leaving little to be desired. Silver medal, Major Wilkinson, R.E., "Netley Abbey" (three), which are good technically and artistically.

**CLASS IV, Figures or Genre Studies.** Thirty-two entries and close competition. The President, Mr. Thornton, takes the gold medal for "A Young Boatman," which tells its story at a glance, and is full of motion. Silver medal, Mr. Sawyer, "A Sail in Sight," which we much admired. Bronze medal, Major Bruno, "A Crafty Lesson," previously honoured in an excursion competition.

**CLASS V, Hand-Camera Work.** Fifty prints. Gold medal, Dr. Newby. Silver medal, Major Bruno, "Six Southsea Scene." In our opinion Mr. Hammond's exhibit should not have been passed over.

**CLASS VI, Lantern-Slides.** 144 entries. Gold medal, Commander Gladstone, R.N. Silver medal, Surgeon-Captain Winter. Bronze medal, Major Wilkinson, R.E. Specially commended, Major Bruno, "Sunset Effects."

**CLASS VII, Enlargements.** All prizes to Mr. Sawyer, who showed some fine subjects of general excellence.

**SPECIALS.** Two special prizes, kindly presented by Mr. G. Knight for general excellence in the work of members in the various sections. Medal, Commander Gladstone, R.N., architecture and lantern-slides. Medal, Major Bruno, landscapes, seascapes, genre studies, enlargements, and slides.

A varied display of the latest novelties in apparatus and processes was shown by Messrs. Rastrick and Co.

## Societies' Meetings.

**Accrington.**—Ordinary monthly meeting held on 3rd inst. The President, Dr. Clayton, gave a demonstration on platinum printing (hot bath process) before a large audience, and the masterly way in which he handled the subject gave satisfaction to all present.

**Belfast** (Y.M.C.A. Camera Club).—The usual monthly meeting was held on 10th inst., Mr. Wm. Swanston, F.G.S., President, in the chair. The prints in monthly competition were passed round for inspection. Mr. Alexander Tate, C.E., who kindly acted as judge, made the awards, as follows:—First, to F. A. Pollock, "Spring on the Lagan," a very fine whole-plate study, a large tree in the foreground with spreading branches almost covering the plate, through which the winding river could be seen to great advantage, every detail in the landscape being admirably brought out; second place to John Coates for a very artistic composition, entitled "In the Harvest Field," and third place to J. McCleery, for a half-plate study, entitled "Left by the Tide," a schooner stranded on the shore at Red Bay, co. Antrim; the remaining competitors all showing good work. Arrangements were made to have a plate-developing competition, ten of the members signifying their intention of entering, three plates having had various exposures (say under, normal, and over) to be handed to each competitor to develop (no intimation being given as to exposure or plates used), the results to be produced at a future meeting of the club. The lantern was afterwards brought into use, and slides passed through and tested.

**Birmingham.**—Ordinary meeting, Mr. A. J. Leeson in the chair. There was a large attendance of members. The minutes of the previous meeting were read and confirmed. The Assistant Secretary read a letter he had received from the President (Sir J. B. Stone), and which was a reply to the congratulatory resolution adopted at the meeting of the Society held August 23rd. Two new members were elected and one nominated for election. The Bynoe printing frame, which was sent by Messrs. R. and J. Beck, attracted a considerable amount of attention from the members present. Mr. E. Underwood was requested by the Chairman to deliver his paper on the manipulation of gelatino-chloride paper (which will appear next week). Mr. Underwood, in addition to his very able paper, gave a demonstration which was of a thoroughly practical nature. The squeegeeing of the prints on to ground glass, stripping them off, etc., was illustrated and explained in such a remarkably explicit manner as to call forth the admiration and thanks of the members present. In the discussion which followed, in addition to the Chairman (Mr. A. J. Leeson), Messrs. W. Jones, J. T. Mousley, J. H. Pickard, J. Simkin, E. Winn, and others took part. This being the first meeting held in the new club-room, the Chairman announced "that the meetings at the Midland Institute would be discontinued. In future the whole of the meetings (with the exception perhaps of one or two large lantern displays) would be held in the new room. The old club-room, which is far too small for the requirements of the Society, will be used as a library and reading room. The fact of all the meetings being held in one place would, he was sure, still further increase the attendance of the members and add to the success of the Society."

**Bolton.**—The Bolton Photographic Society and Mr. Banks, optician, of Corporation Street, invited a large company to an exhibition of lantern slides on the 5th inst., as the opening night of the season. The company included the Rev. T. B. Johnstone, M.A., Dr. Johnston, Dr. Barr, Mr. Roscow, and other gentlemen who have attained a high degree of skill in the gentle and fascinating art of photography. Mr. Banks, who had charge of the lantern, exhibited a very large number of splendid slides by York, Valentine, and Wilson, of scenery in the sealing and whaling fishery grounds of the arctic circles, of a trip round the coast of the British Isles, and on the route of the Canadian Pacific Railway across the Rockies to Vancouver. This series was supplemented by some very fine slides by Mr. Roscow of scenery in Wales and the neighbourhood of Bolton. These views were greatly admired for their technique and sharpness, and judging by the scenes chosen this gentleman is to be credited with a high degree of perception for the picturesque. Dr. Barr also exhibited a number of views taken during a holiday in Holland and in the Ardennes, which also met with warm commendation. The whole display had the effect of demonstrating the wide variety of scene and artistic character which recent years' development in photography has conferred upon the lantern exhibition, and the pleasure which this method of entertainment has in store for those—and their number is legion—who delight in the pictorial. We understand that the photographic society has had a very good year, and their prospective exhibition of work next month will be anticipated with considerable local interest.

**Brixton and Clapham.**—The first open lantern night of the season was held on the 4th inst. The rain, which fell in torrents during the evening, somewhat spoilt the attendance, only seventeen members being present. Those, however, who had braved the elo-

ments were rewarded by seeing some very fine slides taken on a tour in the Scilly Isles and the Land's End by Messrs. H. and T. Bartrop and J. A. Butler, several of the sea pictures evoking great applause. Slides were also shown by Messrs. A. Howard and T. F. Buckle.

**Chorley Polytechnic.**—On 5th inst. the ordinary monthly meeting was held, the President, Mr. J. T. Brierley, in the chair. After the preliminary business had been disposed of, it was decided to have during the winter months a series of demonstrations, lantern exhibitions, etc. It was also decided to have a society's album, and that each member of the society will be expected to contribute his share of prints with a note as to plate, exposure, development, paper used, etc., also Wednesday evening in each week was fixed upon as the special time when members would be expected to meet together for exchange of ideas, social chat, etc. After a very pleasant and free conversation as to the merits and otherwise of various plates and paper and their treatment, the meeting was adjourned.

**Croydon (Micro. and Nat. Hist. Club).**—An ordinary meeting of the photographic section was held on the 7th inst., Mr. Jno. Weir-Brown in the chair, the subject being hand-cameras and any apparatus which they (the members) may have used, and report on the merits or defects as shown in practice. The Chairman called attention to the Club soiree being held as usual on November 23rd, and, being the twenty-third annual soiree, it was hoped that members would get forward their work so that the committee would be able to display and hang it to the best advantage. Mr. W. Low Sarjeant was undertaking the management of the photographic section of the soiree, so that any information required could be obtained from him. Messrs. J. and R. Beck's representative then kindly exhibited and demonstrated the use of their new "Frena" hand-camera for films, taking  $3\frac{1}{2}$  by  $3\frac{1}{2}$ , weighing complete 3 lb. Mr. Tottem, Messrs. G. Houghton's representative, also kindly showed the working and uses of the "Shuttle" hand-camera, which was adapted for plates and films, the quarter-plate weighing  $4\frac{1}{2}$  lb. with plates and 3 lb. with films. Mr. Low Sarjeant also exhibited two hand-cameras. Messrs. Waller and Carter and several other members showed hand-cameras.

**Eastbourne.**—Ordinary meeting, held on the 5th inst. Present:—Rev. A. G. Jameson in the chair, Drs. MacQueen, Haggood, Gabbett, Colgate, Messrs. Fox, Watkins, P. Simpson, Thomson, Hollway, Rodda, Sparrow, East, Strangle, the Secretary E. Burnham, and about twenty others. Seven new members elected, one new member proposed. A demonstration on "Flash Light Photography" was then given by Mr. J. B. Flatman, who in a very able manner described the various lamps, reflectors, powders, etc., etc., which he used in the lecture. One or two photos were taken of the members during the evening by the Secretary and Mr. Bird, by flash-light, and a very instructive evening was passed. A card of events has been compiled, and up till the end of next April there are only three dates vacant.

**Great Yarmouth (Camera Club).**—The annual meeting was held on the 4th inst. for the election of officers. The Secretary stated that during the year many meetings had been held, at which discussions on photographic subjects had taken place, and some very interesting demonstrations given by members. The summer outings had also been very successful, except one, when it was so wet that only three members attended. Among the places visited were Leiston Abbey, Suffolk, where several fine views of the old ruins were obtained, and Ranworth, which were most successful days. The members who visited the latter place will remember with much pleasure the kindness of their host, "Farmer Kerrison." A letter was read from the President, Mr. F. Danby Palmer, D.L., stating that absence from Yarmouth prevented him being present. He, however, wished to express his thanks to the members and officers for their kindness and consideration during his year of office. The following gentlemen were then elected for the ensuing twelve months:—President, Dr. Adcock; Treasurer, Mr. John Taylor; Hon. Secretary, Mr. H. Harvey George. Committee: Col. Shuttleworth, R.A., Messrs. P. Wiltshire and Alfred Price. A hearty vote of thanks was passed to Mr. H. J. Blyth for having kindly lent his wherry to the members for a week's outing on the Norfolk Broads, when a most enjoyable time was spent and many fine pictures taken. It was arranged that at the next meeting each member should be invited to bring an exposed quarter-plate, and that all the plates should be developed at once by Mr. A. Price, who kindly volunteered to do so. The Secretary reported that several fixtures had already been made for the winter season, and that there is every prospect of a pleasant and profitable winter. It was also proposed that during the winter a public meeting of the members and their friends should be held at the town hall.

**Hackney.**—The weekly meeting held on the 4th inst. was an open night. Mr. Beckett presided. The Hon. Sec. announced that Sir Albert Rollitt, who is an amateur photographer, had consented to open the exhibition on the 15th of November next, at the Morley Hall. Work was shown by Messrs. Roope, Wire, Dadd, etc. A

discussion on hand-cameras was taken up. The Chairman thought more care should be used in the selection of a picture. The Hon. Sec. said that dust was more prevented when dark slides were used, and preferred their use to magazine kind. Mr. Gosling preferred magazine if it worked. The risible faculties of the members were tickled at this, many of whom doubtless had tried a magazine camera. Mr. Gosling went on to say he thought dust could be prevented causing damage to a great extent by painting the inside of the camera with glycerine. The Chairman said that sky printing was more neglected than it should be. Mr. Barker said he used a solution of bromide of potassium, applying it to the sky to prevent the action of developer there. Mr. Hudson then showed some prints on Collodine, a new printing-out paper not yet on the market. It was claimed that a print could be toned, fixed, and washed in hot water, and mounted (with permanence) in ten minutes. Mr. Pollard asked if solution of chloro-platinite would keep. Mr. Sodean said it would. The Chairman thought a good way to use amidol would be dry, as it is very soluble.

**Holborn Camera Club.**—On the 7th inst., Mr. E. H. Bayston in the chair, Mr. J. H. Avery demonstrated to the members present the working of the Platinotype Company's new cold-bath process. He hoped to show that platinum printing by this method was one of the simplest of printing processes, and that the ordinary worker with but little spare time and limited space and appliances at his command could work this process with advantage. In his opinion, while the results were far away in advance of most other printing processes, it was at the same time much more easy and pleasant to work. After further comparing platinum paper with other papers, he went on to speak of the working of the new paper, which he characterised as simplicity itself. No hypo baths required, no tedious washing, and they could develop the prints in their ordinary room by either weak daylight or gaslight. Mr. Avery thought the price had stopped the use of platinotype paper amongst some amateurs. Many thought it excessive, but if they took into consideration the superior results, and the small quantity of waste prints they had, he thought they would find it just as cheap as any other paper. Mr. Avery then went on to give various points in favour of the new cold-bath process over the hot-bath process. He developed a number of prints by this new process, and the use and simplicity with which the paper could be worked commended itself to all present. On Saturday last the final outing of the year took place at Westminster Abbey and the Houses of Parliament, finishing the evening with a tea and smoking concert at the club's headquarters.

**Kensington and Bayswater.**—A meeting was held on the 10th inst. Mr. J. E. Hodd presided, and nineteen other gentlemen were present. New and amended rules were adopted. The following gentlemen were elected officers for the coming year:—President, The Hon. L. M. Sinclair; Hon. Treasurer, Mr. F. A. Hahn; Hon. Secretary, Mr. C. W. Brumwell (address, 7, Lower Terrace, Notting Hill, W.) Council, Messrs. Burswell, Frogbrook, Hannaford, J. E. and R. A. Hodd, and Mote. The funds of the society were shown to be in a very satisfactory condition, and the "photographic" year is started with every prospect of success. Gentlemen wishing to join are invited to communicate with the Secretary. The subscription is 10s. per annum.

**Lewes.**—Owing to the wretched weather the meeting on the 4th inst. was only thinly attended. It was announced that the certificate for the quarterly competition was taken by Mr. G. J. Wightman with a very artistic landscape in platinotype. Mr. Tunks gave an interesting demonstration of lantern-slide making, developing with amidol, and Mr. Wightman developed some with hydrokinone.

**Lewisham.**—On the 7th inst. Mr. Alf. H. Miles, Vice-President, in the chair, Mr. J. G. Squire gave "Notes on Development," which led to a very animated discussion, the new developer "Amidol" forming the chief topic. Mr. Squire passed round a negative, one half developed with pyro, the other amidol, the latter comparing very favourably with our dirty old friend pyro. The Secretary also showed a number of lantern slides developed with amidol, and Mr. Davidson gave a few more particulars of his formula published in the AMATEUR PHOTOGRAPHER of the 7th inst. The Secretary passed round one of Shew's Guinea cameras (of similar style to their Eclipse), fitted with three excellent machine-made double slides, lens, shutter, and finder. He also showed some prints taken with it, proving the lens was pretty fair considering the price.

**Liverpool (Central Y.M.C.A. Camera Club).**—The annual meeting was held on the 28th ult., when Wm. P. Christian, Esq., was unanimously re-elected President, and the officers of the past year were also re-elected. The President announced his intention of offering a series of monthly prizes to be competed for by the members, the subjects and conditions to be arranged by the officers. Mr. J. Fowler Shone also offered a prize to the member, non-prize winner, who gained the highest number of marks throughout the competitions. The first meeting of the winter session was held last evening, when Mr. J. Gardner gave a demonstration of flash-light photo-

graphy. Mr. Gardner's remarks were followed with much interest, and several flash-light pictures were taken during the evening. Mr. Jno. C. Lee occupied the chair. The meetings will be continued every Wednesday evening, and papers of a photographic or literary interest will be given each evening, when friends interested are invited to be present. A syllabus may be obtained at the Y.M.C.A. in Mount Pleasant, or will be forwarded on application to the Secretaries.

**Midland (Camera Club).**—Annual general meeting on 7th inst., the President, Dr. Hall Edwards, in the chair. The annual report showed that during the year fourteen general meetings had been held, with an average attendance of twenty-eight. The silver medal for the best excursion picture was awarded by the judge (Mr. F. P. Cembrano, jun.), to the late Hon. Secretary, Mr. Walter D. Welford, for a shot in the Frena hand-camera. The present strength of the club is seventy-eight. The Council regretted that owing to pressure of work Mr. Welford would be unable to continue as Hon. Secretary. The Hon. Treasurer's statement showed a small balance to the good. Commenting upon these reports, the President considered that though they might perhaps have done more, yet the work of the first year was eminently satisfactory. There were always difficulties in working a new club, members not knowing each other, a lack of interest, etc., but he considered they had gone along very well. The average attendance of twenty-eight out of seventy members was good, and he instanced a meeting of a medical society the night before, and an annual meeting, too, 300 strong in membership, with an attendance of only ten. Referring to the new rooms, he thought the members would agree that their club-room upstairs was extremely comfortable and convenient of access, whilst the library in which they were then seated, and which would be used for all large meetings, lantern shows, etc., was one of the most comfortable rooms in Birmingham. Considering the loss occasioned by the removal of the club-room, and the preliminary expenses of the club, the Treasurer's balance-sheet was quite as good as could be possibly expected. The following officers were then elected for 1892-3:—President, Dr. Hall Edwards (re-elected); Vice-President, Rev. J. Henry (re-elected); Hon. Treasurer, Sam G. Mason; Hon. Secretaries, C. Jervis Fowler and Frank H. Mason; Librarian, R. J. Bailey; Council, Mrs. Welford, R. J. Bailey, Frederick Iles, H. R. Leech, M.R.C.S., and H. Roland White. At the end of the meeting sample packets of the Paget Prize plates were distributed for trial, and the framed enlargement kindly presented to the club by the Paget Prize Plate Company was exhibited. Mr. Welford showed and explained the Frena hand-camera, together with negatives and prints taken on a recent bicycle trip to Stratford. The simplicity and ingenuity were much admired.

**North London.**—On the 4th inst., Mr. R. Tanner in the chair. This being the first optical lantern night of the season, slides were exhibited by various members, some especially being of a very high order of merit. Among the slides shown were some exceedingly rapid hand-camera shots, taken by the Frena camera. Being so early in the season, the quantity of work was not large, many members having hardly begun slide printing yet. Next meeting, October 18th, technical night, and nomination of council and officers for the annual meeting on November 1st.

**Oxford.**—The annual meeting was held on the 4th inst. the President (Mr. E. A. Ryman-Hall) in the chair. The report of the committee was read. This showed that sixteen members had been elected, and the loss was four. Nineteen ordinary and seven outdoor meetings were arranged. The exhibitions of lantern slides were well attended, there being from 70 to 300 present. The Society was affiliated to the Photographic Society of Great Britain, and the committee recommended that this be continued. The Treasurer read his balance-sheet. The rules were then amended. In future the ordinary meetings will be on the first Tuesday only in each month, and the conversational meetings on the third Thursday in each month. The officers and committee were then elected. President, Mr. E. A. Ryman-Hall; Vice-Presidents, Mr. C. C. Cole, Mr. W. W. Fisher, M.A., Corpus College, Mr. A. F. Kerry, M.A., Exeter College, Mr. Councilor J. H. Salter; Hon. Treasurer, Mr. R. A. R. Bennett, M.A., Magdalen College, and Walton Manor Lodge; Hon. Secs., F. A. Bellamy, F.R.Met.Soc., 4, St. John's Road, Oxford, and H. Minn, 104, Walton Street, Oxford; official address, 136, High Street; committee, Mr. C. A. Jenkins, F.R.A.S., Mr. J. E. Foort, G. W. Norton, W. J. King, N. G. French, G. Smith, A. Robinson. The usual votes of thanks were given, as well as to the Paget Prize Plate Company, the Eastman Company, and the Editors of the AMATEUR PHOTOGRAPHER and the *Practical Photographer* for presents to the Society.

**Putney Phot. Soc.**—The first ordinary meeting of the winter session was held on the 3rd inst., Dr. J. F. Farrar in the chair. The following five gentlemen were unanimously elected members, viz., Messrs. Beatie, Blake, Noble, Ward, and Woolnough. The meeting was of a social nature, its object being chiefly to enable members to compare experiences and exchange ideas on the work done

during the summer session, the result being a useful discussion of a variety of subjects. Mr. Gorin showed negatives on the Sandell plate, taken under very varying circumstances, with uniformly good results; he also showed the effect caused by interleaving exposed plates with the paper usually sold for this purpose; the image of the sheets were imprinted on the negatives, of course with disastrous consequences. It was generally agreed that it was best to pack exposed plates film to film direct, and to jam them tightly in the boxes, so as to prevent play in any direction. Mr. Poole said that in his hands spirits of turpentine, applied with a soft rag, formed an efficient and convenient reducer of dense negatives, lantern-slides, and opals, for local or general treatment; he stated that it had advantages over methylated spirits similarly applied. Mr. Zachariasen showed a number of prints illustrating a series of experiments carried out by him to ascertain the effects of varying treatment of gelatino-chloride papers; the prints showed the difference between thorough washing and merely rinsing, between a strong and a weak fixing-bath, between acid and alkaline fixing-baths, etc. Three brands of paper were each toned in five different toning baths. The results of altogether 120 different experiments were shown, the characteristics of each paper, bath, and detail of manipulation were pointed out and summarised. He also described some experiments undertaken to find a suitable developer for snap-shots taken on a recent tour in Norway, and which all suffered to some extent from under-exposure. After the pyro formula sent out with the plates, he tried Rodinal, eikonogen, hydrokinone, and Amidol singly or combined, as advocated by the champions of each, all, however, with more or less unsatisfactory results. He then reverted to pyro and ammonia, but made up in the following proportions, viz., pyro, 4 gr.; bromide of potassium, 1 gr.; ammonia ('880), 3 minims to the ounce of developer, to which was added two minims when the image was fairly up. This developer worked very satisfactorily, and was finally adopted, the results being above expectations. This was confirmed by the experience of Mr. Gorin, who had used it for snap-shots taken on Edwards' instantaneous Isochromatic plates, on his recent tour in Morocco. Mr. Zachariasen's negatives were taken on Paget's fifty-times plates, the favourable opinion of which was confirmed by Mr. Blake. Messrs. Beck's Bynoe printing frames were exhibited in various sizes, and were favourably commented upon by members who have had them in use for some time. The discussion was general, and altogether an instructive and pleasant evening was passed.

**Rotherham.**—The annual meeting was held on 4th inst., Dr. F. B. J. Baldwin (President) in the chair. The Hon. Secretary presented the third annual report of the Council, who were of opinion that the society had shown unmistakable signs of progress. The membership had increased, the class of work done had improved in quality, and there had been a better attendance at the monthly meetings. The average number of members present each month was fifteen. Then followed a *resumé* of the year's business. The excursions had been four in number, namely, Conisbro' and Sprotbro', Haddon Hall, Rivelin Valley and Wyming Brook, and Wingfield Manor. The event of the year was the exhibition in St. George's Hall on the 23rd and 24th February, and a most gratifying success rewarded the efforts put forth. The very friendly relations with the Sheffield Photographic Society had been maintained, and several of its members sent pictures for exhibition. The Council realised the help its near neighbour could render, and consider that a general scheme of federation for the district at no very distant date might prove of mutual benefit. In conclusion the Council urged members to manifest an increased interest in the work of the society, and believed that with a little energy it was possible to attain to much higher things than had yet been accomplished, and to make the organisation in every way representative of the district, which has a population of 60,000 inhabitants. The report and balance-sheet (showing a small sum in hand) were approved. Officers were appointed as follows:—President, Dr. F. B. J. Baldwin; Vice-Presidents, Messrs. E. Isle Hubbard, W. H. Hayward, and G. T. M. Rackstraw; Treasurer, Mr. J. Leadbeater; Hon. Secretary, Mr. H. C. Hemmingway; Council, Messrs. I. Wright, W. H. Shephard, W. Mason, J. W. Whittington, and A. B. Clarke (Rawmarsh). It was announced that the programme for the coming season included the holding of an exhibition. Lantern slides were afterwards exhibited. They had been made by Dr. Baldwin (President), Mr. E. Isle Hubbard, and Mr. G. T. M. Rackstraw (Vice-Presidents), Mr. W. Mason, Mr. J. Clarke, and Mr. Hemmingway (Secretary).

**Sheffield (Phot. Soc.).**—The annual meeting was held on 4th inst., Mr. B. J. Taylor in the chair. After the election of a new member, the Treasurer presented his report, showing a substantial balance in hand, which was considered satisfactory and duly passed. The Secretary gave his general report of the proceedings for the year, showing there had been four resignations and eight new members, and that the society had more members on its books than in previous years; that the society was altogether in a prosperous condition, and that the proceedings throughout the year had been characterised by each member being anxious to promote the general good of the

association. The excursions had received considerable attention and support, and had produced some splendid work. The Secretary also announced several important fixtures for the ensuing year. The officers for the coming year were elected as follows:—President, Mr. B. J. Taylor (elected for the fourth time); Vice-Presidents, Messrs. G. Bromley, T. Firth, and E. J. Chesterman; Council, Messrs. W. T. Furniss, J. Smith, T. G. Hibbert, W. M. Toplis, and E. Sampson; Treasurer, Mr. Bradley Nowill; Secretary, Mr. E. Beck; Reporter, Mr. E. H. Pearce. After a vote of thanks to the retiring officers, the members taking part in the photographic exchange produced their pictures for division, there being altogether nearly 300 prints.

**South London.**—On the 3rd inst. ordinary meeting, the President, Mr. F. Edwards, in the chair. It was announced the President intended to offer a prize for the best picture taken on Barnet plates, samples of which, by the courtesy of the makers, were distributed, the results to be judged on the 7th November. Some experiences of developing with Amidol were given. It was found that the developer became inert and colourless if metabisulphite was substituted for sulphite of soda. One member found that used with hydroquinone it produced fog, while another member mixed pyro with success. The further discussion of the subject was deferred to the next meeting. The proceedings terminated with a social entertainment.

**Sydenham.**—An ordinary meeting was held on the 4th inst., the President in the chair. A demonstration was given by the Platinotype Company of platinum printing with their new lamp. Several negatives were printed from, which if they had been printed in bright summer sunlight would have taken at least twenty minutes, but by this lamp scarcely took more than as many seconds, forty grains of magnesium powder only being burnt in the oxy-hydrogen lamp. All the exposures were very correct, and the result pleasing. Mr. W. H. Smith, the demonstrator of the lamp, explained the various parts of the lamp. He also stated that the cost of printing each print amounted to about one halfpenny. Members were advised that the annual exhibition will be held this year on the 2nd and 3rd of November at the Vestry Hall, Anerley Road, and that all slides intended for exhibition must be sent in by Tuesday, 18th inst.

**West Surrey.**—On the 5th inst. the members held the opening meeting of their winter session. The President, Lieut.-Col. J. Gale, occupied the chair, and the Vice-Presidents, Messrs. Geo. Davison, Lyell, and Winsford, and a large number of members were in attendance. The President gave a short address, in which alluding to the work of the society, he drew an interesting parallel between the influence of photography and books. Referring to a recent address of Sir John Lubbock, Col. Gale showed that most of the claims made for books in regard to mental education as well as amusement could be extended to photographs. The subject of the evening was an address by Mr. Davison, touching upon a few practical points in regard to photographic apparatus used with an artistic

purpose. This address proved a treat to all those present, the experience of such a worker as Mr. Davison proving invaluable in various ways. Subsequently a few novelties in apparatus were shown and described to the meeting. These included several pieces of apparatus kindly lent by Messrs. Beck, including the Frena hand-camera, and the Bynoe printing frame, also a new hand-camera about to be introduced by Messrs. Hinton and Co., the aluminium blind shutter, and the changing back of Messrs. Newman and Guardia, and a new hand-camera made by Mr. Hawkins.

**West Kent.**—The annual general meeting was held on the 7th inst., the President, Mr. Andrew Pringle, in the chair. The minutes of the previous meeting having been read and passed, the officers for the ensuing year were elected—Mr. A. Pringle, President; Mr. A. R. Dresser, Vice-President; Mr. E. Hawkins, Hon. Sec. and Treasurer; and for the Council, Messrs. Jones, Court, Taylor, Nash, Clarke, Wiseman, Grant, and Pickell. The accounts for the last year, audited by Messrs. Clark and Wiseman, were then presented to the President and showed a substantial balance. A discussion then arose as to what should be done with the latter, as it was not thought necessary that the society should go on accumulating funds in this manner. It was proposed by Mr. Clark, and seconded by the Hon. Sec., that a soiree and exhibition of members' work with lantern now should be given—carried unanimously. [Proposed by Mr. Clark, and seconded by Mr. Pickell, that it should be held in the Sidcup Public Hall in the first week in December. A Committee was then appointed of Messrs. Pringle, Hawkins, Pickell, Taylor, and Clark to carry out necessary arrangements and report at next meeting. An animated discussion then ensued on the various qualities of the Sandell dry plates and developing the same. Samples of Paget plates and instructions for use of same were handed round.

**Wolverhampton.**—One of the largest meetings for a considerable time past assembled on Tuesday, 4th inst. Mr. Holcroft presided, and among the rest of the members present were Councillor T. Ironmonger, Mr. C. T. Mander, Mr. German, Mr. Lord, Mr. J. W. Evans, and Mr. Ratcliffe, etc. Mr. J. Gale, one of the Hon. Secs. of the Society, gave an excellent paper on "Ammonia Nitrate of Silver Printing on Rough Paper." After dealing with the method of salting the paper, he proceeded to the more essential part of sensitising, printing, and toning it, and in order to show what artistic results the process is capable of producing, Mr. Gale exhibited a number of prints from negatives made during a summer tour, the tones of which ranged from a delicate sepia brown to a rich purple. Two very fine studies, one of Buildwas Abbey on the Severn, and also one of Ludlow Castle, were especially admired, and the marked superiority over prints with a highly glazed surface was freely commented upon. The paper contributed met with the hearty approval of those present. A number of small prints were handed sound by Messrs. J. Stokes and F. W. Hall.

## To Correspondents.

All communications for these columns are to be addressed to **The Editor, "Amateur Photographer," 1, Creed Lane, Ludgate Hill, London, E.C.**

### RULES.

1. Write clearly and distinctly on one side of the paper only.
2. Write each Query or Answer on a separate sheet of paper.
3. Write the name and address legibly on the back of each communication, and sign all Queries and Answers with name or *nom de plume*.
4. All matters for these columns **MUST** be received by **TUESDAY MORNING'S POST**.
5. The Editor does not undertake to answer questions by post.
6. In answering Queries, correspondents are requested to mention, in every instance the *number and full title of the query* referred to.

### QUERIES.

5833. **Photo-Zincography.**—Can any of your readers tell me of a work on photo-zincography, or any means of transferring photographs to zinc plates such as are now so much in use in newspapers?—**NEWSMAN.**

5834. **Accidental Exposure.**—The other day I took a photograph of the interior of a fairly well-lighted room, using extra rapid Ilford plate, and giving two minutes exposure. When I had finished, through carelessness I accidentally drew up the slide of the double-back about half way, holding it at the time in my hand and well exposed to the light. I

afterwards developed it, and, to my surprise, the negative came out all right, though I had expected it to be spoilt. Can anyone tell me why it was not spoilt?—**O. C.**

5835. **Enlarging.**—I wish to enlarge by the use of two cameras—putting the negative in small one against the window, and bromide paper or plate for transparency in the dark slide of the larger camera. Will any of your readers tell me where I shall find full directions for doing this, focussing, etc.?—**C.**

5836. **Dresden.**—Can any reader tell me if Ilford plates and ordinary chemicals are obtainable in Dresden, and also if there is a dark-room there for the use of amateurs?—**TRAVELLER.**

5837. **Dark-Slide.**—Does any reader know of dark-slides (double) which measure less than 5 by 4, for quarter-plates? Would he be good enough to tell me where I could get them?—**FRA.**

5838. **Carbon Enlargements.**—Will someone please tell me—(1) Whether carbon enlargements are easily made by an amateur; (2) how they are made, *i.e.*, a general idea of the process; (3) is the picture enlarged *direct* on to the paper, as with bromide paper; (4) where can I get the paper (ready for use); (5) is it easier or more difficult than bromide enlarging?—**R. A. R. BENNETT.**

5839. **Lens.**—(1) Could any kind reader tell me where the superiority lies of a portrait lens over a rapid rectilinear or an extra rapid? (2) If a rapid rectilinear working at  $f/5.65$  be stopped down to  $f/8$ , would it give a sharper picture than a rapid rectilinear working at  $f/8$  with full aperture?—**FRA.**

5840. **Toning.**—Can any of your readers kindly inform me how much gold is necessary for each shilling packet of Solio paper? Following the P.O.P. instructions, I have hitherto used 2 gr., and get thereby a very nice black tone something similar to a dark platinotype, but this does not suit all subjects, and I should like to vary the tone.—**ANON.**

5841. **Mounting Solio Prints.**—Perhaps some of your readers would feel interested in the following method of mounting Solio prints. I use Marion's mounting solution, and I find, in nine cases out of ten (with care), I succeed in mounting without spoiling of the glaze or troublesome squeezing. I suppose any ordinary gelatine mountant with spirit would act.—**ANON.**

5842. **Chadwick's Stereo Camera.**—I shall be much obliged for any answers to the following questions:—Has the above camera a double extension so as to permit the use of a single combination of an 8 in. R.R. for distant views, etc.? Would a pair of 4 in. lenses be too short a focus for all-round stereo work? Are there any agents in London where the camera may be seen?—**THE SNIPE.**

Correspondents not seeing their queries inserted are requested to look for the same under "Editorial."

Oct. 1th.—Nos. 5827, 5323, 5331, 5332.

### ANSWERS.

5321. **Moonlight Scenes.**—Blue sensitised paper, advertised in a contemporary by Albert E. Mallandain, 1 and 2, Poultry, Cheapside, London, E.C., might suit your purpose.—**THE SNIPE.**

5823. **Hydroquinone Developer for Lantern Slides.**—I have obtained excellent results with Thoms's hydroquinone-potash developer, and I advise you to give it a trial. Any tone, from black to red, may be obtained.—**THE SNIPE.**

5825. **Local Reduction.**—Paint the dense portions over with a small camel's-hair brush dipped in a weak solution of perchloride of iron to which a drop or two of hydrochloric acid has been added (I don't use any particular strength, as I am guided by results). In a minute or two you will see the density is getting less. When it has nearly got to the required point of reduction, plunge the whole negative into water. After this, put it into a fixing bath of the usual strength, which reduces the part painted a little more, so be careful not to leave the iron solution on too long. If not enough reduced, go through the process again. Well wash, and dry. The process needs considerable care.—**R. A. R. BENNETT.**

5826. **Enlarging.**—I have made several successful enlargements with Lancaster's Instantograph by covering the window with some opaque substance,

and just leaving a square opening for the back of the camera, so that no light may enter the room except through the camera. The focussing is done on a sheet of white paper, supported on an easel in front of the camera. For the exposure, which is made on bromide paper (for big enlargements the rough surface is the best), a fixed time, of course cannot be given, but it must be remembered that the more the image is enlarged the longer the exposure will have to be. Development can be effected with restrained ferrous oxalate or hydroquinone developers.—P. HARRISON.

**5826. Enlarging.**—Of course it is quite possible. You have to shut the light out of the room by a board in the window, in which a hole is cut slightly smaller than the negative, which is fixed in front of it. The camera is to be fixed on a shelf in front of the negative, with its lens pointing into the room, and an easel placed in front of it, on which the bromide paper is fixed to receive the picture. But it needs more details than can be given here. See Burton's "Modern Photography," or almost any guide-book.—R. A. R. BENNETT.

**5829. Writing on Prints.**—The following may be used after toning:—

Iodide of potassium .. .. .	10 parts
Water .. .. .	80 "
Iodine .. .. .	1 part
Gum .. .. .	1 "

Write with this on a dark portion of the print, when letters will soon become visible by the conversion of the image into iodide of silver, which will be dissolved by usual fixing bath.—INQUISITIVE.

**5829. Writing on Prints.**—The simplest method of accomplishing this without possessing any special skill or requiring special materials, is to write or draw the title, etc., on the paper before printing, using either Indian ink, or, better still, any opaque water colour (Indian red is specially suitable). The colour should be perfectly dry before printing, and will come off in the first washing water, leaving the writing pure white. Reversed writing on the negative that is sometimes advocated requires a considerable amount of practice, so that if many prints are wanted from one negative, with the same writing on each, it would be least trouble to print on the negative from reversed type, as in the "Name It" process.—H. W. B.

## EDITORIAL.

**SPECIAL NOTICE.**—We are very pleased to find that replies in this column are so much appreciated, but we should be very grateful if those requiring advice would send their letters to us before TUESDAY MORNING'S post if possible. The time occupied in replying in this column is very considerable, and owing to the often late receipt of letters, many matters have to be left over each week. This we much regret.—ED. AM. PHOT.

**TONY.**—(1) It is impossible to say what is the exact cause of your faded prints, it may be due to any one of the three causes you suggest; possibly the mounts are the worst offenders. (2) Gelatine mountant is about the best.

**H. HALL.**—Over-exposure is one cause of your trouble; but dilute your developer more, and add about 1 gr. of bromide of potassium to every ounce of mixed developer.

**F. PARTRIDGE.**—If you write to R. Field and Co., of Birmingham, the agents for Watkins' exposure meter, they will send you their little instruction book, which will tell you what you want to know.

**THE JAY.**—Mr. B. Gay Wilkinson's Exhibition prints are on the roughest sepia platinotype paper.

**AMBROSE.**—You want our candid opinion, you say. Please don't be offended when we say they are awful examples of what should not be done. (1) The path which is as white as snow cuts the print right in two; divide the print down the middle, and you will have two, either of which would be better than the whole. Evidently this was taken after a very heavy snow-storm, for the flowers on both sides are also snow. (2) Another wintry scene. Your road is almost worse than the path in No. 1, and if you wanted to print in clouds, oh, why did you let them leave off with a hard defined line which cuts off part of a chimney. You have been under-exposing and using a pyro developer; we should say pyro and soda, or else that *bete noir* hydroquinone. Both prints are as hard as brilliant, and as painful to the eyes as possible. The printing process you have chosen, and the mirror-like surface, all intensify this. Write and let us know exactly how you work, and send us some more prints, and we will try and help you.

**J. N.**—Cresco-Flyma may be used two or three or even more times, in fact until it gets so weak as not to act well. Immerse the plates properly in the solution, not merely float the film on the top.

**M. EDWARDS.**—You have heard possibly that there is nothing new under the sun, and your letter is an example of it. You have accidentally blundered on a fact which has been known for a very long time, and which forms the basis of nearly all collotype and photolitho grain. The result is decidedly effective, and you can repeat it *ad lib.* We have often amused ourselves by making this peculiar grain for such work as you were doing, and the higher the temperature of the water the coarser the grain.

**ARTIST.**—(1) One of the best methods of getting a sepia on bromide paper is to use

Platinum bichloride .. .. .	15 gr.
Distilled water .. .. .	70 oz.
Hydrochloric acid .. .. .	1 oz.

Immerse the prints, which should have been previously soaked in water, for twenty minutes; and then rinse and soak the prints in solution of cupric chloride, wash and refix. It may also be obtained by a slight toning in uranium and ferricyanide bath. Most of the sepia prints in the Fall Mall Exhibition are on sepia platinotype or gelatin-chloride paper toned with chloro-platinite of potash. (2) Bichloride of platinum will keep in solution.

**A. JANE.**—Thanks for notes, which will duly appear. The tones you have obtained are decidedly good.

**A. MARSDEN.**—(1) Flat and over-printed, sepia platinotype rough surface. (2) Useless, we are afraid. (3) Good carbon or rough bromide. (4) Wants clouds, black platinotype, smooth. (5) Useless. (6) Good. Platinotype or bromide. (7) Matt-surface chloride. (8) Wants clouds and bromide or platinotype. (9) Cut an inch off foreground, rough sepia platinotype. (10) Useless, we are afraid. Try it in bromide. (11) We have cut this print down to the right size—matt-surface chloride or platinotype. (12) Either matt-chloride or platinotype in a warm colour. (13) Wants clouds and sepia platinotype, rough. (14) Rather difficult to make anything of this, the foreground too ugly; try deep printing on rough bromide. (15) Good sepia or black platinotype. (16) Do. (17) Wants clouds and Mezzotype paper. (18) Just a shade of clouds and platinotype or Mezzotype. (19) Hopeless. (20) Cut down and platinotype. (21) Rather difficult, print much deeper on very rough paper, and give it some ridiculous term for a title, such as "staccato." "andante," or "arpeggio," and you will find some go into raptures over it. (22) Useless, from "mottling." (23) Platinotype or gelatin-chloride. (24) Print on Mezzotype and don't vignette. (25) Chloride or platinotype. (26) Hopeless, we are afraid; wants clouds and rough paper to hide double outlines. (27) Good chloride paper only will do this justice. (28) Platinotype. (29) Mezzotype or platinotype rough. It is extremely difficult from such poor prints to say what can be made with careful printing.

**G. RILKY.**—It depends a great deal on the age of the lantern lens; some are now made which can be used for photographic work as well. The only way to tell is to try them in the camera. You will find that we have had a series of papers on the construction of all sorts of apparatus, which commenced on August 5th. Always glad to help you.

**A. JORDAN.**—We should recommend No. 2 set fitted with an R.R. or Euryscope lens.

**H. SALWAY.**—Your fault lay in not washing the paper first. And we have found far better results from the hydroquinone than the pyro developer. The prints will tone in the separate baths, but very slowly, and not so well as in the combined bath.

**F. G. WHITE.**—The print you send is dreadfully flat and poor. We should say the negative wants intensifying. It is not very artistic.

**E. L. THOMAS.**—We are afraid that you will find printing on chloride paper by the electric light even slower than daylight. You would find in our issue of March 25, an article which describes how to cut down the time to about one third.

**A. R. SPEAKMAN.**—You will find article on studio building in Vol. x, Sept. 6, 1889, this is we think the one you refer to.

**R. A. R. BENNETT.**—The expert's opinion was that the markings were in no way the fault of the plate maker, but caused by soaking the plate in water first, and he made some markings just like them by air bubbles. It is not possible except with the solar camera or very powerful paper to enlarge on to carbon paper.

**WASHER.**—The probabilities are that you will find the zinc act on the prints. Replace the zinc by canvas or strained catgut and it would be alright.

**R. E. LONG.**—All prints and negatives sent for our criticism or advice are returned if postage is paid.

**W. T. JONES.**—The snap-shot you send is very good. It might be improved by being just a shade lighter in the left-hand corner and by the introduction of clouds.

**OSCAR BADGE.**—After having printed, wash your prints in four or five changes of water, allowing them to soak in each water, face downwards, keeping them moving; then having twelve hours previously mixed the following bath, place them in the same:—

Toning Bath.

Chloride of gold .. .. .	1 gr.
Sodium bicarbonate .. .. .	5 "
Sodium acetate .. .. .	30 "
Distilled water .. .. .	6 oz.

Keep them moving till on looking through them the reddish colour has nearly disappeared in the deepest shadows, then fix in hyposulphate of soda 3 oz., water 20 oz., bicarbonate of soda 4 oz., allow them to remain in this for fifteen minutes, then take out and wash well. Be careful to keep the fixing and toning baths separate. Keep one dish, which must be absolutely clean, for toning alone. Send us up some prints to see how you get on. Your procedure of development seems alright. If you like, send a negative or two up for us to see.

**ONE IN A FIX.**—The only way to copy your c. d. v. the same size is to fix a cone of tin or wood on to the front of your camera so that you can increase the dis-

tance between your lens and ground-glass. When it is desired to copy anything full size, the distance between the object and lens and lens and ground-glass must be just double the equivalent focus.

**TRIX.**—(1) Nos. 1 and 2 are up to standard. The rusty tone of No. 3 is due to under-exposure and too much bromide. A full exposure and a weak developer with very little bromide, or instead, the addition of 10 gr. of ferrocyanide of potash, will probably give you the tones you want. (2) Prints sent off Tuesday last. (3) It depends whether you have a square-fronted camera or not. If you have back numbers of AMATEUR PHOTOGRAPHER you will find some very complete articles in vols. 12 and 13.

**TYNEMOUTH.**—The size of plate makes no difference to the result of the competitions, and to the best of our recollection your work was up to standard. To find out the exposure required with different sized stops is not difficult. The rule is, square the *f*/*s* numbers. Thus,  $f/10$  and  $f/11$ ;  $10 \times 10 = 100$ ;  $11 \times 11 = 121$ , therefore the exposure is as 100:121, or as 10:12. Therefore, if the exposure for a given subject, sea and sky for instance, as per Burton, be  $\frac{1}{20}$  sec. for  $f/11$ , it will be as 12:10 ::  $\frac{1}{20}$  =  $\frac{1}{24}$  sec. for  $f/10$ . Entry form sent on.

**J. WALKER.**—The peculiar 'positive appearance' is stated to be due to insufficient washing, and to formation of a white compound, possibly hydrargrum ammoniatum. The remedy is said to be the application of mercuric bromide, but we have never tried it.

**W. SHAW.**—Use  $\frac{1}{2}$  oz. of accelerator No. 2 for every 6 grains of pyro. It has no prejudicial effect on the bronchial tubes. For a suitable restrainer a very small quantity of bromide of potash, about 1 grain to every 6 grains of pyro. We have no design for studio of two storeys. You will find a one-storey studio in AMATEUR PHOTOGRAPHER, September 6th, 1889, vol. x. H. P. Robinson's book, "The Studio and What to do in it." Price 2s. 6d., is the best work on the subject.

## Sale and Exchange.

### RULES.

**CHARGE.**—Twelve words or less for Fourpence.

Every additional three words, one penny. The name and address of the sender must be paid for. (A single figure, or group of figures undivided by letter, space, stop, or words, counts as one word; compound words count as two words.)

**DEPOSITS.**—The money for goods forwarded on approval may be deposited with the Publishers of the AMATEUR PHOTOGRAPHER, who will hold the amounts deposited until they are satisfied that the transaction has been completed to the satisfaction of buyer and seller.

**ADDRESS.**—All advertisements (which can be received up to Tuesday mid-day) and other communications having reference to the "Sale and Exchange" column, must be addressed "Sale and Exchange, AMATEUR PHOTOGRAPHER, 1, Creed Lane, London, E.C."

**COMMISSION.**—A charge of 2½ per cent. will be deducted from all deposits whether a sale is effected or not. Minimum charge 1s.

**PAYMENT.**—All payments are to be by cheques of Postal Orders, made payable to Hazell, Watson, and Viney, Ltd., 1, Creed Lane, London, E.C.

**CARRIAGE** must be paid on all apparatus sent for report, and they will be returned carriage forward.

**ADVERTISEMENTS** can be inserted under a number, the name and address being registered, and letters forwarded for a fee of 3d. to cover postage.

**PAYMENTS** should be made in Postal Orders or Postage Stamps.

**REPORTING.**—Apparatus may be sent to the EDITOR, AMATEUR PHOTOGRAPHER, 1, Creed Lane, London, E.C., who will report upon the apparatus to the buyer for a minimum fee of 2s. 6d., or a commission of 2½ per cent., upon the sale price of the apparatus.

**Background.**—Exterior background (garden scene) flatted oils, 8 ft. by 90 in., condition new, price 12s. photograph for stamp.—William Hare, Photographer Sutton, Surrey.

**Enlarging Apparatus.**—Hume's Cantilever enlarging apparatus, 8½ in. condensers, cost with lens £11 15s., perfect condition, no further use, cash £9 10s.—Defaye, David Place, Jersey.

Two lamps for enlarging, each 40 candle power, nearly new, 6s. 6d. each.—White, Poplar's, Sutton-on-Trent, Newark.

**Flash-lamp.**—Good repeating flash-lamp (Fry's), almost new, cost 10s. 6d., price 6s.—Camera, 11, Reverdy Road, Bermondsey.

**Hand-Cameras, etc.**—Kodak No. 1, in excellent order, with finder, price 2 guineas.—Murray, 93, Park Street, Grosvenor Square.

**Lantern, etc.**—Magic lantern (oil) for sale, 11s.; also model steam engine, works well, 5s.—Frank, 150, Och Street, Abingdon.

Lantern, mahogany body, brass front, 4 in. condensers, two front lenses, one a 5 in. double combina-

tion and other an 8 in. single achromatic with lengthening tube, good 8-wick lamp and chimney, also superior safety jet for limelight with necessary sliding tray and extra top, all packed in case, £3 10s.—Thomas, 11, Oakfield, Liverpool.

**Lenses, etc.**—Rapid rectilinears! French make, special value, 5 by 4, 5½ in. focus, 11s. 6d.; 7 by 5, 7½ in. focus, 14s.; 9 by 7, 11 in. focus, 20s., complete with hood, flange, cap, and set of Waterhouse stops, largest aperture f/8; three days trial allowed.—Dorey, Lester and Co., Kilburn, London.

Lens, French rapid rectilinear quarter-plate, Waterhouse stops, new, 21s.; deposit.—A. Wilkinson, 37, Botanic Road, Liverpool.

Splendid half-plate rapid rectilinear lens, iris diaphragms, 18s.—A., 8, Kenilworth Road, Willesden Lane, London.

Portrait lens by Cooke, London, 9 in. focus, diameter of lenses 2½ in., price £1.—E. Lang, Stanley Avenue, St. John's, Ipswich.

Taylor and Hobson's half-plate rapid rectilinear, iris diaphragms, £2 10s.—M. Helliard, Dorset Villa, Yeovil.

**Rollholder, etc.**—For sale, Eastman rollholder, whole-plate, spool half full of film, in good order, 45s.—Geo. Ingall, 45, Derwent Road, Lancaster.

**Sets.**—7½ by 5 Watson's Premier camera, with turntable, four double backs, tripod stand, two bags, Ross' 8 in. P.S. lens, Thornton-Pickard shutter, etc., camera and lens mounted in aluminium, £24; new this spring.—Francke, St. Saviour's Road, Jersey.

Bargain! Studio camera, cabinet size, with legs, dark slide, printing frames, dishes, etc., lot £5 10s.; approval on deposit.—H. D. B., Albion Works, Salford, Manchester.

Half-plate camera, lens, three dark slides, tripod, and all accessories, complete, £5 10s., cost double, almost new.—Black, 112, Gower Street.

Lancaster's quarter-plate Le Merveilleux camera, with tripod, lens, and double dark slide, 14s., in good condition; strong whole-plate camera, with tripod, dark slide, and carriers, no lens, 10s., or exchange for good background on roller, interior preferred; press for raising portraits, with cushion and oval dials for cabinets and c.d.v., 13s.—C. Kaiser, 29, Emmett Street, Poplar.

McKellen's camera (7½ by 5), leather bellows, vertical forward and backward swing, reversing back, side swing, folding swing front, turntable and legs, three double dark slides fitted with quarter-plate carriers, one Hare's (7½ by 5) changing box to hold 12 plates and slide for same, Dallmeyer's rapid rectilinear lens, and stops in morocco case, also Ross's No. 3 wide-angle symmetrical lens with rotating stops, new last June, Thornton-Pickard time and instantaneous shutter fitted with speed indicator, also Phantom drop shutter, two waterproof cases to hold camera slides and legs, all in first-class condition, cost £20, price £20.—F. Clifton, Mile End, Stockport.

Lancaster's quarter-plate special brass-bound camera, four slides, Optimus landscape lens, stand, bag, etc., new, never used.—5, Milton Grove, Stockport.

Hare's 5 by 4 patent camera, three double slides, Eastman rollholder, leather case, folding stand, Dallmeyer's rapid rectilinear lens, Thornton shutter, £10, cost £18 10s., used twice.—26, Calthorpe Street, London.

**Sundries.**—Wanted to exchange Lancaster's washer for 24 negatives for one for 12, any good make; also good rapid rectilinear lens (print sent), price £1, or exchange for anything useful for enlarging or lantern work or canvas case, all half-plate.—Miss Mildred Frere, Lamas Hall, Norwich.

### WANTED.

**Cameras, etc.**—Wanted, whole-plate camera, complete, Shew's preferred; exchange grand St. Bernard puppy.—F., care of Mr. Mathews, 156, Loveridge Road, Kilburn, N.W.

Wanted, quarter-plate or hand-camera in exchange for poultry.—Thomas Walker, Mossley.

Half camera, Watson's or similar make.—Gee, Connaught House, Sellwood Place, Brighton.

Wanted, quarter-plate Instantograph, complete, about 30s.—Address, Marr, Richmond School, Yorkshire.

**Cameras, Lenses, etc.**—Half-plate modern camera, three double slides, Dallmeyer's or Ross's View lens, tripod stand.—Jones, Chemist, Penmaenmawr.

**Exposure Meter, etc.**—Watkins' exposure meter; reply, stating price.—Gee, Connaught House, Sellwood Place, Brighton.

**Lenses, etc.**—Wanted, Voightlander's 5 by 4 enryscope lens.—B., 10, Eglantine Road, Eark Hill, Wandsworth.

**Sets.**—Wanted, half-plate camera, double extension, rectilinear lens, instantaneous shutter, tripod, slides, etc., good maker, good condition. Full particulars, with price, to H., 21, Berners Street, Leicester.

Wanted, good half-plate set, all movements, long extension, immediate, cheap. Particulars to Burrell, People's Palace, Mile End.

Wanted, 12 by 10 camera, three slides, brass fixings, strong tripod, inner frames for all sizes down to half-plates, Ross' No. 3 cabinet portrait lens, and Ross' 18 in. portable symmetrical lens.—Address, terms, X., 7, Batoum Gardens, West Kensington.

**Sundries.**—Half or whole-plate roller required, cheap, good maker, no steel bar arrangement.—No. 345, office of this paper, 1, Creed Lane, E.C.

**Lanterns! Lanterns! Lanterns!!!** Slides! Slides!!! Slides!!! The largest and most varied selection in the whole kingdom. Before selecting elsewhere, call and inspect the stock of the City Sale and Exchange, 54, Lime Street, Leadenhall Street, City, where we have no hesitation in saying you will find all that you require in this way. Lanterns for sale, lanterns lent on hire, lanterns sold on commission, or taken in exchange for other apparatus. Write for special supplemental lists, Manager, City Sale and Exchange, as above.

**Bargains in Cameras and Sets.**—Lancaster's whole-plate 1890 Instantograph, all latest movements, reversing back, etc., Lancaster's lens, iris stops, shutter, three double slides, and folding stand, finest order, £5 10s.; Meagher's quarter-plate camera, wide-angle movement, reversing back, fitted Ross landscape lens, five double slides, solid leather case and folding stand, 75s.; Lancaster's quarter-plate 1889 Instantograph, finest order, all latest improvements, including camera, lens, iris stops, two double slides, stand and case, 37s. 6d.; half-plate camera, reversing back, and rapid rectilinear lens, works f/8, both by Dollond, Ludgate Hill, double slide and folding stand, as new, take £4 4s.; 12 by 10 camera, finest mahogany, double extension, leather bellows, wide-angle movement, rising and falling front, etc., double dark slide, as new, £5 5s.; 5 by 4 best quality camera, by Robinson, Regent Street, leather bellows, rising, falling, and cross front, wide-angle movement, three double slides, fine rapid rectilinear lens, by Robinson; Newman's shutter and Eastman's ½-plate roll holder, quite new, £5 17s. 6d.; 7½ by 5 long-focus camera, by Götze, wide-angle movement, leather bellows, reversing back, rapid rectilinear lens, and folding stand, set complete, £5 15s.; half plate Underwood's Instanto wide-angle movement, double extension, fitted rapid rectilinear lens, slide, and folding stand, £3 17s. 6d.; half-plate camera, by Houghton, all latest movements, grand article, fitted three double slides, rapid rectilinear lens, and double folding stand, £5 10s.; quarter-plate Lancaster's Merveilleux set complete, 15s. All above guaranteed finest order. On view, City Sale and Exchange Rooms, 54, Lime Street, corner Leadenhall Street, City (late Goy's Medium). Second-hand apparatus bought, sold, or taken in exchange. Inspection invited.

**Bargains in Hand Cameras.**—No. 3 Kodak, very finest order, new spool films, rapid rectilinear lens, etc., solid leather case, £5 7s. 6d.; Beck's Frena hand-camera, new packet films, latest pattern, £4 4s.; Swinden and Earp hand-camera, good as new,

carries either 12 or 20 quarter-plates, Laverne R.R. lens, £4 17s. 6d.; hand-cameras by Collins, quarter-plate, covered in morocco, fitted 5 by 4 Wray lens, iris stops, Thornton-Pickard time and instantaneous shutter, finder, direct focuser, patent changing box for 12 plates, Eastman's roll holder, and 6 double slides, quite new, £8 17s. 6d., cost double; Rouch Eureka quarter-plate, rapid rectilinear lens, blind shutter, 12 plates, in case, £3 17s. 6d.; Lancaster's quarter-plate, Omnigraph, as new, carries 6 plates, good lens, 16s. 6d.; Samuel's hand-camera, 9 by 12 centimetre, rectilinear lens, time and instantaneous shutter in case, quite new, take 32s. 6d.; Luzo's hand-camera, Robinson, Regent Street, quarter-plate R.R. lens, instantaneous shutter, carries 100 films, solid leather case, quite new, £4 17s. 6d.; Kodak, No. 4, size 5 by 4, new spool of films, warranted finest condition, in leather case, take £7 17s. 6d., cost £11 7s. 6d.; Adams' Ideal hand-camera, twelve quarter-plates, finest rapid rectilinear lens, time and instantaneous shutter, as new, £5 15s.; Fallowfield's Facile, fitted rapid rectilinear lens, carries twelve quarter-plates, as new, £3 17s. 6d. Optimus magazine hand-camera, covered leather, carries 12 quarter-plates, finest Optimus rapid rectilinear lens, two finders, shutter, etc., as new, take £5 5s.; Talmer hand-camera, carries 12 plates, fine lens, two large finders, time and instantaneous shutters, as new, take 65s. All above are warranted as described. On view, City Sale and Exchange Rooms, 54, Lime Street, corner Leadenhall Street, City (late Goy's Medium). Second-hand apparatus bought, sold, or taken in exchange. Inspection invited.

**Bargains in Lenses.**—Pair stereoscopic wide-angle rectilinear, by Charterhouse Stores, rotating stops, 4 in. focus, 45s. pair; Swift 5 by 4 wide-angle rectilinear lens, 5 in. focus, rotating stops, 32s. 6d.; 5 by 4 Wray rapid rectilinear lens, Waterhouse stops, as new, 35s.; Beck's 8 by 5 Autograph rapid rectilinear lens, iris stops, 9 in. focus, £3 12s. 6d., as new; Lancaster whole-plate wide-angle lens, rotating stops, best order, take 15s.; Dallmeyer portrait lens, c.d.v., grand definition, Waterhouse stops, finest order, 63s.; Fallowfield's portrait lens, rack focussing, Waterhouse stops, 21s.; Ross' No. 2, c.d.v., portrait lens, Waterhouse stops, rack and pinion, take £4 5s.; 7 by 5 Optimus rapid rectilinear, Waterhouse stops, as new, 42s.; whole-plate Optimus rapid landscape lens, rotating stops, quite new, take 35s.; whole-plate Wray's landscape, Casket lenses, 5 in., 7½ in., and 10 in. focus, iris stops, quite new, take 70s.; Shew's c.d.v. portrait lens, Waterhouse stops, rack and pinion, as new, take 21s.; quarter-plate Optimus rapid rectilinear, by Perkin, Son, and Rayment, Waterhouse stops, covers 5 by 4, focus 5½ in., quite new, take 27s. lowest. All above lenses are warranted as described.—On view, City Sale and Exchange Rooms, 54, Lime Street, corner Leadenhall Street, City (late Goy's Medium). Every description of apparatus bought, sold, or taken in exchange.

It is unnecessary to send an advertisement for the "Sale and Exchange" column for more than one insertion, as the goods are usually disposed of when the first advertisement has appeared.

**ENLARGING APPARATUS.**—Hume's enlarging apparatus, 5 in. condenser, without objective, 61s. 6d.; with 8 in. condenser, 122s. 6d., carriage paid.—Hume, 1, West College Street, Edinburgh.

**IMPORTANT TO AMATEURS.**—Negatives skillfully retouched. Printed in silver, gelatin-chloride, etc., and Enlarged. Also Developing, Copying, etc.—Terms strictly moderate.—Address, Wilfred Emery, 24, South Street, Baker Street, W.

**2 PRIZES.—10s. and 5s.**—For the best and next best 2 Photographs from Nature, or Painting of Cows, Poultry, etc., suitable for "Dairy" show cards; the larger the negative the better. Those arriving early stand a chance of being exhibited at the "Dairy" Show at the Agricultural Hall next week. Proofs to be sent to Payton and Co., Ltd., Tower Hill Warehouse on or before October 16th.

## NEW!!

# EDWARDS'S PROTECTIVE VARNISH FOR FILM NEGATIVES.

*INSTRUCTIONS.—Pour the Varnish into a flat dish, soak the Film Negatives in it for two or three minutes, and hang them up to dry.*

**PREVENTS CURLING AND AFFORDS PERFECT PROTECTION.**

**Equally Useful for Negatives on Glass.**

Eight-ounce Bottles, 1s.

Pints, 2s.

Post, 3d. and 6d. extra.

## OUR VIEWS.

"To hold as 'twere the mirror up t' nature."—*Shakespeare*.

The Editor is "At Home" on Monday Afternoons from 2 till 5 o'clock, and will gladly give advice upon all photographic matters; and on Thursday Mornings to Members of the Trade, etc, from 10 till 1 o'clock.

OUR VIEWS.—Phot. Soc. Gt. Brit. Permanent Gallery—Royal Academy and Chantry Bequest—Societies' Notes—Photographers' Benevolent Association—The P.B.A.—A New Power—Pall Mall and Dallmeyer's Lens—Camera Club and Van der Weyde's Photo. Corrector—Its Action—Optimus Competition—Our Next Week's Issue.

### CHIT-CHAT.

PICTORIAL PHOTOGRAPHY AT CHARING CROSS ROAD.

LETTERS.—P.S.G.B. Medals (Morrow)—Dark-room at Llandudno (Jeffreys)—Hand-Cameras (Bell)—Ferro-Prussiate as a Restraint (Burnard)—Phot. Benevolent Assoc. (Ward)—An Appeal (N. H. S.)—Transparent Markings on Gelatine Plates (C. of A.)—The AMATEUR PHOTOGRAPHER Lantern Slide Competition (McEwen, J. W. Wade, Moi-Meme)—The Photographer's Record (Elliott and Son).

ARTICLES.—How to Make a Set of Photographic Apparatus (H. J.)—The Manipulation of Chloride of Silver Gelatine Paper (Underwood)

EXHIBITIONS.—Phot. Soc. Gt. Brit.—Port Elizabeth—Bedford and District—Stockport.

AFFILIATION OF PHOTOGRAPHIC SOCIETIES.

SOCIETIES' NOTES.

SOCIETIES' MEETINGS.—Ashton—Birkenhead—Birmingham—Bolton—Burslem—Chiswick—Cromwell—Derby—Dewsbury—Durham—E. London—Edinburgh—Fairfield—Glasgow High School—Hackney—Halifax—Hereford—Holborn—Hove—Hull—Island—Isle of Thanet—Kensington and Bayswater—Leytonstone—N. Middlesex—Richmond.

EDITORIAL DEPARTMENT.—All Literary Contributions, Queries and Answers, Photographs for Competition or Criticism, Books or apparatus for Notice or Review are to be addressed to the EDITOR, AMATEUR PHOTOGRAPHER, 1, CREED LANE, LUDGATE HILL, LONDON, E.C. (All communications should reach the Editor on Tuesday.)

### TERMS OF SUBSCRIPTION.—

UNITED KINGDOM.....	Six Months, 5s. 6d.....	Twelve Months, 10s. 10d.
POSTAL UNION .....	" 6s. 6d.....	" 13s. 0d.
OUT OF POSTAL UNION ..	" 7s. 9d.....	" 15s. 8d.

TRADE ADVERTISEMENTS are received up to Tuesday morning.

PUBLISHING DEPARTMENT.—All letters containing Subscriptions, Orders, Remittances, SALE and EXCHANGE Advertisements, or other business matters for the AMATEUR PHOTOGRAPHER are to be addressed to the Publishers, HAZEL, WATSON, and VINEY, LD., 1, CREED LANE, LUDGATE HILL, LONDON, E.C. SALE and EXCHANGE Advertisements (at the charge of Three Words for One Penny) must be received by Tuesday evening's post to ensure insertion in the same week's issue.

"Amateur Photographer" Monthly Competition, No. 31.—"INLAND SCENERY WITH AND WITHOUT FIGURES." Latest day, Oct. 24th.—Prizes: Silver and Bronze Medal, with ribbon and clasp. One mounted print only to be sent in. Entry forms, etc., on receipt of stamped envelope. Address: Editor, AMATEUR PHOTOGRAPHER, 1, Creed Lane, E.C. (Prizes will be announced and photographs reproduced and criticised in the AMATEUR PHOTOGRAPHER Supplement, November 11th.)

THE P.S.G.B. are, we understand, about to take a step which will prove not only of very great value but also of great interest. It is proposed to make each year a selection from the pictures exhibited at the annual exhibition, so as to form a collection of works which shall show the progress made in the science and art from year to year.

It is, of course, a well-known fact that the Council of the Royal Academy purchase each year one or two pictures, statues, etc., through the Chantry Bequest, which selected pictures form a very valuable collection. Probably the P.S.G.B. Council will not have to purchase the pictures, as the honour of having a picture selected will be almost if not quite as high as the medals. The only point which will have to be observed is that the prints are in some permanent process.

WE start this week a column devoted to Societies' Notes, in which we shall include all notices of exhibitions, reports, balance-sheets, etc., which may be of interest to members of the various societies and our readers in general.

EVERY one of our readers may help a good cause by purchasing tickets for the special lantern entertainment to be given at Pall Mall on November 4th in aid of the Photographers' Benevolent Association. Tickets may be had from most of the dealers, or from the Secretaries of the various London photographic societies, or from members of the Committee, viz., Messrs. H. D. Atkinson, 18, Stepney Causeway, E.; F. H. Berry, Leigh House, Lordship Lane, S.E.; W. Bedford, 326, Camden Road, N.; R. P. Drage, 95, Blenheim Crescent, W.; T. E. Freshwater, 3, Fleet Street, S.E.; G. T. Harris, Rose Villa, Bisham Gardens, Highgate; T. C. Hepworth, 45, St. Augustine's Road; F. W. Hindley, 146, Charing Cross Road, W.; H. R. Hume, 6, Allen Terrace, Kensington High Street; A. Mackie, 3, Upper Baker Street, E.; W. Parfitt, 18, Gatscombe Road, Tufnell Park, N.; J. S. Rolph, 93, Taunton Road, Lee Green; W. J. Tabrum, 7, Quality Court, Chancery Lane; and from the Hon. Sec., H. Snowden Ward, Memorial Hall, E.C. If any convenience to our readers, we shall be pleased to supply tickets also.

WE do not hear very much of the P. B. A., but it does good work in a quiet way, and is deserving of the support of all amateurs. Many of us will not miss a small mite, and the P. B. A. will be very glad of it, and the Secretary is very energetic and very thankful.

EVIDENTLY we have a new power given us at last, if we may judge from the following extract from an electrical contemporary :—

"I have before me a fine photograph of Sackville Street, Dublin, taken under the electric light; and looking into it I am astonished to find what wonderful effects result from photographing by the electric light. The moon and stars are actually dotted all over the clouds, instead of being behind them as they usually are in this country."

This is quite new, we believe, and we must confess at present a little inexplicable—and should prove useful to astronomers.

At Pall Mall one of the most striking, if not the most striking, exhibit from a scientific point of view is the example of work done by Dallmeyer's Tele-photographic lens. And it is curious to note that at the Camera Club we have an example equally striking of another new advance which may be said to be somewhat akin.

By means of an apparatus which Mr. H. Van der Weyde, the well-known portrait photographer of Regent Street, has devised, he has been able to correct the distortion produced by the lens. The distortion corrected is that of exaggerated size of objects which are near the lens. For instance, it is well known that if a foot is protruded much beyond the plane of the face it will be rendered larger out of all proportion to the rest of the body. By means of the new invention, which is called the "Photo Corrector," this defect in a negative may be corrected, and without any other part of the picture suffering.

MOST of our readers will recall "The Misses Dene," a very fine group exhibited by Mr. Van der Weyde at Pall Mall last year, and which was reproduced in "Photographs of the Year." In this group the heads and hands of the charming quartette are rather too large, though at first sight one does not notice this. The improved picture which is now on show at the Camera Club, at once shows us that this is so, however.

ANOTHER, and possibly a still more striking, example is in the figure of a young lady seated in a chair with her hands nursing one of her knees and foot stretched out in front. In the original the hands and foot are those of a giant, but in the corrected transparency just right.

MR. VAN DER WEYDE promises us that shortly we shall have an opportunity to see the action of his invention, and we shall hope to be able to give our readers an illustration of its action. It is obvious that whilst this gives a true artist a new and hitherto unsuspected power, it also gives us the power of caricature, and we may now with the greatest of ease represent little heads on big bodies, or *vice versa*, and we have here the germ of a new photographic Du Maurier.

IN answer to a suggestion of a correspondent, we beg to inform our readers that in the "Optimus" competition, which closes on the 31st inst., competitors must not send more than one print in each class, and that separate entry forms must accompany each print.

OUR issue of next week will be of special interest, and all our readers will be wise to secure a copy early. We have something new and good, which everyone should see.

## Chit-Chat.

ACCORDING to a telegram, received through Dalziel's agency, Col. Roche, of the Ecole Polytechnique, has discovered that it is possible to transfer the sensibility of a hypnotised person to a photographic negative of the subject, and that if the negative be scratched with a pin, the subject "would shriek with pain." Here, surely, is a field for investigation open to those who affect the scientific rather than the artistic side of photography. Such a discovery, however, gives rise to uncomfortable reflections; fancy the tortures which might be inflicted upon a sensitive subject whilst his negative was undergoing the stippling process of the retoucher, or the agonies that might be occasioned by the rubbing down of an over-dense negative with a rag and methylated spirit!

THE vexed question whether photographers, however artistic their productions may be, are entitled to rank as artists, has, it would appear, been settled by the Zoological Society, which, according to Mr. Gambier Bolton, admits artists to its menagerie without fee, but exacts one from the photographer "*because he is not an artist.*" What does Mr. Gambier Bolton himself think of this distinction? I venture to express the opinion that few painters have excelled Mr. Bolton's magnificent animal studies.

THE terrible mishap which occurred to your correspondent, Mr. T. B. Walshe, prompts me to remind your readers that the use of compressed gas in cylinders presents far fewer dangers than when bags are employed. Gas cylinders can be sent by rail or carrier, without damage or danger, anywhere, and their convenience in use is undeniable. The great majority of the accidents which have occurred in connection with the lime-light *have happened during the preparation of the oxygen itself*, and although thousands of cylinders have been in every day use for many years past, only one fatal accident due to the gas-bottle has, unless my memory is seriously at fault, been recorded, though minor accidents due to the careless use of gauges and regulators have happened. The moral of this is that even in experienced hands bottles are far safer than bags.

ALTHOUGH the exhibits in the apparatus division at Pall Mall are by no means numerous, there are several things which every photographer should inspect. Amongst them may be mentioned Messrs. Taylor's system of interchangeable adapters, Messrs. Watson's studio-stand, which has every possible movement, controlled by a single handle, and Messrs. Beck's "Frena" hand-camera for films, the changing device in which is a perfect piece of mechanism.

EXHIBITIONS are now to the fore, and the prospectuses of several are to hand at the moment of writing. The custom of splitting up the exhibits into a great number of subdivisions and classes still largely prevails, and is, to my thinking, greatly to be deprecated. The practice, for instance, of relegating enlargements to a separate class has the effect of deterring many persons from competing, by which abstentions the promoters are seriously the losers, for some of our best men are now in the habit of making enlarged negatives, prints from which are, of course, debarred entry except they go into the company of raw, unwholesome-looking bromide enlargements, which somehow seem to find a way into every exhibition. CHATTERBOX.

## Pictorial Photography at Charing Cross Road.

### THE CAMERA CLUB "INVITATION EXHIBITION."

THE opening of the present exhibition has been awaited with no little curiosity in various quarters. Much was expected of it—much has been done, and the Camera Club Executive will have no cause for any feeling but one of self-congratulation that the capacious wall-space of the clubroom is so worthily employed. The exhibition is unique in many respects; unique especially from the fact that the pictures have been sent only in response to direct personal invitation.

It was decided to hold an exhibition of pictorial photographs only; that is to say, photographs which aimed at being pictures in the higher acceptation of the term, irrespective of, or to the subordination of, technical excellence, and wholly exclusive of those photographic representations of special objects, the interest in which does not extend outside the philosophical, historical, or scientific, as the case may be. Hence only such workers who were known to make picture-making their especial study were invited, but the most casual observer of the collection of pictures thus brought together cannot but admit that these invitations have been issued with praiseworthy disregard for school or class, with the result that no one particular style or method of production can for a moment be said to preponderate amongst the two hundred frames hung.

The names of the three gentlemen upon whom has devolved the somewhat thankless and arduous duties of a "hanging committee" are well known, and what is equally important, known to be of diverse sympathies, and in some respects of opposite views on matters connected with art and photography, a fact which cannot have failed to inspire confidence amongst intending contributors.

With the wonderfully successful and effective hanging at Mr. Fred Hollyer's Dudley Gallery Exhibition fresh in our mind, we had for a moment hoped that the Hanging Committee at the Camera Club might have been able to advance somewhat in the same direction when arranging the pictures committed to them, but chiefly a want of space and also the extreme diversity of framing and mounting adopted by various exhibitors has severely handicapped any endeavour of this kind which might have been made. Inevitably we have pictures of various sizes, colours, and tone frame to frame without space or separation. Under the circumstances it could not be avoided, but it is noticeable that as far as possible pictures which might have been felt to be mutually destructive of each other's effect or directly antagonistic in impression have been kept apart, and indeed if one considers the matter closely, it may be found that a great deal more discretion and discrimination have been exercised in the arrangement than will at first be recognised. Whatever may be the dangers of an "Invitation" exhibition—dangers of omission and of commission in naming the selected few—one good result is very apparent, and that is the higher average of merit maintained throughout the whole. The exhibition under review may be regarded as of critical importance, and we would wish therefore to judge it as impartially and dispassionately as may be; yet do not hesitate to say that there has not yet been held an exhibition in which the pictorial and artistic quality has been of so high an average, and the mediocre or bad so scarce. There are not more than three or four things at most the presence of which the most exacting critic can seriously regret.

Consistent with the general scheme of the exhibition, the works of each contributor are in most cases, and as far as possible, hung adjacently, and in this manner we may proceed to notice them.

Julio Guardia, in Nos. 1 and 8, gives us evidence of some of the artistic possibilities of hand-camera photography. We take them to be of this class, but both, from the method of printing, namely, on rough paper leaving a masked-out margin, and from the general treatment, seem to elevate (as do many other similar little pictures in the room) the "Snap-shot" above its conventional sphere. No. 1, "Early Morning on the Thames," is perhaps the better, and although so small, yet seems to get a good deal of breadth into its limited compass. In both this and "On the Almond" (No. 8) there is a happy absence of those dark masses of under-exposure too common in work of this class; there is some nicely rendered foliage in No. 8.

Rowland Briant's two tiny pictures are remarkable in many respects. No. 2, "A Reed-Fringed Mere," and "A Winter Fog," hung on the opposite side of the room (No. 129), should receive more than passing attention, and in the face of so much existing conservatism in art matters, we cannot but admire Mr. Rowland Briant's courage, and wish that the same spirit of intelligent originality were a little more widespread. We believe Mr. Briant adopts some peculiar method of exposure, something beyond a modified "pinhole;" be this as it may, suppression of focus has been carried about as far as the senses will tolerate, but the breadth thereby

obtained is not more commendable than the discreet printing and "tonality." True, in "A Winter Fog" (called also "A Study in Black and White") it is hard to tell where the print ends and the mount begins, so slight is it, but it is remarkably true. It is originality which just escapes affectation, but it *does* escape. "A Reed Fringed Mere" is extremely fuzzy, soft, mellow, brown, and poetic.

B. Gay Wilkinson, jun. This exhibitor has done better this year at Pall Mall, where it will be remembered he takes a medal for a number of clever things, chiefly sunset effects. Of the two pictures here, No. 3, "A Sussex Homestead," is perhaps the better, "The Millpool," No. 4, being unlike its author's usual style. The former is well-chosen and boldly executed and has all Mr. Wilkinson's individuality about it; perhaps mannerism has gone a little too far, so has the printing of the landscape, which, although against the light, is too dark for daylight, even sunset. Still, it leaves a strong impression upon the mind, and by no means an unpleasant one.

Karl Greger. We like Mr. Greger's work at the Camera Club much better than at Pall Mall, but are sorry that they are somewhat scattered. We may pass over No. 5, "The Lonely Fir;" it does not appeal to us; but in No. 6, "June in the Fens," there is more originality in subject; it is very simple in arrangement, but very effective, and the impression of midsummer sultriness has, we think, been well caught. A little further on is "Silver Thames" (No. 31) not so good. The sheep are too small and seem lost in the surrounding expanse, whilst the shadows under the low river bank are oppressively heavy. The subject is almost a repetition of "Marshes of the Lower Thames," or some such title, in Pall Mall. But in No. 57, "Bogner Shore," Mr. Karl Greger more than recovers himself, and fully makes amends. We do not remember his ever having done anything better. The composition of the subject is simplicity itself, and may be a useful lesson of how much may be made out of the slightest material. If we may suggest to Mr. Greger, we should ask more of this kind of thing, which is free from the sin of prettiness, and then a little broader treatment.

But to return to the low numbers.

J. S. Bergheim, Nos. 7, 12, 13 and 14. The first and the last are replicas of Pall Mall pictures, which we shall have elsewhere taken opportunity of commending, but No. 12, entitled "A Sketch for a Larger Picture," is quite one of the things in the show, if not indeed the best figure-study in the room. Bold and striking in pose and illumination, Mr. Bergheim has given an admirable example of his masterly management of simple figure subjects. This essentially artistic worker is also seen to advantage in "The Daughter of the Sheik," No. 91.

Thomas J. Bright gives us several examples of dainty "Snap-shot" work, Nos. 10, 11, 22, 37 and 38. "In Pastures Cool," besides being a little gem—oh, so very tiny—possesses the distinction of being the smallest picture in the room, yet it is a picture, and is really worth the back-aching stoop which to see it at all its position necessitates. In "The Launch" (No. 57), Mr. Bright gets into a larger size, probably a composed picture, some seven inches by five, but beyond the quality of the distance and sky, is not so nice as the smaller work.

H. M. Hastings, too, has several little things of a like character, but he uses the now popular rough printing surface, and in more than one instance scores a distinct success.

Arthur Burchett's "Caller Herring" is fully characteristic of its author's skilful and painter-like treatment of large figures, but is perhaps hardly equal to some of his notable triumphs.

Col. J. Gale. Ever the same perfection of finish and faultless technique, the half-dozen typical pictures here shown will not perhaps be remembered as amongst Col. Gale's best. Still in "An Autumn Evening" there seems to be an approach to correct tone and atmosphere rarely attained. In "Under the Old Coast Road" and "At the 'Hard'" one may recognise well chosen bits on the Blackwater Estuary, and seem quite in keeping with the sentiment of the district.

Lieut. C. E. Gladstone and Frederick H. Evans have architectural subjects, and Richard Keene has a landscape, No. 29, but is much better in No. 96, which is a pleasingly soft and sunny scene at "Tissington Spires."

At Nos. 33 to 36 the writer is necessarily at a pause in confronting his own work, conscious of good intention but alive to many faults, and so willingly but with diffidence passes to the two large frames immediately adjacent, Nos. 42 and 43, in which Henry P. Robinson's style is at once recognised.

In the former and larger, "Gossip on the Beach," we have a group of women and girls. "Among the Waste and Lumber of the Shore," with a bright and glittering stretch of sea beyond.

Clever though the grouping is, it seems to betray the forethought and intention which must have been bestowed upon it, and the eye resents the hard cutting outline of the figures against the distance. We are not quite able to understand the lighting of some of the objects, particularly the figure to the extreme left. Nevertheless, the entire picture is one which could only have been accomplished by

the master of combination printing, a field in which Mr. Robinson has no compeer. "The Rising Lark" (No. 43) is somewhat in the same vein as "Carolling," shown by Mr. Robinson several years ago, but we do not consider it is equal to the earlier work, either in treatment or conception. Far more natural and pleasing is Mr. Robinson's landscape with cattle, seen at the further end of the room. Still, we are glad to see that amidst the tide of revolutionary feeling Mr. Robinson is in no way inclined to forsake his earlier opinions. He has been a strong pillar of pictorial photography, and we would not have the space occupied by him here otherwise filled.

F. Seyton Scott has "A Fisher Woman" (No. 46) so admirable in pose and with such true surroundings that we hope Mr. Seyton Scott will be more prolific in the future, and let us see him as an exhibitor more often. His portrait (No. 45), too, has merit, but both frames are a little too high to admit of very careful inspection.

With something noteworthy in every picture hung, it is difficult to pass any without comment, but that our notice would exceed the limits of space, and moreover we feel sure that all our readers who possibly can will visit the Camera Club during the next few weeks, and observe for themselves. Hence we must pass over many that we should like to compliment, such as Walter Cassels, E. Resta, Henry E. Davis, G. Loppé, A. H. Fison, and A. R. Dresser.

F. M. Sutcliffe has four or five frames, of which "Sunshine" is by far the best. It is not in his usual style, but deserves great commendation for its near approach to the high key and luminousness inseparable from sunlight, but which in similar subjects is too rarely secured. Some of the best things done during the last few years have come from Mr. Sutcliffe, and it is evident that he has not yet spent himself.

We are so accustomed to look for reproduction work of high-class photogravure from Walter L. Colls that it is with some surprise that we find four or five very careful sympathetic little works here, direct with the camera, bearing Mr. Colls' name. Of these, "In the Basingstoke Canal" is very charming, bright, and atmospheric. There is very nice quality, too, in Clarence Moore's "Sunshine, Smoke, and Seaweed"—selection and treatment are both artistic.

Some really capital dogs and wonderful flowers and ferns—"Orchids and Ferns" and "Ratters"—are the work of Henry Stevens, who it would seem, in technique at least, has nothing to learn.

Alfred Maskell. This exhibitor has long been known as an exponent of out-of-focus methods, but has, in public at least, confined himself to landscape subjects. Whatever Mr. Maskell does possesses an intellectuality which should command attention, and hence, now that he essays to make portrait pictures, it may be well to consider before criticising. The "Portrait of George Davison, Esquire" and a "Portrait of a Lady" (Nos. 71 and 72) are hung here, and a portrait of another Camera Club familiar, "Victor A. Corbould, Esquire," at the far end of the room. Knowing Mr. Maskell's Impressionism, sympathies, and admiration of Whistler, it is not difficult to see the influence of this modern spirit upon him when producing these portraits. We hope Mr. Maskell will not go so far as to allow it to be said that he is merely aping the methods of a painter, for whilst there is something approaching the whimsical in these portraits, there is at the same time a worthy endeavour to escape from the conventional, which if rightly pursued should lead to higher success. No doubt Mr. Maskell is working in the right lines, and we wish him luck.

S. Bourne has a delightful little vertical landscape (No. 82) consisting of precipitous crags, foliage, and distance; it is very nice, and close to it are several small frames of work quite characteristic of its author.

Bernard Alfieri. In this exhibitor we have another instance of the professed landscapist showing portraits. Mr. Bernard Alfieri, however, gives us both. Of his four landscapes we like "Grass Hummocks" (No. 88) the best. For the first time we find this photographer using a rough-surface paper, but we should have liked to have seen it rougher still. Mr. Alfieri's technique is so dainty and faultless that while it keeps well outside, with room to spare, the sobriquet of "pretty," the spectator is apt to be too much occupied with admiration for the skilful craftsmanship, and lose some of the feeling of which there is much beneath. Mr. Alfieri's selection of subject usually shows nice appreciation of those things in Nature which too many would pass by unheeded. "Winter" (No. 86) and "Grey Dawn" (No. 89) instance this, whilst the sheep in "Sunset" are very happy. If his landscapes are delicate and refined, his portrait "Sweet Seventeen" is not less so. A pretty face, nicely rendered, without affectation in posing or lighting, and produced in very red colour, will probably be a good deal admired; it is very pleasing if not great. It is hung in a rather dark corner, apart from the other things by the same author, but should not be overlooked.

Shapoor N. Bhedwar sends a collection of five large figure subjects illustrating the initiation of a young Indian novice into priestly orders. Such subjects are difficult, but are admirably carried out and possess an interest peculiarly their own.

Next come exhibits by Walter R. Cassells, Robert Terras, R. S. Ash, F. D'Arcis, Francis Powell, R.W.S., and others.

Ralph W. Robinson surpasses, in our opinion, by a long way anything he has done before. Of the three or four pictures sent, "The Long Day Wanes" and "Making Friends" are the most noteworthy, and either of these were sufficient to establish their author's position in the very front rank. The entirely different character of these two are evidence of considerable versatility, especially remembering what excellent pure portrait work Mr. Ralph Robinson can do. In "The Long Day Wanes" we have a strong against-the-light effect on one of those flat landscape subjects a good deal employed of late by artistic workers. The materials which compose the picture are very slight, yet ample, and although the whole is perhaps somewhat too dark, yet the total effect is very fine. "Making Friends" (No. 123) is more in Mr. R. W. Robinson's usual vein, but this time he gets his models from amongst the picturesque French peasantry. Moreover, the figures are bold, strong, and are not overpowered by the landscape, a fault which we have sometimes seen in this clever photographer's pictures. Keep on, Mr. Robinson. We shall look forward with confidence of further pleasures in store for us.

George Davison's contribution to the exhibition he has taken so active a part in organising is rather a surprise, and we feel inclined to reproach the worthy Hon. Sec. for not better satisfying our expectations. Is it that the house-boat has been a castle of indolence and been productive of laziness, or is Mr. Davison preparing some *chef d'œuvre*—which has absorbed all time and thought. Not but what the tiny pictures which he shows here are all very nice and quite characteristic, only one expects from so prominent an artist-photographer something more pretentious than little quarter-plate bits, wholly pleasing in manner and material though they be. No. 133 looks like a little bit cut out of a larger plate and is very effective, whilst others suggest the work of his "Key Camera." Mr. George Davison's large pictures are very large, and would have taken up a lot of space, so perhaps it is only out of consideration to others that he has withheld his own contributions to the show.

Space forbids reference to Nos. 141 and 145 by Albert Kapteyn and Seymour Conway; and in No. 144 a well-known name, Rev. F. C. Lambert, is attached to "A Smoky Sunset," a nice composition, a thoughtful little picture, well executed, but too dark for sunset illumination, even if smoky.

On the end wall we shall find Mr. Lyddell Sawyer largely represented, in point of size, and clever work too, also Mr. H. Tolley, who has two landscapes printed on rough paper, but somewhat harsh, and of cold black colour.

We hope to return to this Exhibition for a little space next week, as there is much still to be noticed. We cannot, however, leave the gallery—for in very truth the Camera Club room, the scene of so many pleasant and social gatherings, has assumed all the dignity of a veritable picture gallery—without a prolonged pause before Mr. Eustace Calland's masterpiece—yes, a veritable masterpiece!—and we do not hesitate to say we have not yet seen its equal. It is needless to compare it with the work of a great modern French painter. It will stand on its own merits, but irresistibly the name of Corot comes to our lips, and we feel little inclined to efface its delightful impression by noticing at present the Belgian pictures which occupy the corner of the room, or the Tennyson portraits on the screens. The former are most noteworthy, and probably nothing quite like them has yet been seen in this country. So we pass out and are thankful that a new era in photographic exhibitions is foreshadowed.

The Leytonstone Camera Club are holding their first annual exhibition and competition on Thursday, Friday, and Saturday, the 10th, 11th, and 12th of November, at the Masonic Hall, High Road, Leytonstone. There are eight classes—four members' and four open. Sixteen very handsome medals are offered for competition. Lady Brooke has graciously consented to open the exhibition on Thursday, the 10th, at 6 o'clock p.m., and will in all probability be accompanied by Lord Brooke, who, by the way, are both amateur photographers. The judges are Mr. A. Horsley Hinton, Rev. F. C. Lambert, and Mr. E. J. Wall. The exhibition will consist of photographic productions of the leading amateur and professional photographers in the United Kingdom; apparatus, etc., will be exhibited, together with some of the latest novelties and appliances; lantern displays will be given twice during each evening; the prize slides of the competition, *Photography* 1892 prize slides, dioramic effects, etc., will be shown, demonstrations, lectures, and other entertainments in the small hall and studio; a fresh feature every half-hour throughout each evening, high class musical selections by the Viennese orchestra, under the direction of Signor Constantine Baga. Entry forms and particulars of the open classes and spaces for exhibits can be had on application to the Hon. Secretary and Treasurer, Albert E. Bailey, Rose Bank, South-West Road, Leytonstone.

## Letters to the Editor.

### THE P.S.G.B. MEDALS.

SIR,—I have become painfully aware from your columns for the last few weeks, that the annual wrangle in connection with the awards at the P.S.G.B. Exhibition is now in full bloom, and it has occurred to me to ask why are not the photographs judged under a *nom de guerre* or motto, the competitor's names to be in sealed envelopes which would not be opened until the completion of the awards?

This would appear to me to be a satisfactory and conclusive method which would silence all objections, for it must be admitted that successive award lists do bear a striking similarity to one another and a disheartening absence of new names. Then the discontented and unrecognised competitors would have their battle-cry of favoritism and cliqueism taken from them and all would go "merry as a marriage bell," and the outside public would be spared the very unedifying spectacle of the little photographic birds tossing each other out of their little P.S.G.B. nest.

The method I advocate is always adopted in architectural design competitions, and if (as I expect) it would not alter the award list to any appreciable extent it would at least let us have peace and quietness in our photographic world, and enable us to show a firm and undivided front to that cavilling, cold-blooded, and unappreciative demon, the great British Public.—Yours, etc.,

J. LLOYD MORROW.

P.S.—Would you think of giving the scheme a trial in connection with your own competitions?

[This suggestion is, we are afraid, quite useless, because the best workers always stamp their work with their own individuality, so that anyone who has been in the habit of seeing exhibitions is able to name at once the operator—a complete parallel being found in the Royal Academy. With regard to our own competitions, the judges do not know the competitors' names, but it is so easy to say, "Oh! that's So and So."—EDITOR.]

\* \* \* \*

### DARK-ROOM AT LLANDUDNO.

SIR,—The new dark-room at Llandudno, erected this year by members of the society, is an excellently appointed affair, its conveniences are ample, and charges exceedingly moderate.

The members with whom I came into contact were most courteous, and gave me many useful hints regarding the photographing of the neighbourhood. Thanks to the notice which appeared in the AMATEUR PHOTOGRAPHER some months since, I was not long in discovering the locality of the room.—Yours, etc.,

ALF. J. JEFFREYS.

\* \* \* \*

### HAND-CAMERAS.

SIR,—My attention has been drawn to your issues of the AMATEUR PHOTOGRAPHER September 16th and 23rd.

The hand-camera mentioned on pages 197 and 212 is an infringement of my patent applied for in May last, and I caution any one making and selling the same without my authority.

The only authorised person is Henry Crouch, Barbican, London.—Yours truly,

JOHN S. B. BELL.

[Before we received this note from our correspondent, we had inspected one of these cameras at Messrs. Crouch's, and the same idea struck us. Our readers will please note this.—EDITOR.]

\* \* \* \*

### FERRO-PRUSSATE AS A RESTRAINER.

SIR,—I must thank Mr. Schultess-Young for calling attention to the excellent restraining properties of yellow prussiate of potash, and I note another correspondent does so also in last week's issue of the AMATEUR PHOTOGRAPHER.

In my experience one can get far better results with it, and clearer shadows than with bromide, and above all, the negative is much more amenable to after treatment. With hydroquinone I find it has a tendency to give too much contrast, but with other developers it leaves nothing to be desired, and does not slow the image as bromide does.—Faithfully yours,

T. C. BURNARD.

\* \* \* \*

### PHOTOGRAPHERS' BENEVOLENT ASSOCIATION.

SIR,—There are various reports as to the state of business amongst photographers during the past season, but those who are in the best position for knowing tell us that the winter outlook for assistants, at any rate, is a bad one. This being so, may I say a word about the Benevolent, and the claim it has upon photographers?

In various recent cases of distress local efforts have been made and special subscriptions raised without any appeal being made to the Benevolent Association, the committee of which has usually heard of the case when too late to be of use. As the Association always prefers to grant prompt and practical relief, not only in money, but also in that help which is often better than money, no man who knows of a deserving case need be afraid to make application. In every case the Association makes the most careful enquiries, but treats the particulars in strict confidence. Where a loan will afford the necessary relief the grant is always made in that form, and it is satisfactory to subscribers to know that in some cases men who have been entirely broken financially have been so firmly set on their feet by the Benevolent as to be able to pay back every penny advanced, so that an excellent work has been done without any real expenditure of the funds.

In connection with the work of the Association there is an employment bureau, upon which we have at present the names of a large number of assistants of almost all classes, and some of them very good men, who are seeking situations. Employers who want assistants will greatly help the work of the Benevolent if they will make application to, yours faithfully,

H. SNOWDEN WARD,

SECRETARY, PHOTOGRAPHERS' BENEVOLENT ASSOCIATION.

\* \* \* \*

### AN APPEAL.

SIR,—Can any of your readers assist the Ragged School Union by the loan of any negative illustrative of the lower stratas of London slum life, for the production of lantern slides to illustrate lectures on behalf of their work? Pictures of street arabs, itinerant vendors, costermongers, street markets, old alleys, gutter children, or anything typical wanted.

A postcard to Mr. John Kirk, 37, Norfolk Street, Strand, or to William H. Steer, Market Place, East Grinstead, describing negatives, will be thankfully received and receive prompt attention.—Yours, etc.,

W. H. S.

\* \* \* \*

### TRANSPARENT MARKINGS ON GELATINE PLATES PRODUCED DURING WASHING.

SIR,—I have read Messrs. B. J. Edwards and Co.'s reply on this subject founded upon an inspection of my defective negative, the markings, as they say, being caused primarily by the use of a developer which evidently contained far too much alkali, but I venture to submit that this opinion is founded on insufficient premises, because it is impossible to judge of the cause of the defect upon mere view of this solitary negative, and without knowledge of what medical men would call the history of the case. I should have thought that this developer with its "far too much alkali," if that had been the cause, would have destroyed the gelatine in every film immersed in it, instead of which it has behaved well with many scores of plates and celluloid films from my very first trial of it in August, 1890, until the middle of September, 1892, when after using about half of my stock of developer from a bottle which when filled held a quart, the markings in question appeared, but since I dissolved the oxide from the zinc washing trough as explained in my last, the remainder of the bottle of developer has produced negatives in all respects satisfactory. It may be said that I am wrong in some of my conclusions. To prove the contrary, I enclose from negatives developed with the mixture in question, printed in their natural state, and without manipulation of any kind, eight prints as follows:—

No. 1.—Negative, Edwards' celluloid film; exposure, 23rd August, 1890.

No. 2.—Negative, Edwards' instantaneous plate; exposed same day. These were developed, printed, and mounted as they now appear, during that month of August. They are the first produced by me with this particular developer.

Nos. 3 and 4.—Negatives, England's celluloid films; exposure, October, 1890, from a batch of about three dozen, all much of same quality, printed by a manufacturer.

No. 5.—Negative, Edwards' Isochromatic plate, one of a dozen, on same kind of plate.

No. 6.—Negative Edwards' instantaneous plate. The two last were exposed in August, 1892, developed about a month afterwards, and printed by me. At this time excellent results were obtained. I had for days together and each day over a dozen negatives of average quality, then came the sudden appearance of the transparent markings and treatment of the zinc tank with

sulphuric acid, as already described, after which on resumption of work with residue of same bottle of developing solution, first-rate results were obtained. In proof of this:—

No. 7.—Negative Edwards' instantaneous plate, exposed August last.

No. 8.—Negative Edwards' instantaneous plate, exposed in September last, both developed and printed by me this month. The last two from a lot of about sixty.

I think you will agree with me that with all the faults of these eight prints, spottiness cannot be counted amongst them.

The concluding remarks of Messrs. B. J. Edwards and Co. are excellent in their way, but they only give another rendering of an oft repeated wrinkle which I have always adopted, viz., "Never condemn any particular brand of plate till you have tried it with the developer recommended by the maker." Bearing this in mind when my old mixture seemed to fail, I developed some Edwards' celluloid films with Edwards' hydroquinone developer in two solutions, which I purchased last June from a city store. The result was unfavourable, for now innumerable opaque black specks appeared all over the film, which in printing might represent a snowstorm. Still, I did not blame the celluloid film. I submitted the result (*i.e.*, the enclosed negative) to an experienced friend, who thought the specks were caused by the recrystallisation of the hydroquinone which had become deposited in the substance of the film. Good gracious!—I do not pretend to know anything about it—I thought I had experienced every possible kind of difficulty which could encounter the photographic student, but I am mistaken, and so I have resumed operations with Edwards' plates and the old mixture, of the ingredients of which I am ignorant, neither do I know anything of its manufacturers, nor anyone connected with them, nor interested either in its production or sale.—I am, yours, etc.,

C. OF A.

\* \* \* \*

#### THE "A. P." LANTERN-SLIDE COMPETITIONS.

SIR,—I notice in last week's issue a letter, signed by "Puzzled," on the AMATEUR PHOTOGRAPHER Lantern-Slide Competitions, and welcome your foot-note to it, as I had given up the Annual Slide Competition on a similar account. Surely you are not going to debar Mr. J. E. Austin, who, as your predecessor said, "has taken about fifty medals"—only fifty! Well, if it had gone on much longer, I think he would have had the competition all to himself. He is quite at liberty to flatter himself and think we are afraid of him, in a similar manner to a lad coming from the sixth standard at school and crowing to those in the first. But if these competitions are treated justly we will only be too pleased to take our stand against him, either at the P.S.G.B. or elsewhere.

There is Mr. John Hodges, the very gentleman that we are looking to for our instructions, carrying off our medals. I think when a man becomes an instructor he should conscientiously cease to be a competitor. I am glad to see that Mr. Dresser, who I had placed as one for a medal in your recent competition, is being rewarded elsewhere, where he would have a hard fight.

Now, Sir, I have something to say which is of far more importance than the foregoing. Has not Mrs. S. Francis Clarke's work already met with its reward in a former competition? Were not "After Mass," "Laughing Eyes," and "Curiosity" gold medal pictures in the Ladies' Competition?

If those slides have been produced from the same negative, then I say most emphatically that she ought to have been disqualified.

This letter is written for the good and protection of those that are "coming on." I was not a competitor in the last competition.—I am, etc.,

WILLIAM McEWEEN.

\* \* \* \*

SIR,—Having for four years been awarded a first, and this year the only final progressive medal in your annual lantern slide competition, I feel myself somewhat implicated in the charge brought by "Puzzled" against the gold medallist. Perhaps you will kindly allow me a few words in reply.

In former years this competition was intended to be the test of quality of the year's work by the amateurs of this country, and, as such, past prize winners were encouraged to compete by the offer of progressive medals, so that when the slides were sent on tour to the societies, both here and America, they should be fairly representative of the work of British amateurs. If the gold medallists are disqualified each year, I trust that it will be

so stated when the slides are exhibited, and that it is a competition for "younger workers."

I fail to see the unfairness of anyone entering the competition, for, being an open one, nobody is "sure of a medal." One man has as good a chance as another, and it speaks ill of British pluck when one amateur is afraid of another for the simple reason that he happens to have won a medal. All the more honour if he can beat the past medallist, and keep it up year after year, so as to show that he has not won it by a fluke.

With regard to the number of slides, I should advise you to increase them to twenty, for by reducing them you encourage that random and careless method of exposing plates the modern amateur too often indulges in, for he nowadays exposes at least two hundred plates in the season, and trusts to luck to pick six good ones for the competition.

According to the rules, having been awarded three gold medals, I am eligible to compete again in this competition, but Mr. Austin has I believe yet another chance, he having failed to get the gold this year.

I trust that in future years "Puzzled" will put his shoulder to the wheel, and thus find that his puzzle is solved, and will no doubt carry off the three gold medals.—Yours truly,

J. W. WADE.

SIR,—I read with much pleasure the letter from "Puzzled," pointing out the inconsistency of allowing certain workers year after year to carry off your medals, and until I did so, was certainly under the impression that your rules precluded such a possibility. In the Monthly Competitions it is so, and certainly should be the same in your "At Home," "Lantern" and other competitions.

After all, success in photography is largely a matter of £ s. d. and plenty of spare time. There are undoubtedly many who, no matter what was their wealth, would die "unwept, unhonoured, and unsung," and who consequently would never come to the front, but, given both the above requisites of cash and time, plus a fair amount of artistic feeling, and the owner thereof is almost bound to scoop in medals galore.

It is hardly fair, as you will admit, to pitting such against perhaps equally good or better workers, but who may have the misfortune to be in business all day, and dependent on their holidays and odd half-Saturdays, with all the attendant risks of bad weather and light for any work they may do.

I can readily understand an Editor wishing to turn out the finest work procurable, but when such is obtained at the expense of the bulk of his supporters it is hardly fair, and, as your "puzzled" correspondent points out, a large number do undoubtedly abstain from competing when they know that year after year the plums always drop into the ravenous maws of the same individuals. Such is certainly the case with

MOI-MEME.

\* \* \* \*

#### THE "PHOTOGRAPHER'S RECORD."

SIR,—In our letter in your last issue it appears that we offer to send our monthly journal post free to individuals. Our letter should have read, we will send supplies to secretaries of societies and dealers in photographic goods, post free and carriage paid.

We have already been overwhelmed with letters from amateurs, asking us to send the paper, and as far as possible we will endeavour to do so for this issue only, as the mistake was our own, but in future we must respectfully ask those who desire the paper sent direct to them to forward us stamped addressed wrappers.—Yours, etc.,

ELLIOTT AND SON.

Mr. Gambler Bolton, F.Z.S., will deliver his lecture, on "Wild Animals in Captivity and Domesticated Animals," illustrated with 150 slides from his well-known studies, before the Uttoxeter Am. Phot. Assoc. on November 4th.

The Eastman Company, of Rochester, U.S.A., have been successful in restraining two of their old employes from using or employing certain secret processes for the manufacture of films and bromide paper, which they had learnt whilst in the plaintiff company's employ.

Lady Murray informs us that owing to the large increase in Indian and colonial business of the sale of her excellent sensitised paper, she has been compelled to change to more commodious rooms, situate at 18, Chichester Road, Westbourne Square, W.

# How to Make a Set of Photographic Apparatus.

By H. J.

## CHAPTER X.

### THE INSTANTANEOUS SHUTTER.

I HAVE found it a matter of much difficulty to decide on the form of instantaneous shutter I should describe in this series of papers, and after hesitating for some time I have settled on the two forms which I am about to give instructions for making, as being most suitable for the purpose, as they are both quite efficient for the purpose they are intended for and they do not require any very exact mechanical work. Had it not been for the reason that I was afraid of putting in too much of the latter, I should have decided on a shutter with a roller-blind, as they are

very good ones; but while there might have been some able to make it, by far the largest majority would be obliged to throw it on one side, therefore I have decided on what I believe will suit most of my readers, and if some of the more clever ones wish for a more elaborate shutter, I will write a special paper on the subject—that is, with the Editor's permission.

I have written these few lines of explanation in case some might say, or think, that the shutters in this paper are too simple to find a place in the pages of our paper; but you must bear in mind that the simpler they are the less likely they

FIG. 81.

are to get out of order, as many of those will allow who have spent pounds on a shutter, and after all come back to one which did not cost so many shillings.

I will first describe the shutter shown in figs. 81 to 85. It can be made of various sizes, but the one I am describing is suitable for a lens with hood of  $1\frac{3}{4}$  in. in diameter, or under, and it is made wholly of mahogany. The back piece A in the figures is 6 in. by  $2\frac{1}{2}$  in. and a half inch thick. On the sides of this are screwed the two pieces B; these are  $\frac{3}{8}$  in. wide by  $\frac{1}{4}$  in. thick, and a rabbet is made in each of them  $\frac{1}{8}$  in. each way, so that when they are fixed on the back a groove is formed down each side, as shown in fig. 82;

FIG. 82.

FIG. 83.

but before screwing them on, the rabbetted part must be cut away for half the length, as shown in figs. 81 and 84, so that the top half of shutter is of the section shown in fig. 83. A top piece can now be screwed on to the back to bring it out level with the side pieces C, figs. 81, 84, and 85, and a bottom piece D in the same figures; this must project an eighth of an inch in front of the side pieces. I find I am getting on too fast. Before screwing on the bottom piece D, a slot must be cut out of the back as at E, fig. 83; as will be seen, it is cut as a dovetail, and should run up the back for a

distance of 2 in. Into this slot fit another piece of wood, but only one inch long; it must have a trench cut out for a part of its length as shown; and in the bottom end—that is, the end which is left intact—a plug-nut must be inserted.

This sliding piece can be placed in the dovetail slot, and the bottom piece can then be screwed on, and a hole made

for the screw to pass through into the nut. The hole can now be bored through the back for the lens; it should be in the middle widthways, and about  $1\frac{3}{4}$  in. from bottom to centre of hole.

A piece of wood an inch wide can now be fitted so that it will slide easily up and down in the grooves; this is shown at F, figs. 81 and 85. It must have no more play than is absolutely necessary, either in thickness or width, but be just loose enough to move without friction. Another piece of the same thickness must now be fitted into the lower part of shutter. In width it must just slide in the grooves as before; in length it must reach from the bottom of shutter to where the grooves are cut off. It is shown in the same position at G, fig. 84, but more clearly in section in fig. 85. These two pieces F and G must now be

FIG. 84.

hinged together, using a hinge the right length to reach across G. After this is done, and F placed in the grooves, and G opened up so that it lies flat against back of shutter, the two pieces should fall by their own weight to the bottom. If they will not do so they are too tight, and must be eased until they do, when they may be considered right. Two small round head-screws must now be inserted in the piece F in the positions shown in fig. 81, and also one in the sliding piece E at the bottom of the part cut away, or rather at the bottom of the trench formed by cutting a part away. The small brass trigger H can now be screwed on as shown, and the spring I, fig. 85, screwed to the flap G. This will finish the shutter, and I will now explain the action.

Place a rubber band on the three screws, as shown in fig. 81, and push up the sliding piece F until the piece G will fold down and rest on the bottom piece D. A slight turn of the trigger will hold it in its place until required to be set off; to do this press on the end of trigger, when the flap will be released and started on its upward journey (as shown by dotted circle in fig. 85) by the spring I, when it closes against the back of shutter, the rubber band comes into operation and closes the aperture by pulling the sliding pieces to the bottom. This is therefore a combined flap-and-drop shutter, which is recommended by some of the highest authorities, for its ability to give more exposure to the foreground than to the sky; and though some may object that it is likely to cause the camera to shake, it is not so in practice, as when the flap flies upwards the air forms a kind of cushion

FIG. 85.

which effectually prevents any jar, but causes it to work beautifully and smoothly. The shutter can be regulated for fast and slow exposures by turning the milled-head nut at bottom, which tightens or slackens the rubber band as necessary, and the speed can be regulated further by using weaker and stronger bands as slower or faster exposures may be required. The pneumatic release can be added to the shutter by making the catch part of trigger to project at right angles under the bottom of shutter, and fixing the bulb end of tube between the two so that when the ball is pressed the expansion of the bulb will force the catch back and release the flap.

We will now turn to shutter No. 2, which is illustrated in fig. 86. For the back of this a piece of half-inch wood, 4 in. by  $2\frac{1}{4}$  in., is required, and on this, all round, strips must be screwed so as to form a shallow tray about  $\frac{3}{16}$  in. deep. The hole for lens must now be bored; this must be in the middle lengthways, and one inch from the bottom of shutter back to centre of hole. Now screw on the slotted plate L, level with bottom of shutter, and fit a piece of wood about an inch and a half long, and the width of brass plate, so that it will slide from end to end of shutter easily between the plate and back of shutter. The shutter itself must now be made out of a piece of wood  $\frac{1}{8}$  in. thick, or, what is better, a piece of ebonite; the shape is shown at M (the dotted circle

FIG. 86.

shows the hole for lens in *back*, and not in shutter). This is fixed by the screw at N, so that it will move up and down freely. The short arm O must be made next, and fixed to the shutter, and also to the sliding piece by screws as shown, the screw in the latter passing through the slot in brass plate. Another small screw must also be inserted in the sliding piece as shown at P; this acts as a guide to keep sliding piece straight, otherwise it might get round end-ways sometimes and cause a hitch in the working of shutter. The brass trigger R must be fixed next, a part of the side, or rather end, being cut away to allow the end to project through.

The screw S can now be inserted in the slot at the end as shown, allowing the head to stand up sufficiently to allow an india-rubber band to be slipped over it. The shutter can now be tried. Place a moderately strong rubber band on the two screws P and S and slide the former back to the end as shown in drawing, allowing the trigger R to engage in the notch in shutter. The band will now be stretched tight, and on the projecting end of trigger being pressed slightly upwards the shutter will be released, and the band pulling the sliding piece along the slot in brass plate, the lever O will cause the shutter to fly up and down again, thus opening and as quickly closing the lens aperture.

† If the pneumatic release is preferred it can be managed by fixing a small brass tube to the end where trigger projects as shown at T. In this a piston is fitted, and the rubber tube of ball being attached to lower end of brass tubing, a slight pressure on the ball will cause the piston to rise and push up the trigger. The front of shutter can be covered with a thin board, except the slotted plate, which must be left open for adjustment of shutter.

Various speeds can be obtained by the use of rubber bands of different strength, and a sliding piece can also be fitted on to front board with various size holes, so as to act as different stops. Then the shutter can be made very serviceable either for fast or slow work, and there is nothing about it to get out of order. Though I do not think it so good as No. 1 for general work, it is equally as good as regards shaking the camera; as the only time that it is possible to shake, is after the exposure is over, when of course it does not matter.

I give below a list of fittings with prices of same, according to my usual custom.

*For No. 1 Shutter.* d.

Hinge for flap .. .. .	3
Milled-head screw to regulate speed .. .. .	4
Spring (I) and catch (H) .. .. .	6

*For No. 2 Shutter.*

Slotted brass plate .. .. .	6
Lever (O) and trigger (R) .. .. .	6
Pneumatic tube and ball for either No. 1 or 2, 2s. 6d.	

(To be continued.)

## The Manipulation of Chloride of Silver Gelatine Paper.\*

By EDWIN UNDERWOOD.

In laying before you my method of manipulating chloride of silver gelatine paper, I make no pretensions to exhaustiveness or completeness either as to the various ways in which the paper may be treated or of the various makes obtainable. Besides some that I made myself some years ago, the only brands I have used much are the Ilford, the Eastman, and the Birmingham Photographic Company's Criterion; most of my prints being on the Ilford and the Birmingham paper. Although the general treatment of them is the same, they all have various characteristics which require to be known. They differ from each other in the colour they assume in the printing, and they behave differently in the after operations of toning and fixing. You will see that they are over-printed certainly not more, if so much, as albumen prints, and in this particular they compare favourably with some of the older gelatine papers, which required such a depth of over-printing as to render it difficult and uncertain to print to a nicety on them. The loss of depth with these papers occurs mostly in the washing before toning, and they lose but little in the fixing. They lose less with the combined toning and fixing than with toning and fixing done separately. Gelatine chloride paper must be kept dry, as it is more susceptible to damp than albumen paper. If not kept dry it will give patchy and uneven prints. If the printing is done out of doors it will be advisable to have an india-rubber pad in the frame at the back of the paper, otherwise it is not necessary. After the printing comes the toning, and the formulae for toning these papers are very numerous.

The toning and fixing operations may be conducted separately, or a combined toning and fixing may be used. The simple toning bath varies from the single sulphocyanide of ammonium and chloride of gold one, to one of half a dozen chemicals, and some of the combined baths are stupendous mixtures, containing alum and lead salt abominations. Why they are out of place is because they decompose a portion of the hyposulphite of soda, and liberate a portion of the sulphurous acid and sulphur which is held in combination. These will combine with the silver of the image and form sulphide of silver, causing what is known as sulphurisation or sulphur toning, and prints so toned are liable to fade and discolour. I have here a series of eight prints toned and fixed in the combined bath. Four of them are on the Eastman paper, and four of them on the Birmingham Company's Criterion paper. Two of each sort of paper were treated in a bath containing:—

Hyposulphite sodium .. .. .	4 oz.
Sulphocyanide of ammonium .. .. .	100 gr.
Phosphate sodium .. .. .	60 "
Chloride of gold .. .. .	2 "
Water .. .. .	16 oz.

The other four were treated in a bath in which 100 gr. of borax

\* Read before the Birmingham Photographic Society.

replaced the phosphate of sodium, and you will see on inspection that there is no perceptible difference in tone. All combined baths require an unfixed print or some scraps of silvered paper soaking in some hours before use. The one great recommendation of the combined bath is, of course, that it is so much less trouble than toning and fixing separately, there is much less swilling and washing. The danger attending its use is that when it has been in use some time, the fixation of the prints may be imperfect, and although the gold may be exhausted, it will go on toning. Now, these conditions, imperfect fixation and sulphur toning, are precisely the conditions under which the print may be certain of a short life, and will result in the unmerited condemnation of paper and bath.

I know of no reason why, if the bath be used fresh and with sufficiency of gold, the toning and fixing should not be complete, and the prints be as permanent as if treated in any other way; but if the bath is used too much, you get yellow-stained prints with the half tones, a most unpleasant colour. I have here some prints made on the Ilford paper more than twelve months ago and treated in the combined bath. You will see that they are warm in tone, and the combined bath has in my hands given better results in this particular than separate toning. When using the combination bath the colour is judged from the surface, not by looking through, and the prints dry perceptibly darker. Coming now to toning pure and simple, the bath I have used mostly is the Ilford formula, viz.:-

Sulphocyanide ammonium	...	...	...	...	30 gr.
Chloride gold	...	...	...	...	2½ "
Water	...	...	...	...	16 oz.

When a tube of chloride of gold is broken it has to be made up into a solution of definite strength, and will usually be found to be decidedly acid. A small scraping of ordinary chalk—not French chalk—should be shaken up in it to counteract this acidity. The prints require washing in several changes of water before toning, and they should not be left soaking in the first two changes. On immersion in the toning bath, the prints change more or less with various papers to a yellow colour. This soon passes away, being succeeded by a purplish-brown, and the progress of the operation is judged by holding the print up against the light. At first the print appears of a reddish colour all over; the next stage the lighter half tones become dark or black, followed by the middle tones, and when the red has almost disappeared from the deep shadows the toning is complete, the surface colour being of a peculiar blueish purple. A washing in two or three changes of water follows a fixing in hypo-sulphite of sodium—3 or 4 oz. to the pint of water, a small bit of washing soda being dropped in to counteract possible acidity. The prints require a final washing of about two hours under the tap or in a pan of water changed many times. This toning bath, as you will see from the prints, gives dark tones, being what I might perhaps call a warm black. With this bath I have been unable to obtain the lighter or brown tones on any of these papers. If the print is taken out while there is any considerable portion of red left in it, you have the shadows of a brown colour, but the lighter parts have toned completely to the warm black, and the result is an unevenly toned print, as in two I will pass round. With this bath, therefore, you have to tone completely, and it has the advantage that you can depend upon getting a very fair uniformity of colour in the prints. The bath will keep, and can be used for some time, but I prefer to use it not more than two or three times, adding, of course, more gold as required. It is recommended to use the old bath as part basis for a new one, but I prefer to make up a fresh one, having a weakness for new and clean baths. Most of the toning troubles with this paper will be found to arise from an insufficiency of gold, and we should be generous with the gold, remembering that the more gold the prints will take up the better it will be for their permanence. I have used the borax toning with the Ilford paper, and have obtained pleasing warm tones with it, as seen from these prints. The proportion is 90 gr. borax to 16 oz. water, gold 2 gr. more or less. Gelatine papers require careful handling, as the gelatine when wet is very soft and soluble. Advantage is taken of this softness when wet to squeegee it, as it is called, on to a surface of glass or other suitable non-absorbent material. When dry it is stripped off, and retains the impression, whether glazed or matt, of the surface on which it dried.

All mine are, as you see, matt-surfaced, and are done on ground glass, and as there is sometimes a difficulty experienced in separating the print, or some portions of it, from the glass, I have thought it best to give details. In the first place you must have the right sort of ground glass. The ordinary window description is of no use at all for the purpose, it is altogether too rough and coarse, and the prints will not separate readily, neither will it give the surface required. The sort to employ is such as is used for focussing screens in cameras. The first thing to be done is to make the glass thoroughly clean, and this I do with soap, soda, hot water, and a scrubbing-brush. I do not find acids, ammonia, or such like at all necessary. Give the glass a good scrubbing on both sides, and then wash thoroughly under the

tap, rubbing it all over both sides and edges, so as not to leave any trace of soap or dirty water, then dry off with a perfectly clean cloth. This done, it has to be rubbed all over with French chalk on a piece of soft rag; use plenty of the chalk, and rub it well all over, but not hard enough to bruise the tale. If the chalk sticks on to any particular part, and it will not rub off, it is a patch of dirt, and is insufficiently washed. It is not necessary to wash the glass every time it is used, if it is kept clean and not finger-marked on the surface used; it only requires rubbing lightly over with the chalk. Another point, too, worth noting is, after the glass has been stripped from a few times, the adhesiveness of the print is very much reduced. The first time of stripping, the hold on to the glass is so great that you feel sure something will happen, but after a few times the print comes away quite easily and altogether. The print may be squeegeed on to the glass direct from the washing water, or it may be dried first. I usually let mine dry and lay them down on the glass some other convenient time. Taking a dry print, then, it is immersed in clean water till quite limp, which will be in a minute or two, but do not leave it soaking for a length of time. Having then lightly dusted off the French chalk with a clean, dry cloth, we brush over the surface of the print while under water with a camels'-hair brush to remove air bubbles and any dirt there may be, and lift out the print by two corners, bringing with it as much water as we can; then we lay it down on the glass in such a manner as to cause the water to drive out the air from between, and finish with a few light strokes with a roller squeegee. When it is thoroughly dry, but not before, the point of a knife is inserted under a corner, and the print lifted from the glass.

### PHOTOGRAPHIC SOCIETY OF GREAT BRITAIN.

#### CONCLUDING NOTICE.

THE work of Adam Distin shows him to be as strong as of old, and he has still the courage to attempt pictures which are regarded by painters as quite beyond the sphere of the camera, except perchance when employed in translating their work into monochrome. It must be admitted that when story telling is attempted by the photographer, the difficulty of giving true life and reality to the expression of the models is so great that the successful efforts are few and far between. As might be expected from such a conscientious worker, the number of pictures exhibited by Mr. Distin since his first great success, "In the Gloaming," has been very limited; and it is only at long intervals that his characteristic productions have appeared on the walls at Pall Mall. This year the two pictures he has sent exhibit the well-known individuality of the worker, but the preternatural gloom has been considerably lessened and the artistic gain is very great in consequence. As in former work, the accessories have been well subordinated, but the method is less visible. "The Rehearsal" has a distinct element of fun in it. An enthusiastic performer on brazen instruments is breathing—or rather blowing—his soul into a mighty brass horn; but the strong, if not sweet, sounds have no effect on an old lady who is fast asleep in her chair. She is probably stone deaf, for how otherwise could she be so utterly oblivious to the mighty sound completely within ear-shot? In contrast to the energetic action and puffed-out cheeks of the performer, the placid expression on the old lady's face is highly ludicrous.

"The Highland Smugglers" is also a well thought out picture. The fire is blazing away under the still, and the arch alchemist, who is no other than Mr. Distin himself—and I hope the exciseman will not read these tell-tale lines—is busy transforming the malt wort into potent spirit, but is arrested in his labours by some doubtful sound. A kilted assistant is eagerly craning his neck to the key-hole of the door. The pose of this figure well expresses anxiety and doubt. The story is well told, and the picture may be considered quite up to the high standard attained by Mr. Distin.

"Evening Ebb," by P. B. Broomhall, is a small picture, but a striking one for all that, and well shows that with effective light and shade a picture may be constructed of the simplest materials. In the one under notice there is a mill, not particularly picturesque, and a muddy river near it. A boat is moored near the mill, and a shallow creek trails its snake-like course through the foreground. The light on the wet mud is very effective, and gives point to the whole picture.

The snow pictures by Mrs. Main, called "Frost and Sunshine," are certainly very fine, and perhaps the most striking feature is the wonderful rendering of snow in shadow. In one especially the high lights are most limited, and the effect of the great masses of snow in half tone, with only here and there a magic touch of high light, is extremely beautiful. There is an absence of the excessive blackness in parts so frequently met with in snow photographs, whilst the delicacy of detail could not be surpassed. The frost studies of G. Renwick must not be overlooked, for there is one hoar-frost scene that it would not be possible to render more perfectly.

"The Love Letter" has been treated by A. Burchett in a manner that is well within the resources of the photographic art, and the result is a great success. The model is graceful and sympathetic, and she has done her part well, for the pose is easy and unstudied. Simplicity of treatment pervades the whole picture. The texture of the drapery is technically perfect, but it does not obtrude itself into notice for all that, and the background does its part in producing harmony throughout the entire picture, which is a worthy successor to "The Knight," exhibited last year by the same gentleman.

E. Lambert has become an executioner with a vengeance with his "Five Studies of Heads." Poor young ladies! What had they done that they should be taken direct from life, even with the aid of a single landscape lens? There they are, all five of them, decapitated and hooped in by circles that will only just contain their heads, and to make matters still worse they are touched to death afterwards.

The portrait of Herbert Sims Reeves by Douglas Pym, is another striking example of the misuse of the retoucher's pencil, for all the lines of manliness have been removed, and in consequence the head is extremely effeminate. A lesson might be taken from the portrait of Professor Herkomer, by Gabell and Co. This picture is perhaps the best example of portraiture in the gallery, for the pose is so easy and unstudied, and the expression full of character; but the point to which we wish specially to draw attention is judgment displayed by the artist when manipulating the negative, for there is no evidence of serious work upon it at all; that is to say, laboured dotting and hatching, which is the curse of modern photography, is apparently conspicuous by its absence. It is true that there is a little work with chalk upon the print, but there is no attempt to disguise it, and on the face it is only used here and there, not to obliterate lines, but to soften down a little crudity in the lights. Contrast this face, which is almost rugged with its life and vigour, with a few of the smooth lifeless productions near it, and surely a most profitable lesson may be learned.

Seymour Conway's Lake subjects are full of light, and that is something to say when the craze just now is to depict nature in her more gloomy moods. In one or two the sky is too light, but in one called "After the Mid-day Meal" the clouds are shown dropping down over the mountain tops. E. Benson's Westmoreland subjects, like those above mentioned, are well selected, and show photographic work of a high character.

The charming little lady who occupies such an exalted position on the walls at Pall Mall is an effective specimen of child portraiture by W. M. Warneuke, and has helped him to a medal.

J. A. Rivington has been most ambitious in his efforts at picture-making, but he has scarcely been successful. He has prepared his Egyptian accessories and background after such great archaeological research, that the beholder is so busy with the task of deciphering the hieroglyphics, that he overlooks the fact that the great "Cleopatra" is before him. She has prepared for her journey to northern shores, for though she has retained her Egyptian head-gear, she has put aside her diaphanous drapery appropriate to the banks of the Nile, and in addition to some good thick drapery, has put on one or two extra petticoats in order to be well protected against the ruder climate.

H. W. Bennett has some successful seascapes, the best of which are "A Stiff Breeze" and "Coming Home." The "Views in and around Venice," by G. W. Tyser, also deserve notice. "Sunset on

the Wey" is one of the best pictures produced by T. M. Brownrigg for several years past, for there is a breadth of light and shade not usual in this gentleman's productions. His work is always technically good, but he is now on the right artistic track, and has only to proceed boldly in order to score still greater successes. A. W. Gottlieb has obtained such a beautiful purple bloom on his "Bunch of Grapes" that they look most tempting.

Gabell and Co. are certainly most successful in portraiture, and the picture of "Miss Eva Moore" is quite free from the ordinary conventionality of the portrait studio. Special note should be taken of the projected shadow of the head on to the background. The portrait of "Miss Eruthea Halse" should not be overlooked, for the pose is strikingly fresh. This is the sort of work to raise the status of photographic portraiture.

The Autotype Company exhibit a number of enlargements which are, perhaps, superior to the work of past years. A Grecian study shows the importance of looking after trifles. A young maiden in Greek costume is performing on the double flute. The operation is a difficult one without doubt, but surely the difficulty is increased when the holes of one of the flutes are turned downwards and the young lady's fingers are actively occupied on the bare part of the tube. This glaring error probably scarcely shows in the small negative, but in the enlarged picture it is far too palpable.

Maroon flock mounts ought to be relics of a barbarous age; a few still remain, however, but after this year's experience it is to be hoped they will be seen no more. The portraits are so peppered all over by the flock dust that the quality of Mr. J. Byrne's work really cannot be properly seen. This is sorry consolation to the exhibitor immediately below, for the beautiful series of hand-camera pictures are so overpowered by the maroon-flocked frame with its many openings, that their exceptional merit will be overlooked by a large majority of the visitors to Pall Mall. These little gems are by W. Thomas.

W. C. Beetham's "Haunt of the Moorhen" and "At Work by the River" are both capital pictures. The first is a landscape without figures, and the balance of light and shade very artistic. At a distance the line of shade made by the trees on the right is too straight and formal, but this defect is not so apparent when near enough to properly judge the picture. Masses of light and shade are always best judged in a dim light or from a distance. This is well known by artists, and should be equally well known by photographers. In the second picture there is life and action. Men and horses are at work on the bank of a stream. The pose of the lad near the foremost horse is very unconstrained and natural, but the man a little further off is evidently looking at the operations of the photographer. The whole group, however, is bold and striking.

C. Court Cole, in his picture called "Evening," has produced an extremely fine work. An unusually beautiful evening sky is reflected in a mirror formed by shallow water, but broken here and there by mud or wet sand. As a picture it might have been perfect but for one grave fault. A boat is placed exactly under the sun and so disturbs the harmony that the beholder feels vexed he is unable to move it a little to the right or left, and so get it into the right place for a perfect effect. It is an illustration of the limitations of photography, for a painter would have moved it out of the way at once, but the photographer is powerless, and therefore it must remain where it is—a blot in an otherwise very beautiful picture.

F. Whulley has made a bold attempt in his pictures called "Worn Out," and there is a great deal in it to commend itself to notice. The subject is a painful one, and beyond the province of photography. A sick child is asleep, and the tired-out father, who has been watching by the bed-side, has dozed off, for the newspaper has dropped from his listless hands. The candle has been screened from the eyes of the sleeping child by a book, and dawn is creeping through the small lattice window. In such a scene the light and shade would be strongly accentuated, but in the present picture the light from the candle plays no part, and that from the window very little indeed. The picture is really lit by a subdued studio light. The pose of the sleeping man is very natural, and the picture has been well thought out; but still it must be regarded as yet another illustration of the limits of photography.

The Canterbury Cathedral interiors by T. H. Morton are very successful, and there is great freedom from halation in most. The one of the crypt is the finest we have yet seen of this most striking subject.

Harry Tolley's "Christmas Time" is worthy of his reputation as an artistic worker. The scene is a lane in winter, and there are dark trees covered here and there by snow. Human interest is given to the scene by the group of sportsmen with their guns and dogs; and at least one of the party is well loaded with game. A lesson may be learned by comparing two views of Calder Abbey, Cumberland. The one by Mr. Tolley at once strikes the eye as a very artistic production. The dark masses of trees on the right, and their long shadows, are contrasted by light trees in the middle distance, whilst

the arcade of ruined arches, with the alternate play of light and shadow upon them, gives distinctive character to the scene and helps to complete the artistic composition of the picture. The other view of Calder Abbey, by S. Bourne, is quite an uninteresting picture, and not likely, therefore, to attract much attention.

J. A. Hodges has several artistic pictures on the screens, but the two best are very badly placed. The one called "Twilight" is an artistic gem, which, fortunately, we had seen before. It was one of the most striking pictures in the collection shown by the members of the West London Society last winter, and on that occasion gained an award. On the back of one of the screens it cannot possibly be seen, and might be called "Night"—midnight, in fact. "Home before the Storm" is more fortunately placed. The effect of the shadows of the boats on the wet sand is striking, and the black cloud gives warning of bad weather.

The nigger newsboy "Counting up his Profits" is a very effective picture by H. S. Harmon. There is great simplicity of treatment, and the picture explains itself without need of title. The boy is leaning against a wall on which the shadow of his head falls with striking effect. Of course, he is very busy turning over the coppers with great care.

"The Village Cobbler," by G. A. Nelson, furnishes a homely subject, and the scene is not overdone with accessories, whilst the chiaroscuro is simple and effective. A piece of the right-hand corner, however, might be cut away with distinct advantage, for it would help to concentrate the interest. The picture of reapers by the same gentleman is another illustration of striking chiaroscuro, and the strong side light has been used with great effect.

M. J. Harding's picture called "A Mountain Stream" depicts a shallow boulder-strewn river, and the point of view has been well selected for artistic effect.

F. Muller exhibits two sets of cabinet portraits, admirable in pose and delicate in lighting. The most striking thing about them, however, is the grace and beauty of his lady models, and their natural yet animated expression.

In J. B. Obernetter's landscapes there is a striking absence of black shadows, and they speak well for the good printing quality of the Obernetter paper. They are besides very artistic in selection, and quite hold their own against similar English work.

The auto-gravure work by the Autotype Company shows distinct advance, and though the picture which has taken the medal is of considerable dimensions, there does not appear to be much after-work with the graver, and this cannot be said of the pictures in the immediate vicinity done by other workers. Mont Blanc, taken at a distance of fifty-six miles by Dallmeyer's telephotographic lens, attracts a great deal of attention. It certainly is a wonderful production, and F. Boissonas well deserves the medal given for his very remarkable photograph.

The examples of the Woodbury gravure process well demonstrate its capacity for book illustrations.

In conclusion it may be said that the Exhibition of 1892 presents no startling innovations, but the average of the work sent in is distinctly higher. There is a strong tendency to forsake Nature in her gay and brighter aspects, or where these are depicted to considerably lower the key, and so take out much of the light and gladness. The more sombre mood, however, is selected by preference by the advanced school. This is all very well, and the effect of their work may be productive of good in the future; but we hope fashion will not run mad, and that there may be determined workers for the advancement of the art side of photography who will not hesitate to grapple with Nature in her gladder mood.

There is greater variety of colour in the prints shown this year than perhaps ever seen before, and though the examples on albumenised paper are very limited, both bromide and platinum prints have departed mainly from the cold grey of former years, and offer a great variety of tints. We are pleased to see carbon so much to the fore, and hope next year to see it improved backwards—that is to say, to the beautiful black shown in the illustrations to the first edition of the manual issued by the Autotype Company. The print referred to is from a negative by the late Robert Faulkner, and is in our estimation something for the photographers of to-day to live up to.

Rough paper has been used with striking effect by those who know how to use it, but there are several examples where it has been most woefully misused. It is to be hoped, however, that the unfortunates will profit by their failures. The great object of the Exhibition should be, not profit, but education for the whole photographic community, and by a careful examination of this year's pictures each one may learn something.

#### PORT ELIZABETH (CAPE OF GOOD HOPE) AMATEUR PHOTOGRAPHIC SOCIETY.

The first annual exhibition and entertainment was held on September 8th, and the proceedings were opened by the President, Mr. A. Walsh. Vocal and instrumental music was given at intervals

with comic recitations. During the evening a negative was taken by flash light and developed in the lantern, a slide also being made in the same way. Considerable interest was shown in the fine collection of picture exhibits, and a series of lantern slides were also shown. From all reports the South African society is in a very strong and flourishing condition.

#### BEDFORD AND DISTRICT CAMERA CLUB.

At the exhibition of this society, held on the 11th, 12th, and 13th inst., the judges, Messrs. Pringle, Cembrano, and Rev. F. C. Lambert gave the following awards:—Class I., bronze medal, withheld; certificates, J. E. Austin and Rev. V. Macdona. Class II., medal, J. E. Austin; certificate, Geo. W. Ramsay; certificate, withheld. Class III., medal, withheld; certificates, T. B. Judson and Rev. V. Macdona. Class IV., medal, A. Tagliaferro; certificates, J. E. Austin and J. W. Evans. Class V., medal, J. E. Austin; certificate, withheld. Class VI., medal, G. W. Ramsay; extra medal, P. Ennis; certificates, J. W. Evans, J. E. Austin, and C. E. Cowper. Class VII., medal, A. R. Dresser; certificate, withheld. Class VIII., medal, A. R. Dresser; certificate, J. H. Gear. Class IX., medal, J. H. Gear; certificate, G. W. Ramsay. Class X., medal, A. R. Dresser; certificates, C. H. Davis and J. Samuels. Class XI., medal, Miss Mother-sill; certificates, Miss Perrott Smith and Miss F. Talbot. Class XII., medal, Master Aubrey Rogers; certificate, Masters W. M. Vandeleur and Basil Macdona. Class XIII., silver medal, A. R. Dresser; bronze medal, G. W. Ramsay. Series of lantern-slides each evening—by Andrew Pringle, "The Alhambra;" the Rev. Albert Macdona, "Norway and the Fjords;" and the Rev. V. Macdona on "Italy and Rome." The committee are to be congratulated on having made both a financial and general success, though considerable dissatisfaction is felt that many well-known workers sent in medalled pictures in other classes than that set apart for the same. Somebody has been rude enough to ask if this is pot-hunting?

#### STOCKPORT AMATEUR PHOTOGRAPHIC SOCIETY.

The exhibition, which is the first inaugurated by the society, but which it is hoped to make an annual affair, is a very comprehensive one, and the pictures include examples of almost all the processes of photography extant. The Mayor of Stockport (Lieut.-Col. Turner, J.P.) does his own enlargements, and, generally speaking, they are splendidly executed. One of his finest pictures on view is King's College, Cambridge, the detail in which is capitally reproduced. His other works include "Hougomont Farm," "Grindelwald," scenes in Alder and Lucerne, Adlington Park, and the river Cam, also a splendid specimen of statuary photography—the Lion of Lucerne. A view of the Stockport cricket pavilion is a very good enlargement. Mr. Oliver Coppock is represented by a lot of really artistic work. He makes a speciality of animal studies, and in this connection the "Lion at the Zoo" is perhaps his best production. How Mr. Coppock has succeeded in obtaining such an admirable view of the lion and has managed to obviate focussing the bars of the animal's cage is a matter of wonder. "The Elephant" at the Zoo is also a first-rate enlargement. Mr. Coppock has also a few effective specimens of landscape work, including views from Grange. Mr. H. N. Cooper has just been awarded the Bronze Medal presented by the AMATEUR PHOTOGRAPHER, and his pictures are indeed beautiful works of art. Mr. Cooper's photographic inclinations seem to tend mostly in the direction of marine views, and he has some excellent examples. Among the best of his instantaneous views are three or four photographs of yachts at sea, the light and shade being perfect, and a little boy laughing, the expression of which is admirable. The training ship *Indefatigable* is another marine view. "The Thames by Moonlight" is a clever production, the sky effects being exceedingly good. Three cloud pictures by Mr. Cooper are also very fine. In addition to his more ambitious efforts, Mr. Cooper has on view a number of stereoscopic pictures of good quality. Mr. B. S. Harlow, the energetic Hon. Secretary of the Society, has done some very effective and carefully taken views. Several scenes at Moreton Old Hall, near Congleton, are reproduced with excellent effect, some of the interiors being marked by very great delicacy. His platinotype, "Farm Work," also makes a pretty picture. Mr. Harlow has in addition some excellent views of Liverpool shipping. Mr. George Hilderley is well represented. Perhaps his most attractive exhibits are a number of miscellaneous views from Wales, Switzerland, Holland, and Belgium, also figure studies. Mr. T. Kay, J.P., the President of the Society, has not any pictures in the exhibition. The department to which Mr. Kay pays most attention is the production of lantern slides, a series of which, illustrative of Greece and Athens, will be exhibited next week. Mr. S. Kay, judged by his examples, is a very painstaking photographer. He is represented by a frame of about 60 views, mostly landscape. Mr. H. J. Heginbotham's views are mostly taken from the neighbourhood of Marple, and include the Aqueduct and the Goyt. The latter river scene is a very nice, soft picture, distance and the shadows being excellently reproduced. Mr.

W. Scott has enlargements of "Menai Straits"—a very delicate work—"Llanberis," "On the Goyt," and "Bramall Lodge." Mr. T. Bedford has an attractive set of enlarged photographs, which comprise "The Packet House" at Worsley, and others. He has also a collection of smaller views of Moreton Hall and Miller's Dale. Mr. C. Dawson has a view, the only carbon prints in the exhibition—"Ashford in the Water," and "Mill at Rossett"—both of which are strikingly effective pictures. Mr. Dawson is also represented by a mount of snapshots and several half-plate pictures. Three very good enlargements from Mr. T. Clayton's negatives of Douglas, Port Erin, and Conway Castle are characterised by splendid colour. Mr. E. F. Ward has on view some very pretty half-plate landscapes, which are highly creditable, especially when it is considered that Mr. Ward is one of the most recently enrolled devotees of the art. Mr. J. Bailey is represented by a number of well executed half-plate landscapes, chiefly Irish, carefully finished in every detail. Mr. G. H. Broome's views of Adlington, Bolton Abbey, and Derbyshire are very attractive. Mr. W. B. Leigh has on view a number of half-plate landscapes of Devonshire. The only examples of machine photography are sent by Mr. Cephas Froggatt, jun., and represent the Palmer Mill engines. The detail is first-class and the views are an admirable pair. Mr. Froggatt has also some smaller pictures of landscapes. Mr. F. Clayton, Mr. G. Ball, jun., and Mr. J. H. Beech also send frames of interesting studies. Mr. Joseph Froggatt has one or two interesting whole-plate pictures representative of English sports—football, cricket, and bowls—besides which he has a frame of views from Haddon. Mr. T. W. Aveyard is represented by a series of Derbyshire views. Mr. Harry J. Robinson's sets of landscapes, taken principally in the Isle of Man and the Isle of Wight, are admirable works. Mr. R. Venables has some carefully finished half-plate prints of good tone. Three frames of quarter-plate prints, sent by the Mayor, in addition to those already mentioned, occupy a prominent position in the exhibition. Mr. J. Jepson has on view some first-rate architectural enlargements, and a number of stereoscopic transparencies by Mr. James Needham are interesting exhibits. Some time ago a determination was formed by the members to make a photographic survey of the town, but only three members—Messrs. H. Robinson, Cooper, and Harlow—have sent in views. Some of them are excellent character studies. The following gentlemen have acted as a hanging committee, and in their work have displayed much taste:—Messrs. G. Hilderley, O. Coppock, H. N. Cooper, and B. S. Harlow. Each evening at 8 o'clock there is to be an exhibition of lantern slides (prepared by the members) by the aid of the oxy-hydrogen lantern. The syllabus comprises views of Switzerland, etc. (the Mayor), Isle of Wight (Messrs. W. B. Leigh and H. J. Robinson), Greece and Athens (Mr. T. Kay, J.P.), and miscellaneous collections (Messrs. H. N. Cooper, O. Coppock, H. D. F. Dobson, and other members).

**Mr. F. E. Ives**, of Philadelphia, has sent us a circular about his heliochromoscope, which he now offers with six chromograms and special lamp for night illumination at 50 dollars. Extra chromograms may be obtained at 10 dollars the dozen.

**Photographers' Benevolent Association.**—A committee meeting was held on October 7th, in the rooms of the Photographic Society of Great Britain, Mr. W. Bedford in the chair. The minutes of the last meeting were read and confirmed, after which the Secretary reported that since the last meeting he had received intimation through Mr. Bedford of a legacy of £52 10s. left to the Association under the will of the late Mrs. Emma Mary Evans. Subscriptions had been received from four new members, and small sums from two collecting boxes. One case of distress had come before the Association. The applicant stated that he had been for twenty years a photographic printer, that his last employer had been obliged to discharge a portion of his staff through decreasing business, and that he (the applicant) had been three months out of work, and with his family was on the verge of poverty. He gave four references, including his last employer, and covering about fifteen years' situations. He asked for assistance in finding a situation, or a grant of money as a temporary relief. The Secretary had made inquiries from three of the references, all of whom gave the applicant an excellent character, and failing to find for him a situation, as a printer, recommended him for a different class of situation, which he obtained. On the proposal of Mr. Mackie, Mr. R. Child Bayley was elected a member of the Association, and Mr. H. W. Watts, Rangoon, Burmah; Miss Catherine Weed Barnes, New York; and Messrs. John Lewis and F. Gillard, both of Birmingham, were elected on the proposal of Mr. H. Snowden Ward. The arrangements for the lantern evening at the P.S.G.B. were fully discussed. The arrears of subscriptions were considered *seriatim*; various members undertook to personally wait upon certain subscribers, and the Secretary was instructed to write to the remainder.

## AFFILIATION OF PHOTOGRAPHIC SOCIETIES.

**FOURTH MEETING OF THE DELEGATES**, held on the 11th inst., at the Rooms of the Photographic Society of Great Britain, Mr. Mackie (North London Phot. Soc.) in the chair.

The Chairman announced the business of the evening to be the arrangement of a winter programme, but there was also upon the agenda the appointment of a working committee.

Mr. P. Everitt (London and Provincial Phot. Asso.) inquired if that had not been arranged at the last meeting, and the extract from the minutes was read, recording that it was deferred.

After some remarks by the Chairman, Mr. Marchant (North Middlesex Phot. Soc.), and Mr. Golding (Holborn Cam. Club), it was decided that the matter be deferred.

The Assistant-Secretary announced that a set of slides for circulation had been received from the Leeds Photographic Society, and sets promised from the Hull, Lancaster, and Madras Societies. The North Middlesex Society had also offered for circulation papers on "Gelativo-chloride of Silver Paper and its Manipulation," by Mr. J. C. S. Mummery, and "Notes on Landscape," by Mr. Pither.

Major Bruno (Southsea Phot. Soc.) stated that he was authorised on behalf of his society to offer a set of slides, and the offers of slides were accepted with thanks.

Mr. Everitt suggested a course of lectures on photo-mechanical processes, and after some remarks by the Chairman, Messrs. Clifton (Phot. Club) and Marchant, it was resolved that arrangements be made for a series of technical lectures, to be held, if possible, at 50, Great Russell Street, on some branch of photo-mechanical printing, and that a committee of three members be approved to make inquiries as to the best means of carrying it out.

**ADJOURNED MEETING OF DELEGATES**, held at 50, Great Russell Street, Friday, the 14th inst., Mr. W. Bedford (P.S.G.B.) in the chair.

Mr. Marchant called attention to the fact that there were no rules as to the calling of meetings of delegates, and thought the scheme ought to be put on a business footing, and suggested the appointment of a Chairman with power to call meetings and to be responsible for the agenda.

It was proposed by Mr. Everitt, seconded by Mr. Marchant, and carried unanimously, that Mr. Bedford be appointed chairman with power to call meetings and arrange the business.

The Chairman thanked the meeting for such an expression of confidence, and called on the delegates to resume the discussion left unsettled at the previous meeting, viz., the appointment of a committee to carry out the proposition as to technical lectures.

Mr. Warnerke (P.S.G.B.) stated he felt sure the parent society would regard this proposition in a sympathetic manner, and after some remarks by the Chairman, Messrs. Everitt, Mackie, Cox (North Middlesex Phot. Soc.), and Clifton, it was decided that the committee consist of the Chairman (*ex-officio*), Messrs. Warnerke, Marchant, and Everitt.

The Chairman referred to a circular that had been received from the International Union of Photography, the object and present position of which Mr. Warnerke explained.

A question was raised as to whether an affiliation of societies could join such a union, and after some remarks by the Chairman and Mr. Cox, Mr. Warnerke promised to obtain further particulars.

The Chairman asked if it were possible to obtain for circulation the lantern slides sent in to the Pall Mall Exhibition, and the Assistant-Secretary was instructed to see what could be done.

Mr. Zachariasen (Putney Phot. Soc.) proposed that tickets should be printed to be issued to all members of affiliated societies, to act as proof to the fact that the holders were members of an affiliated society, but, after a discussion, in which Messrs. Mackie, Clifton, and the Chairman joined, it was determined to obtain a stamp, and that the secretaries of the societies should be invited to send their ordinary members' tickets to the Assistant-Secretary to be stamped.

The Assistant-Secretary announced that at the present moment the papers, etc., at the disposal of the societies were as follows:—1. "Photogravure," by Mr. A. Dawson, with examples by various firms. 2. "A proposal for a National Photographic Record and Survey," by Mr. W. Jerome Harrison, F.G.S., with examples by the Birmingham Photographic Society. 3. "Photography applied to the Detection of Crime," by Dr. Paul Jeserich, illustrated by lantern slides. 4. Set of sixty Indian and colonial lantern slides. 5. Set of seventy-one lantern slides of Yorkshire scenery, by the Leeds Photographic Society. 6. Set of lantern slides by the Hull Photographic Society. 7. "Gelativo-chloride of Silver Paper and its Manipulation," by Mr. J. C. S. Mummery. 8. "Notes on Landscape," by Mr. F. L. Pither. 9. There was also an offer, of which several societies have availed themselves, by Mr. W. E. Debenham, to demonstrate either "Transparencies by the Carbon Process, or Collodio-bromide."

The meetings were adjourned.

## Societies' Notes.

THE report of the Richmond Camera Club to hand shows evidences of good work and a satisfactory balance. The meeting night is now altered from Friday to Monday, and for the future the Greyhound Hotel will be the locale.

Sir Albert K. Rollit, M.P., will open the Hackney Society's exhibition on Tuesday, November 15th, at 4 p.m. Messrs. Elliott and Sons' fine wave study will, at the close of the Pall Mall show, go to Hackney. Entries close October 28th.

Lady Brooke will open the Leytonstone exhibition on November 10th. Both Lord and Lady Brooke are amateur photographers.

The Cornish Camera Club will hold an exhibition of members' work at Penzance, which will open on December 5th.

The Chiswick Camera Club and the West London Photographic Society have amalgamated, and the official title for the space of one year will be "The West London Photographic Society, with which is amalgamated the Chiswick Camera Club."

The Brighton and Sussex Natural History and Philosophic Society are holding a series of competitions for members' work. Silver and bronze medals and certificates will be given away.

Stanley Show Photographic Exhibition will be held at the Agricultural Hall, Islington, from November 18th to 26th inclusive. Fifteen medals, including five gold, have been placed at the disposal of the judges, Messrs. Traill Taylor, H. Sturme, and A. Pringle. Classes:—(A) Instantaneous Cycling Subjects, sets of four; (B) Instantaneous General Subjects, sets of four; (C) Landscape or Seascape (with or without figures); (D) Lantern Slides, sets of six; (E) Pictures by Platinotype Process, any subject. Classes A and E are open; B, C, D, open to amateurs only. In C and E the medals being for single pictures, they should, if possible, be framed separately. Three medals in each class (gold, silver, and bronze) will be placed at the disposal of the judges for artistic and technical excellence. Diplomas of merit will be awarded for sufficiently meritorious pictures not gaining prizes. The entrance fee for any one class is 2s. 6d., or an additional fee of 2s. 6d. will entitle a competitor to enter for any or all of the other classes for which he is eligible. Entries close November 7th. No competitor will be allowed to exhibit more than twelve pictures in each class. Duplicate prints of prize-winning pictures are to be furnished to the Stanley C.C. The Committee will be very glad to receive pictures for exhibition and not for competition—such as medal pictures—(which cannot compete) or pictures illustrating particular processes. No charge for entries for such pictures will be made, but must be marked "Not for Competition." All work (except mounting and framing) must be done solely by the competitor. No competitor to take more than one medal in each class. No prize pictures to compete. *Regulations:*—Photographs: Each competitor must fill up the entry form supplied, and send it with the entrance fee to Herbert Smith, 29, Finsbury Pavement, E.C. All pictures must be mounted and framed. At the back of each picture must be written the name and address of the competitor, the number to which it refers in the entry form, and the class for which it is entered. A card must also be sent with the picture bearing the name of the competitor and the title of the picture. Name must not appear on the picture. Cards and labels will be supplied on receipt of entry. Lantern Slides: All slides must be of the ordinary size ( $3\frac{1}{2}$  by  $3\frac{1}{4}$ ) and properly marked at the two corners for the lantern; each slide must bear a consecutive number, which number, with the title against it, must appear on the entry form. Competitor's name must not appear on the slide. For further particulars see advertisement page.

The second annual exhibition of the East London Photographic Society, interspersed with vocal and instrumental music, will be held on Monday and Tuesday, October 24th and 25th, in the Lecture Hall of the New Tabernacle, Old Street, E.C. (near Town Hall). The judging will take place on Tuesday. Apparatus from the leading photographic firms will be shown. Tickets of admission, 6d. each, may be had of the Hon. Secretary, Mr. A. Wilkinson, 28, Shacklewell Lane, Kingsland, or any member of the society.

Mr. V. T. Gilmer, Manchester Buildings, Cannon Street, Birmingham, writes to us with regard to the formation of a new photographic society for Birmingham:—"Allow me to inform your numerous readers that a society for the promotion of photography amongst working men has been formed. Those who wish to avail themselves of the many facilities offered by the society kindly send in their names as soon as possible. The annual subscription fee will be 5s."

## Societies' Meetings.

**Ashton-under-Lyne.**—The weekly meeting held on the 13th inst. was devoted to an exhibition of members' lantern slides. Mr. J. W. Kenworthy presided. Although during the evening rain fell in torrents, about eighty members put in an appearance (including ladies). 266 slides were thrown on the screen, and the results show a very marked improvement on those of last year. The slides all round were of very good quality. The following members exhibited:—Messrs. Hodson, Turnbull, Platt, Hampson, Gill, Kenworthy, Dean, Lord, W. Marsland, Walter Chadwick, Wm. Chadwick, T. Chadwick, Cheyne, Hollingworthy, Glazebrook, and Hutchinson. Mr. R. T. Marsland worked the lantern (oxy-hydro.)

**Birkenhead.**—The Council considered the AMATEUR PHOTOGRAPHER Prize Slides worthy of special arrangements. They therefore engaged the large hall of the Y.M.C.A. last Thursday, and filled it with members and friends. The lantern was in the hands of Messrs. Archer and Sons, of Liverpool, and the slides were greatly admired. Mr. G. A. Carruthers, the President, was in the chair. During the evening the inevitable "funny man" distinguished himself as usual. It was when the portrait of one of the American competitors was on the screen—a gentleman with a head of hair of which any German musician would be proud—that four shrill notes reverberated through the hall. Not a word was said. The whistle expressed it perfectly, "Get your hair cut!"

**Birmingham.**—Ordinary meeting held on 11th inst., Mr. G. A. Thomason in the chair. Mr. U. B. Osborn read a paper on "Forgotten Processes, and Self-help for Amateurs." Mr. Osborn, during the course of his very interesting paper, described and illustrated some simple methods of making focussing cloths, various kinds of shutters, single and double dark-slides, dark-room and travelling lamps, a capital method of printing stereoscopic pictures which avoids the necessity of cutting and transposing the prints before mounting, and also many other things of interest to the amateur photographer. An extremely simple carbon printing process, invented about forty years ago by the late Mr. Pouncey, was very fully described. Mr. Osborn said he believed that the details of the process had never before received publicity. Several very beautiful prints made by the inventor of the process and by Mr. Osborn were exhibited. A plate washer, made by Messrs. Smith, of Leamington, was shown. The AMATEUR PHOTOGRAPHER Competition Prints were shown, and attracted a considerable amount of attention.

**Bolton.**—In connection with the Bolton Photographic Society an exhibition of slides was given on the 11th inst. by Mr. W. Banks, the occasion marking the commencement of the winter session. There was a good attendance, composed chiefly of those interested in the congenial pursuits of the photographic art and their friends. The slides exhibited were the present season's by some of the largest firms of photographers in the country, such as York, Valentine, Wilson, etc., and also by members of the Society, and as each in turn was thrown on the canvas by the means of a powerful oxy-hydrogen light they proved to be a very artistic collection. Some views in Iceland were exceptionally good, as also were those of the Rocky Mountains. Other excellent views, taken on a yachting cruise round the coast of Scotland, came in for much admiration, whilst for the edification of the younger portion of the audience some diverting pictures were exhibited. Dr. Barr and Mr. J. S. Roscoe, members of the Society, lent a number of slides, dealing principally with local views. It may be added that the weekly photographic tours carried out by the members during the recent summer have been very successful, and there is to be a general exhibition of members' work at the rooms in December. Papers and demonstrations have been promised for every meeting during the winter months, which will no doubt be both attractive and beneficial to the members.

**Burslem.**—Monthly meeting held on 11th inst., Mr. E. B. Wain President, in the chair. A full attendance of members; one new one elected. A number of negatives and prints, the work of members during the last month, were handed round and criticised. Several negatives were exhibited which had been developed with Amidol, which had given very satisfactory results, the general opinion being that it was a most vigorous developer; but it was thought that the formula for developer required some amendment when used for lantern slides, as it gave a little veiling. One of the members exhibited a print from a negative which was made of an ordinary and Sandell plate fixed together in the slide, and exposed at the same time, and developed and printed together. The contrast between the two plates was very marked, the fine detail of the subject being much more finely rendered by the Sandell plate. A print was also shown which had been taken on a Swan 5-times plate, which had been kept for ten years before exposing and developing; it gave a perfect result. Mr. A. Shorter, a member who has recently returned from a visit to America, gave a very graphic and interesting lecture descriptive of his journey, which he illustrated with a number of lantern slides, many of which were from his own negatives taken

on the journey. The series included views of every description, some being on board ship, others in New York harbour, and concluding with some very fine slides of Niagara and the Falls. The meeting concluded with the exhibition of lantern slides recently made by members.

**Chiswick Camera Club.**—The first half-yearly general meeting was held on the 10th inst. The chair was taken by Mr. R. W. Watson, and the Honorary Secretary and Treasurer, Mr. H. Harding Miller, read an interesting report, showing a large amount of useful photographic work, accomplished since the formation of the club in December last. The report showed that many meetings had been held at which papers were read on various subjects. Excursions had been arranged during the summer months, and the club room had been open on Monday evenings for the use of members, when many scientific discussions had taken place, and much increased interest in the art of photography had been evoked amongst the members. A photographic competition had been held, and silver and bronze medals had been awarded to Messrs. G. S. Bigland and H. Rene Rainger; the best pictures (as kindly judged by the Editor of the *AMATEUR PHOTOGRAPHER*), the interior of St. Paul's Church, Grove Park, Chiswick, and a view of Richmond Bridge. A balance-sheet was presented, and the officers were re-elected as follows:—Chairman, R. W. Watson; Committee, Messrs. G. Gentry, L. J. Hunt, H. Rene Rainger, A. E. Stedman; Hon. Sec. and Treasurer, H. Harding Miller ("Parkia," Chiswick). The Chairman in the course of his remarks referred to several proposals which had been made by the West London Photographic Society to this club for amalgamation, which had been dropped by them on two occasions, but which were now again being renewed, and apparently with a better prospect of success, which if agreed to will be announced in due course.

**Cromwell.**—On Monday evening, the 10th inst., the first annual meeting of this flourishing club was held. There was a good attendance, Mr. H. Pechey occupying the chair. Although no report was read, enough was said to show that the society has enjoyed its share of success during the past year, and, moreover, has done much to encourage the use of the camera, by means of outings, lectures, papers, etc. The number and enthusiasm of its members show conclusively that it has opportunely filled a vacant space in local society, and on these facts we heartily congratulate the club. The Hon. Sec. (Mr. Chas. Rumbold) read a letter from Dr. Bately, regretting his inability to be present, and also resigning his position as Vice-President. The election of officers was then proceeded with. Dr. Bately's resignation was not accepted, and he was unanimously re-appointed as one of the vice-presidents for the ensuing year. Miss V. Buxton was also re-elected a vice-president. The Hon. Treasurer (Mr. T. W. Swindell) and the Hon. Sec. (Mr. C. Rumbold) were also again voted to their respective offices, while the following gentlemen were elected to the committee:—Messrs. John Starling, J. J. Owles, A. Price, G. Waller, jun., T. Goate, J. R. Ellis, G. Rumbold, H. Pechey, and E. G. Leach. It was decided, on the motion of Mr. Blyth, that a dinner in connection with the club, be held on a Tuesday in November next at the Cromwell Hotel. The next monthly meeting to be held on November 14th was decided to be a lantern night for the purpose of exhibiting members' slides of work done during the summer outings.

**Derby Phot. Soc.**—The first meeting of the winter session was held on the 11th inst., a large number being present. The first business was the election of officers for 1893, which resulted as follows:—President, Captain W. de W. Abney, R.E., F.R.S., etc.; Vice-President, Mr. Richard Keene; Committee, Messrs. G. Walker, T. Scotton, C. B. Keene, A. H. Bennett, R. Woods, C. Bourdin; Treasurer, Mr. A. B. Hamilton; Hon. Sec., Mr. T. A. Scotton, 9, Church Street, Derby. It was decided to hold an exhibition of members' work in January, 1893, and the medals which will be awarded in the outdoor meeting competition to be presented on this occasion. An exhibition of lantern-slides made by the members was also held, about 120 pictures being passed through the lantern. Votes of thanks to Mr. Keene for presiding, and to Mr. A. Scotton for managing the lantern, were passed, this concluding a very interesting evening.

**Dewsbury.**—The members held their first lantern night on the 13th inst. Mr. S. Mitchell manipulated the lantern, which he had brought with him to the meeting, and to which he had added a bellows arrangement. A nice collection of slides were put through the lantern, the work of the members, and which gave much credit to the members for their excellent quality. It was decided to have a members' lantern evening at the next meeting, November 10th.

**Durham.**—The first indoor meeting of the Durham City Camera Club for the season was held on the 12th inst., Councillor E. White, Vice-President, in the chair. After the formal business, the Hon. Sec. (Mr. R. Hanxwell) announced that he had succeeded in compiling a good programme of meetings for the winter season, which will embrace papers and demonstrations on gelatino-chloride, carbon, and platinotype processes, enlarging, and several exhibitions

of prize lantern slides. An exhibition was then given of members' holiday work by means of the limelight. The slides of inland scenery by Professor Pearce and Mr. G. W. Patty were much admired, the pictures of Swiss scenery by the President (Rev. H. E. Fox), and the hand-camera work by Mr. J. Mirson, and Mr. R. Hanxwell being especially worthy of mention. The Hon. Treasurer (Councillor W. Gray) ably manipulated the lantern. There was a good attendance and a most enjoyable evening was spent.

**East London.**—Ordinary meeting 11th inst., Mr. C. Tylee, Vice-President, in the chair. Before business for the evening commenced a parcel was handed to the Secretary, the contents of which agreeably surprised the members, it being in the form of a massive challenge cup of extensive dimensions, presented by Mr. C. T. Oliver (honorary member), of Hackney Road, N.E., for competition by members. A hearty vote of thanks was recorded Mr. Oliver for his handsome present to the society. Reports upon the Paget plates which were sent for distribution were received, and in each case they were very highly spoken of. Several negatives were handed round, the rapidity of the xxxxx extra rapid surprising many of the members with the favourable results obtained, having been exposed in a dull light with Newman's shutter, 1-100th sec. The P.O.P. sent by the Ilford Company being greatly approved of, there is not the slightest doubt but that it will be the principal paper used in our forthcoming exhibition. Samples of Amidol were distributed; the Secretary informed the members that he had developed bromide papers with it and obtained excellent results.

**Edinburgh (View Finders' Club).**—The annual meeting of this Society was held on October 10th at Mr. Hay's studio. The convener, Dr. Drinkwater, presented the annual report, which showed an increase in membership during the past session, and a very satisfactory financial condition. A proposal was made to alter some of the rules, and afterwards Mr. Hay showed some sketches and water-colours for criticism. Mr. Christie exhibited a print of a figure study mainly to show a novel feature in lighting.

**Fairfield.**—Ordinary monthly meeting was held on the 11th inst., the President (Mr. J. L. Mackrell) in the chair. After the election of sixteen new members, medals (the design of which called forth great commendation) were presented to Messrs. C. A. Timmins and H. Holt, and the presentation prints for the year, 15 by 12 platinotypes of Mr. W. W. Winter's "Look, Mama!" were distributed. Mr. Geo. E. Thompson, the demonstrator for the evening, was then introduced by the President amidst great applause from the large number of members and friends gathered. In the course of the evening he made six slides illustrating his subject, "Chloride Lantern Transparencies." The demonstration was, as is always the case when Mr. Thompson takes a matter in hand, a perfect success, and was highly appreciated by those present.

**Glasgow High School.**—The Rector having thought it advisable that there should be only one society in the school, at a combined meeting of the photographic and literary societies it was determined that they should be amalgamated. The photographic society shall now be known as the photographic branch of the literary society.

**Hackney.**—The usual weekly meeting was held on 11th inst., Mr. S. H. Barton presiding. Messrs. Self and Puttock were nominated for membership. The Chairman asked for papers on different subjects, the members to vote on what they wished most for. Being a lantern evening, the usual questions were curtailed, and Mr. S. J. Beckitt proceeded to give an account of his three journeys to Norway. About 150 slides were shown, and upon each Mr. Beckitt contrived to obtain some merriment. There was perhaps a little too much punning, one of which was a little too much for even the sedate Hackney men. "This," he said, "is a gorge outside the hotel, but is nothing to the gorge taking place inside." The lecture, however, was very much appreciated by a very much crowded audience, after which slides by the following members: Messrs. Carpenter (flower studies), Nunn, Hudson, Grant, Dean, Sodean, and Hankins.

**Halifax.**—On the 3rd inst a lecture was given by Mr. H. M. Smith, of the Eastman Photographic Company, on "Solio Printing." There was a moderate attendance of photographers, principally amateurs, to whom the lecture proved very interesting and instructive. Mr. J. I. Learoyd presided.

**Herefordshire.**—The following are the officers elected for 1892-93:—President, Mr. Alderman Blake; Vice-Presidents, Messrs. Alfred Watkins, T. J. Salwey, and J. Parker; Hon. Treasurer, Mr. W. E. Haines (High Town, Hereford); Hon. Secretaries, Messrs. J. Parker and E. G. Davies (Mansion House, Hereford); Council, Messrs. E. Pilley, E. W. H. Chave, R. Clarke, H. J. Wilson, B. C. Kinsey, A. C. Edwards, jun., W. C. Gethen, and C. H. Woodhouse. Headquarters, Mansion House, Hereford.

**Holborn.**—Mr. A. J. Golding in the chair. It was announced that the annual supper would take place at Anderson's Hotel on Saturday, December 3rd. Mr. A. Horsley Hinton read a short paper on "Accident and Intention." As his experience of photographic work and workers increased, he was bound to admit that his opinion as to their

honesty—the works, not the workers—was not improved, and he did not think the workers often erred on the side of excessive candour. If every successful photograph were conscientiously accredited to happy chance or accident, or, on the other hand, to deliberate and premeditated intention, he wondered which list would be the longer. How rarely was a *bad* picture attributed to the *real* cause of its failure? How often the unapproachable instrument, the weather, the light, or “those wretched plates” bore the blame? Their own judgment, patience, or skill, never! Or, if they pointed out that the picture would be improved if such and such a feature were not quite so central, they got the answer, “Quite so; I know that, but you see I only wanted it as a memento of the place, and didn’t trouble about the picture.” But, oh, the deceit of it! For, if the truth were known, the camera was carefully set up, and on the ground glass screen the subject was thought perfect and delightful, and not until the print was shown to a knowing one was the error noticed. And then there was the charming little bit of landscape which somehow comes out indistinct and fuzzy, and the critic’s approval of the treatment was silently received, as though it were due to one’s artistic motive instead of clumsiness in shaking the lens or stumbling over the legs during the exposure. The question at issue was that if it be guaranteed that most successful things were obtainable through mere chance—and whereas the results of chance could not be admitted as art—what evidence was there on the other side which would support the claims of photography as a deliberate means of artistic expression? If they were content to get a moderate number of plates which would win for them the admiration of their friends, they should set themselves the task of exposing a few gross of plates under fairly favourable circumstances, and they need have no fear of missing the desired end. But if they aspired higher, if their object was to attain the best possible, then they should not trust to the capriciousness of fortune and to chance. Besides, what disappointments always awaited the photographer who depended upon accident. He was convinced that opportunity plus accident, whilst it might furnish many successes, yet the same opportunity plus deliberate intention would, if the intention be the outcome of knowledge, yield a higher average and merit even if the successes were fewer. And moreover they would have failures (and because they knew what they intended, they would therefore know in what they had failed), which they would be able to turn to account and derive some useful lesson thereby. In that direction two lines of thought suggested themselves to him, which for the sake of being definite he would call “discrimination,” or the knowing a good thing when they had it, and “application,” by which he meant the faculty of turning the good to the best account. In both of these cases a certain amount of art knowledge was necessary, and important as was the selection of the subject, it was hardly more so than the exercise of the two faculties, “discrimination” and “application”—both of which, it might be noted, came into operation after the negative was made. In the discrimination and recognition of the good, the artistic ability of the photographer was perhaps first discernible. At one time and another it had been his lot, he might almost say his misfortune, to have passed through his hands parcels of photographs made by the most absolute tyros, photographs taken perhaps during a summer holiday of every description of subject. From amongst the collection there now and again appeared a gem, which from the rough and imperfect manner of its printing and mounting had evidently not been appreciated by its author. Had it not occurred within their own experience that on looking through a batch of old prints which they had long ago thrust on one side as of little importance, they had been surprised to find some picture which in the light of greater experience and knowledge seemed to be wholly satisfactory. How could they account for that singular inability to recognise the good? Was it because when they first made the print and then cast it aside, they were not in a mood or frame of mind responsive to its particular sentiment, or was it because they were deficient in a knowledge of nature, and the eye was not fully educated to perceive when a poetic aspect of nature was transferred or reproduced in the picture? In either case they had an accidental success, and if they could decide the cause of their failing to recognise it, and then cultivate their senses and faculties accordingly, their accident would have become a source of education to them, and would enable them not only to do, but to surpass by intention what was before effected by chance. That would be one phase of “application,” but what he had in mind was rather the preservation of an unsatisfactory print by one process in order that they might ascertain what better could be done with the subject by a different method. Let the unsatisfactory print be an object of careful study, and endeavour to draw from it an explanation of its failure. By dodging, by shading, by cutting down, try to correct the evil, reluctant to the last to abandon it. Thus, out of their failure, also an accident, they might by deliberation come to a successful issue. An interesting discussion followed Mr. Hinton’s paper.

**Herefordshire.**—The annual general meeting was held on 4th inst., when a large attendance of members were present, Mr. Parker

in the chair. The balance showed £13 in hand. Mr. Thos. Blake was unanimously re-elected President, and Messrs. A. Watkins, T. J. Salvey, J. Parker, as Vice-Presidents; Mr. Haines was re-elected Hon. Treasurer, as were also Mr. J. Parker and Mr. E. G. Davies Hon. Secretaries. The Council consist of Messrs. E. Pilley, R. Clarke, E. W. H. Chave, H. J. Wilson, B. C. Kinsey, A. C. Edwards, jun., W. C. Gethen, and C. H. Woodhouse. The fixtures for the winter season were left to the Secretaries. It was resolved to purchase a Society album for the prints of members. The following was unanimously resolved, “That this Society accord their very best thanks to their worthy President, Alderman Blake, for the very efficient manner in which he had acted as President for the past year, and also for the handsome way in which he entertained the members of this Society to the ‘Field Day’ at Speech House in June last.” A vote of thanks also to the Mayor for the use of rooms, the Editor, AMATEUR PHOTOGRAPHER, for judging the prints in competition, to the Editor, *Photography*, for sending lantern-slides, also to the Hon. Treasurer (Mr. W. E. Haines), and Hon. Secretary (Mr. E. G. Davies), for the way in which they had discharged their duties. Three lantern-slide competitions were arranged. A vote of thanks to the Chairman for presiding concluded the proceedings.

**Hove.**—At the meeting held on 11th inst. Mr. Watts read a paper on exposure. He warmly advocated the careful calculation of every exposure, even by the most experienced. The various factors were easily ascertainable, and the necessary calculations could be made while adjusting the dark slide. The earlier tables in use were shown and the different factors and calculations explained, examples for different times and seasons being worked out. Mr. Watts had lately been using Hurter and Driffield’s Actinograph with plates having the speed number marked, and he found the exposures invariably exact. The working of this instrument as well as Watkins’ exposure meter, and various other tables and actinometers were lucidly explained. In the discussion which followed, one member said that he occasionally used Watkins’ exposure meter, and found about half the exposure sufficient. Mr. Watts said his own experience of that instrument was similar. While most of those present had at some time or other in their career made use of tables or actinometers, they had for the most part now discarded them. Some were guided by records of previous exposures; some judged by the amount of illumination on the focussing screen; others, guided too by experience, were content to give whatever exposure was convenient under the circumstances (within certain limits, of course), and trust to after-treatment in development for the production of good negatives. Amongst these apparently haphazard workers were some of the best picture-makers. Mr. Watts claimed that much of this facility in estimating exposure was due to previous experience with tables, etc., and that much trouble would be saved and more certainty of results obtained by combining their use. All were agreed as to the value of exposure tables to beginners.

**Hull.**—The members met on the 13th inst. under the presidency of Mr. C. D. Holmes. In the course of the presidential address, the chairman alluded to the success that had seemed to attend the society, and attributed it largely to the efforts of those who had held the reins of office, paying tribute especially to the services rendered by the retiring president, Dr. E. H. Howlett. He and every member of the council was anxious to assist the beginners. In photography success could only be achieved by perseverance and the experience gained by failure. He was pleased to think that stereoscopic work was once more to the fore, and he commended a study of it to all present, especially to those who were interested in lantern work. Referring to microscopic work, he said that this fascinating study was especially adapted for winter work, inasmuch as it could be carried on indoors. In conclusion, he urged the members to freely ventilate their troubles, and not to be ashamed to confess their failures. The address, which was throughout listened to with much interest, created a favourable impression. A discussion followed, in which Messrs. John Pybus, J. H. Allcott, Boveille, Coleman, and others took part.

**Ireland.**—The opening meeting of the session was held on 14th inst., when, despite the inclemency of the weather, a large number of members and visitors turned up. In the unavoidable absence of the President, Mr. Geo. Mansfield, J.P., the chair was taken by Mr. M. Hedley, who announced that in the summer excursion competitions the prizes had been awarded as follows:—Poulaphuca Excursion: 1st, Mr. R. M. Inglis; 2nd, Mr. V. E. Smith. Boyne Excursion: 1st, Mr. A. M. Geddis; 2nd, Mr. J. A. C. Ruthven. Professor J. A. Scott, Vice-President, was then called on for the lecture he had kindly consented at almost a moment’s notice to deliver. Professor Scott then gave a very interesting and humorous account of how he spent his holidays in the east and west of Ireland, illustrated by a large number of excellent slides made from hand-camera shots. The pictures of the dwellings of the people and of the people themselves were highly characteristic of the poorer peasantry of the country; but Professor Scott stated that in Galway at least they were prepared for him, the veriest *gamin* appearing to know as much about

hand-cameras as himself, consequently it was a matter of considerable difficulty to catch them "napping." Professor Scott's lecture was listened to with very great interest, and at the conclusion slides were also exhibited by Miss Thwaites and Messrs. Geddis, Inglis, and Mathews.

**Isle of Thanet.**—On the 10th inst. the members assembled in full force to observe a demonstration on "Solio" paper, which was given by Mr. A. C. Baldwin, a representative of the Eastman Company. This gentleman, who was well up to his work, gave a very interesting and practical demonstration of the method of working the paper and toning it before his audience. A number of prints and bromide enlargements obtained by the electric light were exhibited, giving general satisfaction. The chair was taken by Mr. W. Saunders, Vice-President, and a very pleasant evening was spent.

**Kensington and Bayswater.**—A meeting was held on the 17th inst.; Mr. B. Frogbrook presided, and twenty-three other gentlemen were present. It was resolved that a lantern should be purchased as soon as the funds should permit. The following donations had already been offered, namely, £1 each from Messrs. Robinson, Hahn, and Brumwell. On ascertaining the total cost of lantern and accessories, Mr. Robinson kindly offered to increase his donation to the amount required, which is £9 16s., thus making his generous gift amount to £7 16s. It need hardly be stated that Mr. Robinson's kindness was greeted with loud applause. Mr. G. Bursnell was elected honorary lanternist, and Mr. Brumwell honorary librarian. Upwards of eighty slides were shown by Mr. Bursnell in the lantern kindly lent by Mr. Short. The members who exhibited were Messrs. Bursnell, Davidson, Frogbrook, Hahn, Hannaford, Hodd, Jones, Parrott, Seales, Sutherland, and Brumwell. Some of the slides exhibited were the member's first attempt, and the results show great care in manipulation. Notable among these were the slides of Messrs. Hannaford and Parrott, the former exhibiting some very fine "Ideal" snap-shots taken in Jersey, and the latter some excellent river scenes. Mr. Bursnell showed some excellent results on "printing-out" slides of his own manufacture. Mr. Frogbrook's illustrations of City life show hand-camera work to advantage. Captain Davidson's slides of British gunboats were much appreciated. The Messrs. Hodd showed some very picturesque sea and landscapes.

**Leytonstone.**—At a meeting on the 15th inst., Mr. J. Watson Brown, M.A., in the chair, Mr. D. G. Riddick, in the presence of a good muster, delivered his lecture upon "Hand-Cameras." He exhibited and described the Shuttle, which was admired for its simple changing action; the Frena, the good points of which are its simple changing action and swing back; and Messrs. Watson's Vaneck, which is fitted with a finder almost as large as the plate and has many other improvements. He also showed Mr. Roberts' cheap hand-camera, which is provided with a swing back and may be used upon a stand. Mr. Symmons then showed his Eureka, and the President showed his Roberts' magazine camera. Mr. Cricks, a member of the club, brought up a new hand-camera of his own invention, which met with great approval, and has advantages in respect of changing movement and shutter over any in the market. The lecturer exhibited as well numerous results of his own in this class of work and some enlargements from hand-camera negatives. In the discussion that followed the President said he preferred plates to films; he also was in favour of blind shutters. He then pointed out several advantages of a hand-camera, its portability, always ready for use, being able to work without getting a crowd round, and not likely to have remarks passed and attract attention. He thought that no photographer's outfit was complete without one. Mr. Wates advocated complete simplicity of action, and was glad to see the introduction of a swing back, as in the Frena and Roberts, as he thought that the want of one in some of the hand-cameras of the day was their great fault. Mr. T. Symmons followed, and considered that for snap-shots and for travelling, hand-cameras were all that could be desired, and strongly advocated their being as small as possible consistent with efficiency. He also preferred a fixed focus lens, and pointed out the many advantages; but still thought that when you come to time exposures there was nothing like our old friend on the tripod, with which we can take our time with focussing, and have our swing-back, side-swing, rising front, level, etc. Several members and the President gave their experience of the use of hand-cameras, the latter saying that notwithstanding the many excellent cameras he had seen that evening he still thought that Roberts's was the best, not because it was the cheapest, or because Mr. Roberts was a member of the club, but conscientiously, and because he had had so few failures with it.

**North Middlesex.**—On 10th inst. the President (Mr. J. W. Marchant) was in the chair, and between sixty and seventy members were present. Col. J. Gale addressed the Society, and illustrated his remarks with a selection of his beautiful lantern-slides. The views were drawn from all parts of the country, and illustrated many different phases of rustic life and employment, and varied atmospheric effects—sunrise, sunset, mist, snow, hoar-frost, rain,

and sunshine. Among the slides were included by special request a number which Col. Gale had shown on a previous occasion, noticeably "Abandoned," "Through the Driftway to the Fold," and a number of atmospheric effects on the Sussex downs. He then exhibited a fine selection of slides by his friends Mr. Bright and Mr. B. Gay Wilkinson. Mr. Wilkinson's slides were chiefly beautiful studies of rustic scenery, and Mr. Bright's were partly marine studies, and partly humorous studies of children and animals. One of a child sitting on the sands and glowering at the camerist caused repeated peals of laughter. A most enjoyable evening was spent, and a vote of thanks was moved in suitable terms by Mr. F. Cherry, and seconded by Mr. H. Walker, who related how, when recently on a photographic tour in the lake district, he came across a cottager who showed him with evident pride a photograph of her cottage which had been presented to her by Col. Gale. The next meeting will be held on the 24th inst., when an exhibition of members' slides will be given. Ladies are invited, and visitors will be welcome.

**Richmond.**—At the annual general meeting held on the 7th inst. the following officers for the ensuing year were elected:—President, F. P. Cembrano, jun.; Committee, J. H. Alabaster, A. Ardaseer, C. H. Davis, A. Hunter, F. Neville, G. W. Ramsay; Hon. Sec., P. Ennis. The President announced that the annual dinner would be on the 28th November at the Greyhound Hotel, and that the conversazione would be held at the Theatre Royal on the 9th January, 1893. The annual report and balance sheet were accepted. Beginning from October 10th, the meetings will be held on Mondays instead of Fridays. The first meeting of the winter session took place on the 10th inst., it being also the first meeting under the new conditions, that is to say, held on Monday evening instead of Friday, and in the larger room to secure the use of which has been the object of the change of day. The advantages of the new room were manifest, the ventilation, lighting, and general comfort leaving nothing to be desired. Mr. Ennis read the paper by Mr. Dawson on "Photogravure," lent by the P.S.G.B., and the subject was illustrated by a large number of choice prints lent by Mr. Ramsay, in addition to those supplied with the lecture. The paper was interesting, but the absence of the black-board illustrations to which frequent reference was made, rendered some portions of it less intelligible than might otherwise have been the case.

**Magnesium as a Source of Light.**—In the *American Journal of Science*, April, 1892, Mr. Frederick J. Rogers sums up the results of his investigations as follows:—(1) The spectrum of burning magnesium, as has already been pointed out by Pickering, approaches much more nearly that of sunlight than does the spectrum of any other artificial illuminant. (2) The temperature of the magnesium flame, about 1,340 deg. C., lies between that of the Bunsen burner and that of the air-blast lamp, although the character of its spectrum is such as would correspond to a temperature of nearly 5,000 deg. C., were its light due to ordinary incandescence. (3) The "radiant efficiency" (the ratio of luminous energy to total radiant energy) is 13½ per cent., a value higher than that for any other artificial illuminant (excepting, perhaps, the light of the electric discharge in vacuo, for which Dr. Staub, of Zurich, has found an efficiency of about 34 per cent.). (4) The radiant energy emitted by burning magnesium is about 4,630 calories per gram. of the metal burned, or 75 per cent. of the total heat of combustion; as compared with 15 per cent. to 20 per cent. in the case of illuminating gas. (5) The thermal equivalent of one candle-power-minute of magnesium light is about 2.5 lesser calories, as against 3.5 to 4.0 for other artificial illuminants. (6) The total efficiency of the magnesium light is about 10 per cent. as compared with a quarter of one per

cent. for illuminating gas. (7) Taking into consideration the greater average luminosity of the rays of the visible spectrum of the magnesium flame, it is certain that *per unit of energy expended, the light-giving power of burning magnesium is from fifty to sixty times greater than that of gas.*

**Before the Camera.**—"Well," said the photographer, "it's funny how people will take attitudes when they find the camera pointed at them. You tell them to look pleasant, and at once their faces take on an expression of ghastly smirk, or if the sitter be a young lady she almost always wants to be taken side face, looking down with a conscious simper. People with turn-up or very long noses invariably wish to be taken in profile, while the cross-eyed man with a huge mouth is always taken front face. It's no use. I've been in the business for years, and now I don't argue with them. I let them have their say, and then I try to have mine. Now, sea this tall man coming in. He'll cross his legs and put one foot in the sphere of the lens so that it will take the size of two, and this old lady with two or three chins will be taken with front face and look like Humpty Dumpty." They both did.—*Answers.*

**Gilmer Brothers**, agents for Messrs. Clement and Gilmer, of Paris, have removed to larger and more commodious premises, which are situate at Manchester Buildings, Cannon Street, Birmingham.

## To Correspondents.

All communications for these columns are to be addressed to **The Editor, "Amateur Photographer," 1, Creed Lane, Ludgate Hill, London, E.C.**

### RULES.

1. Write clearly and distinctly on one side of the paper only.
2. Write each Query or Answer on a separate sheet of paper.
3. Write the name and address legibly on the back of each communication, and sign all Queries and Answers with name or *nom de plume*.
4. All matters for these columns MUST be received by TUESDAY MORNING'S POST.
5. The Editor does not undertake to answer questions by post.
6. In answering Queries, correspondents are requested to mention, in every instance the number and full title of the query referred to.

### QUERIES.

5843. **Riviera.**—Can any of your readers inform me if there are any dark-rooms to be found in the Riviera, say at Cannes, San Raphael, Hyeres, etc.; also if there are any difficulties that a lady with a hand-camera would be likely to meet with (provided she kept clear of fortifications)? Would the Customs officials be likely to want to open a "Frena" camera full of exposed films, if carried in the hand? Any information in regard to photographic possibilities in the Sunny South would be acceptable. Length of exposure, I take it, would be at least half what is necessary here.—*EXCELSIOR.*

5844. **Toning.**—I have the following formula by me recommended, I believe, for albumenised paper, giving rich velvety tones, similar to an engraving.

**Uranium and Gold Toning Bath:—**  
 Sodium acetate .. .. 60 gr.  
 Sodium bicarbonate .. .. 10 "  
 Sodium chloride .. .. 39 "  
 Uranium nitrate .. .. 5 "  
 Gold .. .. 4 "  
 Water .. .. 20 oz.

Would some kind reader inform me whether this precise formula will do for gelatino-chloride paper? If not, information will be gladly received.—*Lo Dr.*

5845. **Starch Mountant.**—Can any reader tell me what I should put in starch paste to make it keep and prevent it from turning watery?—*STAG.*

5846. **Portraits on Plain Paper.**—Will any of your kind readers inform me how the photograph which takes a medal is reproduced and put in the *AMATEUR PHOTOGRAPHER* or in any book, as I want to put some in a book, and should very much like to know the process, as it seems to me to be a cheap way? Any information will greatly oblige.—*T. T.*

Correspondents not seeing their queries inserted are requested to look for the same under "Editorial."

### QUERIES UNANSWERED.

Sept. 30th.—No. 5822.  
 Oct. 7th.—Nos. 5827, 5828, 5831, 5832.  
 „ 14th.—Nos. 5834, 5835, 5836, 5837, 5838, 5839, 5841, 5842.

## ANSWERS.

5839. **Photo-Zincography.**—Best work is "Photo-Mechanical Printing," by W. T. Wilkinson. It would take too much space to describe it, except in outline. The image is impressed upon a zinc plate by means of a greasy ink, and an etching fluid being applied eats away the groundwork, leaving the image in relief, so that it can be printed from like ordinary type.—*INQUISITIVE.*

5840. **Toning.**—"Anon" is much over-toning the prints. There should not be more than four or five in the bath at a time, as this class of paper tones with great rapidity. The prints are ready when the darker parts viewed by transmitted light are still a warm brown colour, and, though the surface will appear almost grey, it will return after fixing to a pleasing brown tone.—*W. PITCAIRN CRAIG.*

## EDITORIAL.

**SPECIAL NOTICE.**—We are very pleased to find that replies in this column are so much appreciated, but we should be very grateful if those requiring advice would send their letters to us BEFORE TUESDAY MORNING'S POST if possible. The time occupied in replying in this column is very considerable, and owing to the often late receipt of letters, many matters have to be left over each week. This we much regret.—*ED. AM. PHOT.*

**W. A. GAUNTLETT (Assam).**—We are afraid nothing can be done for your chloride paper. Such a mishap is, we believe, quite unique. You might try washing the prints thoroughly in water and then placing in a chrome alum bath, washing and drying. And then toning. We should also recommend the use of a combined toning bath with at least double the amount of alum in it. The stops for the Suter lens should be f/6.75, f/9, f/10, f/22.5, f/32, and f/40. Possibly f/22.5 and f/32 may not be there, but it is very easy to determine by finding the equivalent focus, and dividing it by the diameter of diaphragm aperture.

**FROST.**—The questions are rather difficult to answer, because of the varying light, but with f/32 stop and sunlight about 1 sec. for a snow scene. For a frost scene, by which we suppose you mean, hoar frost at close quarters, about 2 secs. In developing such pictures use pyro and ammonia, and avoid too great contrast.

**UMBRIA.**—The front of the Crouch-Dresser hand-camera is removable, so that the lens can be easily got at. It is not possible to use a lens of shorter focus than the one supplied, nor is it advisable. In our hands the camera has proved very efficient.

**J. N. WILLIAMS.**—Many thanks for your letter, the contents of which we have noted.

**NEWTOWN.**—The cause of your stains is undoubtedly using the washing water of first batch for the second, and allowing the prints to lie one on top of the other.

**CARLTON.**—(1) Over-printed; negative would probably stand intensification with improved result. (2) Ditto. (3) Wants clouds to balance it, and slightly over-printed. (4) Flat and over-toned, camera was not straight. (5) Flat and over-toned, see note to 1. You try to get too much on your plate, all your prints are wanting in objects of interests, they are too panoramic; little bits will give you better results.

**E. GAREBUTT.**—The instructions you want are too long to include here. Write to Mawson and Swan for their little pamphlet, price 3d.; or Snowden Ward's "Practical Ferrotypes," price 6d., will tell you all you want to know.

**H. F. LINGING.**—It may have been the fixing bath being used in a dirty dish. The sulphocyanide toning bath is acid, unless neutralised, and to place the print direct from this into hypo is not advisable unless the

hypo is distinctly alkaline. A very common cause for yellow whites is not changing the first washing water quickly. We prefer placing the prints into carbonate of soda or salt and water, so as to convert the free nitrate of silver into an insoluble salt. The addition of salt to the toning bath is also advantageous, because the toning is more regular. The cause of your dirty yellow images is due to insufficient toning.

**C. B. O.**—You will find, we think, the following give you better results for your snap-shot work.

Pyro .. ..	480 gr.
Sodium sulphite .. ..	4 oz.
Citric acid .. ..	80 gr.
Water to .. ..	10 oz.

Anhydrous carbonate of soda .. ..	480 gr.
Sodium sulphite .. ..	160 "
Water to .. ..	10 oz.

For use take of  
 Solution 1 .. .. 20 min.  
 Solution 2 .. .. 240 "  
 Water to .. .. 1 oz.

Do not add all the soda at once, and bromide is unnecessary as a rule. The new Cadett lightning plate is certainly the most rapid plate we have used yet. We shall be pleased to criticise negatives for you.

**HARVEY SWIFT.**—(1) Sitter's mouth too open, and dress too white, shadow under left eyebrow too dark. (2) Spoilt by the mouth and teeth. (3) Good. Nos. 2 and 3 are rather too low down on print. To avoid showing spotting, mix your colours with weak gum water, or else use a little albumen with them. No. 3 print quite up to standard.

**FRA. WA. BA.**—(1) If you unscrew the back combination, and screw the front one in its place, you can use the lens for landscape work. (2) Tylar's pulp slabs or enamelled iron for gloss, matt celluloid for matt surfaces. (3) We believe the instrument you name is patented, and therefore it is illegal to make it—a short-focus reading-glass lens, to be had from any working opticians. Try Mr. Brooker, of Robertson Street. Send up article, and let us see it before we commit ourselves.

**G. E. T.**—The full text of the paper you want will be found in our issue of Nov. 23, 1888, but an extract is given in our issue of July 29th, 1892, p. 63.

**PLATINA.**—If you can turn out such prints as the one you send, after having had a camera a fortnight, we prophesy that it won't be long before you take a medal. Lyonel Clark's toning process is applicable to chloride papers, but a better one even is

Chloroplatinite of potash .. ..	1 gr.
Citric acid .. ..	30 "
Water .. ..	4 oz.

or  
 Chloroplatinite of potash .. .. 1 gr.  
 Sodium bitartrate .. .. 30 gr.  
 Water .. .. 4 oz.

You can get rid of or avoid the glassy spots by using matt celluloid to squeegee on to instead of glass. The cause of your paper sticking is that you do not wax or talc the glass sufficiently. Don't vignette your prints, and try Mezzotype paper, which is a rough surface paper. Write again, or call and see us with some more work.

**T. WATSON CRAIK.**—Many thanks for prints. We hope to reproduce one.

**H. TONKIN.**—Pleased to lend you prints. Write again, please, about ten days before you want them.

**FRA.**—The pinkness of which you complain is generally due to want of gold in the bath. Try platinum toning chloride paper; it gives lovely results. We hardly see why you wanted the third figure, it would have been well balanced without. Try a rough paper like Mezzotype.

**TOM TUX.**—You have omitted one very important datum, viz., the name of the developer you use. Write

and let us know. At present the only suggestion we can make is that the water contains a lot of chlorides.

**CROCODILE.**—(1) The films you name are very satisfactory, but you might get a better developer, we think, though that is, of course, a matter of opinion only. (2) Greeff's fixing salts are very satisfactory, and quite as effectual as hypo. (3) Yes, they require the same amount of washing. (4) The chemicals should be in a good condition if they have never been opened. (5) Why not try the Tabloids? They are good, and very convenient to carry.

**SOLIO.**—The print you send is a good specimen of platinum toning, and if of matt-surface would resemble Karl Greger's prints which took a medal at Pall Mall.

**KI-NON.**—The price of the camera is £5 5s., but we have asked the makers to send you list, etc. The negatives are beautifully sharp and enlarge perfectly, and are especially useful for lantern and enlarging work. The makers are going to make a quarter-plate size. Mr. Turnbull's address is 6, Rose Street, Edinburgh. Sutton's article was in the AMATEUR PHOTOGRAPHER last year, we believe, but will look it up.

**J. R. BICNEY.**—One of the probable causes of the peculiar fading may be that you do not wash the prints sufficiently. Over-exposure may also be the cause. Do not use too much bromide, and develop longer. None of the prints you send are developed enough.

**J. S. FORSYTH.**—Fault lies in the paper. Write to the makers. Is it not old paper you have?

**E. S. THOMAS.**—Letter by post.

**W. F. BECK.**—You will find in this column above, in answer to C. B. O., a very good snap-shot developer. The best developer for lantern plates depends upon the tone you require. Let us know this, and we can help you.

**B. PUCKLE.**—The cause of your fuzzy outlines is non-registration of the bromide paper with the focusing surface. Let us know how you work.

**H. PRESS.**—You could easily have a slit cut in the tube and diaphragms. The large aperture is useful for children and such sitters. The lens is, we should say, an old one, but is probably worth about £4. For the Optimus competition send one entry form for every print.

## Sale and Exchange.

### RULES.

**CHARGE.**—Twelve words or less for Fourpence.

Every additional three words, one penny. The name and address of the sender must be paid for. (A single figure, or group of figures undivided by letter, space, stop, or words, counts as one word; compound words count as two words.)

**DEPOSITS.**—The money for goods forwarded on approval may be deposited with the Publishers of the AMATEUR PHOTOGRAPHER, who will hold the amounts deposited until they are satisfied that the transaction has been completed to the satisfaction of buyer and seller.

**ADDRESS.**—All advertisements (which can be received up to Tuesday mid-day) and other communications having reference to the "Sale and Exchange" column, must be addressed "Sale and Exchange, AMATEUR PHOTOGRAPHER, 1, Creed Lane, London, E.C."

**COMMISSION.**—A charge of 2½ per cent. will be deducted from all deposits whether a sale is effected or not. Minimum charge 1s.

**PAYMENT.**—All payments are to be by cheques of Postal Orders, made payable to Hazell, Watson, and Viney, Ltd., 1, Creed Lane, London, E.C.

**CARRIAGE** must be paid on all apparatus sent for report, and they will be returned carriage forward.

**ADVERTISEMENTS** can be inserted under a number, the name and address being registered, and letters forwarded for a fee of 8d. to cover postage.

**PAYMENTS** should be made in Postal Orders or Postage Stamps.

**REPORTING.**—Apparatus may be sent to the EDITOR, AMATEUR PHOTOGRAPHER, 1, Creed Lane, London, E.C., who will report upon the apparatus to the buyer for a minimum fee of 2s. 6d., or a commission of 2½ per cent., upon the sale price of the apparatus.

**Cameras, etc.**—Lancaster's quarter-plate camera (Instantograph), complete, four double slides and leather bag, guaranteed in good condition, reason for selling no time for working, price 40s.—A. E. Barrett, c/o R. T. Smith and Co., Hereford.

**Cameras, Lenses, etc.**—Half-plate camera, with whole-plate portrait lens, £3 15s., lens worth all the money.—F. Garner, Glen Cottage, Blacker Road, Huddersfield.

**Enlarging Apparatus.**—Hume's Cantilever enlarging apparatus, 8½ in. condensers, cost with lens £11 15s., perfect condition, no further use, cash £9 10s.—Defaye, David Place, Jersey.

**Hand-Cameras, etc.**—Marvel hand-camera, two double backs, finder, good lens, folding ruby lamp, unbreakable, and Iford manual, 12s. cash.—C., 1, New Henry Road, Gloucester.

**Lenses, etc.**—Rapid rectilinears! French make, special value, 5 by 4, 5½ in. focus, 11s. 6d.; 7 by 5, 7½ in. focus, 14s.; 9 by 7, 11 in. focus, 20s., complete with hood, flange, cap, and set of Waterhouse stops, largest aperture f/8; three days' trial allowed.—Dorey, Lester and Co., Kilburn, London.

Splendid half-plate rapid rectilinear lens, iris diaphragms, 18s.—A., 8, Kenilworth Road, Willesden Lane, London.

Ross's compound lens for stereo portraits, groups, and views, 3½ in. focus, with rack, and pinion, and diaphragms, good condition, cost £5; also Lancaster's quarter Meritote view lens, together or separate, for reasonable offer.—No. 348, office of this paper, 1, Creed Lane, E.C.

**Sets.**—7½ by 5 Watson's Premier camera, with turntable, four double backs, tripod stand, two bags, Ross's 8 in. P.S. lens, Thornton-Pickard shutter, etc., camera and lens mounted in aluminium, £24; new this spring.—Francke, St. Saviour's Road, Jersey.

Quarter-plate photographic set for sale; exchange for aquarium or anything useful.—Dry, 6, Garfield Terrace, Paignton, S. Devon.

Half-plate camera, three double backs, brass bound, Optimus rectilinear, and Lancaster's wide-angle lenses, Newman's shutter, in solid leather case, Meyall's tripod in canvas case, good condition, cost over £18, price £8.—C. Oldfield, Sedgemoor, Shaftesbury.

Half-plate camera by Morley, three double dark slides, tripod and case, Hockin lens, splendid condition, £5 10s.—No. 336, office of this paper, 1, Creed Lane, E.C.

Lancaster's quarter-plate special brass bound camera, four slides, Optimus landscape lens, stand, bag, etc., new, never used.—5, Milton Grove, Stockport.

**Sundries.**—Photography, 12 volumes of AMATEUR PHOTOGRAPHER, viz., 1, 2, and 7 up to date, with 5 volumes of "Photographic Journal," and quantity of catalogues, etc., 15s.; clean.—Address, A. Tice, Stationer, South Street, Manningtree, Essex.

Gent's silver watch, thorough order, 17s. 6d., or will exchange for Griffiths' enlarging camera from quarter to whole plate, must be in good condition, or other useful article.—Cooper Lodge, New Road, Bocking, Essex.

What offers? "Popular Educator," "Teachers' Aid," vols. 1 to 13, "Pick-me-up," No. 1 to date, "Chambers's Journal," 1886, 1887, 1889, 1890, "Argosy," 1888, "Photographic Punch," vols. 1 to 3, "Shorthand Star," vols. 1, 2, "Casell's Magazine," 1891.—George Tipper, Grimston, Lynn.

### WANTED.

**Cameras, etc.**—Wanted, whole-plate camera, complete, Shew's preferred; exchange grand St. Bernard puppy.—F., care of Mr. Mathews, 156, Loveridge Road, Kilburn, N.W.

Wanted, half-plate camera, s.d.s. and tripod.—Sowerby, 12, Station Road, Harlesden.

Good long focus camera wanted, half-plate or larger, in exchange for half-plate single extension camera, with three book backs, removable stereo division, pair single stereo lenses and shutter.—E. Smith, 28, Burford Road, Nottingham.

**Cameras, Lenses, etc.**—Half-plate modern camera, three double slides, Dallmeyer's or Ross's View lens, tripod stand.—Jones, Chemist, Penmaenmawr.

Half-plate camera, Lancaster or similar make, and lens.—No. 347, office of this paper, 1, Creed Lane, E.C.

**Changing Box, etc.**—Changing box and slide for Hare's half-plate camera, must be in good condition and cheap (replies to another paper lost through misdirection).—No. 346, office of this paper, 1, Creed Lane, E.C.

**Prints.**—Wanted, rough prints of snap-shots of "figures in action," children preferred, for scrap book. State terms.—Stainforth, Temple Chambers, Falcon Court, Fleet Street.

**Shutter.**—Thornton-Pickard snap-shot, safety blind shutter for 1½ in. lens tube.—Garwood, 9, Arlington Street, Glasgow.

**Bargains in Cameras and Sets.**—Optimus half-plate Raymont camera, reversing back, and all best movements, fitted rapid rectilinear lens, iris stops, three double slides, and three-fold stand, grand set, as new, £7 5s.; half-plate Le Meritote camera, Lancaster's lens, rack focussing, three metal double slides, focussing screen and stand, 45s.; half plate Underwood's Instanto wide-angle movement, double extension, fitted rapid rectilinear lens, slide, and folding stand, £5 17s. 6d.; half-plate camera, by Houghton, all latest movements, grand article, fitted three double slides, rapid rectilinear lens, and double folding stand, £6 10s.; quarter-plate Lancaster's Merveilleux set complete, 15s.; Meagher's quarter-plate camera, wide-angle movement, reversing back, fitted Ross landscape lens, five double slides, solid leather case and folding stand, 75s.; Lancaster's quarter-plate Instantograph, finest order, all latest improvements, including camera, lens, iris stops, two double slides, s.d. and case, 37s. 6d.; half-plate camera, reversing back, and rapid rectilinear lens, works f/8, both by Dollond, Ludgate Hill, double

slide and folding stand, as new, take £4 4s.; 12 by 10 camera, finest mahogany, double extension, leather bellows, wide-angle movement, rising and falling front, etc., double dark slide, as new, £5 5s.; 5 by 4 best quality camera, by Robinson, Regent Street, leather bellows, rising, falling, and cross front, wide-angle movement, three double slides, fine rapid rectilinear lens, by Robinson; Newman's shutter and Eastman's ½-plate roll holder, quite new, £5 17s. 6d. All above guaranteed finest order. On view, City Sale and Exchange Rooms, 54, Lime Street, corner Leadenhall Street, City (late Goy's Medium). Second-hand apparatus bought, sold, or taken in exchange, Inspection invited.

**Bargains in Lenses.**—Voigtlander whole-plate, grand definition, best condition, 30s.; 5 by 4 Optimus rapid Euryscope, Waterhouse stops moveable hood, 5½ in. focus, 47s. 6d.; quite new whole-plate rapid rectilinear by Charterhouse Stores, Waterhouse stops, best condition, 35s.; Lancaster's half-plate Instantograph lens, iris stops, grand definition, time and instantaneous shutter, 16s.; pair stereoscopic wide-angle rectilinear, by Charterhouse Stores, rotating stops, 4 in. focus, 45s. pair; Swift 5 by 4 wide-angle rectilinear, 5 in. focus, rotating stops, 32s. 6d.; Beck's 8 by 5 Autograph rapid rectilinear lens, iris stops, 9 in. focus, £3 12s. 6d., as new; Lancaster whole-plate wide-angle lens, rotating stops, best order, take 15s.; Dallmeyer portrait lens, c.d.v., grand definition, Waterhouse stops, finest order, 63s.; Ross' No. 2, c.d. v., portrait lens, Waterhouse stops, rack and pinion, take £4 5s.; 7 by 5 Optimus rapid rectilinear, Waterhouse stops, as new, 42s.; whole-plate Wray's landscape, Casket lenses, 5 in., 7½ in., and 10 in. focus, iris stops, quite new, take 70s., lowest. All above lenses are warranted as described.—On view, City Sale and Exchange Rooms, 54, Lime Street, corner Leadenhall Street, City (late Goy's Medium). Every description of apparatus bought, sold, or taken in exchange.

**Bargains in Hand Cameras.**—Talmer No. 3, fitted with Euryscope lens, iris stops, two large finders, time and instantaneous shutter, lever focussing, as new, £5 5s.; Optimus Ubique hand-camera, fitted Optimus R.R. lens, instantaneous shutter, three double slides, finder, adjustable focussing, £2 17s. 6d.; Kodak No. 1, best R.R. lens, carries 100 films, best order, in leather case, 40s.; McKellen's hand-camera, R.R. lens, shutter, carries 12 quarter-plates, covered leather, as new, 35s.; No. 1 Talmer, best lens, two large finders, time and instantaneous shutter, carries 12 quarter-plates, changing bag, as new, 62s. 6d.; No. 3 Kodak, very finest order, new spool films, rapid rectilinear lens, etc., solid leather case, £5 7s. 6d.; Beck's Frena hand-camera, new packet films, latest pattern, £4 4s.; hand-camera by Collins, quarter-plate, covered in morocco, fitted 5 by 4 Wray lens, iris stops, Thornton-Pickard time and instantaneous shutter, finder, direct focussing, patent changing box for 12 plates, Eastman's roll holder, and 6 double slides, quite new, £8 17s. 6d., cost double; Samuel's hand-camera, 9 by 12 centimetre, rectilinear lens, time and instantaneous shutter in case, quite new, take 32s. 6d.; Luzo's hand-camera, Robinson, Regent Street, quarter-plate R.R. lens, instantaneous shutter, carries 100 films, solid leather case, quite new, £4 17s. 6d.; Kodak, No. 4, size 5 by 4, new spool of films, warranted finest condition, in leather case, take £7 17s. 6d., cost £11 7s. 6d.; Adams' Ideal hand-camera, twelve quarter-plates, finest rapid rectilinear lens, time and instantaneous shutter, as new, £5 15s.; Fallowfield's Facile, fitted rapid rectilinear lens, carries twelve quarter-plates, as new, £3 17s. 6d.; Optimus magazine hand-camera, covered leather, carries 12 quarter-plates, finest Optimus rapid rectilinear lens, two finders, shutter, etc., as new, take £5 5s. All above are warranted as described. On view, City Sale and Exchange Rooms, 54, Lime Street, corner of Leadenhall Street, City (late Goy's Medium). Second-hand apparatus bought, sold, or taken in exchange, Inspection invited.

**Lanterns! Lanterns!! Lanterns!!!** Slides! Slides!! Slides!!! The largest and most varied selection in the whole kingdom. Before selecting elsewhere, call and inspect the stock of the City Sale and Exchange, 54, Lime Street, Leadenhall Street, City, where we have no hesitation in saying you will find all that you require in this way. Lanterns for sale, lanterns lent on hire, lanterns sold on commission, or taken in exchange for other apparatus. Write for special supplemental lists, Manager, City Sale and Exchange, as above.

*It is unnecessary to send an advertisement for the "Sale and Exchange" column for more than one insertion, as the goods are usually disposed of when the first advertisement has appeared.*

**ENLARGING APPARATUS.**—Hume's enlarging apparatus, 5 in. condenser, without objective, 61s. 6d.; with 8 in. condenser, 122s. 6d., carriage paid.—Hume, 1, West College Street, Edinburgh.

**IMPORTANT TO AMATEURS.**—Negatives skillfully Retouched. Printed in silver, gelatin-chloride, etc., and Enlarged. Also Developing, Copying, etc.—Terms strictly moderate.—Address, Wilfred Emery, 24, South Street, Baker Street, W.

OUR LANTERN SCREEN.—Our Dissolving Views.

FLASHES, by Oxygen.

It having come to our knowledge that it has been stated that our forthcoming issue of "Photographs of the Year" will be reproductions in colotype, we think it only right to publicly state that this is a deliberate mis-statement made by an interested party for his own ends. The pictures selected have been reproduced in Glyptogravure, which is a modified Woodbury process, and which has yielded results quite equal to, if not superior to those of last year.

WE have no hesitation in saying that in artistic merit the pictures of this year are superior to those of last issue. A copy of the portfolio, "Photographs of the Year," 1892, has been placed by permission on the table of the Assistant-Secretary, at Pall Mall, and visitors can easily see for themselves, not only the quality of the reproductions, but the artistic merit of the pictures. Although the specimen copies are not identical in colour with those which will be issued, we have no fear that the final results will be inferior. Our publishers request us to again draw the attention of our readers to the fact that the price before publication will be 7s. 6d., and afterwards 10s. 6d. The actual date of publication will be Friday, November 4th, but a few subscribers may receive their copies before that.

IF the Hon. Secretary of any photographic society, who does not now receive weekly a free copy of our paper for the use of the members, will inform us of the fact, we shall have much pleasure in placing the society on the free list.

YET again we think we score one. We issue this week, beyond our regular quantum, an eight-page Supplement devoted to the Lantern. This will not, for the present at any rate, interfere with the ordinary Illustrated Supplement which appears on the second Friday of each month. "Our Lantern Screen," as we have called it, will appear on the fourth Friday of each month during the lantern season, and in connection with it we have instituted Monthly Lantern Slide Competitions.

ONE of our competitors, Mr. F. Udale, of Utttoxeter, in the last Monthly Competition sent us a print of a very curious old custom, of sufficient interest to warrant our reproducing it with the account of the custom. He says—

"During a ramble with the camera I found myself in Abbots Burnley, a village of about 2,000 inhabitants

EDITORIAL DEPARTMENT.—All Literary Contributions, Queries and Answers, Photographs for Competition or Criticism, Books or apparatus for Notice or Review are to be addressed to the EDITOR, AMATEUR PHOTOGRAPHER, 1, CREED LANE, LUDGATE HILL, LONDON, E.C. (All communications should reach the Editor on Tuesday.)

TRADE ADVERTISEMENTS are received up to Tuesday morning.

PUBLISHING DEPARTMENT.—All letters containing Subscriptions, Orders, Remittances, SALE and EXCHANGE Advertisements, or other business matters for the AMATEUR PHOTOGRAPHER are to be addressed to the Publishers, HAZELL, WATSON, and VINEY, LD., 1, CREED LANE, LUDGATE HILL, LONDON, E.C. SALE and EXCHANGE Advertisements (at the charge of Three Words for One Penny) must be received by Tuesday evening's post to ensure insertion in the same week's issue.

"Amateur Photographer" Monthly Competition, No. 42.—"SEA PIECES and RIVER SCENERY." Latest day, November 21st.—Prizes: Silver and Bronze Medal, with ribbon and clasp. One mounted print only to be sent in. Entry forms, etc., on receipt of stamped envelope. Address: Editor, AMATEUR PHOTOGRAPHER, 1, Creed Lane, E.C. (Prizes will be announced and photographs reproduced and criticised in the AMATEUR PHOTOGRAPHER Supplement, December 9th.)

situated on the borders of Needwood Forest, about twelve miles from Burton-on-Trent. The natives were celebrating their annual wakes, and amongst the attractions to be seen was a dance called 'The Horn Dance,' the subject of the picture. About eight deers' horns mounted are carried by men in grotesque attire, and to a lively tune they dance, charging each other, and then running away. The one on left is mounted on a hobby-horse; he now and again wips them up, and the archer in front shoots them. The whole thing is grotesque in the extreme. I was informed by the Vicar that the custom dates many centuries back, and 100 years ago the Horns were danced at the main entrance to the Parish Church on Sunday morning in the summer-time, a collection being made, and the proceeds used in the relief of the poor."

CAPTAIN FRASSEIS has just invented, or shall we say adapted, our own familiar friend the camera to artillery, so as to enable an easy and certain aim to be taken. The actual method is of course kept secret, but it seems that the image of the object to be hit passes through a lens and

"THE HORN DANCE."

is reproduced upon a screen, the centre of which is accurately marked out. When the image of the object falls on the central point the gun is fired.

THE accuracy of aim is said to be astounding, and also a mere novice may enter the darkened room containing the screen, and without any practice secure each time a hit. As the invention is to be fitted to field and siege guns, and the infantry are threatened with the same thing, the art of killing will become so highly perfected that there will be no one left to kill.

AN international exhibition of the ancient and modern press, organised by the Belgian Union of the periodical press and the Belgian circle of collectors of journals, will be opened in April and May, 1893, at the Museum of Fine Arts, Brussels. The "Helios Belge," charged with the photographic section of this enterprise, hopes to gather a complete collection of the special papers of the whole world. To cover the enormous cost of the enterprise, a tax of 7 fr. 50 cents. has been established.

PHOTOGRAPHY, as the handmaid of astronomy, has yet again enabled Professor Barnard, by the aid of the huge Lick telescope, to discover a new comet on 12th inst. With Mr. Barnard's discovery of Jupiter's fifth satellite and the new comet, he is fast taking rank as the first astronomical discoverer of the day. But it is not everybody who has such a magnificent instrument to work with as the Lick telescope.

MESSRS. WORMALD AND Co.'s second Photomnibus pin-hole competition closes for entries on the 31st inst. Intending competitors may like to be reminded of the date. The prizes are a repeat of those given in June last—First, £2 2s.; second, £1 1s.; third, 10s. 6d.

Truth is again on the war path, and the old firm and the old trick, the "free portrait" swindle, is again to the front. It really is astonishing to find that there are still some dupes who can be gulled by this most transparent trick.

"THEY do things better in France" is almost as old a saying as the one of good Queen Ann. Still it happens to be true also of photographing criminals, if we may judge from the enclosed:—

"The Bath Chronicle gives an account of the attempt to photograph two men, now in Horfield gaol, charged with a watch robbery at Bath, and says the man giving the name of Ambrose, who ran off with the booty, made such a strenuous resistance that it is feared the likeness will not do much in leading to his identification. In the photograph obtained, the two hands of a stalwart police officer are round his neck, another hand has a tight grip of the prisoner's hair, while his arms are also held; but despite these forcible measures, Ambrose, by turning his face aside, thrusting his tongue in his cheek, and closing his eyes firmly, defied the skill of the artist and the strength of the police. Of Brett, his companion, the photograph is much better. We have often marvelled at the simplicity of the most cunning of our criminals, in allowing the gaol authorities to secure such excellent likenesses of their faces, that subsequent identification is readily made. Sometimes photographs are obtained in two or three positions, and showing the hands placed across the breast so as to display any peculiarities in them. In these days of snap-shots, it ought not to be a difficult matter, one would think, to secure photographs without the criminal having a chance to defeat the object of the authorities, as did Ambrose. But goodness knows how much correspondence with the Home Office, and how much tape and sealing-wax, any attempt at such an innovation would mean."

DURING the winter months it is not unusual for societies to give some sort of public entertainment, and too often this is a lantern show. Now, to make a lantern show interesting and entertaining to the outside public, you must have an interesting subject, good slides, and a good lecturer. It is far better to sacrifice a little of the photographic and introduce a little musical element, as is, we note, being done by the Y.M.C.A. Photographic Club at Sunderland.

## Chit-Chat.

JUDGING from the correspondence which has taken place upon the subject, the awards in the recent lantern-slide competition seem to have given rise to some controversy. There is, I think, much to be said on both sides of the question. Allowing past medallists to compete of course makes the competition a keener one, and raises the standard of excellence, but it certainly gives the producers of poor work less chance of obtaining distinction.

I CANNOT agree with Mr. McEwan in holding that because a particular picture happens to have been medalled, a lantern-slide of the same subject should not be eligible for entry in a subsequent lantern-slide competition. Is the technique demanded in the production of the slide to count for nought?

MR. J. W. WADE'S views accord entirely with my own; the more skilled the competitors, the better the work, and the keener the competition, and, in the event of an award, the greater the honour.

"MOI-MEME" apparently invites you, Sir, to a classification of your competitors which, if adopted, would certainly be novel. Are you to inquire of them the amount of time which circumstances permit them to devote to photography; and shall you demand to know, as a condition of competition, the amount of their income for the current year?

I TRUST, however, that my readers will not infer from the foregoing that I am in any way attempting to defend the "pot-hunter." For him, and for his methods, I have the most profound contempt.

It is high time that the too common practice of sending medalled pictures to exhibition after exhibition should be stopped, and I infer from the awards at the Bedford Society's show that the judges were of the same opinion, for I see that in several instances certificates instead of medals were awarded to certain well-known exhibitors who had sent in work which had previously been medalled. By the way, I am tempted to inquire how it was that "Chaff" and "Winter" came to be entered in Classes 4 and 6, and not in the champion class which was provided? I am under the impression, though I may be wrong, that both pictures have received distinction elsewhere.

THE Camera Club Committee have good reason to be proud of their labours, for the collection of pictures, albeit there is a preponderance of "impressionist" work, is undoubtedly one of the finest ever brought together.

It is, however, not quite so representative in character as its promoters would have us believe, for I know of several exhibitors whose productions, and position in photographic circles, should certainly have entitled them to the courtesy of an invitation, who are unrepresented, simply by reason of the invitation not having been extended to them.

I SHALL have more to say upon the pictures next week, but pending that, I would draw the attention of intending visitors to "Reed Harvesting" and "Lowland Solitude," the exhibits of Mr. Horsley Hinton. Both pictures rank among the best work in the room. Other notable exhibits are "Making Friends" and "The Long Day Wanes," by Mr. Ralph Robinson—these pictures alone are worth journeying to the Club to see.

THE past week has afforded the landscape photographer some of the finest opportunities for landscape work. The frosts and slight fogs of approaching winter have driven the ordinary pleasure-seeker and the mere ephemera of photographers from the scene, and now the earnest student may work without interruption. I have had one or two days with the camera recently on the shores of the tidal waters of the Thames, and have met with some splendid subjects for broad treatment. Seize the fleeting opportunity, ye medal hunters, and secure "ye misty mornings" while ye may.

CHATTERBOX.

## Letters to the Editor.

### PHOTO. PORTFOLIO CLUB.

SIR,—Would you kindly make it known in your next issue that there are vacancies for five members in the Photographic Portfolio Club. Ladies and gentlemen are eligible; intending members to submit specimens of their work. Full particulars will be sent on application.—Yours, etc.,

FRED. G. READER.

\* \* \* \*

### EXHIBITION GOODS.

SIR,—The season has now approached when many exhibitions are taking place throughout the country, and manufacturers of specialities are requested to exhibit some of their latest goods. A great deal is usually promised by the person applying as to the care that will be exercised in showing the articles and returning same, but my experience is a sorry one, for if the goods have been fairly handled (I say nothing of soiling), the *repacking* is simply vile, possibly left to some persons who never packed a box in their lives. Polished goods sent in tissue paper, etc., will be returned bare, a burnisher tumbling about with mahogany cameras, and such like carelessness. Perhaps others have experienced the same kind of thing, and, like myself, almost vow not to exhibit again. If secretaries of societies and others desire to show the goods of manufacturers, and there is certainly an incentive on both sides to be up to date, the least that can be done in common justice to the exhibitor is to see personally that goods are properly and sensibly packed, so that no loss or quibble arises in a mutual arrangement.—Yours, etc.,

57, High Street, Aston, Birmingham.

WM. TYLER.

\* \* \* \*

### THE P.S.G.B. MEDALS.

SIR,—The suggestion made in your last issue that the medals of the Photographic Society should be awarded without the competitors' names being known to the jurors is a good one, but it is, as you explain, impracticable.

It is a fact that both the hanging of the pictures and the awards have met with much adverse criticism year after year, not only from exhibitors themselves, in which case it might be set down to personal feeling, but by the photographic press. It is quite time that some effort should be made to remedy this state of things, for the holding of the annual exhibition is the chief function of the Society. Hints are frequently thrown out that partiality is shown in making these annual awards, and although there is probably no ground whatever for them, the fact which was admitted at a meeting of the Society last year that Mr. Robinson had been permitted to have his pictures hung where he pleased, lends some colour to the charge. It also leaked out at the same meeting that only one member of the hanging committee was present to direct the hanging of the pictures, although the absent members had "accepted the appointment," and the Hon. Secretary, whose presence would probably have prevented the unfortunate incidents which occurred while the hanging operations were in progress, was absent in the country. It is certainly desirable that the judges shall possess the full confidence of the exhibitors, and the present system of electing them is hardly conducive to such a result.

It is questionable whether an exhibitor should not be altogether disqualified from being a judge. He must inevitably have a leaning towards his own style of work, and is hardly in a position to judge impartially of the work of those by whom at previous exhibitions he may himself have been awarded a medal.

Would not the experiment be worth trying of obtaining the services of three artists as judges to act alone in that capacity, separate judges being selected to make the awards on apparatus and technical exhibits? Such an arrangement would put an end to charges of "favouritism" and "cliqueism" so frequently made at present. Moreover, there is some reason to think that the awards would be better, and would carry more weight than they do at present, and be more instructive to photographers.—I am, yours, etc.,

A MEMBER OF THE P.S.G.B.

\* \* \* \*

### UNIVERSAL HAND-CAMERA.

SIR,—In that portion of article on "A Universal Hand-camera" by Major Bruno, in your issue for June 24, 1892, the view finder of the instrument is described. No dimensions are given for the box, and I find, on scaling the sketch, that its dimensions do not correspond with the aperture to be cut in

front door of case, given in the same chapter as  $1\frac{1}{2}$  in. by 1 in., and further, neither the diameter nor focus of the bi-concave lens recommended is given.

If Major Bruno will kindly give me the dimensions of the finder-box, and the diameter and focus of lens, I shall be much obliged. I am of course assuming that the lens is circular.—  
Yours, etc.,  
A. J. GARWOOD.

\* \* \* \*

#### A NEW SOCIETY.

SIR,—A society is being formed for the purpose of giving free lantern entertainments at the various London hospitals and charities. The first meeting is fixed for Thursday the 27th October at the address below, in Room No. XI., for 8 o'clock sharp, and it is requested that all gentlemen wishing to help in this effort to brighten the lives of our less fortunate fellow creatures are asked to attend this meeting.

All who wish to join this society and cannot attend, are desired to communicate with the undersigned.—Yours faithfully,

B. FOULKES WINKS, F. SIMMONS (*Secs. pro t m.*)

Y.M.C.A., 182, Aldersgate Street, E.C.

\* \* \* \*

#### MASON'S TONING BATH.

SIR,—I have been giving Mr. Mason's toning bath a good trial with two papers, the Ilford and Eastman gelatine printing-out papers. The result of my experience is that on the whole it is a very good bath for the Ilford paper, saves a lot of washing, which alone is a great advantage with this paper, more so than it would be with the albumen. The danger to be avoided is that the bath soon becomes excessively acid and yellow tones result on fixing; but the remedy is obvious. The tones, with satisfactory negative, are warm purple brown; it is quick, but the gold must not be stinted. With the Eastman paper I find it takes first a blue-black tone that rapidly turns to pink in the half tones, though the bath is rich in gold. This pink fades slightly on fixing, but the tone remains decidedly pink to warm brown in shadows. Bath keeps neutral, fixing solution a little alkaline. I think that the bath should be tried with the Ilford paper, as it is nearly as little trouble as the combined baths, the tone richer, and has not the pitfalls to the beginner that the combined bath leads him into. Should much like to have the results of others with the Eastman paper. I feel much obliged to Mr. Mason for introducing the bath, and remain, yours, etc.,  
HY. LINGING.

\* \* \* \*

#### CHLORIDE P.O. PAPER.

SIR,—I have just read Mr. Underwood's very able and interesting paper on the above subject in your issue of 21st inst., but may I ask him (as an amateur) to define "a small scraping of chalk," "a small bit of washing soda." Surely these terms are ambiguous and embarrassing to a beginner? Perhaps he would also kindly say how long prints should be left in hypo 3 oz., to 20 of aqua? Or is there any means by which one can tell when fixation is complete? Are untuned prints on this paper durable?

With apologies for queries, and thanks in anticipation, faithfully yours,  
W. FALKNER WILKINSON.

\* \* \* \*

#### EXPANSION OF AMMONIA ON DILUTION.

SIR,—In reply to Mr. Cadett's letter on page 259 in your issue of the 14th inst., allow me to draw his attention to what is said in Watts' *Dictionary of Chemistry* on the authority of the late Dr. Ure: "One volume of water by absorbing 505 volumes of ammonia forms a solution occupying 1.5 volumes, and having a specific gravity 0.9. This when mixed with an equal bulk of water yields a liquid of specific gravity 0.9455, whence it appears that aqueous ammonia expands on dilution." Such a mixture ought, according to Griffin, to occupy a volume 2; but if we calculate from the above data, we find that it occupies 2.0084 volumes, giving an increase of volume corresponding to 0.42 per cent. The number I obtained from the rough experiment I made lately gave an increase of 0.37 per cent., showing that I was not very far from the truth.

If Mr. Griffin's tables were calculated on the assumption that there is no increase in volume when ammonia is diluted with water, they must be wrong.

The whole matter can be easily settled by obtaining the reply to the following question: Does ammonia on dilution expand, or is the volume of the diluted ammonia the sum of the volumes of

the constituents? I have given my answer above, and I hope Mr. Cadett will repeat that simple experiment I referred to at the London and Provincial Photographic Association, with all the necessary precautions, and report the result. I am convinced that when he has done so his faith in the particular tables will not be as great as it is at present.

The most recent researches on the connexion between specific gravity and percentage of ammonia in different solutions do not agree with the tables given by Griffin.

I never made any allusion to the expansion affecting results practically. All that I wished to draw attention to was the statement that ammonia differed from all other liquids in neither expanding nor contracting on being diluted with water, and that calculations based on that assumption must be erroneous; but this departure from the straight line may not introduce serious errors in practice.—I am, yours, etc.,  
A. HADDON.

R.N. College, Greenwich, S.E., October 22, 1892.

\* \* \* \*

#### EXETER EXHIBITION.

SIR,—Will you allow me through the medium of your columns, to inform the numerous applicants for entry forms for our Exhibition, that the latter part of Rule 2, prohibiting marks on the face of exhibits, is not intended to exclude the *titles* of pictures.—Yours truly,  
JOHN SPARSHATT (Hon. Sec.)

\* \* \* \*

#### AMIDOL FOR LANTERN-SLIDES.

SIR,—Since you published the Amidol formula with 20 gr. of 10 per cent. yellow prussiate of potash to the ounce of diluted developer, I have used it with great success for reductions in the camera, although the developer seems too energetic for contact exposures.

Two lengths of from 6 in. to 9 in. of magnesium ribbon burned behind ground-glass give a sufficient exposure for reducing a full plate to lantern size, using a  $f/6$  stop and Thomas' lantern plate.

The modified Amidol developer appears to be quite as energetic as 1 in 20 Rodinal without restrainer. Lantern-slides may be made by this means from large negatives by reduction quite as easily as contact slides from smaller negatives, and the results are far superior.

If you think it would be at all of service, I will send you a sketch and description of the simple home-made apparatus, costing only two or three shillings, which I have used.—Yours truly,  
EDW. B. WAIN.

\* \* \* \*

#### THE "A. P." LANTERN-SLIDE COMPETITION.

SIR,—Referring to this much-vexed question, we should, with all due deference as to encroaching upon your space, like to add our opinions.

What we contend is, it seems hardly just and in accordance with "fair play," that the multitude, or rather the "obscure workers," in this interesting pastime should, by reason of the continued competition of others who have attained the top of the tree, be debarred year after year from gaining recognition of their work.

We cannot for one moment believe that the "average worker" is devoid of that pluck and determination to get to the front, or to contest the supremacy held by others, which is so inherent in the young worker. Such is not the case! And yet when we consider that his opportunities of improving the shining hour, and possibly his resources too, are so much less than his more fortunate colleague's, it is quite time some distinction was made between the medallists and the aspirants to such honours.

The gold medallists are surely numerous enough now to hold a competition between themselves, and we therefore suggest that a Championship Class, devoted to gold medallists exclusively, should be instituted, and another class for the silver medallists and minor awards.

We feel sure this would give universal satisfaction, and would prevent for all time these constant bickerings. Then when the competitor in the lesser competitions had risen to eminence, he would have an opportunity of tackling the gold medallist according as his impetuous or peaceable nature dictated.—We are, yours faithfully,

A. WHITMAN,  
G. S. WILLIAMS,  
WM. WHITEN.

# IMPERIAL LANTERN PLATES.

EXTREME DELICACY OF GRADATION.  
PERFECT TRANSPARENCY OF SHADOWS.

## READ THIS.

THE PHOTOGRAPHIC NEWS of 30th Sept. says:

"The Imperial Dry Plate Co. have brought out a Lantern Plate which gives excellent results, translating with great beauty every gradation of tone observable in the negative. The new plate differs from other lantern plates in being quick instead of slow. This is a great advantage when it is desired to make reduced pictures from larger negatives. The plates admit of wonderful latitude in exposure. We developed four plates together, having given exposures of 12, 8, 5, and 3 seconds respectively. We were astonished to find that there was little to choose from the resulting pictures, which were all of excellent quality."

Price, 1s. per Dozen. Sample Dozen, 1s., post free.

# THE CADETT LIGHTNING PLATE

Challenges the WORLD for Speed and Quality.

(SEE PRESS OPINIONS.)

## THE "CADETT" LANTERN PLATE

(From Opinions of Experts) **TAKES FRONT RANK.**

AVIS

For those who want a Plate of Medium Speed and Excellence of Quality, our ORDINARY will be found to surpass in sensitiveness any on the market; in fact, when compared to the intermediate makes of other brands, IT IS THE CHEAPEST IN THE WORLD.

 *Photographic Work* (Oct. 21st) says: "We have received some plates of the extraordinary rapidity of 85 Hurter & Driffield, or 127 Watkins, and yet retaining the excellent general qualities of those we previously noticed; trial with an exposure determined by means of the actinograph fully confirming the stated speed number, which is an advance of nearly 50 per cent. on those we previously noticed." This is confirmed in a letter from Mr. Watkins, who says "they are fully as sensitive as the speed number implies, in fact they are exactly P130 on my scale. So far as I have tested different boxes of your Plates I have found the Hurter & Driffield speed numbers marked on them correctly represent their speed."

## CADETT & NEALL, Ashted, Surrey.

### CHIEF DEPÔTS.

London - - W. WATSON & SONS, 313, High Holborn, W.C.

Aberdeen - G. W. WILSON & CO.,

## Reviews.

*A Photographic Tragedy.* By Graham Harvey. Published by J. Guest, 1, Paternoster Avenue, E.C. Price 2d.

This little tragedy in blank verse treats of the baneful results of "Photographie" as practised by Colonel Lee, and how this gallant soldier got into trouble and appeared before a court-martial, with the final result that "when the Colonel got home he roar'd out for a hammer, a chisel, a pickaxe, and broke up his camera." In style it recalls very much some of the "Ingoldsby Legends," and it will form a very amusing little skit for post-prandial or annual smoking entertainments.

*A Catechism for the People, Pastor, and Preacher.* By D. Mart. Luther. A reproduction of the edition printed at Frankfort-on-Maine in 1553. Edited by W. Harry Rylands, F.S.A., Published for the Holbein Society by A. Brothers, 14, St. Ann's Square, Manchester.

This work is a splendid proof of the value of photography for reproducing with all fidelity such old books and MSS.

The work contains twenty-four woodcut illustrations, most of them, as stated in the introduction by the Editor, bearing the well-known monogram of Hans Behaim. The text includes the ten commandments, and each page is headed by a woodcut and concludes by a short examination. The Creed is next treated in like manner. Then the Lord's Prayer and the Sacrament of Holy Baptism, and then we are taught how all should learn to confess. The Sacrament of the Last Supper is followed by some shorter instructions and a small book on marriage.

The original work was lent by Mr. Bernard Quaritch, the well-known antiquarian bookseller, and the beauty and fidelity of the reproduction is of great credit to Mr. A. Brothers. If we cannot all of us have the original work, this reproduction may well take its place.

*Platinotype.* Simple instructions for working the cold development process. By J. T. Chapman, Albert Square, Manchester.

Mr. Chapman's little handbooks are well known, and the latest addition to these is the above simple treatise, which certainly fulfils a want, as there is no other instruction book on the subject. The directions are clearly written and should certainly be of great use to the beginner in platinotype work.

*The Ilford Year Book, 1893.* Published by the Britannia Works Co., Ltd., Ilford, London, E. Price 1s.

This little book is a new departure, and certainly will be very welcome. It is a neat morocco-covered gilt-edged book, and contains a brief review of 1892, and some useful notes collated from Mr. C. H. Bothamley's Ilford Manual. These notes include, the use of swing back, on focussing, stops, subject, light, exposure, hints when on tour, and notes on rational development. A diary is also given, with a week at an opening. A register of exposures and exposure tables for Ilford plates, weights and measures, and other useful tables.

Probably nearly everybody uses a diary of some kind or other, and to the amateur and professional photographer this will be very welcome, as it is exceptionally cheap and useful.

## Apparatus.

### CELLOIDIN PAPER.

A. AND M. ZIMMERMANN, of 6 and 7, Cross Lane, E.C., have submitted a sample of the above, which they are now introducing. This is a collodio-chloride paper, which in our hands gives very good results. A combined toning and fixing bath is recommended, and though we have not used the one specially advised we have found that rich tones are obtained either with the combined or separate baths. One great advantage with this paper is that very long washing is not essential, and the usual fault of curling may be entirely obviated by treating the print prior to toning with very hot water.

### THE CADETT LIGHTNING PLATE.

Messrs. Cadett and Neal, of Greville Works, Ashted, Surrey, have forwarded us another sample of their Lightning plates,

which register 85 on Hurter and Driffield's, which is equal to 127½ on Watkins'. This is nearly 50 per cent. greater than the plates noted by us a week or two back, and with such great speed the quality does not suffer. Given such plates as this, we really ought to be able to obtain some good winter snap-shots, and we shall look forward with pleasure to some good work if there is any skating on this year.

We have also received a sample of the Cadett lantern plate; our notice of which appears in Our Lantern Screen.

### PANORAMIC ALBUM.

Percy Lund and Co., of Memorial Hall, Farringdon Street, and Bradford, are placing a convenient form of album on the market. As will be seen from the illustration, it is made on the style of the well-known panoramas, and instead of having to mount each photograph, slips are provided for the insertion of the corners. It is made in three sizes, quarter, half, and whole plate, and will form a neat and useful place to store prints, as more than one

can be placed in a page.

## General and Photographic Chemistry. — XI.

By E. C. CONRAD, F.C.S.

### THE NON-METALLIC ELEMENTS AND THEIR COMPOUNDS.—(Continued).

#### CARBON (C=12).

Oc.: Carbon, when found in the free state, is always a solid, and occurs in three allotropic forms, which are the Diamond, Graphite or Plumbago, and Charcoal. These modifications of the element differ in their physical properties, especially in hardness, specific gravity, and colour; but they each, on combustion in the air or oxygen, produce, for every twelve parts by weight taken, forty-four parts by weight of the gas carbon-dioxide. Carbon, in combination, forms an essential part of all organic compounds, and exists in large quantities, as carbon-dioxide, marsh gas, etc., and also in coal, petroleum, and other substances.

The DIAMOND is found in India, Brazil, South Africa, and in smaller numbers in a few other places. It is the hardest substance known, and the colourless stones constitute the purest form of carbon, leaving, on combustion, only a trace of ash; others, coloured yellow, red, green, etc., may contain from 0.2 to 0.5 of foreign matter. The specific gravity of the diamond is about 3.5; it is a very bad conductor of electricity, and although, under ordinary conditions, it is perhaps the most unchangeable of substances, yet, subject to an intense heat, it swells up and changes to a black mass resembling coal. It combines with oxygen at a much lower temperature, and appears to burn in layers. Nothing is known as to the mode in which diamonds have been formed. Diamonds which are crystallised and quite colour-

less and translucent are, after cutting and polishing, used for jewellery; there is also a crystalline variety known as "boart," which cannot be cut, but reduced to powder is used for cutting the crystallised gems and glass; an amorphous variety, of a grey colour and quite opaque, known commercially as "carbonate," is also used for cutting gems, and by Swiss watchmakers. Diamonds are sold by weight, a "carat" 3.174 gr. troy being the standard in England (carats of other countries vary).

GRAPHITE or PLUMBAGO is found in Cumberland, Scotland, United States, etc. It occurs in hexagonal plates, crystallising in a form quite distinct from the diamond. Carbon is therefore *dimorphous*—that is, it occurs in two distinct crystalline shapes. Graphite has a greyish-black metallic appearance, and is commonly called *black lead*. It is friable, and leaves a mark on paper. It is a good conductor of electricity, and has a specific gravity of about 2.2. Graphite is not so pure a form of carbon as the diamond, but it is quite permanent under ordinary conditions, and oxidises with difficulty. Its principal uses are to make lead-pencils, polish stoves, lubricate machinery, make crucibles, and cover the grains of gunpowder.

CHARCOAL is the third allotropic form of carbon, and it is *amorphous*, having no regular structure. It is obtained whenever animal or vegetable matter is heated in a limited supply of air. Where wood is plentiful, it is stacked in heaps having a hollow space in the centre, and a few holes at the base, the outside of the stack being protected from the air by a covering of earth or turf, etc.; a lighted faggot is introduced in the centre, and the heap allowed to burn itself out. If carefully conducted, a yield of from 20 to 25 per cent. of charcoal will be obtained after some days. In England the destructive distillation of wood is conducted in iron retorts, and the products, consisting of tar, acetic acid, wood-spirit, and other hydrocarbons, are collected, and a residue of charcoal is left in the retort. The shells of coconuts give the most porous variety. Oils or fats give, under the same treatment, *lamp-black*, used as a pigment. Bones produce *bone-black* or *animal charcoal*—a porous mass of calcium phosphate and finely-divided charcoal, largely used in sugar-refining for removing the colour from the syrups. Charcoal has a specific gravity of about 1.5 but floats in water on account of the air enclosed in the pores. Besides the uses given above, charcoal is used as a disinfectant, the gases evolved during putrefaction being absorbed by the powdered charcoal and oxidised by the oxygen, also absorbed by it from the air. Charcoal obtained from cocoa-nut fibre can absorb about fifteen times its own volume of oxygen and carbon-dioxide; ammonia and other gases to a much larger extent.

COAL is a form of carbon that has been produced naturally from vegetable matter, and is much more impure than charcoal, containing oxygen, hydrogen, and nitrogen, and also having become bituminised during its formation. The following percentage composition is of interest in showing the gradual relative increase of the carbon in the decay and compression of oakwood:—

	Carbon	Hydrogen	Oxygen and Nitrogen.
Oakwood ... ..	50	6	44
Decayed oak ... ..	53	5	42
Peat ... ..	60	6	34
Cannel or Wigan coal ...	83	6	11
Caking or Newcastle coal...	88	5	7
Anthracite or Welsh coal...	93	3	4

Coals always leave, on combustion, a large amount of ash—sometimes as much as 30 per cent., and rarely below 10 per cent. This ash usually consists of the oxides of silica, aluminium, and iron. Sulphur is always present in coal, but is given off on heating, burning to sulphur-dioxide.

COKE is the residue obtained when coal is subject to

destructive distillation. *Gas-carbon* is a very hard variety of coke obtained from gas retorts; it is used to form the negative poles in a Bunsen cell.

COAL GAS, so largely used for lighting, heating, etc., is produced by heating coal in closed vessels called retorts. The coal decomposes, and forms a large number of different compounds—gases, liquids, and solids—most of which distil over, leaving a residue of impure carbon or coke. The products of distillation vary with the temperature—the higher the temperature, the more gaseous compounds are formed; while a low temperature produces more semi-liquids or tars. Hydrogen, methane, nitrogen, oxides of carbon, hydrogen sulphide, and such hydrocarbons as ethene, propene, etc., are the principal gases. The liquids are water, carbon-disulphide, benzene, phenol, etc., and the solids are various compounds of ammonia and paraffin, naphthalene, etc. These and other compounds issue from the retorts, and are led through iron pipes and cisterns, in which the liquids and solids separate out, and the gaseous products, after being purified by slake lime or oxide of iron and sawdust from as much of the hydrogen-sulphide and carbon-dioxide as possible, are collected in gasometers (inverted iron chambers standing in water). The value of the gas as an illuminating body depends on the presence of the hydrocarbon gases mentioned above, while its heating properties are principally supplied by the uncombined hydrogen and the methane, which together constitute about 80 per cent. of the total quantity. It is essential that as much of the compounds of sulphur as possible should be separated from the gas, because they rapidly attack metals, pigments, and the other decorative fittings in houses, and are also injurious to health.

*Composition of Flame.*—If the flame of a candle (which is simply the compounds composing it heated to incandescence) is examined, it will be seen to be divided into four unequal cones:—(a) That at the base of the wick being light blue in colour and of small area; at this point the combustible material, being in contact with the air, has sufficient oxygen to burn it completely, and produces a hot, non-luminous section of flame. (b) This cone is situated above the last, and surrounds the wick; it is of a dark colour, and is composed of vapours distilled from the wick, and the products of combustion of cone a—viz., water, oxides of carbon, and nitrogen from the air. (c) The third cone is above and also surrounds b, and is composed of the hydrocarbon vapours of that cone heated to incandescence; it is this portion that gives nearly all the light. (d) The last cone is of a yellow colour, and surrounds c, being formed by the combustion of the constituents of the luminous cone in the air. All luminous flames have these cones, although their relative areas often vary considerably. If a stream of air from a blow-pipe is directed into such a flame, its luminosity is destroyed, but it is rendered much hotter; this is due to the increased supply of air enabling the carbonaceous matter to burn much quicker. A blow-pipe flame is composed of two cones—first, an inner one of a blue colour, which still requires oxygen for its complete combustion, and is called the *reducing flame*, because many metallic oxides are decomposed or reduced by it; second, an outer flame of a darker colour. At this point all the combustible compounds are completely burnt, and there is an excess of highly-heated oxygen, and this portion of the flame is therefore called the *oxidising flame*, because many substances are burnt to oxides by it. The *bunsen lamp* gives a flame of this description, and consists of a small jet surrounded by a larger tube provided with several holes for the admission of air. The gas and air mix in this tube, and burn at the top with a non-luminous flame.

(To be continued.)

# OUR LANTERN SCREEN.

*A Monthly Supplement to the "Amateur Photographer."*

No. 1.

OCTOBER 28, 1892.

## Our Dissolving Views.

THE appearance of "Our Lantern Screen" will, we think, be heartily welcomed by all our readers, and we trust that the verbal pictures we may throw on the same will be found chatty, readable, and instructive. Our Lantern Supplement will be published on the fourth Friday of each month during the winter season, and form part and parcel of our regular issue, the price of which will remain the same.

We ask the cordial co-operation of all our readers, the Secretaries of societies, etc., in making this new feature of our paper a success.

In conjunction with "Our Lantern Screen," we have also commenced a series of Monthly Lantern Slide Competitions, and the following are the conditions, etc. :-

### PRIZES.

First Prize .. ..	Silver Medal and Clasp.
Second Prize .. ..	Bronze " "
Third Prize .. ..	Certificate.

Each competitor must send in two slides. The slides must be mounted and be properly marked, and bear the title of the picture legibly written on the face of mask. Any slide not properly marked will be disqualified. The marking, which must be adopted, is that most general, viz., two spots (white or coloured) on the face of the mask, which said spots should be placed downwards next the condenser in the lantern, so as to show the slide the correct way on the screen.

Past prize winners of the Gold and Silver Medals in our Annual Lantern Slide Competition, or past winners of the Silver Medal in our Monthly Lantern Slide Competitions, are disqualified. Any competitor winning a Silver Medal will be disqualified for any subsequent competition, but if competing he may be awarded an extra silver bar for the ribbon. Winners of the Bronze Medal or Certificate can only compete for the higher prize or prizes in subsequent competitions.

The slides of competitors which do not gain a prize will be divided into three classes according to merit, and the competitor's names, etc., published in the next number of "Our Lantern Screen."

Winners of the Silver Medal must supply to the Editor on demand an unmounted print from the original negative from which the lantern slide was made.

All slides entered for competition to become the property of the AMATEUR PHOTOGRAPHER.

### SUBJECTS AND LATEST DATES.

Landscape, with or without figure ..	Nov. 12th.
Sea Pieces and River Scenery ..	Dec. 17th.
Portraiture and Figure Studies ..	Jan. 14th.
Instantaneous Work ..	Feb. 11th.
Architecture (exterior and interior) ..	Mar. 18th.

Entry forms, etc., may be had by forwarding a stamped addressed envelope to the Editor.

We shall hope to have a hearty support to "Our Lantern Competitions." We, on our part, will endeavour to give every assistance to competitors. The winning slides we hope to re-

produce with criticisms on the same, and each competition will give us the text for a brief article on the faults noticeable.

THE slides will be available for loan to societies immediately after the appearance of the number of "Our Lantern Screen" in which the awards are announced, on payment of the usual booking fee.

THE notice for our first competition, which closes on November 12th, is rather short, but there will, we think, be no difficulty in this respect; it will, at any rate, be fair to all.

It has been suggested to us that it is unfair to allow a competitor to take a prize for a lantern slide made from a negative a print from which has been awarded a prize in any of our print competitions. But we would point out that it is not unfair provided the competitor has only just begun to make lantern slides, and should it happen that the judges award a prize to a lantern slide from such a negative, we shall require a declaration from the competitor that he or she has commenced lantern slide making within six months.

THE following is the itinerary of the AMATEUR PHOTOGRAPHER 1892 Lantern Slides. We regret that owing to the very late application for the same by some Secretaries, we have not been able to avoid long journeys in some cases.

1892.	1893.
Oct. 13 Birkenhead	Jan. 2 Richmond
" 14 Shrewsbury	" 6 Blackburn
" 18 Birmingham	" 10 Phot. Soc., Ireland
" 21 Burton-on-Trent	" 13 Munster
" 25 Delph	" 19 Gloucester
" 27 Liverpool	" 20 Hereford
" 29 Douglas, Isle of Man	" 23 Devonport (Cam. Club)
Nov. 3 Barrow	" 24 Plymouth (Graphic)
" 5 Chorley	" 25 Devonport (R. N. Col.)
" 9 Kendal	" 30 Todmorden
" 11 Carlisle	Feb. 2 Stockton
" 14 Ulster	" 4 Whitby
" 15 Belfast	" 7 Newcastle
" 18 Preston	" 8 Durham
" 22 Rodley	" 9 Sunderland
" 24 Louth	" 10 Tyneside
" 28 King's Lynn	" 11 Haltwhistle
" 29 Peterborough	" 14 Sunderland
" 30 Yarmouth	" 17 Selby
Dec. 3 Hull	" 18 Bootham
" 6 Wolverhampton	" 20 York
" 8 Wigan	" 22 Stockport
" 9 Warrington	" 23 Oldham
" 13 Manchester	" 24 Lancaster
" 16 Lewisham	" 27 Sheffield
" 19 Blackheath	Mar. 1 Crewe
" 20 Faversham	" 3 Walton
" 22 Hastings	" 6 Accrington
" 23 Maidstone	" 7 Keighley
" 27 Guildford	" 8 Wakefield
" 28 Brighton	" 9 Huddersfield
" 29 Sutton	" 14 Hove
" 31 Polytechnic, London, W.	" 15 Eastbourne

Mar. 18 Leytonstone	April 10 Cheltenham
" 21 Sydenham	" 13 Torquay
" 22 Woolwich	" 14 Pudsey
" 24 Brixton	" 15 Oxford
" 28 East London	" 21 Glasgow
April 3 North Surrey	" 28 West London
" 5 Ramsgate	May 1 Kensington
" 8 Cirencester	" 9 Bolton

WE are glad to hear that wherever the Slides have yet been exhibited, they have given every satisfaction and gained golden opinions.

ADVERTISING is now a very important item, and one of the comic papers this week shows two explorers traversing some fearfully desolate spot far from civilised countries, and one congratulates the other that here at least they have reached a point never before trodden by the foot of man. In the next picture they are depicted as horror-struck, on reaching a rock under which they wished to take shelter, and finding painted on the same a recommendation to try somebody's patent food.

THIS, no doubt, is bad enough, but really it is getting a serious matter when we hear that some experimenters have been successful in projecting advertisements upon the clouds by means of a very powerful optical lantern. This will be too bad. We shall probably find shortly when we go out for a walk of an evening that the whole sky will be a huge advertisement board, and we shall see a blank space with the words "To let" projected on the same. Worse still, these sky spoilers are really going to make their own clouds when there are no natural ones.

OUR publishers will issue at the end of next week a new and complete work on lantern-slide making, called "The Lantern Slide Manual," by Mr. John A. Hodges. It will be found very easy of comprehension, very practical, and an indispensable adjunct to every lantern-slide maker's library.

How valuable the optical lantern may be made is a fact but rarely recognised by the many. The Brechin Photographic Association will have an exhibition of slides on December 14th, illustrating the manufacture of linen.

ANOTHER example of the value of lantern slides is the set by Mr. Freshwater on bee culture shown at Pall Mall. Why these did not receive a medal is a question which has been asked once or twice. That they thoroughly deserve one is recognised by many.

WE shall be glad to receive any hints or suggestions from our readers as to this Supplement, or to receive any short papers bearing on lantern topics for consideration or insertion.

## Flashes.

THE latest novelty in the lantern world—"Our Lantern Screen."

Is the idea of the Supplement original, or did the Editor s—, I mean borrow it?

SUPPOSING he did—what then? Aren't we better off for having more paper even if we don't get any more to read?

THE Editor is real mean; he says he is going to disqualify me from entering his competitions because I am an old hand. Well, I have only made slides for the last six years, and never having got a medal yet, it's too bad. I shall write to the AMATEUR PHOTOGRAPHER about it.

To make matters worse, when I was asked to turn on the

oxygen he said he should like to see some of my work, and he sends back the slides and says:—

DEAR OXYGEN,—I really think you might compete, as I am quite sure nobody else would stand a chance of winning—"

And here I had to turn over the page, and whilst doing so, felt at least three inches higher. I turned over, and he was mean enough to wind up by saying "the wooden spoon."

Was I mad? Oh no, it's no use getting angry with the Editor he has a happy knack of dropping you or your letters in the waste-paper basket, and sending you a card to that effect. But didn't my wife, children, and the servant suffer for a day or two! My wife, Hydrogen, wants to know what was the matter, and had serious thoughts of applying for a regulator for me, but I'm better now.

I SEE there has been a good deal of discussion as to the awards in the AMATEUR PHOTOGRAPHER 1892 Lantern-slide Competition, and whilst there is a good deal of fuss about nothing, I really think there is some cause for complaint, if I may say so, with one or two competitors. But surely we are snarling unnecessarily when we feel aggrieved at Mr. Hodges taking a medal. I always thought the annual competitions were to show annual progress, and the monthly ones for young workers.

HOWEVER, I was talking about friend Hodges, who, by the bye, I see has been elected President of the West London Photographic Society. So far as I can recall, he has not won everything, and no one can accuse him of being a pot-hunter. Of course, I don't mean to insinuate for one moment that anybody else is; oh no! not at all. Well, why should he not win a medal? Because he professes to instruct us, somebody says. Well, so much the better, and, in the face of his silver medal, I have read with far greater relish his "Lantern Slide Manual," an advance copy of which the Editor has sent me. His medal is at least proof that he can apply what he writes about, and the sterling instruction he gives is worth anybody and everybody's close and careful study. I strongly advise all would-be lantern-slide makers to get a copy as soon as it is published.

WHILST I am on this subject let me congratulate the Editor, the competitors, and all those who will see the slides, upon the high excellence of work which they show. I went to Pall Mall on the 8th of this month, when they were passed through the lantern and described by the Editor, and they really are fine. I don't wonder that I should be told that I should take the wooden spoon.

How much depends in a lantern show upon the lecturer! Some men seem to speak in their beards, or else through their noses. Others you can't hear at all, and when asked to speak up they squeal and make matters worse. It's a pity that our Editor can't be sent round in the box—no, I mean can't go round with the slides—because he can make himself heard. But there, he's an old hand at speaking in public; I can remember hearing him lecture more than ten years ago, though no photography when I was a young hand at chemistry.

I WANT our generous friend, the Editor, to make a small innovation and open his purse-strings still wider. He tells me he is going to institute slide competitions, and I want him to award marks to all competitors, and those that gain the highest total in the whole of the competitions to receive some reward. How nice it would be, now, if I was the lucky man to gain the highest number of marks, and I got a nice aluminium-gold-mounted binial lantern with diamond lenses. Shouldn't I be proud of it? Seriously, though, wouldn't some such plan as this prevent flukes and reward honest, hard work?

I HAVE been seriously warned that my "Flashes" are getting too long or too frivolous, and that evidently there is no chance of the supply failing, so I incontinently turn off the

OXYGEN.

THE Pall Mall Show still keeps up its average of attendance, which was 1,542 for the week ending 15th inst., making a total of 3,264 since the opening of the exhibition.

## Experiments with the Optical Lantern.

A FEW months back Mons. H. Fournier gave at the Photographie Club in Paris a most interesting lecture, setting forth the great benefits to science afforded by the use of the optical lantern.

After detailing a brief history of its invention and improvement, M. Fournier enlarged upon its innumerable resources, enabling large luminous images of photographs to be exhibited to numbers of people; and it is not only confined to this pleasurable application, but is also of enormous interest and value in projecting on a screen magnified representations of natural phenomena—the minuteness of these phenomena causing the greatest surprise, allowing us to grasp, by the aid of the lantern, the marvellous working of all these infinite forces, the combination of which around us constitutes the splendid work of life.

M. Fournier dealt only with picturesque science and of that branch of science of which the sovereign mistress is photography, and he proceeded with his audience to analyse some of the reactions produced in the course of its operations.

M. Molteni, a very able and skilful operator, then placed in a lantern made for the purpose, a tank filled with a solution of sea salt—the chloride of sodium of the chemists—of which no image was formed on the screen; but this became visible upon the addition of a small drop of a solution of acetate of silver placed on the surface of the solution, when a double decomposition took place, the chloride embracing the silver and forming a salt, insoluble and heavy, which was precipitated in elegant shapes, and slowly descended to the bottom. M. Fournier remarked that although the precipitate, on account of its opaqueness, was represented on the screen as being black, it was in reality of a beautiful white. A small quantity of acetate of silver was then added to the liquid and agitated; and now the screen took a greyish tint. Into this muddy-looking liquid, with another small tube, a solution of hyposulphite of soda was injected, and everywhere on the passage of the reagent the chloride of silver decomposed and passed to the state of soluble hyposulphite.

The various salts, and in particular the metallic salts, give place to precipitates as mentioned above; and a number of them being coloured in characteristic fashion, the colours produced by the reactions enable the chemist to rapidly distinguish the bodies with which he is dealing.

A tank was then placed in the lantern, filled with an important reagent, the yellow ferro-cyanide of potassium, and with the aid of a small tube, a drop of a solution of salt of iron was injected, when immediately a precipitate was formed of a beautiful blue, known so well under the name of Prussian blue.

If a drop of a salt of copper solution is mixed with the pure reagent, a typical reddish precipitate will be formed. These two very characteristic reactions allow the chemist to recognise the presence of one or the other metal in an unknown solution; and it should be particularly noted that the reaction takes place even when the metal is in very feeble proportions.

M. Molteni now placed in the lantern a tank containing litmus, a much employed reagent, extracted from certain lichens which grow principally in the Canary Islands, and on the screen formed a bluish-violet image, the normal colour of litmus. Upon a drop of acid being allowed to fall in the bowl, the colour of the litmus immediately changed to red. This very perceptible reaction permits the acidity of the solution tried to be immediately recognised. A drop of ammonia now being put in the tank, the blue colour immediately reappeared. Litmus, therefore, is a reagent which allows the recognition both of acids and alkalis.

Aniline colours were the next subject dealt with, the lantern projecting on the screen an example of magnificent carmine. Chemistry, has, indeed, furnished industry with a marvellous palette, in the aniline dyes, whose beautiful colours are all extracted from coal; but unfortunately these colours in many of their varied tints are sometimes extremely delicate and fugitive; and the ladies, no doubt, have good reason to execrate the chemistry which gives them such unstable colours.

**Precipitates: Acetate of Lead.**—A tank containing a perfectly transparent poisonous solution—acetate of lead—was next placed in the lantern, and a small drop of ammonium chloride solution placed on the surface. Immediately a precipitate (as in the previous cases) of chloride of lead was formed; and this, on account of its weight, gained the bottom of the bowl very quickly, and produced long streaks resembling a veritable display of fireworks. These reactions which give birth to precipitates frequently cause very curious manifestations.

**Decomposition of Water.**—The next study approached was the decomposition of liquids and salts by the electric current, a science which Faraday studied very completely, and which he gave the name of Electrolysis.

M. Molteni now placed in the lantern a tank filled with water, and containing two platinum wires in communication with an electric battery. The current was made to pass, and immediately there appeared, seemingly engendered by the platinum threads, a number of small black points, which were in reality bubbles of gas. It was noticeable that some of these bubbles were extremely small, whilst others large in volume, and we therefore draw the conclusion that water is formed of two gases; and if further experiments are made, and the gases gathered, it will be found that one, by its causing so much activity to combustion, is oxygen, and the other, by its combustibility, is hydrogen; and  $H_2O$  is the correct formula of water.

If the current is reversed the opposite effect is produced, and the thread to which the hydrogen bubbles attached themselves now collects oxygen, and *vice versa*. This experiment was first made by Carlisle and Nicholson in the beginning of the present century. It should be noted that hydrogen is attracted to the negative pole, and oxygen to the positive pole.

**The Occlusion by Palladium.**—M. Fournier, in continuation of the above experiment, now dealt with the occlusion of palladium, a bluish-white metal, somewhat similar to silver, discovered by Wollaston in 1803. This metal has the curious property of being able to absorb 966 times its volume of hydrogen. M. Molteni placed in the lantern a tank filled with water, and containing two conductors, one of platinum, quite straight, and the other of palladium, in the form of a spiral, the exterior surface of which was varnished. The current was now made to pass in such a manner that the negative pole was on the palladium.

Now around the platinum appeared bubbles of oxygen, but nothing was visible near the palladium, this metal absorbing the hydrogen, as produced, causing the spiral to gradually unroll. Upon the current being reversed, the hydrogen disengaged itself from the platinum, and the oxygen chased the gas absorbed by the metal, which at once took its original form.

**Electrolysis of Salts.**—M. Fournier now resumed his treating of the electrolysis, and remarked that Faraday demonstrated that when a salt, *i.e.*, the combination of an acid and a base, is submitted to the influence of an electric current, the base attaches itself to the negative pole, and the acid to the positive pole, a means admirable in its simplicity, of analysing any sort of chemical combination.

M. Molteni placed in the lantern a tank filled with water and containing a U-shaped tube in which was placed a solution of neutral sulphate of potash coloured blue with litmus. Two platinum wires, one in each branch of the U, conducted, the electric current which was made to pass; little by little the solution in one of the branches coloured rose, whilst that in the other remained blue. Upon reversal of the current, the colouring was also reversed.

**The Electrolysis of Lead.**—This marvellous property of the electric current has given birth to an industry, electroplating, which renders us daily enormous services. The discovery was made in 1837 by a Russian, Doctor Jacobi, who studied a Daniell cell with the view of applying electricity to the propulsion of a boat, when he recognised that the sulphate of copper in the interior of the cell was decomposed, the copper in a metallic state having moulded itself on the negative pole with extreme fidelity. In pursuing his experiments, Jacobi plunged in the solution of a metallic salt, a mould formed of gutta-percha, a non-conductor of electricity, to which the crude conductors were attached by the aid of solder. He fixed the mould to the negative pole of a cell, whilst the positive pole was formed of a sheet of metal contained in the salt. The current little by little decomposed the salt, and deposited on the surface of the mould a pellicle of metal, which shaped itself with a surprising and unprecedented delicacy. The pellicle once formed, it was separated from the mould, and thus a perfect facsimile of the original was obtained. It is by these means that objects of art are at the present day reproduced, and silver ware covered with a thin pellicle of gold; iron goods with a layer of nickel, etc.

M. Fournier regretted that on account of the operation requiring several hours he could not give a practical demonstration of the formation of the electrolytic deposit of copper. He, however, reproduced the experiment on a more rapidly decomposable salt, that of lead, with which a tank was now filled, and also contained two electrodes, the extremities being branches of platinum. Upon the current passing, the tree-like branches on one of the electrodes were immediately covered with a rich metallic vegetation, whilst from the platinum branches of the other pole seemed to come liquid streams, which appeared on the screen in undulating lines, on account of the difference of density of the two liquids.

Upon reversing the current, the first "tree," little by little, was stripped, and the second "tree" now covered itself in its turn with a metallic foliage.

**Diffusion of Liquids.**—M. Fournier remarked that his audience had probably been able to notice in the course of his experiments the curious forms taken by acids diffused in the middle of saline solutions; and for illustration he injected into a tank filled with water a

drop of a coloured liquid, which at once produced tiny spirals and anodes, which expanded and penetrated each other in a most interesting fashion.

It is not absolutely necessary that the liquid should be coloured in order to observe the phenomena; it is sufficient so long as the liquids have different densities. Into a tank of water was placed a small piece of ice, and the cold liquid streams, denser than the remainder of the water, transformed themselves immediately into tiny spirals twirling capriciously.

*Capillary Attraction.*—Another phenomenon, or perhaps rather a force, which is constantly employed around us is capillary attraction. It is in a great measure owing to this action that the vital forces act. It is this which makes the sap mount in plants; and again, that which causes the oil to rise in our lamps. One of the principal laws of capillary attraction is the more a liquid finds itself pressed between two sides which it cannot soak into, the more it rises notwithstanding the general law of the level of liquids. Two sheets of glass, making between them an acute angle, were placed in the lantern; also a tank of brightly coloured liquid, and directly the level reached the bottom of the glass it rushed up quickly, mounting in proportion as the gases were brought nearer to the point of contact.

*Crystallisation.*—M. Fournier now proceeded to a class of experiment of great interest. Of course, it is known that salts present themselves to us in geometric forms called crystals. When the water, which has served to dissolve a salt, evaporates, crystalline forms are gradually seen to form.

On a sheet of glass M. Fournier now placed a saturated solution of a salt. Of this no image formed on the screen; but gradually one "needle" appeared, followed by a second, ultimately giving birth to those capricious designs which the frost sometimes traces on our windows. But for the chemist, the form of the crystal, unalterable and characteristic, permits him to recognise with what body he is dealing. This experiment could be varied in a thousand ways.

*Movements of camphor.*—M. Fournier then passed to an entirely distinct phenomenon which has exerted in vain the wisdom of would-be discoverers, and of which the theory does not seem yet to be perfectly established.

M. Molteni placed on a special lantern apparatus for horizontal projections, a bowl with a transparent bottom and filled with water; on the water some camphor in fine powder was thrown; immediately all the little crystals were animated with a strange gyratory movement. What is the force which puts them in motion? Is it the vapour emanating from the camphor which strikes the water, and by reaction makes the little crystals whirl round? Are these electric manifestations, as some have supposed? At all events, immerse the end of your finger in the bowl, and immediately all movement ceases; draw out your finger and the corpuscles take up again their mysterious movement.

*Development of a plate.*—The horizontal tank being at hand, M. Fournier employed it to project on the screen the chief experiments of the photographic life, the development of a plate.

M. Molteni furnished the lantern with a yellow glass, thus modifying the light, which was then without any action on the sensitive plate employed. The glass was placed in contact with a negative and exposed to the light. This being finished, a developer was poured on the horizontal tank, and the plate (on which it was shown there was no image) was introduced. The reagent acted and slowly little by little the high-lights appeared and the image was finally completed. It was shown that the plate was finished, but in some way veiled by the unimpressed chloride of silver. M. Fournier asked his audience to recall that at the commencement of his lecture it was shown that hyposulphite dissolves unimpressed chloride of silver. The developing bath was therefore removed and was replaced by one of hyposulphite. The plate was shown when half cleared, and finally when entirely clear.

*The Microscope.*—M. Fournier then proceeded to show another transformation of the optical lantern; not a new invention, but one which was made in the middle of the last century by Lieberkuhn, a Swedish savant, who had the idea of brilliantly lighting by the aid of the sun infinite organisms, and to enlarge them with a special microscope which projected a very large image of the objects on a screen. To accomplish this, in place of the ordinary microscope which is such a personal instrument, a disposition was substituted so that a great number of people at a time could observe the image. Thanks to the present intense lights, we are no longer at the disposition of Phœbus, and M. Fournier then proceeded to show with what delicacy and what infinite pains Dame Nature has treated even the most infinite atoms. His instrument permits the study of the intimate structures of the three kingdoms, such, for instance, as the characteristic difference between the crystals of saltpetre and boric acid, which are clearly defined, thanks to the enlargement. Of the animal kingdom was shown an enlarged image of an enemy of our repose, and in spite of all we cannot help admiring the natural formation so well accommodated to its

life; its two legs, such powerful levers which enable it to execute such rapid and plentiful work; its mouth strongly armed with piercers and suckers, of which we have experienced the smarting but sure functions.

M. Fournier then took up the feather of a humming bird, of which the delicate featherettes are so correct in design, and thus cause our admiration. Every feather is terminated by a little hard appendix, which decomposes the light by a sort of phenomenon of interference, and gives by its many combinations the changeable tints we admire so much in the bird.

In the vegetable kingdom a fragment of a geranium petal will inform us of the geometric structure of the tissue of the plant. A series of hexagonal cells constitute this leaf which our eye, unpowerful, considered to be an united surface.

M. Fournier then showed some eels in paste and somewhat mummified, in balsam of Canada, and then what seemed to be monstrous crabs with enormous claws, but which were in reality cheese mites. M. Fournier remarked that he thought this time we should be ungrateful to complain of our feebleness of sight, and he asked if it were not better to be able to ignore all these formations in our food.

The optical lantern lend itself easily to a number of experiments in the physical kingdom, which it was not possible for Mr. Fournier to abridge in his lecture. He however, contented, himself with showing some of the phenomena of light, which furnish a great deal of wonder, and then proceeded to deal with the spectrum, and the analysis of white light. In the course of the rays emanating from the lantern, was placed a very narrow slit, so as to reduce the rays to a thin, flat sheaf. This bundle or sheaf of rays was taken up by a lens, which concentrated them on a prism, and immediately spread as a magnificent cloth of a thousand colours placed in regular order. This was the solar spectrum of seven principal colours arranged in the following scale. Violet, indigo, blue, green, yellow, orange, red. This order should be particularly noted, as it will be of assistance later on. M. Fournier did not expand on the theory of light, remarking that the spectrum is composed of rays of various colours of which we perceive only a part. At the side of the red, for instance, spreads a long band, dull to us, but characterised by considerable calorific effects. By the side of the violet also a large band unperceived, but very capable of chemical effects. It can be proved easily by moving in the darkened part outside the violet, a bottle filled with a solution of sulphate of quinone, and immediately the liquid will take a violet fluorescence very noticeable. Put then a piece of blotting paper imbibed with this salt, and the paper will be illuminated with a very characteristic lavender.

It is perfectly admitted after numerous experiments that the spectrum presents three maxima of intensity, having their own character; towards the external of the violet the maximum of chemical intensity, upon the yellow the maximum of luminous intensity, at the extremity of the red the maximum of calorific intensity straightly placed one within the other, and one of these manifestations cannot be produced without the others being more or less visible.

M. Fournier only occupied himself with the luminous manifestations, and remarked that the savants had sought to reduce the seven colours of the spectrum to three fundamental tints. Brewster proposed red, yellow, and blue; Young Helmholtz—and this is the actual theory recognised—that the veritable three were red, green, violet. M. Fournier gave an example of Newton's method to prove that the mixture of the seven colours makes white, although there are several means of doing this. On a disc divided in sections in proportion to the space occupied by the various colours, were painted two or three spectrums. This disc was made to turn round rapidly, and on account of the slowness of the fading of an image perceived by our eyes, the colours mix and the coloured disc vanished, giving place to the impression of white light. But it is not necessary in order to produce white light to have recourse to the combination of the seven colours; it has been recognised that two colours—not neighbouring—can by their mixing produce white when they are properly chosen.

M. Fournier showed a disc half green and half red, which was made to turn rapidly, and gave a sensitiveness with the double lantern. Two luminous patches were projected on the screen, one green, the other red, and upon the patches being mixed the sheet remained white. M. Fournier now turned his attention to the problem of stereoscopic lantern projections solved by D'Almeida in a very curious fashion. If the two stereoscopic images of an object are projected one on the other, the images not being superposable a troubled view will be obtained. But brighten one of them with red light by interposing a coloured glass and the other with green light. The image will not yet have gained, and will seem to be a mixture of red and green. But on taking two small pieces of glass, one red and one green, putting the red one before the right eye and the green before the left eye, the view immediately becomes clear and the stereoscopic effect is produced.

## The Oil-lantern and its Manipulation.

By JOHN A. HODGES.

INCREDIBLE as the statement may seem, it is nevertheless a fact that many amateur photographers who devote a considerable amount of time to making lantern-slides do not possess an optical lantern. That this should be the case is very much to be regretted, for not only do they place themselves at some disadvantage in not having the means of privately testing the quality of their slides before submitting them for public criticism, but they lose a great deal of the enjoyment which the private exhibition of the slides to their home circle would confer.

A great many are doubtless deterred from purchasing a lantern because they do not understand the use of the limelight, and are under the impression that an oil-lit lantern is inefficient, and dirty and messy in use. It is to remove this stigma from a much-abused type of instrument, and to show how really good results may be obtained with it, that I have undertaken to write this article. But to be quite candid I must begin by making the unfortunate admission that in careless hands an oil-lantern may fully deserve the unenviable reputation which in some quarters it has gained.

First, with regard to the instrument itself. If a good article is required a reasonable price must be paid for it. A demand for a low-priced lantern has arisen, which has, not unnaturally, been responded to by the manufacturers. Now, I do not want to say a word against cheap lanterns, as such—the only wonder to me is how so much value can be given for the money—but the weakest part of a cheap lantern is generally to be found in the lamp, and if only a very small outlay can be afforded I think the best plan would be to procure a lantern of a cheap type minus the lamp, and have it fitted with a lamp of good construction, such as Stocks', Hughes', or Newton's. I do not, however, advise this being done in preference to buying a well-made lantern and lamp complete, which will be found, perhaps, the cheapest plan in the end. Nor do I recommend those who are not familiar with lantern matters to purchase one of the second-hand bargains (?) which are constantly advertised. If the assistance of an expert can be obtained, well and good; if not, the buyer is more than likely to repent of his bargain. The lantern must, of course, be of the modern pattern, and not of the old phantasmagoria type, which is useless for the projection of photographic slides. I mention this because more than one amateur slide maker of my acquaintance has been deluded into buying a "bargain" of this nature. The lamp should be what is known as a "four-wick" one. There are a few people who still maintain that a two-wick lamp will give as much illumination as one with four wicks, but such a statement is either due to ignorance or a deliberate intention to pervert the truth. I have taken a great deal of interest in the matter, and have actually compared the brilliancy of different makes of lamps, with the result that I found that a three-wick lamp gave more illumination than a two-wick, and a four-wick more than either. Curiously enough, a five-wick lamp, which was tried at the same time, appeared to give no further increase of illumination, and the tendency to smoke was also greater. There are several excellent lamps in the market, the merits of which I do not for a moment seek to disparage, but at the risk of being accused of giving a gratuitous advertisement, I cannot help drawing attention to Stock's patent lamp, which I consider to be a distinct improvement in lamps for lantern illumination. The light given by it is remarkably intense, and white in colour, due to the very perfect combustion, but its novel feature consists in a mechanical device whereby the chimney can be raised or lowered in height. The higher the flame can be turned the greater is the illumination, but when the smoking point is reached in an ordinary lamp the flame has to be lowered, and the light is consequently reduced. In Stock's lamp it is not necessary to lower the flame, for by increasing the height of the chimney the tendency to smoke is overcome by the increased draught.

A little attention to one or two matters of detail in the manipulation of the lamp will remove one of the popular prejudices against its use. In the first place only the best oil should be used. In the words of a popular advertisement, not only ask for it, but see that you get it, for, irrespective of price, inferior oils are often palmed off upon the unwary. A good oil should be free from smell and colourless. Care should be taken, in filling, to avoid spilling any oil upon the reservoir, which after filling should be carefully wiped with a clean, soft dry cloth. Smell from a lamp is caused either by imperfect combustion, evaporation of oil spilt upon the lamp, or by the use of an inferior oil. After use the oil remaining in the lamp should be drained out, and the wicks removed. It is very important to have good quality wicks, and it is generally safer to procure them from the maker of the lantern, as those obtainable from the

oil shops are often of inferior quality. They should be cut to about eight inches in length with an old razor, and when inserted in the lamp should be exactly level with the tops of the wick chamber; the least irregularity will result in forking of the flame and a consequent loss of light. After having been in use, it is better to trim them by carefully rubbing off the charred edges with the thumb and finger, rather than attempt to cut them with the scissors. If the extreme corners are cut off each wick, the tendency to forking out of the flame at the edges, which sometimes occurs, will be obviated. The lamp should be lighted with a wax taper, and not with a wooden match or paper spill, for any charred fragments of the latter falling on the lamp will, when it becomes hot, give off an offensive smell. The wicks must, after lighting, be kept quite low for at least five minutes, or until the lantern and lamp get quite warm, and then at short intervals they should be raised until the smoking point is reached. The lamp will be working at its best when just short of though not actually smoking. Each wick must then be gently lowered until the smoking ceases, or, if Stock's patent lamp is used, the chimney must be extended until the same effect is produced. The best result will be attained by keeping the two central flames a little higher than the outside ones. When the lantern and lamp get thoroughly hot, the flames will rise higher, and probably begin to smoke; if they are then manipulated in the manner described, they will probably not require further attention during the time the lantern is in use. It is sometimes recommended to dissolve camphor in the oil, and at one time I used to do so, but I am convinced that more harm than good results, for the camphor greatly increases the tendency to smoke, and, moreover, in time, clogs up the wicks.

I do not propose now to deal very minutely with the other parts of the lantern, but a word or two on the objective may not be out of place. The objective usually supplied with a lantern of the type under consideration is a quarter-plate portrait combination, generally of French make. A similar lens, but with a larger back combination, is often recommended by the dealers. The advantage is a slightly greater brilliancy of image on the screen, but, on the other hand, the marginal definition, unless the lens be an expensive one, is not nearly so good. I, therefore, recommend in preference a lens of the ordinary type. Both the condenser and the objective should be gently polished with a piece of soft washleather before the lantern is used; and the condenser, wrapped in a piece of old flannel, should be warmed on the stove before the lamp is placed in the lantern. The latter is a necessary precaution in cold or damp weather, to avoid fracture.

The next essential matter to be considered is the lantern screen. Now a good many people who use a lantern for the first time think that anything white will do for a screen, and a sudden demand upon the household authorities generally results in the production of the worst sheet the linen press contains. Generally, more or less crumpled, pulled taut at the top, quite loose at the bottom, and waving to and fro with every breath of air, it is not to be wondered at that under such conditions the exhibition is not the success which was anticipated. There are two kinds of screens used—opaque and transparent. Dealing first with the former, I may remark that a whitewashed or distempered wall affords the best possible screen for use with an oil, or, indeed, any other lantern. The wall being absolutely opaque, no light is lost by transmission, as is frequently the case with ordinary screens. Therefore the best plan to adopt where a large room or nursery is available, is to have the paper stripped from one end wall, and replaced by two or three coats of whitewash made *slightly* blue, to counteract the yellowness of the oil light. When it is not possible to disturb existing arrangements in this way, a portable screen must be procured. A linen screen may be used, but a great deal of light will be lost by transmission. I have tried a good many materials, and have finally settled down upon a paper screen. Mine I got made at a map mounter's. It consists of a continuous cartridge paper 60 inches wide, and is mounted on strong linen, backed with opaque black paper, and is therefore practically opaque. It is affixed to a roller, and when not in use can be packed away in a large fishing-rod case. Such a screen will be found to answer admirably for small-sized discs up to about 5 feet in diameter, and no light being lost by transmission will yield a very brilliant picture. An even more brilliant result may, however, be obtained by using a transparent screen of oiled paper or very thin tracing cloth. A very brilliant image may be obtained in this way, but as the screen has to be placed between the audience and the lantern a longer room becomes necessary, or else one must be content with a much smaller disc. A transparent paper screen can be easily made by fastening a piece of continuous cartridge paper (which may be obtained up to 4 ft. 6 in. in width) to a roller; it may be made transparent by rubbing olive oil or turpentine over its surface with a ball of cotton wool. This should be done about a couple of hours before it is required to be used, so as to allow plenty of time for the oil to permeate the pores of the paper. The drawback to this method lies in the fact

that the screen after once having been oiled soon attracts dirt and moreover requires to be re-oiled before being again used. If the tracing paper is employed it will require no further preparation, and will be found to answer the purpose well, the only drawback to its use being the small size of the screen, for the tracing cloth is sold in much narrower widths than the thin cartridge paper. If a seam is not objected to, two pieces may be joined with Le Page's glue, and a larger screen so obtained.

If brilliant results with an oil illuminant are desired, we must, of course, be content with a small sized disc. To expect to get a twelve foot picture as brilliantly lighted with oil as with a mixed jet would of course be absurd, and yet this is what a good many do attempt, and because they do not succeed, turn-round and abuse the oil lamp. If a dealer tells you that his oil lantern will throw a twelve foot picture equal to the limelight, do not believe him; the thing is at present an impossibility, and when such statements are made it will be found that a hand-painted slide and not a photograph was used as a test. But is there any necessity for such large-sized discs? In my opinion, none whatever; for home use a 4 ft. or at the most a 5 ft. disc will amply meet all requirements. If attention be paid to all the details to which I have referred, a very satisfactory result will be obtained, and if the slides are good, even an expert will find but little cause to grumble at the "show." I may just add that the room in which the exhibition is to take place should be thoroughly dark; a fire burning in the grate will detract greatly from the effect, as will the light from a street lamp shining through thin blinds. All these little matters must receive attention if the best results possible are to be obtained.

A word in conclusion on the character of the slides—particularly addressed to those who make their own. Some writers recommend that slides intended for exhibition by an oil light should be very thin. This, however, is quite a mistake, for a slide of good quality will show almost equally well by either gas or oil. What is wanted is good gradation and clear high lights. Undue density should of course be avoided. The use of hydrokinone for development has, in unpractised hands tended to lower the quality of slides generally, the tendency being to under-expose and over-develop; this fact should be borne in mind by the novice, a full exposure and a diluted developer being the chief remedies for the evil. In regard to colour, slides which have received a normal exposure and development, which treatment generally results in the production of a good engraving-black tone, will be found to show the best. The effect of delicate tones and shades is generally lost when the slides are projected by an oil light, which, though apparently brilliant, is very yellow when compared with that of a mixed jet. But my pen is running away with me, and I must bear in mind the Editor's strict injunctions to be practical and concise. The subject is a fascinating one, but I think I have said sufficient to show those who will follow the hints I have thrown out, how very good results may be obtained with an oil-lit lantern. Of the slides I may have more to say on a future occasion.

## Gelatine Plates for Lantern-Slide Work.

By GEORGE T. HARRIS.

IN spite of the facility of manipulation and excellence of result claimed for collodio-bromide by many of its adherents, it does not require that one should be an accomplished prophet to predict that eighty per cent. of the slides made and shown at metropolitan and provincial societies during the coming lantern season will be on gelatine plates. For while admitting that a lantern slide made on a collodio-bromide plate by an accomplished worker in this process is justly regarded among lanternists as the acme of perfection, yet when one comes to consider critically the slides occasionally shown at societies' meetings by average workers in collodio-bromide, and contrast them with the slides of the average worker in gelatine, it must, I think, be conceded that the advantage is with the latter. Again, there is a convenience and certainty about a gelatine plate that is rather absent from a collodio-bromide plate; the film is not so liable to abrasion in contact printing, nor anything like so prone to slide off the glass into the developing sink, as is the wicked wont of my collodion films when an especially fine slide is being developed. The development of a gelatine plate, also, is a process which the large number of lantern-slide makers are sufficiently familiar with to prevent a feeling of strangeness when undertaking it. And, to sum up in favour of gelatine for lantern work, it would, I think, require rather an astute person to distinguish on the screen between a first-class gelatine slide and one on collodio-bromide.

When it comes to the home preparation of the plates, a point with which this paper has more particularly to deal, the advantage in

simplicity of process and certainty of result is, in my experience, unquestionably on the side of gelatine. I have prepared many batches of collodion emulsion, some of them of very good quality, but could never depend on always attaining the same standard of excellence, and I believe my experience is also that of other workers. In gelatine emulsion making this uncertainty has never presented itself to me provided an approved formula has been adhered to, and the necessary manipulations carefully carried out.

### THE PREPARATION OF THE PLATES.

The formula which has given me the most satisfactory result is, with slight modifications, due to Professor Burton, and was selected after trying several others, because of the good range of colour that could be obtained with it. It is—

Nelson's No. 1 gelatine	...	...	...	...	80 gr.
Ammonium bromide...	...	...	...	...	210 "
Sodium chloride	...	...	...	...	50 "
Hydrochloric acid	...	...	...	...	5 min.
Water (distilled)	...	...	...	...	8 oz.
2.					
Silver nitrate	...	...	...	...	400 gr.
Water (distilled)	...	...	...	...	2 oz.
3.					
Hard gelatine (Heinrich's)	...	...	...	...	400 gr.

Emulsification is performed with the No. 1 and No. 2 solutions, at a temperature of 130 deg. Fahr., and after the silver solution has been added very slowly to the bromised gelatine during its vigorous agitation, the jar is set on one side for a short time, when No. 3 is added, having previously been thoroughly well soaked in distilled water. As soon as the last added gelatine is perfectly dissolved in the emulsion, the jar may be immersed in cold water, to set the contents quickly. It is necessary for success in lantern emulsions to work with solutions as cool as possible, and avoid any tendency to cook. The emulsion, if properly made, should show ruby by transmitted light, and will be in an extremely fine state of division.

After the emulsion has set quite firmly, it has to be washed, and this is accomplished by squeezing it through a piece of moderately coarse "scrim," into distilled water. Some emulsion workers have rather questioned the necessity for using distilled water in washing emulsion, and it may not be so desirable in ordinary negative emulsion, but a careful comparison between slides made from emulsions washed in tap and distilled waters leaves me in no doubt as to the advisability of using distilled water in every instance.

Having left the squeezed emulsion to soak for a short time in the vessel of distilled water, it is squeezed again through the canvas into a fresh lot of distilled water, and again left to soak for a short time. Half a dozen squeezes, and as many soakings between are, I find, sufficient to completely remove the bye-products from the small batch of emulsion that the above quantities will make. I consider there is more efficacy in repeatedly squeezing an emulsion than in the long washing so often advocated, and by adopting the above mode of washing it is possible, in a long evening, to make an emulsion, wash and filter it, and coat the plates. It is not necessary to coat the plate thickly; indeed, rather the opposite is preferable.

### DEVELOPMENT AND VARIETY OF TONES.

With plates prepared in the manner just described, a good variety of tones is obtainable, from quite a warm chocolate to a perfect black, and the clearness of the plate, if carefully made, is perfect. The developer with which warm tones are readiest obtained is made up from ten per cent. solutions of sulpho-pyrogallol, ammonium bromide, ammonium carbonate, and ammonium hydrate respectively. As an example I may give—

Sulpho-pyrogallol	...	...	...	...	3 gr.
Ammonium bromide	...	...	...	...	3 "
" carbonate	...	...	...	...	6 "
" hydrate	...	...	...	...	3 minims
Distilled water	...	...	...	...	2 oz.

A great variety of tones may be got by varying the exposure and the quantities of the above ingredients.

The fixing bath is not an unimportant factor in procuring excellence in a lantern slide, for however clean the slide may be when it leaves the developer, if the fixing bath be even slightly discoloured the purity of the slide is sure to be depreciated. The formula I use myself is—

Chrome alum	...	...	...	...	1 part
Potassium meta-bisulphite	...	...	...	...	5 parts
Sodium thiosulphate	...	...	...	...	40 "
Water	...	...	...	...	160 "

This bath is an attractive green colour when made up, and retains its clearness until it commences to be saturated with silver, but it has always appeared to me unwise to continue using a fixing bath after it has commenced to show signs of saturation, and I strongly advise the use of two fixing baths in lantern-slide as in negative

work. An acid bath before the final washing removes any suspicion of stain.

#### INTENSIFICATION.

The intensification of lantern slides is a point deserving of more attention than I think it has hitherto received. With collodio-bromide it is a frequent practice to leave a fully exposed slide under-developed and gain the requisite density by silver intensification. Slides prepared in this manner are of the highest excellence. That gelatine slides have not been treated in the same manner is due, I feel sure, to the uncertainty of intensification. My first essays in this direction were with a modification of Mr. Wellington's sulphocyanide of silver intensifier, in which sulpho-hydroquinone and sodium carbonate replaced the pyrogallol and ammonium hydrate. The process of intensification was a very slow one, but the resulting slides were of high quality, perfectly clear in the high lights, and the original colour maintained unaltered. This intensifier was discarded, however, when it was found that an ordinary wet-plate formula gave equally good results in a more expeditious manner. The formula here given is one used for collodio-bromide plates and has answered perfectly in my hands for gelatine work:—

Silver nitrate...	...	...	...	2 parts
Citric acid ...	...	...	...	1 part
Nitric acid ...	...	...	...	1 "
Water (distilled)	...	...	...	16 parts

Two or three minims of this silver solution are added to a drachm of the ordinary ten per cent. solution of sulpho-pyrogallol, and the solution poured on and off the plate as in wet-plate redevelopment. When silver intensification fails with a gelatine plate it is usually because of insufficient washing, and one reason for the success I have met with in the silver intensification of gelatine slides is due, perhaps, to the extreme thinness of the film, which favours the more perfect elimination of the fixing salt. Full exposure, moderate development, and silver intensification is the procedure I would suggest in making lantern slides.

In conclusion, I would like to assure intending emulsionists that they will find the preparation of a batch of emulsion, sufficient for a gross or two of lantern plates, a much simpler matter than the text-books make it appear, and the additional interest it gives slide-making is ample remuneration for surmounting the initial difficulties of the process.

## Substitutes for the Lime.

EVERY worker with the limelight has at some period of his lantern experience wished heartily for some efficient substitute for the lime, which has a happy knack of becoming useless, or else cracking or flying to bits, etc. We need not, of course, point out that the cause of the spoiling of limes when not very carefully preserved is the absorption of aqueous vapour and carbonic acid.

Pfaff tested the light emitted by lime and found that with the oxy-hydrogen it was equal to 153 candles; with ether and oxygen, 76; with spirit and oxygen, 69; with household gas and oxygen, 19 candles. Ordinary chalk, alumina, and magnesia gave much poorer light.

Drummond compared the light obtained by heating magnesia, etc., with oxygen and his alcohol flame, and found, with Rumford's photometer, that the limelight was 37, zirconium 31, and magnesia 16 times brighter than an Argand lamp.

Caron, of Paris, stated in 1868 that magnesia gave a better light than lime, but that the magnesia must be pure; a very slight impurity of silicates reduced the light to one-third.

Monckhoven recommended cylinders of magnesia, and gave a method of preparing the same ("Photo. Corresp.," 1869, p. 214), but, unfortunately, they would not stand the great heat, splitting and cracking in all directions. A similar fate befell the magnesium balls recommended by Roux (Eder's "Jahrbuch," 1889, p. 300).

That numerous experiments should be made on this subject is but natural, and Plössl, of Vienna, have placed upon the market small rods of magnesia which are said to give very satisfactory results. These pencils are about  $2\frac{1}{2}$  in. long, and although after some time they become pitted with a hole by the action of the light, at the price of ninepence they are cheap, as they may be used over and over again.

Caron and Tessié du Motay in 1869 recommended zirconia for the lantern, and Schmidt and Haensch, of Berlin, prepare little zirconium disks mounted in platinum, but these unfortunately are rather dear.

At a recent meeting of the Manchester Society a disc of magnesia was used, which, by means of a platinum pin and holder, was fixed to the ordinary lime pin. The light with the blow through was said to be equal to that of the lime, and the great advantage of the magnesia standing atmospheric influences better is not to be despised.

We had occasion last year to try experimentally the adaptation of the old Welsbach mantle to the lantern, and working from that we continued our experiments with the zirconium and other earths, the same being based upon the researches of Mr. McKean and reported by him in a paper read before the Chemical Society. And whilst it is comparatively easy to get a disc, cylinder, or pencil which will give an intense light in the oxy-hydrogen flame, it is by no means easy to manufacture such a substitute for the lime that will stand the heat long.

Undoubtedly we have here a field of experiment which will afford not only considerable occupation, but also considerable profit to the successful experimenter. We would suggest as a possible road to success the employment of zirconium, yttrium, didymium, etc., with a very powerful compressing machine, which might be made on the lines of those now used for making tabloids and compressed tablets of drugs.

## Apparatus.

### THE CADETT LANTERN PLATE.

MESSRS. CADETT AND NEALL, of Greville Works, Ashtead, Surrey, have sent us samples of their lantern plates, which in our hands have given excellent results, with images of great pluck and clearness, and yet without any blocking up of the shadows. With ferrous oxalate, eikonogen, and hydroquinone good warm blacks are obtained, and with the pyro developer recommended there is no rustiness but a rich velvet tone. The special formula is—

#### I.

Pyrogallol acid ..	..	..	..	40 gr.
Potass. metabisulphite ..	..	..	..	2 dram.
Ammonium bromide ..	..	..	..	40 gr.
Distilled water, to make ..	..	..	..	20 oz.

#### II.

Liq. ammonia, '890 ..	..	..	..	$2\frac{1}{2}$ dram.
Distilled water, to make ..	..	..	..	20 oz.

Equal parts of I. and II. to be mixed just before development.

### THE MAWSON LANTERN PLATE.

This plate has long been a favourite, and from the samples we have tried in our experiments with amidol, etc., during the last week, they still retain all the high character and richness of tone for which they have been so long famous.

## Lantern Notes.

A LANTERN show on an extensive scale in aid of the club funds is arranged by the Croydon Camera Club for the 4th November, at the Braithwaite Hall, the main attraction being the Robinson slides, known as "Picture-Making by Photography," supplemented by a selection of members' slides, and relieved by vocal and instrumental music. All interested in artistic photography, should seize the opportunity thus offered; the more so that the shilling entrance will help to strengthen the hands of those who are promoting the advancement of local photography.

NORTH MIDDLESEX.—On the 24th inst. the first members' lantern evening of the season was held. The President (Mr. J. W. Marchant) was in the chair, and about one hundred and twenty members and friends were present. Messrs. Ainsley, Beadle, Chang, Fox, Gregory, Jones, Marchant, Mummery, Plunkett, Smith, Taylor, Tittenor, Wall, and Wynne contributed slides, and Mr. R. F. Wynne manipulated the lantern. The slides were of the usual varied character, some of the sets being of great beauty, and as a whole showed a marked improvement over last year's work. In nearly all instances much attention had been given to securing atmospheric effects, and in the majority with considerable success; the glittering black and white slides with points of light spotted all over them of early days were conspicuous by their absence. The next meeting will be held on November 14th, when Mr. J. Traill Taylor will address the society on "Photographic Optics." Visitors will be welcome.

## Trade Notes.

RILEY BROS., of 5, Cheapside, Bradford, favour us with no less than three lists, which are all well compiled and illustrated. This firm are noted for their cheap hiring scale. We note also that they offer a special oil lantern called the "Praestantia" which is constructed on the idea of creating great draught and thus gaining very brilliant illumination. Apparatus and slides both new and second-hand are offered at reasonable terms. These price lists are well worth looking through by any lanternist requiring anything.

Mr. Alfred Underhill, of 32, Clarendon Road, West Croydon, sends us a very complete list of slides, both plain and coloured, photographic and otherwise. Mr. Underhill has long been known for his artistic colouring, which he undertakes at from 1s. per slide.

Wormald and Co., of Sutton, Surrey, sends us a very neat little set of sample masks, which are mounted on cards with their special "photographic paste." This set of samples enables one to judge at once the best mask for any slide. Now that the fashion runs into narrow oblong pictures, Messrs. Wormald have introduced a new shape,  $2\frac{1}{2}$  in. by  $1\frac{1}{2}$  in., which is very convenient. The other new shapes are an oblong,  $2\frac{1}{2}$  by  $2\frac{1}{2}$ , suitable for 10 by 8 reductions, and a large oval  $2\frac{1}{2}$  by  $2\frac{3}{4}$ . Other lantern requisites are binding strips, white spots, and last, but not least, the Wormald lantern-slide printing-frame for contact printing from large negatives. We have had one of these frames in use for the last two lantern seasons, and found it of great convenience.

In our issue of October 7th we publish a letter from Mr. Davidson upon the developing of lantern plates with Amidol, with the addition of ferrocyanide. Messrs. Mawson and Swan have sent us some samples of slides developed with hydroquinone and also with Amidol with and without bromide and with and without ferrocyanide, and they show that ferrocyanide has no antifogging action in the Amidol developer, and that the slides sent us by Mr. Davidson are misleading, in that one-half is more developed than the other.

We ourselves have been able, since receiving Mr. Davison's slides, to make a series of experiments with Amidol, both for negative and positive work, and trying it with and without ferrocyanide we have been unable to detect any improvement by adding ferrocyanide, even when this amounts to ten or fifteen grains per ounce of developer. We shall continue our experiments and report in our next Lantern Supplement.

Archer and Sons, of 43 to 49, Lord Street, Liverpool, promise some novelties for our next number, and announce the introduction of a new Unilux lantern, or two lanterns with only one light; an "Ideal" lantern dissolver and carrier frame combined for single lanterns; the improved Ideal single lantern with bellows front; and last but not least, a new set of slides called "Slum Life in our Great Cities," which have been photographed direct from life in the slums by means of a hand-camera. With regard to these slides, Messrs. Archer say, "It need scarcely be mentioned that this was a work of no small difficulty, and at times of danger also; for many of the inhabitants in these districts strongly object to have their portraits taken, or to be photographed or noticed in any way. The photographer was several times threatened, and at others taken for a detective officer (he believes that the reason he was not actually molested is due to the fact of his being a very big man). It needed skill, tact, and perseverance for four months to produce the set of views we are now about to show you. We think the time well spent, for the pictures give a true insight to the character and habits of the people who live in these districts, as well as the natural expressions on their faces, which can be obtained in no other way." This ought to be a capital set, and one which should prove very popular with photographic exhibitions of all kinds.

On November 7th a selection of slides the work of the members of the London and Provincial Photographic Association, and on November 9th slides by Captain Abney and Mr. B. Gay Wilkinson, will be shown at Pall Mall.

## LANTERN FIXTURES.

- Oct. 27.—LIVERPOOL.—AMATEUR PHOTOGRAPHER 1892 Prize Slides.

## SLIDE PAINTING COLOURS,

SPECIALLY PREPARED FOR PAINTING MAGIC LANTERN SLIDES.

IN COLLAPSIBLE TUBES AND GLASS POTS.

Boxes fitted with Varnish Colours, 5s., 15s., and 30s. each.  
 Boxes fitted with Water Colours, 2s., 5s. and 21s. each.

JUST PUBLISHED.

"A Manual on Painting on Glass, and How to Use the Magic Lantern."

1s. each.

ALSO MANUFACTURERS OF THE

NEW-CHROMO PRINTED MAGIC LANTERN SLIDES.

5s. per Set. 12 Slides. 80 Subjects.

New Lists Just Ready, Post Free.

J. BARNARD & SON, Manufacturing Artists' Colourmen,  
 RETAIL, WHOLESALE, AND EXPORT,  
 19, BERNERS STREET, LONDON, W.

**DOLLOND & CO.,**  
 35, LUDGATE HILL. Branch—62, OLD BROAD STREET,  
 MANUFACTURERS OF  
**Optical Lanterns and Slides.**

SPECIAL COPYRIGHT SETS FROM ORIGINAL DRAWINGS.

SPECIAL SET FOR TECHNICAL EDUCATION,  
**The "BUSY BEE."**

Forty-five Slides, complete, with Lecture.

**DOLLOND'S "DURO" CLOTH LANTERN SLIDE BINDINGS**

LAST LONGER AND LOOK NEATER THAN ANY OTHERS.  
 GROSS BOXES, 1s.

## THE EAST LONDON PHOT. SOCIETY.

THE East London Society have been fortunate enough in getting together a really good show for so young a society. The judges (Messrs. A. Horsley Hinton and E. J. Wall) made the following awards in the various classes. Class A, Landscape and river scenery: 1st prize, by C. Tylee; 2nd, E. Stone; 3rd, C. Tylee. Class B, Seascapes: 1st, F. Uffindell 2nd, C. N. Mead; 3rd, W. R. Gould. Class C, Groups and portraits: 1st, C. Tylee; 2nd, M. A. Wilkinson; 3rd, G. S. Pasco. Class D, Instantaneous, 1st and 3rd, C. Tylee; 2nd, M. A. Wilkinson. Class E, Architecture: 1st, C. Tylee; 2nd, M. A. Wilkinson; 3rd, E. Stone. Class F, Enlargements: 1st and 3rd, C. N. Mead; 2nd, M. A. Wilkinson. Class G, Novices: 1st, A. G. Cooke; 2nd and 3rd, Mr. Greenwood. Class H, Open, 1st, C. Tylee; 2nd, G. E. Bennett; 3rd, J. E. Austin. Class I, Outing pictures: 1st, M. A. Wilkinson; 2nd, F. Uffindell; 3rd, C. N. Mead. The silver medal and challenge cup, presented by Mr. C. J. Oliver, for the best picture in the exhibition, was awarded to a very fine study called "Ploughing," by C. Tylee.

Taking the work on the whole it shows first-class merit, and here and there one comes across a real little triumph. Besides the competition pictures a large number lent by the Editor of the AMATEUR PHOTOGRAPHER were on view, and Mr. Horsley Hinton had also lent some of his masterpieces.

A small but select show of apparatus was exhibited. Messrs. Platt and Witte have, of course, a fine collection of brass and aluminium fittings of all kinds, several lanterns, both single and biunial, in metal and wood, and we noted a very neat contrivance for centering the lanterns on one of the biunials. This firm also showed a cheap German toy lantern, which sells for 12s., a real marvel at the price.

The City Sale and Exchange Rooms, of Lime Street, E.C., have a very varied show of all the leading makes of cameras in the market, both stand and hand, with also a lot of lenses.

R. and J. Beck, of Cornhill, show the Bynoe printing frame and their Frena hand-camera. Perken, Son, and Rayment, of Hatton Garden, show some excellent prints from negatives taken with their lenses.

Mr. T. H. Powell, of 116, Denmark Hill, S.E., fills a central table with his specialities in compressed developers and toning baths. The novelties shown by Mr. Powell are silhouette masks with full instructions for taking profile likenesses, a new photographic measure of neat and practical design; and a new Christmas card with mount for photograph will be of great attraction this season. Some good prints on Hardcastle's platinum print-out paper, for which Mr. Powell is agent, speak well for the capabilities of it.

**Ramsgate.**—On 3rd inst. the opening meeting of the winter session was held. Although the proceedings were entirely of a business nature, the members turned up in goodly numbers, and it was determined to have four excursions during the session, and a lantern competition in 1893. The plan of forming an excursion party to visit the Pall Mall Exhibition was mooted.

## Societies' Notes.

**OXFORD UNIVERSITY PHOTOGRAPHIC CLUB.**—The officers for this term are A. McMullen (Balliol), President; J. Walker, M.A. (Christ Church); A. Eglington (Lincoln), Hon. Secretary. The next meeting will be held on October 31st, when C. J. Mead-Allen will give a lantern exhibition of the Isle of Wight.

WE hear that the application for entry forms for the Hackney Society's show has been "tremendous," and from well-known men too. The last day for sending in entries is the 29th inst., and the energetic Hon. Secretary asks us "to tell the dilettanti"—we suppose he means the dilatory ones—to hurry up, or else they will be where the little boat was, that is a long way behind. Messrs. Marion, Wray, Watson, Paget, Park, Platinotype, Platte, etc., are to send apparatus.

**THE Tunbridge Wells Am. Phot. Assoc.** will hold their sixth annual exhibition on November 23rd or 25th. The following are the classes:—

Classes for Members Only.—1, Architecture, exterior or interior; 2, Interiors, other than architectural; 3, Landscape and seascape; 4, Genre; 5, Lantern slides, best series of six, any subject; 6, Transparencies and stereoscopic; 7, Scientific, or any subject not included in the above; 8, Four prints from negatives taken with a hand-camera; 9, Four lantern slides.

Open to Members of any Photographic Society in Kent and Sussex. —Best Set of Four Prints: 10, Figure studies; 11, Landscape, seascape, and architecture.

Open Classes.—Amateurs: 12, Landscape or seascape; 13, Genre; 14, Lantern slides, best series of six; 15, Architecture, exterior or interior. Professional: 16, Landscape or seascape; 17, Genre; 18, Lantern slides, best series of six; 19, Portraits; 20, Enlargements.

One silver medal will be given for the best exhibit of apparatus. Silver and bronze medals will be given in each class. Entry forms and full particulars from the Hon. Secretary, Mr. Jos. Chamberlain, 14, Calverley Park Gardens, Tunbridge Wells.

THE annual report of the Blackheath Camera Club shows a very satisfactory state of affairs. A substantial balance to the good, a good programme got through and numerous excursions, besides which £4 has been handed over to the National Lifeboat Institution. Well done, Blackheath! This last item might well be copied by other societies.

THE Sunderland Y.M.C.A. Camera Club will hold a social evening on November 1st, when there will be some prints, stereoscopes, etc., on view, a short concert, then the limelight, more singing, and then more lantern. Evidently the powers that be think there is nothing like variety, an opinion we hold also.

MONDAY, October 31st, is the last day for receiving exhibits (which must be accompanied by entry forms if not previously sent) for the exhibition of the Leytonstone Camera Club at the Masonic Hall, Leytonstone, on the 10th, 11th, and 12th of November. Lady Brooke will open the exhibition at six o'clock on Tuesday, the 10th inst. Messrs. Elliott and Son's prize medal wave study from the Convention will be on show, also several other carbon enlargements by the same firm. Photo-mechanical printing will be shown in all its branches, as will also be a large collection of apparatus and photographic appliances, a number of microscopes, polariscopes, etc., will be shown by members of the Club and explained to visitors. The programme will consist of a fresh feature in entertainment every half hour in each evening. Official catalogues, when ready, will be sent post free on receipt of four stamps.

THE visitors to the P.S.G.B. show for the week ending Oct. 22nd numbered 1,471. The total since opening, 6,277.

A correspondent kindly sends us notice that English plates and papers may be obtained from Herr Sigmund Federlein, Hanover.

A curiosity has been sent us by M. Rogers, of Church Street, Great Missenden, Bucks, and is a photographic reproduction of a postcard on which the word "Prizes" is written 10,858 times.

The *Photographer's Record*, published by Elliott and Son, has this month a quarter-plate illustration by the carbon process of "Welsh Ponies at Barnet Fair"—a snap-shot, taken by Mr. Birt Acres on a Barnet plate with Houghton's Shuttle hand-camera, which speaks well for the camera, plate, and printing process.

## Societies' Meetings.

**Barrow.**—This section opened their winter session by a public meeting on the 13th inst. The meeting was well attended, and was presided over by Mr. A. Blechynden, the chairman of the section. Eighty lantern-slides, showing various parts of the Holy Land (by Wilson, of Aberdeen) were shown on the screen by Mr. J. Timms with his triple lantern. Mr. J. Gaudie read the connective readings in an able manner. The slides were of a high-class quality, and were made from genuine photographs, and were valuable in giving a true idea of the country, showing also the inhabitants, street scenes, interiors, and scenes familiar to lovers of the Holy Scriptures, and would probably alter the impression which many have conceived of this interesting country, which is very often associated with fertile plains and palm trees, etc. Many of the slides showed scenery of a wild, barren, rocky nature, with very little vegetation.

**Blackheath.**—The first annual general meeting was held on 4th inst., the chair being taken by Dr. Ernest Clarke, M.D., B.S. The officers for the session of 1892-93 were elected, as follows:—President, Mr. W. H. M. Christie, M.A., F.R.S., F.R.A.S. (Astronomer-Royal); Vice-Presidents, Dr. Ernest Clarke, M.D., B.S., and Mr. J. T. Field, L. Mus. T.C.L.; Council, Revs. W. P. McDonald, M.A., and W. K. Soames, M.A., F.R.A.S., Messrs. Edmund Dashwood, M.R.C.S., W. Claude Johnson, M. Inst. C.E., F.R.A.S., Samuel E. Phillips, George Vesper, and E. J. C. Wiseman; Hon. Curator, Mr. W. Farrington; Hon. Treasurer, Mr. A. W. Young; Hon. Secretaries, Messrs. T. B. Earle, The Cottage, Handen Road, Lee, S.E., and C. W. Piper, 46, Shooters' Hill Road, Blackheath, S.E. The report for the last session, which was unanimously adopted, shows a good record of work done in the way of lectures, demonstrations, and summer excursions, while the balance-sheet shows that the club is in a very satisfactory financial condition, considering that it is only just entering the second year of its existence. The Council hope to be able in a short time to provide a dark-room for the use of members, to many of whom it will doubtless be of great service. The first ordinary meeting of the present session was held, the Rev. J. H. S. Taylor, B.A., being in the chair. Dr. Ernest Clarke (Vice-President) gave a very interesting lecture on "The Eye as a Camera," illustrated by lantern slides, specially prepared for the occasion, and also by models. The lecturer described in detail the complicated structure of the human eye, pointing out the manner in which the various parts are reproduced in the camera. He explained that the lens of the eye can be separated into three distinct lenses, two divergent menisci, with a double convex between, thus bearing a striking analogy to a photographic lens. The iris corresponds to the diaphragm and stops, but automatically adjusts itself, the aperture becoming smaller as the light increases, and larger as the light diminishes. It is in front of the lens, and both are protected by the cornea, which is simply a transparent cover, to prevent dust, etc., from interfering with the delicate mechanism of the iris and lens. The retina corresponds to the sensitive plate, and consists of the interior coating of the back of the eye, which, under the microscope is seen to be of a very complicated structure. From this sensitive surface the sensations of light and colour are carried by the optic nerve to the brain. The retina differs from the sensitive plate in having a curved surface, which at all parts is equidistant from the lens, whereas the photographic plate has of necessity a plane surface, the centre being nearer the lens than any other portion, and the edges being at a greater distance. This is the cause of what is known as curvature of the field, a defect which, of course, does not exist in the eye. The most remarkable difference between the eye and the camera is in the manner of focussing. This in the camera is accomplished by moving the lens, either further from, or nearer to the plate, but in the eye the lens itself is altered by a series of muscles, arranged so as to act upon it from all sides, which make it more or less convex as required. In the normal eye focussing is only necessary for objects within a difference of about 20 feet. For anything beyond that distance the eye is practically a fixed-focus camera. The whole interior of the eye is filled with a semi-fluid transparent matter, and the retina is impregnated with a black pigment to prevent the reflection of light within the eye; the interior of a camera is, of course, blacked for the same reason. After various questions, put by the members, had been answered by the lecturer, a hearty vote of thanks was unanimously passed to Dr. Clarke for his most interesting lecture, and the meeting terminated with another vote of thanks to the chairman for presiding.

**Bournemouth.**—The inaugural meeting of the winter session was held on the 19th inst. The President (Rev. J. R. Husband, M.A.) took the chair. A short address was delivered by the President, who referred to the work accomplished during the summer, also urging the members to renewed exertions in the direction of artistic photography as well as to excel in the working of the various processes. The President also gave some very interesting notes on the "New Cold Bath Platinotype Printing Paper," during the reading of

which the chair was occupied by Dr. H. Nankwell, one of the Vice-Presidents. Two prints were developed and fixed by the new process, and the simplicity with which the paper was worked recommended itself to all present. An album of interesting views on this paper was shown, and the President also announced his intention to give a prize to be competed for by the members of the society who were beginners. Some excellent notes on "Ilford P.O.P." were also given by Mr. P. H. Price, the various results to be obtained by different toning baths, also the difficulties that could be overcome in numerous ways during the operations of printing, toning, etc., were well illustrated by some nicely finished views, which were handed round for inspection. Several members present brought numerous specimens of their summer work, which were passed round for criticism.

**Brechin.**—The usual monthly meeting was held on the 19th inst., Mr. H. Braid, Vice-President, in the chair. The secretary, as delegate to the Photographic Convention, gave a short report of the proceedings and exhibits, and exhibited the Developan and Beck's new metal printing-frame. The Developan having only come to hand that morning, it had not been possible to get a plate developed to show how it would work. Mr. J. D. Ross thereafter read a short paper on "Enlarging," and finished up with a demonstration on Eastman's bromide paper. The subjects were a statue of Hamlet and a view of Brechin Cathedral. Both turned out very successful, and, on the motion of the chairman, Mr. Ross was thanked for his paper and demonstration.

**Brixton and Clapham.**—An ordinary meeting was held on the 18th inst., Mr. James W. Coade, Vice-President, in the chair. The Chairman first referred to the Club Exhibition to be held on the 17th, 18th, and 19th of next month, and begged the members to put their shoulders to the wheel and to make the exhibition a great success; he also reminded them that the last day for receiving exhibits was the 8th prox. He then called attention to the Exeter Society and the Stanley Show Exhibitions, and stated that the secretary would supply entry forms on application. Subsequently, Mr. F. W. Kent made some interesting remarks on "Bromide Paper and Lantern Slides." By printing and developing several pictures, he showed how different results in colour, etc., could be obtained by varying the length of exposure, the distance from the light, and the developer. The paper used was Ilford slow, and the developer ferrous oxalate. He also made some lantern slides from half-plate negatives in a reducing camera of his own construction. Some discussion followed, in which Messrs. Butler, Haward, Willoughby, and others took part.

**Crewe.**—The first of a series of limelight lantern demonstrations was given on the 19th inst. The subject was "A Visit to the Alps and Fjords," by the Rev. W. G. Rainsford, D.D., President of the society, Mr. T. Gorrell presiding. There was a good attendance. The views exhibited on the screen were photographed by the rev. gentleman himself, and were very fine specimens. The lecture was most interesting, humorous, and entertaining. The succeeding nights will include members' own slides, competition slides, Channel Islands, and the AMATEUR PHOTOGRAPHER Prize Slides.

**Croydon.**—The first of the winter meetings for the reading of papers was held on Monday, the President, Mr. H. Maclean, F.G.S., in the chair. Having presented Mr. H. E. Holland with a copy of Woodbury's Encyclopædia, being prize for Summer Excursion Competition, the President proceeded to give his promised "impressions" of the Pall Mall Exhibition, in the course of which he emphasised the value of *viva voce* criticism in comparison with the written article, particularly in the case of a society such as the Croydon one, for while, on the one hand, the critic's remarks were likely to be more genuine and outspoken, on the other, any errors are generally checked and corrected by some one or other of his hearers. A series of reproductions, kindly lent by Mr. C. W. Hastings, served to illustrate several of the points touched upon. An interesting discussion ensued. Subsequently, Mr. A. E. Isaac delivered a series of notes founded upon personal experiments on the subjects of "Reduction and Intensification." He explained how, paradoxically, a reducer (say Farmer's) can be used to intensify, and conversely an intensifier used to reduce contrast, always, be it understood, with negatives of a suitable character. Besides which, the value of a combination of reduction and intensification was insisted on. In a well-sustained discussion, Messrs. Sargeant and Packham urged the benefit of altering the printing values of otherwise satisfactory negatives by the modifying power available by turning the negative into a positive (transparency plate being used) and then making another negative from the latter. Several fine enlargements by Messrs. Hirst and Packham were shown, also an album of hand-camera work done in the Highlands by Mr. S. C. Brookes.

**Glasgow and West of Scotland.**—On the 17th inst. the first monthly meeting of the session was held. There was a large turnout of members, and the ensuing session promises to be a great success. Mr. Thomas Taylor, President, after his opening remarks on the novelties lately introduced into photography, gave a demon-

HERBERT SMITH,  
 29, FINSBURY PAVEMENT, E.C.

stration on an enlargement camera, one of the largest made, and had a picture ready "while you wait." There was a large collection of beautifully-executed lantern slides shown on the screen. This brought the meeting to a close.

**Greenwich.**—A meeting was held on Wednesday, October 19th, at the Lecture Hall, Greenwich, at which Mr. E. W. Maunder, F.R.A.S., presided, "to consider the advisability of forming a Photographic Society for Greenwich." After introductory remarks by the Chairman, Mr. Haddon gave a short account of method of procedure in such societies as he was acquainted with. The Chairman, resuming, pointed out that the project was warmly supported by the officials of the Royal Observatory and Royal Naval College, and by several local amateurs. A series of propositions having been put and carried unanimously, the meeting resulted in the formation of the Greenwich Photographic Society. The Executive will consist of the following gentlemen:—President, Rev. Brooke Lambert, M.A., B.O.L. Vice-Presidents, Messrs. H. Haddon and H. H. Turner, M.A. Committee, Messrs. Maunder, F.R.A.S.; Arthur Martin; T. Lewis, F.R.A.S.; Dr. Waghorn; J. Q. Braidwood; J. H. Kingdon; G. S. Criswick, F.R.A.S.; R. Lewis, and W. Ellis, F.R.A.S. Hon. Treasurer, Mr. Charles C. Churchill, 5, Annandale Road, Greenwich. Hon. Secretary, Mr. Leon J. Atkinson, 193, Greenwich Road, S.E. Applications for membership may be made to Secretary or Treasurer. Subscriptions 5s., payable to Treasurer. The first meeting of the new Society will take place at the earliest possible date. Upwards of forty ladies and gentlemen have already signified their intention to join the Society.

**Hackney.**—On the 18th inst., Mr. W. P. Dando in the chair, Messrs. Cross, Green, and Dr. Vere-Nichol were nominated for membership. Work was shown by Messrs. Gosling, Puttick, and Beckett (portraits of the exhibition committee), and J. Beckett, Funston. Mr. S. H. Barton then gave a short paper and illustrations on "Portraiture without a Studio." He had been fairly successful outdoors in taking portraits, and his method was to take them between two walls. He said it was advisable to not have too much top light; portraits should be soft, and a formula he recommended to obtain softness was an eikonogen one given by Mr. Chapman Jones. The Society's blackboard was then requisitioned, and the Hon. Sec. proceeded to draw a design he had made for taking portraits in the open. It consisted of four uprights—after the fashion of an ordinary clothes horse—and the lighting was subdued as required at top and sides by various kinds of calicos, etc. Mr. Gosling had used a roll of Lancaster's window blind as a background and shield from the top light. The Chairman had found the ordinary brown paper used for putting under carpets of service. The Hon. Sec. said he had obtained good results with this. Mr. Beckett, in answer to various questions put to him, said he would have a fair amount of top light and a high shield at the back and side. As far as retouching was concerned, he advised it in a general way, but the likeness ought never to be sacrificed to the retouching. Mr. Gosling asked how to reduce a small dense part of a negative. The Chairman said he would use methylated spirit 1 part, water 2 parts, gently rubbing in solution with cotton wool. Mr. Beckett said he would use a knife, but with great care. The Hon. Sec. announced that the next meeting (Tuesday) would be a flashlight evening.

**Holborn (Camera Club).**—On 21st inst., Mr. J. H. Avery in the chair, Mr. Ernest gave an interesting demonstration on "Simple Chemical Analysis for Photographers," the knowledge of which, he thought, was a powerful weapon with which to fight the many difficulties in which the path of photography ran. He gave various experiments, including testing with iodide of starch for hypo, and many other tests. On Saturday last the Camera Club entertained the members of the Holborn Cycling Club. The evening commenced with a few songs, and wound up with a lantern show. A large number of lantern-slides, made from negatives taken at the Southern Counties Cyclists' Camp, held at Dorking in August this year, were thrown on the screen to a large number of members of both Clubs.

**Kendal.**—A meeting was held on the 20th inst., Mr. Frank Wilson being in the chair. The prints of the recent competition were exhibited, and the awards announced. These had been kindly made by Mr. Paul Lange, of Liverpool, who expressed the opinion that for such a small society, the Kendal one showed very fair and generally very good average work. In Class I., landscapes, Mr. F. P. Heath ranked first, Mr. J. Severs second, and Mr. J. H. Rhodes third. In Class II., marine or lake subjects, Mr. R. O. Pennington stood first, and Mr. J. H. Rhodes second. In Class III., figure studies, Mr. R. O. Pennington was first, and Mr. J. Severs second. In Class IV., animals, Mr. F. P. Heath was first, Mr. R. O. Pennington second, and Mr. J. Severs third. In Class VI., architecture, Mr. J. H. Rhodes was first. In the class for living objects in motion, Mr. Severs was first. An interesting paper was read by Mr. J. H. Rhodes on "Isochromatic Photography," illustrated by specimens of his own work, and gave rise to considerable discussion on the merits and otherwise of isochromatic plates. Mr. Rhodes sketched briefly

the growth of photography from the collodion to the gelatine dry-plate, as introduced by Dr. Maddox, and thence to the Isochromatic plate by Taillor, and gave credit to the Ilford Company for removing one great objection to its use, viz., cost. Professor Crooks had many years ago pointed out the defect caused by the unequal action of the yellow and the blue rays on the same plate, and suggested the use of a yellow screen as a remedy. This was not found all that was required, and Colonel Waterhouse and Dr. Vogel were the first to experiment on the plate itself. They used collodion, and it was found that their experiments were quite ineffectual with gelatine plates. Professor Taillor then took the matter up, and his process was brought out after considerable trouble. The lecturer's experience was, after exposing several dozens, that with ordinary care he never had a case of fog or halation with isochromatic, but no ammonia in any form should be used in the development of them. Prints and negatives were exhibited, showing the manner in which the true values of the varying shades in landscape had been rendered by these plates, as also the very beautiful detail in mountain scenery, and the fine cloud effects, which he had never had on ordinary plates. An animated discussion on the merits and otherwise of Isochromatic plates closed this interesting meeting.

**Leytonstone.**—On the 22nd inst. Mr. A. P. Wire gave a "lecturette" on "Stereoscopic Photography with a Single Camera." Dr. W. P. Turner, President, occupied the chair, and the meeting was well attended. Mr. Wire, in opening the subject, first of all explained, very lucidly, the principles involved in the construction of the stereoscope, its lenses and pictures. A stereoscope was exhibited that was made by the lecturer, and made in such a way that the lenses could be taken out for examination. In explaining on what principles the pictures were made, Mr. Wire showed some line drawings made by hand in which the stereoscopic principle was adopted, and which in the stereoscope showed the well-known solidity. Next were shown some photographs of still-life, shells and vases of flowers, which had been made by the lecturer. The camera was fixed, and the object to be taken placed on a small turntable. Taking one view, and then moving the object and table slightly round, a second view was taken. In this way, by using ordinary quarter-plates, the two necessary views were taken, and capital stereoscopic photographs made. Mr. Wire having shown that his plan was only adapted to still life, Dr. Turner "took up the parable," showed a handsome little stereo camera for outdoor work, with single lens and baseboard so arranged that the two pictures can be taken on a stereoscopic plate by moving the camera along the case. A discussion followed, in which Messrs. Watson Brown, M.A., F. Wates, W. G. Roberts, and others took part. The names of Mr. D. J. Morgan, J.P., and Dr. Warwick were put to the meeting for election and accepted, making up the muster roll to 110.

**Lewisham.**—On 21st inst., Mr. B. Davidson in the chair, the lecture by Mr. C. W. Hastings on "Picture-making by Photography," with lantern illustrations from Mr. H. P. Robinson's celebrated pictures, as was expected, proved to be one of the most successful meetings the club has had. After giving a short history of Mr. Robinson and his works, Mr. Hastings said he was the first that had been privileged to take copies for the lantern from his pictures, the result being that one has now the opportunity of seeing the most notable of them in one evening. Among others might be mentioned "Fading Away," "Holiday in the Woods," "Somebody Coming," "The Day's Labour Done," "Gossips," "A Merry Tale," "Under a Hay-cock Fast Asleep," "Dawn and Sunset," "Hark, the Lark," "Carolling," etc. As each picture was thrown on the screen, attention was drawn to the method of composition, in some instances saying what suggested the picture, and the means by which it was accomplished. The lantern was of Mr. James' own construction, having a bellows front with rack and pinion, so that he was enabled to use an Optimus Euryscope lens of  $8\frac{1}{2}$  in. focus. He was using a benzoline saturator, and the carrier was one just patented, which automatically raised the slide when a fresh one was pushed in.

**Liverpool (Camera Club).**—The members began their winter session on 12th inst. with a smoking concert, in their rooms, 128A, Mount Pleasant. The President gave a hearty welcome to the friends in a few words, and then introduced Mr. A. C. Yule as the Chairman for the evening. The printed programmes were illustrated with comic sketches of the summer outings, and some of the accessories of an amateur's outfit. The evening's enjoyment was contributed to by singing and instrumental items. Incidents of the past session were graphically described, and a few topical hits made by the Secretary in his "Lay of the Liverpool Camera Club." The second annual fancy dress ball in connection with this Club will be held on the 12th December in the City Hall.

**London and Provincial.**—On the 13th inst., Mr. W. E. Debenham in the chair, in answer to a question, Mr. Leon Warnerke described his method of breaking emulsion in bulk and used a silver cylinder with a mesh of silver wire about five to the inch with a plunger working in an india-rubber collar. Mr. Ripley was elected a member, Mr. Richard, introduced by Mr. Warnerke, showed the Photo-

Jumelle, an opera-glass camera with special enlarging apparatus for the negatives. Some very good results were shown. Mr. Levy's new Flying carrier was also exhibited, and Percy Lund's new album was exhibited by Mr. Snowden Ward. Mr. Redmond Barrett then showed examples of retouching, and in the course of his remarks said that the great fault was over-working. Cross-hatching was not always admissible, and in fact should be avoided as a rule. The main idea should be to get what was wanted, and he held that as a rule the more lead the less likeness. In answer to numerous questions, Mr. Barrett said the H.B. was a safe pencil, and he always used the Autotype medium, which should be applied with a pad of cotton-wool. An interesting discussion ensued. Mr. Archer Clarke showed the results of some experiments of developing negatives with Amidol followed by hydroquinone, which were covered with black spots and utterly useless.

**Louth.**—On 20th inst. Mr. C. W. Hastings gave a lecture on "Picture-making by Photography," illustrated by lantern-slides from Mr. H. P. Robinson's pictures. Instrumental and vocal music was given at intervals.

**Munster.**—The first annual meeting was held on the 12th inst. Major Lysaght (President) occupied the chair. Mr. Franklin read the annual report, which stated that although the club had been only twelve months in existence its progress should be regarded as highly satisfactory. One hundred and nine members had been elected, and it was hoped this number would be added to in the ensuing session. There had been several disappointments in connection with the evening meetings, mainly owing to the late date last winter when the club was formed. This prevented arrangements being made beforehand for the supply of papers or lantern, but for the coming session a programme had been arranged, giving the business for each meeting. The society now possessed a very complete dark-room which, however, had not been used by the members to the extent expected, and they had, in addition, the use of the theatre for two evenings each month, and a room for meetings of the committee. The outdoor meetings could not be regarded as a success. Except on one occasion the attendance of members was very small. This was, perhaps, due to the fact that there was no regular half holiday in Cork, as was so general in other places. Owing to the pressure of business, Mr. Franklin had been compelled to resign his position as hon. secretary, and Mr. Baker had consented to undertake the duties. The club was greatly indebted to Mr. Franklin for undertaking the post of secretary and the formation of the club, when a great amount of organisation, entailing much serious work, had to be done. Mr. Bradshaw had kindly undertaken to superintend the lantern arrangements for the coming session. It was proposed to hold an exhibition of members' work, prints and lantern slides, at the School of Art; and it was also suggested that an album to receive the spare prints which most photographers possess should be provided and circulated amongst the local hospitals. Mr. J. Day had kindly undertaken to look after this, and would be glad to receive contributions of prints. Mr. Atkins submitted a statement of accounts showing that the total revenue of the club was £30 17s., and the ordinary expenditure £20 13s., leaving a balance of £10 13s. 11d. to their credit. This sum was appropriated to the construction of a dark-room, oxygen cylinders, etc. The President, Vice-Presidents, and officers were re-elected. Mr. D. Franklin for Mr. R. S. Baker on the committee, Mr. Baker having accepted the office of Hon. Secretary, and Mr. Gerard Percival in place of Rev. J. O'Mahony, resigned.

**North London.**—On 18th inst., Mr. J. Traill-Taylor in the chair, copies of Messrs. Cadett and Neall's new monthly paper "Dry Plates" were distributed. Mr. Mackie showed an advance copy of the Ilford "Year Book," which was much appreciated. Nominations were received for election of Council at the annual meeting to be held on November 1st. The Chairman then brought before the members a series of notes on the reproduction of photographs by means of printing ink, in which he dealt with the various photo-mechanical processes from the time of Nicéphore St. Niepce to the present, the process being not only described but illustrated by specimens.

**North Surrey.**—At the last meeting on 18th inst. Mr. Fitzpayne read a paper and gave a demonstration of the method of development of the new cold-bath platinotype paper. He commenced by stating that the paper was more convenient to manipulate than the hot-bath paper, that the results achieved were superior, that the film was not susceptible to abrasion, and that the liability to scald the fingers was, of course, entirely absent; and then proceeded to practically prove his assertions by developing several prints, during which operation the remarkable control which could be exercised over the action of the developer was very apparent. He explained the necessity for printing the paper until the whole of the details were out; in fact, that printing should be carried as far as possible without solarisation, but stated that should this stage be reached, it was possible to print out with the paper, and then, of course, no development was necessary, the print only requiring to be fixed in the

hydrochloric acid bath. He drew attention to the necessity of using a much weaker developer than was required for the hot-bath paper, and recommended the use of the Platinotype Company's D salts in the proportion of  $\frac{1}{4}$  lb. to 48 oz. water, and showed how, when mixed with an equal quantity of glycerine, the operation of development was most simply performed with a brush, the print being stretched on a glass slab or on the bottom of a dish. After developing the prints with the most excellent results, Mr. Fitzpayne explained the process of toning, or, to describe it more more accurately, of printing the platinum image with uranium, for the formula of which he referred the members to his memo. on the subject in the "Camera Club Journal" for October. Numerous prints that had received this treatment were handed round for inspection, some showing the different shades that could be obtained, from light brown to a very deep red, and some, the bad effect of not entirely eliminating the iron from the print before toning. In reply to a member, Mr. Fitzpayne explained why "painting" was an apter description of his process than "toning," as the whole resulting colour could be easily removed by immersing the print in a weak solution of ammonia.

**Preston.**—An appreciative audience of members and friends met on 20th inst. to hear an interesting lecture on the "Architecture of some English Cathedrals," by Mr. E. J. Andrew. About one hundred beautifully-executed slides of the cathedrals of Canterbury, York, Durham, Ely, Salisbury, and Wells were used in illustration of various eras and styles of architecture, the particular beauties and prominent points of which were lucidly explained without confusing a general audience by the use of too many technical terms. The evening's entertainment concluded by the exhibition of three new comic sets, which were emphasised by original and extempore remarks by Mr. W. F. Livesey.

**Putney.**—The second meeting of the winter session was held on the 17th inst., the Rev. L. Macdona in the chair. There was a good attendance of members, the subject being "How to Make a Lantern Slide," by Mr. S. Herbert Fry. The Chairman, in opening the proceedings, said it would be unnecessary to introduce Mr. Fry to the majority of the members present, as his interesting lecture on "Bromide Enlargements," given before the society last year, would be fresh in their memories. Mr. Fry commenced by pointing out what qualities were necessary in good lantern plates, and in what particulars their treatment and the result desired differed from negative plates. The essential requirements of a good slide were that in some part of it there should be absolutely clear glass, and that the darkest shadows should be transparent. In order to secure these results a fairly correct exposure was necessary, and forcing of development should on no account be attempted; he therefore recommended a standard developer, which by experience had been found to work well with the particular brand of plates in use, and that no modification of this should be tried in order to compensate for over or under exposure. The use of such a standard developer naturally required a more correct exposure, relatively, than that necessary for a negative plate, where a modification of the developer was permissible; but as the exposure of the lantern plate was under more perfect control, there would in practice be found little difficulty in giving the right time. The slides could be made in two ways, viz., by contact or in the camera. Contact printing was on the whole best done by artificial light, and in the camera by daylight. Mr. Fry showed a printing frame in which a slide could be made by contact from any suitable part of a larger negative; he claimed no special advantage for the particular form of frame, but it was obvious that a contrivance of the kind was a convenience, not to say necessity, in successful working, as it was of importance that the edges of the lantern plate, i.e., the thickness of the glass, should be protected against stray light; the omission of such protection was a frequent source of fog near the edges. With regard to the illuminant used during exposure, it was no doubt possible as a *tour de force* to use a wax vesta, but Mr. Fry said he would assume that the members generally worked with a paraffin lamp or gas burner, and these would perhaps be found the most convenient in ordinary work. Weak negatives were best printed from by a weak light, or at a considerable distance from a powerful one, whereas plucky or dense negatives would give the best results when printed close to a good light. The time of exposure would, of course, vary with the character of the negative, but the correct exposure could be readily determined in the following manner: Divide the plate approximately into say five strips, then shield four-fifths, and expose the one-fifth 10 seconds, the shield being then moved so as to screen only three-fifths, and kept in this position another 10 seconds, and so on until the whole of the plates have been exposed; one-fifth will then have been exposed 10, the next 20, 30, 40, and 50 seconds respectively. On developing this trial-plate in the standard developer it would at once be apparent which part of it had received the correct exposure. When the correct exposure had been once ascertained, it should be noted on the negative, together with the nature of the light and the distance from it, for future reference;

the negative envelopes now commonly in use lend themselves conveniently for notes of this kind, as well as for storage. The exposure being correct, the development in the standard developer would present no difficulties, it being only necessary to watch progress and to take the plate out when of sufficient density. On the subject of exposure in the camera, Mr. Fry said this could be done either in daylight or by artificial light. When daylight was used, the negative could conveniently be placed against the window and the camera pointed at it, and focussed to the desired size, care being taken that no buildings, chimneys, trees, etc., should appear behind the negative, as these would, of course, be reproduced on the lantern plate. It would not be necessary to exclude daylight from the room, but direct rays of light must be prevented from entering the lens, and this could be efficiently done by placing a piece of brown paper with a hole cut in the centre for the negative, against the window, the paper being of such a size as to cover the cone of light entering the lens; no further covering between the negative and lens is necessary. Daylight being very variable, no rule as to the length of exposure could be laid down. Generally a small stop should by preference be used in a fair light, so that the exposure might be well under control. As regards artificial light, the chief difficulty was to obtain even illumination of the negative. Mr. Fry said he had used with satisfactory results the following arrangement: The negative is placed at the end of a suitable box or frame opposite the lens, which may be mounted in the usual way on an ordinary camera, and the lantern plate exposed in a double slide, exactly as when taking a negative; special apparatus for making a lantern slide by reduction is frequently used, but, as will be seen, is no necessity. The illumination of the negative is obtained as follows: A piece of white opal, white paper, or a white-washed board is placed at some little distance behind the negative and parallel with it. On each side between the negative and reflector is placed a lamp or gas light, or other convenient illuminant; the two lights should be placed near the negative and as close together as possible, but without allowing any part of their images to enter the field of the lens. It has been found that by this system of using reflected light about 40 per cent. of the total is utilised, and that the illumination is very even. In order to obtain the best results, as large a stop as possible, consistent with the covering power of the lens, should be used. As an example, it may be stated that with a good light, and an average negative working the lens at  $f/16$ , an exposure of four minutes will be about right. One of the advantages of the reduction method in the camera is that by the careful use of the swing-back, divergent and convergent lines in the negative may be rectified in the slide. On the subject of printing-in clouds, Mr. Fry said that the easiest method was to print them on a separate plate and use this as a cover plate; due note being taken that when so placed the direction of the light would be reversed, and that therefore it was necessary to print from a cloud negative with the light coming from the right in order to suit a view which is lighted from the left, and *vice versa*. The cloud print should be given a comparatively short exposure, and should not be developed far, otherwise there was danger of loss of transparency. During the lecture Mr. Fry illustrated his prints by practical demonstration, exposing, developing, and fixing prints of views and clouds. The whole subject was brought before the meeting in a very thorough manner, and the interest was maintained throughout. At Mr. Fry's suggestion, questions were asked by the members during the course of the address, and a general discussion followed at its close. A hearty vote of thanks to Mr. Fry for his able and interesting lecture was proposed by Dr. Sheppard (Vice-President), and carried with acclamation. A special meeting of the society will be held on Monday, the 31st inst., at 8 p.m., when Dr. Jeserich will read a paper on "Photography Applied to the Detection of Crime." This is one of the series of papers which the Affiliated Societies' Central Committee have, by the courtesy of their authors, been able to place at the disposal of societies which have joined the affiliation. The next ordinary meeting will be held on Monday, the 7th November, at 8 p.m., when Mr. S. G. Buchanan-Wollaston will read a paper on "Platinum Printing Processes."

**South London.**—On the 17th inst. an ordinary meeting was held, the President, Mr. F. W. Edwards, in the chair. At the conclusion of the formal business Mr. Arthur C. Baldwin opened "A Chat on the Eastman Products." In opening he dealt with the various methods for producing the stripping films formerly sold by the Eastman Company, which ultimately led to the manufacture of the rollable film, as now manufactured. The method of using the roll-holder was also explained, and specimens shown. The "Solio" paper was then dealt with, and explanation was given as to the means to be adopted for producing a variety of tones. The formulæ for the borax bath (blue tones) and the combined toning and fixing bath (warm tones) were given with the paper when purchased. For rich velvety-black tones the following was recommended:—Phosphate of soda, 100 gr.; chloride of gold, 5 gr.; water, 40 oz. The addition of a pinch of aluminium chloride to

ordinary alum bath materially assisted in the hardening of the gelatine film. Potash alum must always be used, as ammonia alum does not form in this case a good substitute. The combined bath was so simple "that a child can make and use it, i. delightfully certain in its action, and is practically permanent." The proceedings terminated with the toning of several prints by the different baths, to show the tones obtainable. Attendance 48.

**Sunderland.**—The annual meeting was held on the 19th inst. Mr. J. Lynn presiding. The report shows the society to be in a flourishing condition, there being sixty-four members on the roll. The meetings during the past year have been well attended, and various competitions held, the chief prize winners being Messrs. Lynn, Peddie, and Cowper. The officers for the ensuing year were elected as follows:—President, Mr. W. Milburn; Vice-Presidents, Messrs. J. Lynn and W. Pratt; Council, Messrs. W. Bartram, J. W. Broderick, A. G. Boulton, E. R. Kirkley, Dr. Legat, A. Peddie, W. J. Pope, and R. Stafford; Hon. Treasurer, Mr. T. Walton; Hon. Secretary, Mr. C. E. Cowper, Thornhill Gardens, Sunderland.

**Wakefield.**—The annual meeting was held on the 12th inst., the President, Mr. A. W. Stanfield, J.P., being in the chair. The report took the form of an address by the President, in the course of which he reviewed the work of the society during the past year, which had, on the whole, been successful, and the society at present had a membership of forty-seven. The balance-sheet (presented by the Hon. Treasurer, Mr. C. W. Richardson) showed a balance in hand of £5 5s. 5d., which was considered satisfactory. The election of officers for the coming year was then proceeded with, and the following gentlemen were selected to fill the various posts:—President, Captain Norwood; Vice-Presidents, Mr. Isaac Briggs, J.P., and Mr. A. W. Stanfield, J.P.; Hon. Treasurer, Mr. W. Townend; Hon. Secretary, Mr. C. W. Richardson; Hon. Lanternist, Mr. J. H. Chaplin; Committee, Messrs. J. H. Chaplin, H. Crutchley, G. F. Firth, H. Parkin, H. Haigh, and W. Wrigley, after which slight alterations were made to the rules, the most important being the reduction of subscriptions from 7s. 6d. to 5s. The syllabus for the winter session was then read and approved, and the usual votes of thanks brought the business part of the meeting to a close. The late Secretary then showed the latest thing in hand-cameras, The Frena, and the ingenuity of its movements, particularly that for changing the films, and the general compactness and finish of the camera was greatly admired. A discussion on this and kindred subjects terminated a very pleasant evening's work. The society held their first weekly meeting under the new syllabus on the 19th inst., when a most enjoyable two hours were spent by those present listening to an account given by their new President, Captain Norwood, of his recent visit to the "Land of the Midnight Sun." He came to the meeting quite unprepared for the task that was going to be required of him, but his hearers did not appear to lose much on that score. In addition to describing his various adventures, and we might say misadventures—the latter, of course, being caused by the presence of that terrible instrument which is inseparable from a photographer when on the war path—he gave most useful hints to those who were contemplating a visit to Norway, urging most strongly, for those who can afford it and on "photography bent," not to journey with a public excursion party, or they will find little time for anything but keeping up with the others in the general scramble to see everything or in securing comfortable travelling quarters for the next stage of the journey. He then went on to describe the journey from the Fjords to the North Cape, where he was fortunate in getting a good negative of the sun at midnight; and also his visit to the whaling station situated there, where by reason of an under-development of his olfactory nerves he was able to get a few photographs of two whales which had recently been brought in, whose skins were spread out to dry, and whose bodies were undergoing a general dissection, which gave rise to the most abominable stench imaginable, so much so that his friends having got a whiff of it, were content to use their most powerful telescopic lenses, and leave him sole honour of being photographer-general to the North Cape Whaling Station for that occasion. In conclusion he very kindly promised to show slides from all his negatives on one of the lantern evenings, and accompanied same with suitable remarks.

**West London.**—The annual general meeting was held on the 14th inst., the President in the chair. The report was adopted, and the following officers were elected for the ensuing year: President, Mr. J. A. Hodges; Vice-Presidents, Messrs. W. A. Brown, C. Bilton, W. L. Colls, and C. Whiting; Council, Messrs. J. J. Adam, J. D. England, R. Horton, G. Lamley, H. Selby, A. W. Scanlan, G. E. Varden, R. W. Watson, J. Wilson, C. Winter; Hon. Treasurer, W. H. Whitear; Hon. Secretary, L. C. Bennett; Assist. Hon. Secretary, W. S. Rogers; Hon. Librarian, J. Wilson; Hon. Lanternist, R. Horton; Hon. Auditors, J. Stein and T. Turner. The terms of the amalgamation of the Chiswick Camera Club with the West London were formally agreed to, and it was felt that the example thus set by the West London and Chiswick societies might be followed with

advantage in those districts where two or more societies were trying to do the work which might be better done by one strong central society. The Chairman stated, that, owing to new arrangements having been made at the School of Arts, it was found impossible to hold the meetings on Fridays as heretofore, and after some discussion it was arranged that Rule 7 should be altered by inserting the word "Tuesday" in place of "Friday." The change of evening will, however, not come into effect for a few weeks, and members are notified that the next four meetings will be held on the usual Fridays, October 21st, Technical Social; October 28th, Presidential address and lantern; November 4th, Technical Social; and November 11th, Mr. E. J. Wall's paper. After that date, however, the alteration will come into effect. Happening at the last moment when it was totally unexpected, this has necessitated some alterations in the syllabus and will lead to a slight delay in getting it printed, but every effort will be made to make the delay as short as possible.

**West Surrey.**—Usual fortnightly meeting, the Vice-President, Mr. Winsford, in the chair. A large number of members were present. The subject of the evening was a demonstration by Mr. George H. James, of the carbon printing process. Mr. James went fully into all the details of both the single and double transfer processes, illustrating his remarks by prints from some of his very fine negatives. Mr. James, after having described the safe edge necessary in carbon printing, and various forms of actinometer to gauge the depth of printing by, went on to describe the development of the image. He said that one of the peculiarities of this process is that the development takes place from the back, this being due to the fact that the parts of the sensitive bichromated gelatine acted upon by the light is rendered insoluble in water, and as the light never did penetrate right through to the surface of the paper there was always between the insoluble gelatine and the paper a layer of soluble gelatine, which was dissolved out in developing, hence the necessity of fixing the print upon the temporary or permanent support before development. A large number of prints made by the Woodbury Company were handed round for inspection.

**Wigan.**—A meeting was held on the 20th inst., at the new rooms in the Y.M.C.A., Rodney Street, which are a decided improvement on the last. The following members, Messrs. Richardson, Betley and Smith, handed round a number of prints on "Solio" paper and P.O.P. toned in various baths, and finished in different styles, the matt-surfaced platinum toned finding the most favour. Mr. Lowe, the President, exhibited an album of his excellent instantaneous pictures in platinum, all taken with a Thornton-Pickard shutter, and several of which are to be reproduced by the Thornton-Pickard Company. He also gave his recently-acquired experiences of Fitch's films, which were decidedly in their favour, compared with plates, and exhibited two different forms of film carrier for the dark slide (Fitch's and Gutz's) which are both extremely simple. The second number of "Dry Plates" was distributed, and two new members, Messrs. Harold Tarbuck and Gasper Clephaw, were proposed.

### SOCIETIES' FIXTURES.

"Dry Plates," by Cadett and Neall, No. 2, for October, gives some very good notes upon weights and measures, and this usually dry and uninteresting subject is made very readable and plain.

It is now well known that a beam of light produces sound although comparatively few people have had an opportunity to test the fact for themselves. A beam of sunlight is thrown through a lens on a glass vessel that contains lampblack, coloured silk or worsted, or other substances. A disc, having openings or slits cut in it, is made to revolve swiftly in this beam of light, so as to cut it up, thus making alternate flashes of light and shadow. On putting the ear to the glass vessel, strange sounds are heard so long as the flashing beam is falling on the vessel. Recently a more wonderful discovery has been made. A beam of sunlight is caused to pass through a prism, so as to produce what is called the solar spectrum or rainbow. The disc is turned, and the coloured light of the rainbow is made to break through it. Now place the ear to the vessel containing the silk, wool, or other material. As the coloured lights of the spectrum fall upon it, sounds will be given by different parts of the spectrum, and there will be silence in other parts. For instance, if the vessel contains red worsted, and the green light flashes upon it, loud sounds will be given. Only feeble sounds will be heard if the red and blue parts of the rainbow fall upon the vessel, and other colours make no sound at all. Green silk gives sound best in a red light. Every kind of material gives more or less sound in different colours, and utters no sound in others.

**Leytonstone.**—The opening night of the winter season was held on the 1st inst., with an address by the President, Dr. W. Pickett Turner, who opened by complimenting the club on the position it had made and the strength it had attained, the muster being ninety-six members; he next went on to the science and art of photography, dealing with the chemistry, first giving with the aid of the black-board the various formulæ of the various salts and compounds used in photography, explaining that the rational changes were not chemical but molecular, advising beginners to study orthodox chemistry, first taking Roscoe or Fownes as their Bible. He next went on to the science of optics, and then touched on the art side of photography, and explained that manipulative dexterity can be acquired by practice, and how highly important for success it was that the best apparatus that could be afforded should always be had, particularly the lens, which was a sine qua non to good work, explaining that they were the cheapest in the long run, as they were always worth their money. The collodion process was next touched upon, and he was of opinion that notwithstanding the many advantages of the dry plate, collodion still held its own for transparencies and lantern slides. There was, he said, a branch of photography which had almost died out but was now coming to the fore again. He alluded to stereoscopic photography. He thought it one of the highest branches, and gave the most charming results, and strongly advocated it being taken up by the members. The evening closed with a hearty vote of thanks to the President for his highly interesting and instructive address.

The annual outing of Messrs. Morgan and Kidd's employés took place on 1st inst., when the party, numbering close upon one hundred, proceeded by rail to Portsmouth, and thence by tram to Southsea. Owing to the growth of the business, the number present this year was larger than at any previous outing. Upon arriving at Southsea the party proceeded to inspect the various places of interest. Dinner was served at the Esplanade Hotel, where full justice was done to the good things provided. One of the novelties of the dinner table was a unique invitation and menu card, designed by Mr. Durham (Messrs. Morgan and Kidd's chief artist), and executed in collotype by Mr. Berghoff, the plant for this process having recently been laid down at a great outlay. The health of Mr. and Mrs. Kidd was drunk with great enthusiasm, and a hearty vote of thanks was accorded to Mr. Kidd for his kindness in providing the day's pleasure, this being proposed by Mr. Ernest Morgan, and seconded by Mr. Dennes. Both spoke of the great interest Mr. Kidd always took in his employés, no matter how humble the position they might hold in his establishment. Mr. Kidd, upon rising to respond, was greeted with rounds of applause, and must have been gratified at a reception which clearly showed his popularity as an employer. He thanked them all for the kind way in which his name had been received, and expressed the hope that he and Mrs. Kidd might long have the pleasure of meeting them at similar gatherings. "Success to the Collotype Department," as the latest addition to this establishment, was proposed by Mr. Dennes and seconded in an able manner by Mr. Durham, who spoke at some length upon the great future which he believed was before this department. As the party were more inclined for sight-seeing than making speeches, an adjournment was made to the beach and pier, and at seven o'clock the journey home was undertaken. Richmond was reached shortly after ten o'clock, all agreeing that a most enjoyable day had been spent, and that the annual outing of 1892 would long be remembered.

## To Correspondents.

All communications for these columns are to be addressed to **The Editor, "Amateur Photographer," 1, Creed Lane, Ludgate Hill, London, E.C.**

### QUERIES.

**5847. Isochromatic Plates.**—Do these invariably need a yellow screen, and how would this be fixed to a combination rectigraph quarter-plate lens? Where could the screen be procured? Do the Isochromatic plates need backing to avoid halation in taking the interior of a church, and do they require longer exposure than ordinary plates?—**E. M.**

**5848. Sensitising Silk.**—Can anyone tell me how to sensitise silk for printing out, or where to buy it ready sensitised? I tried first by soaking silk in 10 per cent. solution of salt, and then in nitrate of silver, but on toning with borax nothing remained on the silk.—**SORABJEE P. SETHNA.**

**5849. Lens.**—Will someone oblige by telling me what kind of lens would be suitable for taking views on a small plate, say  $1\frac{1}{2}$  by  $1\frac{1}{4}$ , having  $1\frac{1}{2}$  focus, and where such lens could be got, single or double, but cheap?—**R. W. C.**

Correspondents not seeing their queries inserted are requested to look for the same under "Editorial."

### QUERIES UNANSWERED.

Sept. 30th.—No. 5822.

Oct. 7th.—Nos. 5827, 5828, 5831, 5832.

" 14th.—Nos. 5834, 5835, 5836, 5837, 5841.

" 21st.—Nos. 5844, 5846.

### ANSWERS.

**5838. Carbon Enlargements.**—As Mr. Bennett appears to be familiar with the bromide enlarging process, I should think he would find no particular difficulty in the manufacture of carbon enlargements. An enlarged negative is first made, and the picture is printed by contact from this negative. The paper may be obtained from the Autotype Company, 74, New Oxford Street, W., in sheets out to the ordinary photographic sizes, and ready sensitised. If Mr. Bennett is unacquainted with the carbon process he had better obtain the "A B C of Autotype Printing" from the Company, as it would be impossible to treat the subject adequately in this column.—**O. W. DOWNING.**

**5839. Lens.**—(1) The superiority lies in the fact that the portrait lens is about twice the rapidity of the R.R., their working aperture generally being about  $f/4$ . (2) Possibly, but no appreciable difference or practical gain.—**O. W. DOWNING.**

**5842. Chadwick's Stereo Camera.**—If "The Snipe" had written direct he would have had a reply per return post; as it is, he may get the reply in a fortnight, thus a long extension of time. Well, the camera is not provided with a double extension, and as the use of a single combination of an 8 in. R.R. lens for a half-plate is not to be recommended, it would have defeated the object for which this camera was designed to have made it so, adding unnecessary weight and expense. A 4 in. focus lens will do for stereo work if the lens covers the plate, and on a three-quarter plate will give just the same angle of view that an 8 in. focus lens would on a half-plate. The camera may be seen in London.—**W. I. CHADWICK.**

**5843. Riviera.**—Dark-rooms are generally found obtainable at nearly all the Riviera towns. A complete list of foreign dark-rooms has, I believe, been published by the AMATEUR PHOTOGRAPHER. I do not see what difficulties a lady need fear more than a gentleman, provided she keeps a very respectable distance off fortifications and the like. There is no difficulty, as a rule, with the Customs officials. It is best to be very courteous and frank with them, and they will not trouble you. They see so many cameras pass the customs that a little explanation will generally satisfy them. The Riviera is practically inexhaustible in resources for the amateur. The road from Nice to Genoa is full of picturesque scenery. Exposure not more than half that for England.—**S. C. B. (Genoa).**

**5843. Riviera.**—At Cannes there are dark-rooms at Numa Blanc Filis, and P. Benscher on the Promenade. A lady with a hand-camera might pass anywhere without hindrance. Shutter exposures may be made during the ordinary daylight, even of February and March, with medium rapid plates. Care must be taken in the very bright sunlight not to over-expose, as the light is far more actinic and the atmosphere much clearer than in England. About half of English exposures for the same time of day and year will be the best. I have found it best to change my plates at night, with red lamp and candle, and defer all my development until my return home. I have had no difficulty with Customs officials, even with many dozens of glass plates. Hand-cameras are seldom even noticed. It will be found advisable to take away material for a large number of exposures. I have found it difficult to obtain English sizes at the photographic warehouses abroad.—**W. B. LEIGH.**

**5845. Starch Mountant.**—A few drops of carbolic acid added when making the starch will act as a preservative, but the best way is to make fresh each time.—**O. W. DOWNING.**

## EDITORIAL.

**J. N. WILLIAMS.**—We regret that we cannot see our way to publish your letter re exposure tables. With regard to our lady competitor, we think you are certainly unfair. We know she works alone, and not with assistance. With regard to the other question, we at present hold our hand, but we shall speak presently.

**TEPIDUS.**—Many thanks for your note. We shall be very glad to have samples, and will report on the same in due course.

**H. H. WESENCRAFT.**—Your print duly received. The question of tone is a purely personal one, though really it has little to do with the awarding of prizes, unless of course a very hideous, unsuitable, or uneven one is obtained. You are labouring under a great mistake if you think that the fact of a negative being taken with a rapid rectilinear will give it any advantage over one taken with a single lens. It is artistic and technical merit which always wins. On the other hand, there are occasions when an R.R. is useful and superior. We could not express an opinion on the lenses without examination; we should rather say go for a well-known maker, such as Crouch, Wray, Taylor, Perken, Son and Rayment, or Beck.

**PT.**—We referred to toning gelatino-chloride papers in general—not one in particular. All are amenable to this treatment.

**JOHN HAYWOOD.**—The formula which Isis spoke of is:

Sodium chloride or salt, . . . . .	64 gr.
Ammonium sulphocyanide . . . . .	15 "
Gold chloride . . . . .	2 "
Water . . . . .	10 oz.

Print slightly deeper than required in finished print. Immerse in toning bath without previous washing, then pass direct to fixing bath.

**H. HILL.**—The developer can be used for landscapes, portraits, and interior work. Use it in the same way, but add half grain of bromide of potassium to every ounce of developer.

**W. E. A.**—The best guide-book to what to photograph is our 1892 Annual. The best guides to artistic work are H. P. Robinson's "Pictorial Effect in Photography" and "Picture Making by Photography," price 2s. 6d. each, to be had from our publishers.

**ISOBEL WATERBURY.**—Mezzotype paper can be obtained from the Carlotype Company, Rainham, Essex; it is printed and toned in the usual way. We shall have a paper on it next week.

**J. DRURY.**—By our rules your queries are inadmissible. The camera you name is efficient, and can be used with artificial light, either gas, oil, or magnesium.

**PRICE.**—The advantages of gelatino-chloride printing out papers are that there is a much finer rendering of detail, finer tones, and greater permanency, a high polish, or matt-surface at will. They may be toned and fixed in the same way, but better results are obtained by using the sulphocyanide and combined baths.

**H. F. LINGING.**—(1) It is usual to etch glass by placing two parts calcium fluoride in a leaden dish, make it into a paste with three parts sulphuric acid, stirring with a bit of wood. The glass to be etched is then placed on the dish as a cover, and the mixture gently warmed. This must be done in the open air or under a fume chimney. We believe a white acid used by glass frosters is made by taking strong hydrofluoric acid, and stirring in carbonate of soda, till a thick white paste is formed. (2) Ten minutes' washing after fixing is not enough before using the alum bath. Alum is recommended before toning so as to prevent the softening effect of the sulphocyanides. Chrome alum does not lose its tanning properties by being made alkaline, and it will keep for some time.

**ECCLESIASTICAL.**—Your query is inadmissible. Write and let us know what you want to do, interiors or exteriors, hand work and stand work combined, or what; then we can help you.

**L. GUBBONS.**—Please number prints when sending for criticism. (1) Both figures are staring hard at camera, and the blank sky would be improved by clouds. (2) This might be a good picture, but it is utterly impossible to say from a bad blue print. (3) Wants at least 24 inches off foreground, and clouds printed in. (4) Very fair, but wants clouds too. (5) Wants clouds, and the castle is too small.

**F. W. NEALE.**—The best book on photo-mechanical printing is W. T. Wilkinson's "Photo-engraving Collotype," price 5s., publishers, Hampton, Judd, and Co., 13, Cursitor Street, Chancery Lane, E.C. We do not think you could get bichromate plates anywhere. They are usually prepared by the operators.

**E. B.**—Many thanks, but we are full up at present, or we would take advantage of your offer.

**NEWSMAN.**—See answer above.

**ALPHA.**—(1) We can recommend the camera named for good all-round work. (2) It is superior to the Instanto. (3) We should prefer a good rapid rectilinear, such as the Optimus, Crouch, Beck, Wray, or Taylor. (5) The R.R. is suitable for all work, and is superior to the lens sent with camera.

**LOST IN THE COUNTRY.**—Negative over-exposed, wants intensifying, too much foreground, and the whole of the wreck should have been got in. Print over-printed, over-toned, flat and poor. Is this out-

spoken enough to please? Send us up some more work to judge of your capabilities.

**E. W. MALE.**—A slow paper will give you better results, and we should advise you to stick to the iron developer. Rightly used, there is nothing to beat it. A good formula is

Amidol . . . . .	1 part
Sodium sulphite . . . . .	10 parts
Distilled water . . . . .	200 "
Bromide of potash . . . . .	1 part.

for plates. For paper, dilute with an equal quantity of water, and increase bromide to  $1\frac{1}{2}$  parts. Carrying the lens and camera on bicycle would not damage lens. You will see some notes on ferrocyanide and amidol in this week's issue.

**PROFESSIONAL.**—(1) The print should have been toned longer. (2) Both papers may be used. The sepia tone is much admired by some, and looks very well with matt-surface prints.

**W. PRICE.**—(1) Too much pews; the rising front should have been used; rather over-toned. (2) Over-printed. (3) Good, though clouds would improve it. (4) Better still, the richer tone is more pleasing. (5) Printed too deep. (6) The right depth of printing, but over-toned. (7 and 8) Both over-toned. (9) Over-printed. (10) Just right, really very nice. (11) Over-printed. (12) Over-toned.

**AMATEUR.**—Intensify your negative, or else retouch the face, or else work on the back of the negative with matt varnish and a stump. With the improvement of the face it would be a very fair portrait.

**D. W. F. M.**—You could not copy the print and sell prints, or allow anybody else to sell them, without infringing the copyright, but possibly the firm who took the negative would give you permission, or even sell you the negative. We shall be pleased to see prints.

**E. B. H.**—We prefer the first-named, and the results are quite good enough to enlarge from.

**W. J. S.**—The translators are wrong; the only paper on the market containing an appreciable amount of chloride is Alpha. The process for distinguishing between the two is not easy.

**MISS L. RIDLEY.**—The peculiar colour of the negative is due to iridescent or green fog, which is generally caused by forcing with too much alkali, or else an impurity in the developer. We believe that the adhesive mounts are not now on the market.

**HALATION.**—We should use medium isochromatic, and with the largest stop that will give you sufficiently sharp definition, say  $f/22$ , at midday, without sunshine, the exposure should be about 10 secs., but of course this depends so much upon how much light there is.

**B. PUCKLE.**—Probably your lens is not corrected for photography; try stopping down or after-focusing, shifting the paper just a shade closer to the lens.

**ROBIN.**—The cause of the marks on negative is, we believe, drying the negative by heat, or unequal drying. (1) Too much foreground. (2) Rather over-toned. (3) Far too formal in composition. (4) Good, a little too much foreground. (5) Wants clouds. (6) Over-toned and flat. (7) Rather uninteresting, nicely exposed and developed, though. (8) Wants less foreground and clouds. Toning with platinum is not difficult. The bath is—

Chloroplatinate of potash . . . . .	1 gr.
Bitartrate of soda . . . . .	30 "
Distilled water . . . . .	4 oz.

**A. W. DOWNING.**—The amount of enlargement, and the number that can be enlarged, depends to a great extent on what developer was used. This you do not say. Longer soaking should put the matter right.

**HALF PLATE.**—(1) Rather under-printed, and the dark shadow looks as though the negative had not been kept carefully rocked when developing. (2) As the needle was the principal object, you should have got nearer to it, and focussed down sharper. Now it is not a bad view of the Embankment.

**DOZEY G.**—Many thanks, please send paper on, very glad to have it.

## Sale and Exchange.

### RULES.

**CHARGE.**—Twelve words or less for Fourpences.

Every additional three words, one penny. The name and address of the sender must be paid for. (A single figure, or group of figures undivided by letter, space, stop, or words, counts as one word; compound words count as two words.)

**DEPOSITS.**—The money for goods forwarded on approval may be deposited with the Publishers of the AMATEUR PHOTOGRAPHER, who will hold the amounts deposited until they are satisfied that the transaction has been completed to the satisfaction of buyer and seller.

**ADVERTISEMENTS** can be inserted under a number, the name and address being registered, and letters forwarded for a fee of 8d. to cover postage.

**PAYMENTS** should be made in Postal Orders or Postage Stamps.

**Cameras, etc.**—Lancaster's quarter-plate Instantograph, complete, new last May, with one extra dark slide, box and strap, 42s.—Webster, 29, Earl Street, Broughton, Manchester.

Camera, half-plate, square leather bellows, rising front, double swing back, with two double dark slides (book form), 35s.—8, Berkley Road, Westbury Park, Bristol.

**Cameras, Lenses, etc.**—Half or whole plate camera, two or three slides, good lens, for cash, cheap, or exchange portrait lens.—No. 349, office of this paper, 1, Creed Lane, E.C.

**Hand-Cameras, etc.**—Facile hand-camera, R.R. lens, with solid leather case.—F. C. Newland, Kingstown, Dublin.

**Lanterns, etc.**—Lantern, 4 in. condensers, best achromatic lens, 3-wick lamp, and double slide carrier, packed in neat carrying case, new four weeks ago, bargain, 25s., cost 40s.—Dunlop, 7, Cathedral Street, Glasgow.

Pair oxy-hydrogen lanterns, bronzed tin bodies, 1½ in. objectives, 4 in. focus, compound condensers (double convex and concave convex), 4 in. diameter, 4 in. focus, blow-through jets, six way dissolver, and rubber tube, in painted lock up travelling case, £5.—Whitehead, 141, Manchester Street, Oldham.

Lantern, 3½ in. condensers, photo lens, front, cheap.—75, Monument Road, Birmingham.

**Lenses, etc.**—Rapid rectilinear! French make, special value, 5 by 4, 5½ in. focus, 11s. 6d.; 7 by 5, 7½ in. focus, 14s.; 9 by 7, 11 in. focus, 20s., complete with hood, flange, cap, and set of Waterhouse stops, largest aperture f/8; three days' trial allowed.—Dorey, Lester and Co., Kilburn, London.

Splendid half-plate rapid rectilinear lens, iris diaphragms, 18s.—A., 8, Kenilworth Road, Willesden Lane, London.

Will exchange 5 by 4 Optimus rectilinear lens, Waterhouse diaphragms, fitted with pneumatic plunger shutter, and perfect, as new, for 5 by 4 Optimus euryscope lens, iris diaphragms, in good condition; approval; specimens.—J. K. Smith, Little London, Rawdon, Leeds, Yorks.

Half-plate rapid rectilinear lens, with iris diaphragms, good as new, only 17s. 6d.; camera case, 5s.—Cheltenham House, Stroud.

**Sets.**—Lancaster's quarter-plate Instantograph, new, including camera, lens, iris stops, two double slides, stand in case, bag for camera, also rod to attach to cycle, 40s. Want half-plate.—Williams, 16, High Street, Leicester.

Half-plate long-extension camera by Perken, Son, and Rayment, turntable, R.R. lens, three-fold stand, three dark slides, two strong cases, Thornton-Pickard shutter, all accessories, forming complete outfit, sell cheap; can be seen by appointment.—Creasy, 69, Cornhill.

Relinquishing photography. £7 will purchase my half-plate camera, splendidly made, with three double dark slides, a whole-plate London Stereoscopic rapid landscape lens, long focus, Black Band series, in conical mount, splendid definition, Decoudun's photometer, and an Ashford patent folding tripod; the lot cost £10 5s.; I will send on approval on deposit.—Williams, Liberal Club, Saffron Walden.

Quarter-plate: Simplex pocket camera in case, with three double backs, special R.R. lens, finder, etc., neat little set of first-class workmanship, bought last August from Dollond for £4 17s. 6d. and scarcely used, price £3 15s.—Letters to H. A., 139, Dashwood House, London, E.C.

**Sundries.**—Will exchange gold watch, stamped 18 c., for good hand-camera, R.R. lens; approval.—E. A. Lunn, College, Rosscarbery, co. Cork.

"Amateur Photographer's Annual," 1892, 1s. 6d.; "Iford Manual," 8d.; 10 numbers AMATEUR PHOTOGRAPHER (June, July, August), 9d.; all post free.—Geo. Birtwhistle, 8, George's Road, Liverpool.

"Boy's Own Paper," vols. 3, 4, 5, 6, monthly parts; offers wanted; cash, or photographic exchange.—Abc, 124, Malmesbury Road, Bow.

Two mixed gas jets, 16s. pair; sixteen plain and coloured slides, 5s., post free; or will exchange for slipping or life model slides.—H. Bamford, Augusta Street, Rochdale.

## WANTED.

**Cameras, etc.**—Wanted, good second-hand whole-plate camera, double extension to quite 22 in., two or three double backs to fit same; must be cheap and in good condition.—Lockwood, Sedbergh, Yorks.

Good quarter-plate camera, cash or exchange; have for disposal two safety bicycles, two watches, and 5 by 4 camera.—Readhead, Flamboro', Yorks.

**Cameras, Lenses, etc.**—Half-plate camera, rectilinear lens, etc., of latest pattern; also a good hand-camera; handsome exchange offered.—78, Clifton Street, Brooks Bar, Manchester.

**Enlarging Apparatus.**—Multum-in-Parvo enlarging camera.—Pellatt, The Friars, Muswell Hill.

**Hand-Cameras, etc.**—Good hand-camera; exchange large six-air musical box, or sell £2.—Frederick Sharpe, Church Street, Oakham.

Wanted, Watson's hand-camera, quarter-plate.—W. Walker, 156, Noel Street, Nottingham.

Twin, or divided, focussing hand-camera, quarter-plate, no lenses.—Whitehead, 141, Manchester Street, Oldham.

**Rollholder.**—Eastman quarter-plate rollholder, latest pattern.—H. Norris, 15, Seymour Grove, Old Trafford, Manchester.

**Sets.**—Wanted Lancaster's half-plate Instantograph

outfit, cheap for cash.—J. Clarke, Prospect Place, Grantham.

**Stereoscopic Apparatus.**—Stereoscopic camera and lenses, together or separate.—H., 100, Dalling Road, Hammersmith.

**Lanterns! Lanterns!! Lanterns!!!** Slides! Slides!! Slides!!! The largest and most varied selection in the whole kingdom. Before selecting elsewhere, call and inspect the stock of the City Sale and Exchange, 54, Lime Street, Leadenhall Street, City, where we have no hesitation in saying you will find all that you require in this way. Lanterns for sale, lanterns lent on hire, lanterns sold on commission, or taken in exchange for other apparatus. Write for special supplemental lists, Manager, City Sale and Exchange, as above.

**Bargains in Lenses.**—9 by 7 Optimus rapid euryscope lens, grand definition, Waterhouse stops, as new, £5 5s.; Ross' half-plate rapid symmetrical, as new, Waterhouse stops, £3 17s. 6d.; Lancaster half-plate wide-angle rectigraph, iris stops, 30s.; half-plate landscape lens (rapid view) by Hinton, Strand, 15s.; 5 by 4 Optimus rapid euryscope, Waterhouse stops moveable hood, 5½ in. focus, 47s. 6d.; quite new whole-plate rapid rectilinear by Charterhouse Stores, Waterhouse stops, best condition, 35s.; Lancaster's half-plate Instantograph lens, iris stops, grand definition, time and instantaneous shutter, 16s.; pair stereoscopic wide-angle rectilinear, by Charterhouse Stores, rotating stops, 4 in. focus, 45s. pair; Swift 5 by 4 wide-angle rectilinear, 5 in. focus, rotating stops, 32s. 6d.; Beck's 8 by 5 Autograph rapid rectilinear lens, iris stops, 9 in. focus, £3 12s. 6d., as new; Dallmeyer portrait lens, c.d.v., grand definition, Waterhouse stops, finest order, 63s.; 7 by 5 Optimus rapid rectilinear, Waterhouse stops, as new, 42s. All above lenses are warranted as described.—On view, City Sale and Exchange Rooms, 54, Lime Street, corner Leadenhall Street, City (late Goy's Medium). Every description of apparatus bought, sold, or taken in exchange.

**Bargains in Hand Cameras.**—Rough Eureka hand-camera, size 5 by 4, carries 12 plates, Rough R.R. lens, finder, focuser, etc., covered leather, and in leather case, £4 17s. 6d.; Talmer No. 3, fitted with Euryscope lens, iris stops, two large finders, time and instantaneous shutter, lever focussing, as new, £5 5s.; Optimus Ubique hand-camera, fitted Optimus R.R. lens, instantaneous shutter, three double slides, finder adjustable focussing, £2 17s. 6d.; Kodak No. 1, best R.R. lens, carries 100 films, best order, in leather case, 40s.; McKellen's hand-camera, R.R. lens, shutter, carries 12 quarter-plates, covered leather, as new, 35s.; No. 1 Talmer, best lens, two large finders, time and instantaneous shutter, carries 12 quarter-plates, changing bag, as new, 63s. 6d.; No. 3 Kodak, very finest order, new spool films, rapid rectilinear lens, etc., solid leather case, £5 7s. 6d.; Beck's Frena hand-camera, new packet films, latest pattern, £4 4s.; Samuel's hand-camera, 9 by 12 centimetre, rectilinear lens, time and instantaneous shutter in case, quite new, take 32s. 6d.; Luzo's hand-camera, Robinson, Regent Street, quarter-plate R.R. lens, instantaneous shutter, carries 100 films, solid leather case, quite new, £4 17s. 6d.; Kodak No. 4, size 5 by 4, new spool of films, warranted finest condition, in leather case, take £7 7s., cost £11 7s. 6d.; Adams' Ideal hand-camera, twelve quarter-plates, finest rapid rectilinear lens, time and instantaneous shutter, as new, £5 15s.; Fallowfield's Facile, fitted rapid rectilinear lens, carries twelve quarter-plates, as new, £3 17s. 6d. Optimus magazine hand-camera, covered leather, carries 12 quarter-plates, finest Optimus rapid rectilinear lens, two finders, shutter, etc., as new, take £5 5s. All above are warranted as described. On view, City Sale and Exchange Rooms, 54, Lime Street, corner of Leadenhall Street, City (late Goy's Medium). Second hand apparatus bought, sold, or taken in exchange. Inspection invited.

landscape lens, five double slides, solid leather case and folding stand, 75s.; Lancaster's quarter-plate Instantograph, finest order, all latest improvements, including camera, lens, iris stops, two double slides, stand and case, 37s. 6d.; half-plate camera, reversing back, and rapid rectilinear lens, works f/8, both by Dollond, Ludgate Hill, double slide and folding stand, as new, take £4 4s.; 5 by 4 best quality camera, by Robinson, Regent Street, leather bellows, rising, falling, and cross front, wide-angle movement, three double slides, fine rapid rectilinear lens, by Robinson; Newman's shutter and Eastman's ½-plate roll holder, quite new, £5 17s. 6d. All above guaranteed finest order. On view, City Sale and Exchange Rooms, 54, Lime Street, corner Leadenhall Street, City (late Goy's Medium). Second-hand apparatus bought, sold, or taken in exchange. Inspection invited.

**Magic Lanterns and Slides.**—Walter Tyler's Helioscopic is perfection of all lanterns, supplied to Indian Government, School Boards, science classes, clergy, and exhibitors throughout the world. Impossible to have lanterns give better definition or more satisfactory results; specially constructed lens, which no other lantern possesses.—Walter Tyler, 48, Waterloo Road, London.

**Walter Tyler's Best Triples and Binoculars** are unsurpassed, and perfect in every detail. Good binoculars, mahogany bodied, brass fronts, and all improvements, £7 10s.; single lantern, with 4 in. condensers, portrait front lens, 4-wick lamp, complete, in case, 27s. 6d.—Walter Tyler, 48, Waterloo Road, London.

**Lantern Lenses.**—Specially constructed. Walter Tyler's new Helioscopic portrait combination lantern lens gives the most perfect definition and brilliancy, can be fitted to any lantern, and for excellence cannot be surpassed. No other maker has this lens, which is manufactured expressly for Walter Tyler, 48, Waterloo Road, London.

**Regulators and Gauges.**—Great reduction, in price. Either can now be had of Walter Tyler for 14s. each. The largest stock of gas cylinders in England. Best seamless steel, tested and valved, and all sizes at very low prices.

**Slides from Negatives and Pictures**—Walter Tyler manufactures and colours slides on the premises, thus ensuring speedy delivery, and prices are most moderate.—Walter Tyler, 48, Waterloo Road, London.

**Binial Lanterns.**—If you are in want of a really good binial lantern, perfect in every respect, call and see Walter Tyler's entire brass fronted, mahogany-bodied, lined with Russian iron, and fitted with new best quality lenses, and sold at a most moderate price. The top lantern will take a 4-wick lamp. These are great bargains.—Walter Tyler, 48, Waterloo Road, London.

**Hire Department** is now perfect. Largest and best collection of slides in the world; over 200,000 always in stock. Temperance, travels, Scripture, educational, comic, tales, etc. Cheaper than any other house, no extra charge for coloured slides or effects. Special terms for large quantities.—Walter Tyler, 48, Waterloo Road, London.

**Lanterns and Slides.**—If you wish to hire, purchase, or exchange, you cannot possibly do better than go to Walter Tyler, who makes this business a speciality, and you will thus save dealer's and all intermediate profits.—Walter Tyler, 48, Waterloo Road, London.

**Second-hand Lanterns and Slides** at very moderate prices, also all kinds of apparatus. Send for large catalogue, 420 pages, with instructions for working lanterns of all kinds, and costing an immense sum to produce, sent free for 6 stamps. Small catalogue and second-hand list, post free.—Walter Tyler, 48, Waterloo Road, London.

*It is unnecessary to send an advertisement for the "Sale and Exchange" column for more than one insertion, as the goods are usually disposed of when the first advertisement has appeared.*

**ENLARGING APPARATUS.**—Hume's enlarging apparatus, 5 in. condenser, without objective, 61s. 6d.; with 8 in. condenser, 122s. 6d., carriage paid.—Hume, 1, West College Street, Edinburgh.

THURSDAY, NOVEMBER 3RD.

**THE REMAINING STOCK OF PHOTOGRAPHIC APPARATUS OF MR. J. WERGE.**

**MR. J. C. STEVENS** will Sell by Auction at his Great Rooms, 38, King Street, Covent Garden, on Thursday, Nov. 3rd, at half-past 12 precisely, the remaining Stock of Photographic Apparatus, Chemicals, and Sundries of Mr. J. Werge, late of 11a, Berners Street, W., including Dallmeyer and other Lenses, Cameras, etc., and a Unique Collection of Historical Apparatus, Books, and Pictures relating to the early process of Photography.

**PUBLISHING DEPARTMENT.**—All letters containing Subscriptions, Orders, Remittances, SALE and EXCHANGE Advertisements, or other business matters for the AMATEUR PHOTOGRAPHER are to be addressed to the Publishers, HAZEL, WATSON, and VINEY, LD., 1, CREED LANE, LUDGATE HILL, LONDON, E.C. SALE and EXCHANGE Advertisements (at the charge of *Three Words for One Penny*) must be received by Tuesday evening's post to ensure insertion in the same week's issue.

**"Amateur Photographer" Monthly Competition, No. 42.**—"SEA PIECES AND RIVER SCENERY." Latest day, November 21st.—Prizes: Silver and Bronze Medal, with ribbon and clasp. One mounted print only to be sent in. Entry forms, etc., on receipt of stamped envelope. Address: Editor, AMATEUR PHOTOGRAPHER, 1, Creed Lane, E.C. (Prizes will be announced and photographs reproduced and criticised in the AMATEUR PHOTOGRAPHER Supplement, December 9th.)

We are introducing new blood into the Editorial staff, which will the better enable us to meet the increasingly diversified tastes of our readers. From the severely scientific to the extreme artistic is a pretty wide range, but we do not fear to promise that the covers of the AMATEUR PHOTOGRAPHER shall contain fair measure of both, and of the numerous intermediate matters which are for the average reader. A contemporary skittishly refers to us as "The Immature Photogenic." If "immature" because we have not yet attained our highest ideal, well and good. *Non eram quod sum, non sum quod ero.* We have good things in store which may yet beat the record.

PHOTOGRAPHIC exhibitions are just now so plentiful as to be quite epidemic in character, and the respective methods of organisation with regard to the distribution of awards are as varied as they are unsatisfactory, and give serious grounds for thought.

To commence with, the Invitation Exhibition at Charing Cross has no awards of any kind. At Pall Mall we have awards, all of equal value, but no classes. At Leytonstone professional photographers are debarred from taking medals, a serious mistake which we understand the executive have already recognised. At Exeter and at Hackney there are four open classes; at Tunbridge Wells four open classes for amateurs, and a like number of professionals.

STILL this separation of professional from amateur! How long shall this tradition of a past age remain? Witness the medal takers at Pall Mall this year. Does it look as if in an "open" competition the amateur photographer is at a disadvantage? In the classes for "members only" it may be only fair to take the opinion of the members of the club, but in those classes which appeal to all outside the society let them be open without qualification of any kind.

THERE's another point to which we would call attention, and that is the limitation of medals that can go to one exhibitor. The baneful influence of the absence of any restriction of this kind was painfully noticeable in a recent exhibition in the East of London, when one exhibitor took first medal in some four or five classes, and first and second in one class! Where this is possible in a young society the members of which are mostly beginners, it only needs a thoroughly good all-round worker to become a member

and enter for all classes, for him to "sweep the boards," so to speak, and take medals by the dozen, and—with sorrow we confess it—there seem to be some exhibitors now-a-days who would not flinch at committing such an act as this.

SYSTEMATIC medal-hunters—"pot-hunters" if you will, only we don't like the expression—are not far to seek in photographic circles. Would that some influence could be brought to bear upon these gentlemen which would restrain them from sending into every little local exhibition. Their practice is not a very dignified one, and when they do chance to get beaten and have to give first place to some unknown tyro—and it happens so sometimes—the position is almost ludicrous. Theoretically there is nothing to be said against the competitor sending in to all classes and carrying away the prize in each, neither can we find any logical reason why duplicate prints of the same picture should not be entered and medalled for different classes,

"TWO OF OIRISH."

(Snapshot by F. W. Hindley. Taken with the "Miall" Hand Camera.

nor yet why previously successful work should not be admitted. But perhaps because the whole system of medal giving is wrong, it therefore becomes necessary to adopt some arbitrary regulations which shall prevent the abuse of the usual rules and conditions. Well, time and experience may right these matters, meanwhile we state our views and invite the suggestions of others.

LAST WEEK the hypnotising of the image on a photographic negative was talked of, and now it is announced we are to have the photography of thoughts. How is it done? say you. Perhaps the discoverer's own statement will be lucid enough without any comments of our own. He says:—

"Since the cerebral radiations—consequence of the brain vibrating in unison with the external vibrations which convey to us the perception of things, and which alone explain the phenomena of suggestion—are analogous to the radiations of light and heat, one can easily conceive the possibility of obtaining on a photo-plate suitably sensitised, their equivalent in photographic impressions."

POSSIBLY "one can easily conceive." Some people can imagine anything. Not long ago some one read a paper at the Camera Club on "The Photographic Expression of Thought," but he didn't come to this height, after which the photography of the shades of the departed, or of burglars "in the act," or the snap-shotting of Cabinet ministers as they arrive in Downing Street are insignificant achievements.

THE Platinotype Company are not content with the present wide use of their incomparable papers, and with admirable enterprise have made arrangements for lectures and demonstrations both in this country and on the Continent, so as to make the simple manipulations which the platinotype papers require thoroughly familiar to all. Thus, whilst in London and the provinces Mr. Buchanan S. G. Wollaston has been appointed to give special demonstrations and lectures, Mr. Alfred Maskell starts this week for Paris on a similar mission.

FOR this task Mr. Maskell's mastery of the French language fits him, and he takes with him a capital collection of pictures by most of the well-known workers in platinotype, illustrating the various methods and styles to which the process lends itself. Strange to say, platinotype is comparatively little known in France, and it may be readily imagined that the class of French photographers to which Mr. Maskell will address himself will not be slow to recognise and welcome the artistic advantages of Mr. Willis's process.

THE first lecture will be given in the handsome and spacious rooms of the Geographical Society in Paris, and is to be quite a *solemnitie*. We understand that Brussels, Vienna, Berlin, and other continental cities will be similarly visited in due course.

PROBABLY by the time that our present issue is in the hands of readers, "Photographs of the Year" will also have reached the subscribers and those who have ordered in advance. Although issued from the same publishing office, and in some way connected with ourselves, we do not hesitate to say that the work is in no way behind its predecessor of last year; and, indeed, as with the progress of time might be expected, we consider the illustrations superior in many ways. As is generally known, it is not without its rival. No doubt there is room for both. Any way, it is first in appearance, as we prophesied it would be, and this, at least, we know that the selection of pictures was made absolutely without prejudice, and made from amongst the pictures as they hung in the Pall Mall Gallery with all the advantages or disadvantages of surroundings. We should not like to say that possible exhibitors were approached by someone else by letter long before the Exhibition was opened, but if such a thing were done, it was *not* done for "Photographs of the Year." Does anybody plead guilty?

COMBINATION printing is bad enough—that is to say, in practice. Theoretically we have not a word to say against it, and when it simply implies the wedding of clouds to landscape, there is less danger of incongruity, and with knowledge and judgment the practice has everything to recommend it. But when it is attempted to compose a picture by the combination of two or more negatives the result is hardly ever, practically never, satisfactory—falsity of tone, want of harmony, error in lighting seem ever present. And if this be so of combination, what about composite photography? But it is probably the former to

which the *Daily Chronicle* refers in the following paragraph:—

"The new-fashioned 'composition photograph' is responsible for a good many absurdities, but we have seldom seen anything so entirely idiotic as the specimens of 'composition photograph' of the time in the *Century* for November. The subject is the reprisals of the Paris Communists of 1871, when six hostages were shot in La Roquette and sixty-two in Belleville. The first of these represents a firing party three deep, the first and second ranks having the muzzles of the rifles of those in their rear placed just behind their ears. Needless to say, no man in the first two ranks would ever have heard a sound again if the rifles had been fired in that position. The second picture shows a crowd of a hundred people firing indiscriminately with rifles and carbines and revolvers over each other's shoulders, eight or nine deep. We should have thought that the war experiences of the editor of the *Century*, which have extended over so many hundreds of his own pages, would have saved him from reproducing such pictorial nonsense. It is impossible, of course, that Mr. Archibald Forbes can have seen these illustrations."

Yes, "composition" or "combination" photography has earned a bad name on account of just such absurdities as the above. Like other branches of photography, it is not so much that the principle or the process is bad, but that its exponents are usually wanting in ability to the utmost, or, further, are either blinded by the pleasure of having achieved some measure of success, or are deficient in perfect judgment, and thus do not perceive faults in their own work which are immediately apparent to another.

It is the old question—it is one thing to produce an artistically satisfactory photograph, it is a greater thing to know it to be such, and, obversely, we may feel ourselves capable of producing artistic work, may attempt it, and through our own coloured glasses—the knowledge of good intention—may fancy ourselves far more successful than we really are. Herein is the application of the maxim, "We are judged by what we have actually done, not by what we know ourselves capable of."

ANENT the Camera Club Exhibition, we understand the number of visitors far exceeds anticipation, and some of the members who are *habitués* of the general club-room rather resent the constant intrusion of strangers. But the grievance, if it be one, will not be of long duration; another few weeks and the first photographic salon in this country will have become a matter of history. Those who have not yet visited this noteworthy exhibition of artistic work should not miss the opportunity. Be it regarded as a new and original venture, an experiment, or as the split from Pall Mall, it cannot fail to be interesting and instructive.

WHAT say those of our contemporaries who but a short while since had not a good word to say for the "Fuzzies" and their producers and supporters? Amidst the chorus of applause there is not one dissident. Perhaps the surest sign that a new school, a new style is something more than a passing fashion is that it can outlive severe adverse criticism, and subsequently secure the adhesion of its earlier antagonists. Here we have the ultimate impressions which are the result of cultivation enduring, where immediate likes and dislikes have proved their falsity by their evanescence.

WHAT says Mr. Ruskin?—"The temper by which right taste is formed is characteristically patient. It dwells upon what is submitted to it. It does not trample upon it—lest it should be pearls, even though it look like husks. It is good ground, penetrable, retentive; it does not send up thorns of unkind thoughts, to choke the weak seeds... It clasps all that it loves so hard that it crushes it if it be hollow."

AMIDST the number of exhibitions—pictures and photographs—which are now being held in London, Mr. Frederick Hollyer's platinotype reproductions at the Dudley Gallery should not be forgotten. The collection, numbering some 220 works in all, are a magnificent monument to the painstaking life-work of Mr. Hollyer. One finds here reproduced in monochrome the paintings of E. Barae-Jones, A.R.A., D. G. Rossetti, G. F. Watts, R.A., Botticelli, Hobbema, Corot, Sir Joshua Reynolds, P. P. Rubens, Geo. Moreland, Velasquez, Raphael, L. da Vinci, Perugini, and a host of other masters, and also several prominent members of the New English Art Club.

THERE is here a veritable storehouse, an inexhaustible fountain of study and inspiration for any art student, and to the art photographer; the fact of their being in black and white will make them the easier to study, and their lessons the easier to apply to his own work. We should like all our readers if possible to see Mr. Hollyer's exhibition, which remains open for yet two or three weeks. Mr. Horace Townsend concludes his preface to the catalogue with the following paragraph:—

"The charge has, and not without foundation, been brought against Mr. Hollyer's reproductions that there is in them not only the original artist, but a suggestion of Mr. Hollyer himself, and this in spite of the fact that there is absolutely no retouching of the negative. So far from looking upon this as a defect, it seems to me to be the differentiating touch which elevates his work from a process into an art."

NOTE, when at the Dudley Gallery, the total absence of white mounts, and reflect on the enormous gain to the pictures, individually and collectively, which is derived by the dark mounting and framing. What suggestions for framing are here! See that you profit by them.

WE have received several letters from correspondents complaining as to the short period which has elapsed since their holidays and the closing of our Optimus Competition. We have therefore decided to extend the time of receiving prints till November 30th, although this will lead to rather more work, the number of prints now having been sent in being rather more than we usually get for a competition. But then we suppose £105 of apparatus is worth trying for.

WE would remind our readers that the Photographic Society of Great Britain is devoting the proceeds of its Exhibition and Lantern Show at the Pall Mall to-night (Friday, November 4th) to the Photographers' Benevolent Association. This annual benefit which is given to the Benevolent by the parent society usually realises a good sum. Last year it amounted to £7 10s. 4d. We hope that this year the receipts will be the largest ever recorded, and ask our readers to do whatever they can to make the show a great success. We would remind those who have not seen this year's Pall Mall Exhibition that it closes next week, and that the Benevolent lantern night is as good an opportunity as they can have for seeing both the pictures and a good display of special lantern-slides. The small entrance fee will not be missed by anyone, and even our wives and cousins and aunts may be glad to assist in such a good cause.

JUST as we close for press, Dollond and Co. have shown us a monacle or special set of spectacle lenses they are introducing, which include four lenses with special mounting to allow of correction for non-coincidence of foci. We shall give a more detailed description of this next week, but we understand that the price will be about one guinea.

THE Polytechnic Institution, under the direction of Mr. Howard Farmer, offers some sound technical instruction in photography to our readers. The advertisement which appears in another place will show, from the array of talent which has been collected, what may be expected. Such names as Valentine Blanchard for art, Howard Farmer for technique, A. W. Dollond for science, and Wesson, Holzhausen, Whiting, Beeson, and Wolfgang Arnot are pretty good guarantees of the soundness of the instruction. A free introductory lecture will be given on Tuesday, November 8th, and our readers might do far worse than go to hear the same.

### Chit-Chat.

MAY I be allowed to congratulate you upon your "Lantern Screen," Mr. Editor? If the "light" is always as "bright" and the screen as "taut" as last week, you will have scored an undoubted success.

I was looking over the portfolio of "Photographs of the Year" upon the table of the P.S.G.B., and was greatly struck with the high artistic qualities of the pictures. There was another publication somewhat similar in outside appearance upon the table, which I at first took to be yours. I do not want to institute a comparison—but, well, facts speak for themselves.

MR. F. P. CEMBRANO, the genial President of the Richmond Photographic Society, in speaking upon architectural photography before the P.S.G.B., is reported to have said that the best position for the camera was at the height of the eyes from the ground. May I be permitted to ask him whether, when he laid down the rule, he had in contemplation the distance of his own eyes from the ground, or those of Mr. J. B. B. Wellington, for instance!

I KNOW he will not be offended with me for putting the question, and will acquit me of any intention to throw ridicule upon his remarks. The paper was a thoroughly practical one, being the outcome of the experience of one who is a master of his art in that particular direction, and it should be perused by all who are interested in architectural photography.

THE Exhibition question appears to be still a burning one. I do not agree with "A Member of the P.S.G.B.," who suggests the appointment of three artists to get over the "judging" difficulty. I have seen artists judge, and have judged with them, and my experience leads me to the opinion, that, if ignorant of photographic technique, their awards are apt to be, to say the least of it, eccentric.

THOSE who lack the necessary qualifications are, of course, sometimes chosen to officiate as judges, but the unwillingness of exhibitors to submit their work to such would be to some extent overcome were the promoters of exhibitions always to announce upon the entry forms the names of the gentlemen selected. This, I think, should always be done.

IN regard to Pall Mall, it is, it seems to me, the hanging rather than the judging which calls for reform. It is something more than a coincidence that a few well-known exhibitors always get their pictures hung together, whilst "Tom," "Dick," and "Harry" have their exhibits dotted

about all over the walls in the most promiscuous fashion possible. I venture to ask for an explanation of this, not, however, in the expectation of obtaining one.

THE Camera Club exhibition may, not inaptly be termed "a harmony in brown," nine-tenths of the exhibits being of that colour, but in very few instances is the tone aimed at—sepia—truly rendered.

THE intention expressed in the catalogue of confining the exhibits to new work has apparently not been adhered to, else how is it that we find such old friends as L. Clark's "Dedham Lock," and "A Portrait," "Highland Smugglers" by Adam Diston, architectural views by F. H. Evans, and several of R. Keen's rather topographical subjects upon the walls? Some of the pictures are of a very impressionist type, notably a something which in the catalogue is designated "A Reed-Fringed Mere," and some pictures by Mr. Eustace Calland, Mr. Maskell, and others, but then, if people will use shaky cameras and bad lenses, they must expect that sort of thing, I suppose.

CHATTERBOX.

### Letters to the Editor.

THE P. B. A.

SIR,—I thank you for the space you gave for my letter *re* the Benevolent. It may interest you to know that it has caused one case of apparently critical distress, which can be relieved by a temporary loan, to be brought before us. We have given temporary assistance in one or two other cases, and have several cases in our hands of assistants wanting places. One typical case is of an operator and retoucher, who has nearly twenty years' excellent testimonial from one of the best firms of photographers in the country. Over a year ago he emigrated on an engagement, and found to his deep disappointment that the firm to whom he had gone was "no good." He picked up a month's work as a temporary hand, was out of work for a week or two, and then, robbed of everything, including his specimens, worked a passage back to England, and has spent nearly a year answering advertisements and looking for work. No specimens, no good. Is now broken in fortune, and almost broken-spirited, but, hoping against hope, and unwilling to take money from us, or to lay his case before the committee at all. In seeking work he has tramped as much as seventy miles, sheltering at night in coach-houses to husband his last shilling or two, which is rather hard on a man who has mixed with the best of photographic society.

This is one of the cases that ought not to occur if more general interest were taken in the Benevolent, and if photographers wanting assistants would apply to us. Is there any good house near London that will give this gentleman a week's trial even, or a temporary berth? His references are excellent.

We have another case almost as bad, of a really good man who is working, and has been doing so all the summer, at a mere pittance—one of those places with a small salary and large commission (in theory) but little or no commission in practice. We have almost all classes of assistants on the books.—Yours, etc.,

H. SNOWDEN WARD.

\* \* \* \*

### TONING CHLORIDE PAPER.

SIR,—My experience of Mr. Mason's toning bath is the same as Mr. Ling's. It works well with the Ilford paper, but not so well with the Eastman. The following bath gives me the best results with Eastman paper:—

Borax	..	..	..	..	..	40 gr.
Gold chloride	..	..	..	..	..	2 "
Water	..	..	..	..	..	10 oz.

Wash well before toning. Gives a rich brown tone.—I am, yours, etc.,  
W. EDWARDS.

## MASON'S TONING BATH.

SIR,—I tried this bath as soon as I saw it published, and have found it satisfactory. I use Eastman paper only. I believe that with this paper—probably with all similar papers—the tone of the print, whatever bath is used, depends greatly on the negative, more so than with albumen paper. With a bright negative, clear in the shadows and fairly vigorous, I get a very pleasing warm black with this bath. With some negatives I cannot get beyond a dark brown. I have noticed the *pink* tint to which your correspondent refers. It comes with negatives somewhat blocked up in the shadows. Altogether I think I like this bath better than the combined bath. The sulphocyanide makes the film a little soft. I use a little chrome alum in the hypo bath, and soak the prints in chrome alum during the time of washing.—I am, yours, etc.,

CLIFFORD E. F. NASH.

\* \* \* \*

## A UNIVERSAL HAND-CAMERA.

SIR,—In reply to the inquiry in your issue of the 28th October, the sketch of the view-finder referred to was given merely to show the construction of this type of finder.

No dimensions were given, nor was the sketch drawn to scale, for the simple reason that the size of the box depends on the diameter of the lens selected.

The lens should first be obtained and fitted to front of box, and then the rest of the casing added, keeping the lid off until the view has been arranged to correspond with the image thrown by the ordinary lens on the plate.

A suitable diameter for the lens is  $1\frac{1}{2}$  in. The focal length (if it can be so called) is immaterial.

All that is necessary is to centre the lens in front of box, fix the mirror at the proper angle, and adjust the aperture in front of the lens so that the size of view coincides with the image on the focussing screen.—I am, yours, etc.,

H. W. B. BRUNO.

\* \* \* \*

## THE "A. P." LANTERN-SLIDE COMPETITION.

SIR,—The subject of the letter in your issue of the 28th, signed by Messrs Whitman, Williams, and Whiten, is to my mind very important, and I trust you will forgive me for troubling you with these few remarks.

Undoubtedly there are many obscure workers who are ambitious to compete in your monthly and other competitions, not from any wish to become medal hunters, but from an honest wish to have their work judged and to try and improve themselves. How can such, who are mostly beginners, hope to compete with the old hands who have been taking your medals for some years, and whom I should call professionals? Such men as Dresser, Austin, and many more have opportunities to produce work which the ordinary amateur does not possess. I would not grudge them the honours they have most deservedly won or may win in the future, but let them have a class to themselves. I feel sure there are many who will welcome such an arrangement as suggested by the three gentlemen I refer to, and that a championship class be established, in which all who have won a medal should be allowed to compete. The ordinary competition should be open only to those who have *never taken a medal*. As soon as any competitor takes a medal in this competition he should be debarred from competing again in that one, but he could do so in the championship class, which would soon grow into large numbers and be the means of improving the work. I believe that it would be a grand stimulus, for who would not then be proud of saying "I compete in the championship class"?

It seems to me such a simple arrangement, and I am sure the cost of the medals will not be a consideration with you.—I am, etc.,

H. HARVEY GEORGE.

\* \* \* \*

## THE CHARITABLE LANTERN ENTERTAINING SOCIETY.

SIR,—The above society, the objects of which are to provide free lantern entertainments to charities and hospitals, has now been formed, and we shall be pleased to receive the names of gentlemen wishing to join.

We shall be grateful for any help, also the gift of any apparatus and slides.—We are, etc.,

Y. M. C. A.,  
182, Aldersgate Street, E.C.

B. FOULKES WINES } Secretaries.  
F. SIMMONS }

## AMIDOL.

SIR,—Is it not probable that your own, Mr. Davidson's, and others' experiments on Amidol as a lantern-slide developer may be reconciled into a question purely of exposure?

I have used Amidol in conjunction with ferrocyanide of potassium, bromide of potassium, bromide of ammonium, carbonate of ammonium, and carbonate of soda with the following results:—

1. Amidol in conjunction with carbonate of ammonium does not give brown tones, such as when the latter is used with pyro or hydroquinone.
2. Amidol with ferrocyanide of potassium does not remove the veil from over high lights.
3. Amidol and bromide of potassium will remove the veil.
4. Amidol with ferrocyanide of potassium and bromide of potassium has the same effect as with bromide alone.
5. Amidol and carbonate of soda increase the veil.
6. Compared with a good standard hydroquinone developer, under similar conditions, Amidol veils in high lights.
7. The veiling is due to light getting through the dense parts of negative.
8. The use of bromide consists in removing this slight fog.
9. Exposing two plates a normal time to suit the standard hydroquinone developer, the hydroquinone gives a good clear slide, and Amidol gives a fogged slide.
10. Exposing two plates for one-fifth (a normal time for Amidol), the time required by standard hydroquinone; Amidol gives a good clear slide, quite free from veil, and hydroquinone produces a perfectly useless result.
11. From the above it will be seen that the energetic reducing action of Amidol renders it imperative that every precaution be taken to prevent the action of light through the dense parts of negative.
12. Reducing the exposure, or using bromide, effect the removal of veil, or light fog, the veil not being due to staining action.
13. The developer was made up as follows:—Water, 4 oz.; sulphite of soda, 100 gr.; Amidol, 10 gr. The sulphite of soda must be thoroughly dissolved *before* adding the Amidol.
14. With the above were developed ten quarter-plate negatives, the developer then allowed to stand in uncovered measure for twenty-four hours, seven positives were then made, using same solution, the last (the seventeenth plate) being from a snap shot of such character as would produce a slide having every tendency to veil, if Amidol had a plate-staining action (prolonged development being required to get detail in high lights of positive). I enclose this slide, and would be glad, Sir, if you will say whether there is much sign of veil.

I have recently made some non-tabulated experiments, in which the sulphite is increased to 150 grains and Amidol 15 grains, water remaining the same—4 ounces. This requires a shorter exposure, and gives more density; the colour seems better. For hard negatives the first formula seems the best; for soft negatives the latter. The exposure must be kept back. From results I have seen in some positives since intensified for photo-mechanical use, I am inclined to think under-development, with subsequent intensification, will produce the finest colour in Amidol-developed lantern-slides.—Yours, etc.,

HENRY SUTTON.

[The slide sent is absolutely free from veil.—EDITOR.]

\* \* \* \*

## EXPOSURE.

SIR,—I notice in a recent report of a society's meeting at Hove, that two members mention that my exposure meter gave them over-exposure (using, I presume, the speed numbers suggested in the instructions).

The following warning, printed in the instructions issued with the instrument, fully explains the reason and remedy:—

"The speed-numbers of plates must be only regarded as approximate, and a guide to the first trial; for in the first place few makes are always issued at the same sensitiveness, and in the second place different workers vary in their method of development and in their idea of what a negative ought to be. The P number may be regarded as the regulator of the instrument, to be set fast or slow according to individual needs.

"Caution.—The P numbers given are all calculated for fully-

exposed (not merely pretty) negatives, the developer used having a minimum of alkali. Many good workers, especially those using stronger developers, find that they give over-exposure, and therefore use P numbers one half greater, or even double those suggested."—Yours truly,  
ALFRED WATKINS.

## Apparatus.

### MEZZOTYPE PAPER.

THE CARLOTYPE Co., of Rainham, Essex, are preparing the above, which is a rough-surface paper, in two qualities, No. 1 very rough, and No. 2 medium rough. It is printed out just the same as ordinary plain salted paper, that is to say much darker than the finished print is required. The print is then washed thoroughly for fifteen minutes and toned in any ordinary bath diluted—the manufacturers state—with one-third its bulk of water, but we prefer to add at least an equal bulk of water to the ordinary bath. The sulphocyanide toning bath is also recommended, and one that has given very fine tones in our hands is the uranium and gold bath as used for plain paper. Platinum toning is very easy with this paper, and the usual nitric acid and chloroplatinite bath is suggested. For sepia tones, the old seld'or or hypsulphite of gold bath is suggested, but we much prefer to get these tones with platinum, using for this purpose the following:—

Chloroplatinite of potash .. .. .	1 gr.
Bitartrate of soda .. .. .	30 "
Distilled water .. .. .	10 oz.

The fixing bath should be weakened also for this paper, the makers suggesting 1 to 5, but we find that with a weaker bath namely, 1 to 8, the print loses less in fixing.

This paper lends itself most readily to really artistic effects and many a negative which gives merely a good technical print will on this paper yield a really artistic result, a very striking instance coming to our notice in our Monthly Competition which closed on 24th ult. We hope to have in a week or two a paper upon Platinum toning Mezzotype, the result of a series of experiments which have been carefully carried out.

### DURAN'S BACKGROUNDS.

Mr. F. Duran, of 21, Terrace Road, Handsworth, Birmingham, has sent us some photographic prints of some of his artistic backgrounds. They are painted in flatted oils, and are really low in price. One in particular, which is suitable for a bust, is only 7s. 6d., with frame complete. So excellently are these painted that in the prints one hesitates to say whether they are not actual interiors in some cases.

Those of our readers who go in for home portraiture should give these backgrounds a trial. Mr. Duran sends us some portraits taken against his grounds, which enable one to judge very easily what charming results they give.

### THIOTONE.

Messrs. G. Wright and Co., of 97, Manchester Road, Hopwood, Lancashire, have introduced a new toning solution, which presumably is intended for a substitute for gold. The print is obtained in the usual way, washed, and fixed in an alkaline hypo bath, then well freed from hypo and immersed in the toning bath, which is composed of two or three parts of Thiotone to 500 parts of water. The special features claimed for this bath are—(1) Its cheapness, the cost being about one-tenth of toning with gold; (2) the great permanency of the print; (3) the rapidity with which the operation is carried out; (4) simplicity of the process, it being only necessary to add a very small quantity of Thiotone to a very large quantity of water to form the toning bath.

We have tried this on chloride, albumenised, and plain paper, and have obtained some very good tones. The ease and simplicity of working are very great, and for these reasons alone it should find many a friend amongst our readers.

### NOXINOL.

This preparation, also introduced by the above firm, is intended as a protection to the plate in developing. A stock solution of Noxinol is prepared, and a little of this added to the mixed de-

veloper helps to protect the plate from light fog, although, of course, it will not prevent chemical fog.

We have tried this and found that if the negatives developed under this protection are alumed in the ordinary way, the faint red tinge imparted to the gelatine entirely disappears. Many a tyro fogs his plate by too bright a light, and this preparation will help him materially.

### IMPROVEMENTS IN THE OPTICAL LANTERN.

Mr. Wm. Rice has submitted to us an extremely ingenious improvement in the lantern which he calls the "Screw Carrier Grip." As is well known, in ordinary lanterns the slide-carrier is usually held in its place by springs. Mr. Rice's improvement consists of fitting to the front tube of the lantern a screw brass collar which can be screwed up tightly, and thus clamps the carrier all round instead of at several points. This improvement is a practical and useful one, and will be warmly welcomed by all lanternists who know of the difficulty of keeping a carrier firmly fixed for registration, etc.

The lantern to which this improvement has been fitted is one specially made for Messrs. Geo. Philip and Son, of Fleet Street, who are now opening up an optical lantern branch in connection with schools and technical institutes. The lantern is very strongly made, the body being stamped out of one sheet of stout iron, and is provided with two side doors with glazed sight holes, and a four-wick lamp or lime jet and tray is provided for the same money. The stage carrying the slide and objective is of solid brass running in solid brass runners, thus preventing any sag, or giving with a heavily mounted objective, and this also allows of accurate adjustment of the slide and objective for the cone of light. The price complete is £4 4s.

A special bamboo stand and table top which exactly fits the side of the lantern box is also to be obtained, and the box is fixed to the table top, forming a support for the lantern, the inside being used for a gas bottle or the stock of slides, etc.

### SCHOLZIG'S ENAMEL PAPER.

OTTO SCHOLZIG, of 31, Binfield Road, Clapham, S.W., is now issuing a special paper under the above title, which is neither albumenised nor an emulsion paper, but is coated with a specially hardened salted film which any photographer may sensitise for himself.

Mr. Scholzig kindly sent us some of the paper ready sensitised, and we have given it a trial, and find that whilst it renders every fine detail as faithfully as gelatine-chloride papers it can be toned and fixed in the same manner and in the same baths as the ordinary albumenised paper.

The tones to be obtained are very fine, and to those who wish to sensitise their own paper and obtain one that will not blister it will be a great boon.

The sensitising bath recommended is

Silver nitrate .. .. .	1 oz.
Distilled water .. .. .	8 "

Float for two minutes. Obviously this paper will place a new power in the hands of intelligent workers, who may thus sensitise their own paper on strong or weak baths to suit the character of their negatives.

The toning baths suggested are for purple tones

Borax .. .. .	6 drms.
Chloride of gold .. .. .	6 gr.
Distilled water .. .. .	2 pints

For black tones

Ammonium sulphocyanide .. .. .	6 drms.
Chloride of gold .. .. .	6 gr.
Distilled water .. .. .	2 pints

For fixing

Hypo .. .. .	3 oz.
Water .. .. .	1 pint.

Immerse for ten minutes and keep moving.

### TOMES' NEGATIVE BOX.

Mr. Alfred Tomes, of 43, Bedford Street, Leamington Spa, has placed on the market a very useful and well made negative box constructed to hold fifty plates. It is provided in the lid with a numbered register for recording the negatives stored, and is just the thing required by the busy man with scores of negatives, or the neat and tidy worker desirous of seeing his dark-room tidy, and those who are neither busy nor tidy must perforce buy one to be up with the times.

# W. WATSON & SONS, 313, HIGH HOLBORN, LONDON,

## OF THE PHOTOGRAPHIC SOCIETY OF GREAT BRITAIN

HAS BEEN AWARDED TO

# ELLIOTT & SON'S

MAGNIFICENT ENLARGEMENT, ENTITLED—

**"BREAK, BREAK, BREAK, AT THE FOOT OF THY CRAGS, O SEA!"**

### OPINIONS OF THE PRESS.

#### DAILY CHRONICLE.

The work which will command most attention, no less for its beauty than its size, is a carbon enlargement, exhibited by Messrs. Elliott & Son, from a negative by Mr. Birt Acres. The picture, which measures 7 ft. by 5 ft., is a fine study of the surf breaking upon a rockbound coast. *A greenish tint has been given to it, which heightens the realism, and there is none of that blur which so often obtrudes itself upon photographic seascapes.*"

#### PHOTOGRAPHIC NEWS.

"We now come to the largest picture in the gallery, No. 250 entitled—  
'Break, break, break,  
At the foot of thy crags, oh sea!'"

This is a carbon enlargement, measuring no less than 7ft. by 5 ft. without its frame, by Messrs. Elliott & Son, of Barnet. It is certainly one of the finest pictures of the kind ever produced. The picture represents a rough sea breaking on a rocky shore, and is not

too sharp to do away with all notion of movement. It is not a frozen sea, as a photographic sea too often is, but is full of life and movement. It seems indeed to be rolling in towards the spectator as he looks at the picture. It is worth the trouble of going to Pall Mall to see this one fine example of photographic art. It takes a medal."

#### STANDARD.

"It is a remarkable work, even less on account of its size than of its artistic merits as a presentation of the broken waters and lights of the sea."

#### BRITISH JOURNAL OF PHOTOGRAPHY.

"It is, without doubt, a majestic work. From a placid sea the white crested waves tumble in upon ridges of ugly jagged rocks in the foreground, the seething, surging waters almost sounding in one's ears. *The particular pigment employed adds to the fine effect of the study*, which, in addition of its artistic value, is a splendid specimen of carbon work."

Amateurs can obtain our Enlargements through any Dealer or Professional Photographer.  
Manufacturers of the well-known **BARNET AND STUDIO PLATES.**

**FRANCESCO DURAN, Medallist, Paris and Vienna Studios, 21, Terrace Road, HANDSWORTH, BIRMINGHAM.**

PLEASE MENTION THIS PAPER.

## Study and Practice of Art in Field Photography.—X.

By A. HORSLEY HINTON.

(Continued from page 143.)

In the last chapter we made a passing reference to the subjects of "Tone" and "Aerial Perspective," and will now devote a little more time to these most important matters.

Although since the advance of artistic photography the two terms above used have been frequently written about and discussed, it is probable that a goodly number of our readers are still comparatively ignorant of their real meaning. Unfortunately, amongst photographers "tone" is a word likely to be a great deal misunderstood, in consequence of its being almost universally employed for "colour," in connection with those printing processes in which the original colour of the print is changed or modified by subsequent chemical action, this process being described as "toning." In the sense in which the painter-artist uses the word, however, "tone" is a matter of far greater importance. Upon the correctness of tone depend the picture's beauty and truthfulness. With false tonality the most pleasing arrangement and admirable drawing are useless, but let the relative tones of the various parts of the picture be true, and the simplest subjects may be elevated from the commonplace and become infused with a poetry and sentiment essential to good art.

Mr. Francis Bate, in his excellent little book "The Naturalistic School of Painting," gives us the following definition:—"Tone signifies the amount of light received by the divers planes of divers objects; and 'relative tone' the difference in amount of light received by these different planes in comparison with and relation to each other." The word "tone," then, is applied to the whole subject; "relative tone" is used when speaking of parts in comparison. In other words, we mean the lightness and darkness of things and the difference between the light and the shade. The light and the shade have a relative value one to another, and hence some painters speak of relative tones as "values." If the shadow part of an object be ten times darker than the lighted portion, then in the picture the relative tones of these two portions must be in the value of ten to one, and if the green grass field be so many times darker than the dusty footpath crossing it, then in the picture the relative "value," the proportional darkness and lightness of the green and the dust colour, must be carefully observed, so we shall say the "relative tones" are correctly rendered.

It will be seen then that relative tone will depend upon the amount of light falling upon the surfaces of things, imparting varying degrees between the extremes of high light and deep shadow. There is, however, another circumstance which will influence the relative light value of objects, and that is the presence of an intervening film of atmosphere, which if present to any great degree we call haze or mist.

The representation of this character in a landscape gives the impression of distance, and is what is called "aerial perspective." But if we remember that the presence of this atmospheric haze is only perceptible in proportion as the light (and its own density) makes it visible, it will be difficult to separate its consideration apart from the general question of "tone."

The vital importance of a careful study of tones or values in nature to a student of any picture-making art cannot be over-estimated. It is, however, a difficult subject to illustrate or to teach, and a proper knowledge of it must depend almost entirely upon the student's own persistent observa-

tion, and we would strongly recommend our readers to read the little book above referred to.\*

But in pursuing the subject of "tone" in its more general sense, and as applied to the entire subject, we must get deeply rooted in our mind the knowledge of how exceedingly *light* nature is, and how far, how very far, below nature's standard our most brilliant pictures must necessarily be.

In our pictures (photographs) the highest expression of light is white paper; but as we hold the photograph in our hands compare its whitest portion with a lump of chalk or a piece of white paper lying out in the sunlight, and then again compare this latter with the glinting sunlight on the ripples of water or on the surfaces of shiny or wet leaves and grasses. Sunlight has been scientifically ascertained to be many thousands of times lighter than purest white pigment, and hence artists have come to acknowledge that it is impossible to imitate or to portray the lightness of sunlight, and must be content to use such skill as shall in some manner *suggest* what cannot be depicted.

But if we are limited in our ascent to the higher, there is no curtailment of our powers with regard to the lower tones in the light scale, and hence the safest maxim will be to represent the darks of the deepest shadows correctly, and the shades next lighter and so upwards in the scale until we reach the natural limitations, beyond which the artist is powerless to proceed. By such a method some portion of our work at least will be truthful, and with so much success we must be satisfied.

It is, however, strangely enough, in just that very part, in just those tones where the photographer may be successful, that the greatest errors have been committed. Photographs are nearly always too dark; there is not one in a thousand but which, in representing shadows out of doors, goes far too low in the scale, and so lowers the tone of the whole. If we take an average photographic print of an open landscape in summer sunshine, and compare it with a scene in nature under similar conditions, what do we find? Such portions of trees and undergrowth which chance to be in shadow are deep green or grey, brown, and blue. Hold up a black coat sleeve so as to bring it against these darker regions, and we shall find they are whole volumes lighter than black, and yet in the photograph they are represented oftentimes by the jetty blackness of a platinum deposit. The shadows under clumps of foreground plants, and tufts of grass in nature are far removed from black, which is synonymous for *total absence of light*. Nature's deepest shadows are full of light, suffused with a magic luminousness composed of many varying tones, putting to shame the solid opacity of our copies.

Except in rare cases of local colouring, there is no such thing as black in the landscape, for even a freshly painted black barn or a boat with its heavily tarred sides reflects from the surrounding objects, from the grass fields or the water, and from the sky above, so much light that it is far from black, but full of subtle gradations of greys. How then must it be with trees and hedges, shady banks and still reflections? And how is it in our photographs? We have before us a good and admired photograph, say, of a fishing boat. The dark tanned sails are so nearly black that it is hard for the black hull to come blacker, and in the eddying ripples which pursue each other in its wake there are deep reflections interspersed with hard crisp lines and spaces of an ebony hue. Is such an one a true representation of all the wonderful translucence of the sea or river, or of the strange light which is reflected on to the boat's sides, and the swelling folds of canvas sails? And worse libel

\* "The Naturalistic School of Painting." By Francis Bate. Published by W. Reeves, 185, Fleet Street, London.

is perhaps found in a picture of some corner of our favourite marsh. The hollows slowly worn in the overhanging bank, the narrow recesses in the long walls of rushes where the sunlight passes over, the tiny pools in the soft mud under the canopy of broad dock leaves, are all photographed *black*, as though the world were not filled with the sun's penetrating radiance. Mr. Francis Bate puts this very simply. He is speaking, of course, of paintings, but the lesson may be ours. He says: "It is lighter always in the open air than in the lightest room. Looking up from within a room to the window, all without is light. That is our first impression (no matter how light may be the room or how dull the day) before we realise the character of the scene we look upon. The window-sash is a frame to the scene—a picture seen through its opening—a frame as it were, suspended upon the wall of the room, and holding a picture lighter than the wall." Speaking of pictures themselves, he says: "It should seem as if through an opening in the wall one saw the scene depicted; as though one could breathe in through it the air, and the freshness of things unconfined."

We make no apology for so lengthy an excerpt, in which this important matter is so clearly put. It is this gospel of light which photographers have been so slow to accept. Composition, definition, and other kindred principles have been taken up, studied, and acted upon, but how few photographic pictures show evidence of the artist having realised and appreciated the lightness of outdoor scenes; and, alas! when some advance in this direction is made, we too often find public opinion describes it as "weak," "washy," "flat," and the like.

Now the artist's error in this matter arises no doubt from prejudice; that is, he has grown up amongst dark pictures, and has unconsciously come to consider such pictures as true, and so involuntarily imitates and falls into the traditional groove, so that what we have to do is to cultivate for ourselves a right appreciation of the value or tone of nature out of doors, and irrespective of what others may have done or what others may say make our pictures *true to our own impressions of nature*.

As has been already said, it is physically impossible to make our high lights as bright as those in nature; the means at our disposal are at fault, and we must accept the inevitable. But it will be our own blame if we have our shadows and half-tones wrong; so that it is here we should seek improvement.

Let the idea of the lightness of things be once securely established in our fancy, and it will so influence our work that we shall unconsciously modify many of our methods, and an alteration will be observable in our results.

Carry these remarks in your mind into the fields and apply them, observe for yourself, and it may be that some surprise will be experienced on finding how few and how very restricted are the portions of the scene which are any-

thing like as black or as dark as you may have imagined them, or as they are usually represented. So far then, for the present, as to the general tone of the picture; and much the same may be said of the "relative tones" of the several parts. It is not sufficient that the negative was rightly exposed, developed, and printed, because no amount of colour correction will always induce the sensitive plate to register the various parts of the scene in correct relation, and it is therefore the development, or more especially in the printing, that correction of the errors must be attempted. But the difficulty which at once arises is that unless we have previously very carefully studied the scene in nature under the precise conditions prevailing when the negative was exposed, and made a very complete mental or written record for reference, we shall not know wherein the negative errs, or what it is, if anything, that needs correction, and what the result is which the negative has failed to attain. This knowledge is to be acquired—and only to be acquired—by individual and persistent observation; keep the matter always in mind, ask yourself on every possible occasion when out of doors, whether in town or country, which is the deepest dark and which are the highest lights before you, and fill up the intermediate gradations in a general manner, and by this means the eye may become so trained that when a picture, of whatsoever character, be laid before you you will at once instinctively know whether the relative tones of the various planes are correct, and point out in what manner the faults might be remedied.

In such a subject as the present, rules, examples, instructions, illustrations are utterly

futile; it can only be understood by careful observation. In a general way darks are darker and lights lighter in proportion as they are nearer to the spectator; that is, as they approach the immediate foreground, light objects are lowered in tone, and shadows grow greyer as they recede and become further removed. But this principle is often misunderstood, and strongly contrasted blacks and whites are depended upon to give strength and nearness to the foreground. A little study of Nature, however, will show us that foregrounds are often deficient in either extremes, and that strength is as often suggested by judicious contrasting of broad half-tones as by violently opposed black and white.

We have here the accompanying reproduction of a landscape subject which is fairly successful in suggesting the gradually receding planes, but the great mass of shadow is not in the foreground, the strength of which is derived from the body of light on the water, and the contrast obtained by the darker lines of the reeds which transect it; quite fine lines are these, and not very dark, yet the transition from the light water to the darker reed stalks is greater and more sudden than found in any other adjacent objects in the picture; thus, as it were, the sum total of all

'LOWLAND SOLITUDES.'

the contrasts in the foreground would far out-weigh in volume the contrasts in the middle distance or that of the more remote distance.

Note too how often foliage or leafless trees in winter and spring come out so very darkly in our average photographs, and the consequence is that they appear nearer, closer to the eye, than the nearest foreground. The shadow of such portions is often exaggerated, but the fault may often be found from the sky which they touch, and with which they contrast, being too light, and a very strong sudden contrast is thus established; but lower the tone of the sky or introduce some heavier clouds, and the obtrusive dark trees will be found to have acquired a more distant appearance. The tone of the extreme distance and the sky which it meets are, except under special circumstances, very near to each other and an idea of remoteness is given. This brings us to the subject of skies, and clouds in their relation (as regards tone) to the landscape, and is a matter of sufficient importance to command a separate chapter.

## Catalogues.

GEO. R. TWEEDIE, of 54, Hawley Square, Margate.

This gentleman sends us his price list of lantern slides and readings for hire. The subjects are "Life and Works of Oliver Goldsmith," "Ghosts," "Witches," "Fortune Telling," etc.

VEVERS' Second-hand and Job Lot List.

Mr. C. C. Vevers, of 12, Market Street, Briggate, Leeds, sends us his October list of second-hand goods, amongst which we notice some good bargains well worth attention.

SUPPLEMENTARY LIST OF OPTICAL LANTERN SLIDES.

MR. ALFRED UNDERHILL, of 32, Clarendon Road, W. Croydon, has sent us the above, which includes some new and interesting sets, such as "The Life and Work of the late C. H. Spurgeon," "Life in the British Army," "P. and O. Pencillings," etc. Mr. Underhill also goes in for designing, drawing, and colouring lantern slides of all descriptions.

MR. ANDREW H. BAIRD, of 15, Lothian Street, Edinburgh, has some lantern specialities which are of great interest and usefulness. Looking through his lantern catalogue we note he stocks lanterns and lantern requisites of all kinds. A wall-map pattern screen on roller and lath, which has one side white and the other black will commend itself not only to lanternists but physicists also. Another useful idea of Mr. Baird is that of supplying very fine ground-glass which may be drawn on with ordinary pen or pencil, and can then be rendered transparent. Special slide colours in collapsible tubes and neat tin box are also catalogued, and the "improved" combined mask and binder will save many a lot of trouble. The Lothian etching plates are also prepared in blue or brown in lantern size, and are coated with a medium which can easily be scraped off with a sharp point, leaving clear white lines on the coloured ground.

MR. W. C. HUGHES, of 82, Mortimer Road, Kingsland Road, has edited a new catalogue of 140 pages, well printed and illustrated, and which contains novelties and requisites of all kinds for the lantern season. The simplest and the most elaborate lanterns are to be found from the humble single iron at 27s. 6d. to the stately three-decker at £100. Slides of every description, stands, screens, etc., are all to be found priced and illustrated.

Warrington. —The usual monthly meeting was held on 25th ult, there being a large number of members present. Mr. H. N. Houghton gave a practical demonstration on "Negative Enlarging." Two examples were given, viz, from 3½ by 3½ to 10 by 8, with excellent results. He also demonstrated lantern-slide making developed with "Amidol." Mr. Wm. Lawson, of Newton-le-Willows, also introduced to the meeting his improved limelight saturator made to fit into any lantern; it certainly excels the ordinary blow-through jet, yielding a beautiful steady light, and apart from the advantages in the lantern it would make a splendid outside illumination for business purposes. The following gentlemen were elected members of the Society: Mr. Vernon, Mr. David Stone, and Captain Molyneux Seel.

## Working with Spectacle Lenses.

Now that Mr. J. E. Austin has been so successful with his portraits taken with a spectacle lens, doubtless many of our readers will be anxious to try the same, and for their benefit we translate two papers which have lately appeared in the *Photographische Rundschau*, the organ of the Club der Amateur Photographen in Wien, which is one of the most influential clubs in the world, and possibly possesses the best journal.

Professor Hans Watzek says that for our work the monacle (as he calls it) is a circular convex eye-glass of about 4 cm. (= 1½ in.) diameter. The monacle has, like all uncorrected lenses, two foci—the one the visual, that is, the focus for the brilliant (yellow) rays; and the chemical, which is the focus of the actinic (violet) rays. With the eye we focus the sharp image on the ground-glass always at the visual focus; a dry plate only gives a sharp negative when the image has been focussed for the chemical focus. The distance of the visual to the chemical focus is called the difference of focus.

If it is desired to obtain as sharp a negative as possible with the monacle, one has to focus the image on the ground-glass very sharp, and then rack the dark-slide in towards the lens to the amount of the difference of foci. The difference of focus in the convex glasses used amounted to ½ cm. (= ½ in.) with a camera extension of 5 cm. (= 2 in.), ¾ cm. (= ¾ in.), with 10 cm. (= 4 in.), ¾ for 15 cm., and so on; thus in every case ¼ of the camera extension.

The monacle only gives an image of such a degree of sharpness as corresponds with ordinary requirements when stopped down to *f*/20. With sunlit landscapes the stopping down may be as far as *f*/100. The more a monacle is stopped down the greater is the sharpness of definition, but it never attains that of achromatised lenses. If the diameter of the stop is 1 mm. or under, the image suffered in sharpness by the appearance of the phenomenon of interference. Landscapes which were prepared in this way were very much like those made with a pinhole, but were not so fuzzy.

If the distance of any object from the lens is 100 times the focus of the lens, the ground-glass must be placed at the focus of the lens, and the image is 1-100th of the natural size. If the size of the image is the same as the object, then the distance between the lens and object and the lens and ground-glass are equal, and this distance is double the focus of lens. In fact, the ordinary law which applies to corrected lenses applies to the monacle. The time of exposure is dependent, all other things being equal, entirely upon the *f*/*w* ratio of the diaphragm. Heads of one-third natural size were taken with a monacle of 20 cm. (= 8 ins) focus, and 6 mm., = *f*/33, aperture, in diffused daylight, in 2 seconds.

In order to reduce the time of exposure as much as possible, the most sensitive plates were pre-exposed under eight thicknesses of tissue paper in the camera for the same time as the real exposure, and the time of exposure thus reduced to one-third. Technically, excellent results have been obtained of life and three-quarter life size with a monacle of 150 c.cm. (= 59 in.) with a relative aperture of *f*/40.

Prof. Watzek's paper is necessarily condensed, but the above forms the leading and most instructive features in it.

Herr Anton M. Haschek, who we regret to note died on September 9th at the early age of twenty-five, contributed the following paper upon the non-coincidence of foci, which is valuable and useful to those desiring to work with a spectacle lens.

The simple formula for the focus of a lens is:

$$\frac{1}{f} = (n - 1) \left( \frac{1}{r_1} - \frac{1}{r_2} \right),$$

in which

*f* = the focus.

*r*<sub>1</sub>, *r*<sub>2</sub>, the radii of curvative of the lenses in the direction of the incident rays.

*n* = the refractive co-efficient of the glass from which the lens is made.

White daylight is, however, as is well known, composed of coloured lights, into which it can be decomposed by the aid of a prism. By this means a solar spectrum is formed with the colours red, orange, yellow, green, indigo, and violet, of which the first are distinguished by their intensity to the eye, and the later for their chemical activity. The cause of the decomposition of white light is the different refraction of the colours as they pass through glass. Every colour has its own particular co-efficient of refraction. In photography this circumstance is particularly noticeable in an unpleasant manner. For whilst we focus with the visually active colours, red, yellow, and green, the blue and violet rays, which are scarcely recognised by the eye, act much more energetically upon the plate, and produce, as is generally known, a very troublesome indistinctness.

Briefly summarising the above, we arrive at the following conclusions:—The chemically active rays have a higher index of refraction than the visual. If we assign, therefore, in the above

formula a greater value for  $n$ , we obtain for convex lenses a smaller value for  $f$ . Thus the chemical focus lies nearer the objective than the visual focus. In order to obtain a sharp image, therefore, when using a simple lens, rack in the focussing screen about this amount towards the objective.

In order to estimate this amount, we will call  $ng$  the index of refraction for yellow and  $nv$  that for violet light. By this we obtain as the focus for yellow light  $fg$ .

$$\frac{1}{fg} = (ng - 1) \left( \frac{1}{r_1} - \frac{1}{r_2} \right)$$

or

$$fg = \frac{1}{4ng - 1} \cdot \frac{r_1 r_2}{r_2 - r_1}$$

and for violet light  $fv$

$$fv = \frac{1}{4nv - 1} \cdot \frac{r_1 r_2}{r_2 - r_1}$$

The difference of focus is estimated by subtraction of the two equations:—

$$fg - fv = \left( \frac{1}{4ng - 1} - \frac{1}{4nv - 1} \right) \frac{r_1 r_2}{r_2 - r_1} = \frac{nv - ng}{(ng - 1)(nv - 1)} \cdot \frac{r_1 r_2}{r_2 - r_1}$$

We can bring these values into a simpler form if we arrange the formula as follows:—

$$fg - fv = \frac{nv - ng}{nv - 1} \cdot \frac{1}{ng - 1} \cdot \frac{r_1 r_2}{r_2 - r_1}$$

and fo:

$$\frac{1}{ng - 1} \cdot \frac{r_1 r_2}{r_2 - r_1}$$

introduce the value of  $fg$ , found above. By this means the equation becomes:—

$$fg - fv = \frac{nv - ng}{nv - 1} \cdot fg$$

We may replace the value  $\frac{nv - ng}{nv - 1}$  without introducing any seri-

ous error by  $\frac{\Delta n}{n - 1}$ , the expression of the dispersion used, by which means the reckoning is much simplified. Roughly the value for—

$$\frac{\Delta n}{n - 1} = 0.02.$$

Therefore the difference of foci, which we will designate by  $\Delta f$ , is estimated by the equation,

$$\Delta f = f \cdot 0.02.$$

We thus obtain very simply for ordinary landscape work, with satisfactory accuracy, the difference of foci, if we focus by the visual rays, measure the distance between the lens and focussing-screen, and multiply this by 0.02. Thus for a lens of 100 mm. (=4 in.) the difference of foci is 100.0.02 mm.=2 m. ( $\frac{1}{2}$  in.), for a lens of 250 mm. (=10 in.), 250.0.02=5 mm. ( $\frac{1}{4}$  in.), and so on.

The formula thus obtained for the estimation of the difference of foci only applies, however, when the object is at infinity or a great distance, as in landscape work. The question which now naturally occurs is what is the ratio of the difference of foci to the equivalent focus when we have lengthened the working focus considerably, as, for instance, in portraiture, such as lately the monacle has been used for?

In order to clear up this relation we utilise the formula:—

$$\frac{1}{g} + \frac{1}{b} = \frac{1}{f}$$

In which the size of the object  $g$  may be considered constant, and reckon the focus  $f$  the size of image  $b$  for yellow and blue rays. We thus find that if we distinguish the ratio for yellow by the index  $g$ , and that for blue by  $b$ :—

$$\text{For yellow rays, } \frac{1}{g} + \frac{1}{b_g} = \frac{1}{fg}$$

$$\text{For blue rays, } \frac{1}{g} + \frac{1}{b_b} = \frac{1}{fb}$$

and from this by subtraction,

$$\frac{1}{b_g} - \frac{1}{b_b} = \frac{1}{fg} - \frac{1}{fb}, \text{ or } \frac{b_b - b_g}{b_g \cdot b_b} = \frac{f_b - f_g}{f_g \cdot f_b}$$

in this formula we may replace the products  $b_g = b_b$  by  $b^2$ , and  $f_g f_b$  by  $f^2$ .  $b_b - b_g$  is the difference of foci with an object at a great distance, and according to the foregoing calculations it =  $f \cdot 0.02$ ,

$b_g - b_b$  is the difference of foci, which we distinguish by  $\Delta b$ . We find the same therefore expressed by the formula:—

$$\Delta b = \frac{b^2 \cdot 0.02}{f^2} = \frac{b^2 \cdot 0.02}{f}$$

We see from this that the difference of foci when working at close quarters is directly proportional to the square of the size of the image, and inversely to the focus. Since, however, in this instance the calculation is considerably more difficult, it is preferable to use the following table of the difference of foci with various distances between lens and focussing screen.

This contains the foci  $f$  from 100 to 1,000 mm. (4 in. to 39½ in.), and under each one the corresponding difference of foci exact to  $\frac{1}{10}$  mm. In the horizontal rows is given the proportion between the image and object from  $\frac{1}{10}$  to  $\frac{1}{10}$ , and underneath the corresponding difference of foci. Thus one finds with a monacle of 250 mm. (=10 in.) with an extension of camera of 400 mm. (=15½ in.) [proportion of image to object as 6 : 10] the difference of foci = 12.8 mm. (=½ in.). A lens of 1 metre (=39½ in.) has when taking objects life size (proportion of image to object 10 : 10) a difference of foci of 80.0 mm. (=3½ in.). In taking portraits of half life size (proportion of image to object 5 : 10) the extension of camera is 1,500 mm. (=57½ in.), the difference of focus is 45 mm. (=1½ in.).

In order to test practically also the accuracy of the calculations, a number of concave convex, or so-called periscopic lenses were placed in the mount of a landscape lens, and reproductions were made without correction and with correction of varying amount. As the object a line drawing with black lines on white ground was chosen. As the smallest diaphragm a diameter of 5 mm. was chosen. The negatives taken with the correction made showed an unexpected sharpness.

As a second test, portraits measuring 40 × 50 cm. (=16 × 20 in.) of  $\frac{3}{4}$  natural size were made with a lens of 650 mm. (=25½ in.). As with this, however, too much light was lost, the diaphragm was removed altogether, the exposure made with full aperture, by which means the time of exposure was reduced to  $\frac{1}{2}$  of that with a diaphragm. These negatives also showed a good and equal sharpness over the whole of the picture. Very excellent is, however, the softness and modulation, and even it may be said that it could not be obtained with the best portrait lenses. It is worth anyone's while to try this experiment, not only on account of the fine results, but also on account of the moderate outlay for the lenses, of which any amateur can buy a dozen or so.

TABLE SHOWING THE CORRECTION FOR ACTINIC FOCI WITH MONOCLES OR SPECTACLE LENSES.

# ADAMS & CO.'S 1892 ANNUAL NOW READY.

Circulates over the whole world, contains particulars of dozens of absolute novelties, and is the most complete record of photographic progress ever published. Produced at a cost of Two SHILLINGS per copy. PRICE SIXPENCE. Post free, ONE SHILLING. 400 pages and 500 illustrations.

## ADAMS & CO.'S CLUB ALBUM.

Prints removed and re arranged at will. No mounting required. Perfect for emulsion papers, as they keep their surface. Handsomely and strongly bound, with gold edges. No. 1, for 48  $\frac{1}{2}$  plate prints, one on page, 3s. 6d., post free 3s. 10d. No. 2 takes 96, two on a page, 5/6, postage 6d. No. 3 takes 192, four on a page, 10/6, postage 9d. No. 4 takes 48 5 by 4 prints, one on a page, 4s. 6d., postage 6d. No. 5 takes 48  $\frac{1}{2}$  plates, one on a page, 5s. 6d., postage 6d. No. 6 takes 48 1/1 plates, one on a page, 10s. 6d., postage 9d. All prices Net.

## ADAMS & CO.'S 'ADJUSTABLE' SHUTTER.

NO FITTING REQUIRED.

A  $\frac{1}{2}$ -pl. fits any  $\frac{1}{2}$ -pl. Lens; a  $\frac{1}{4}$ -pl. any  $\frac{1}{4}$ -pl., and so on. Extremely small and light, works at set speed from  $\frac{1}{4}$  to 1/100 of a second; also time exposure. Gives the necessary extra exposure to foreground. One of the best and simplest of Shutters, as well as cheapest.

## THE 'IDEAL' HAND CAMERA

Has repeated the phenomenal success of 1891, and the Photography Competition just decided again proves 'IDEAL' FIRST, OTHERS NOWHERE. Fifteen 'Ideals' and one 'Adams' carry off the prizes.

It is the ONLY Automatic Camera that is entirely free from complications, and the ONLY one that CANNOT get out of order. Every Camera is GUARANTEED.

No. 1. Fixed Focus, best Rectilinear Lens	...	...	...	£7 net.
No. 2. Made to Focus, with WRAY Lens	...	...	...	£8 10s. net.

## The 'Adams' Changing Box.

Holds 12 plates, and can be fitted to any Camera. Full particulars in 1892 Annual.  $\frac{1}{2}$ , 5 by 4, and  $\frac{1}{2}$  plate. NOW READY. Takes either plates or films.

## ADAMS & CO.'S REGISTERED LANTERN SLIDE FRAME

Register No. 163,571.

Takes any size up to 1/1 plate.

By using this any part of a negative may be selected, even the extreme corners; and, should any part of the picture be out of upright, it can at once be adjusted, and the lantern plate cannot slip or get scratched.

Price 3s. 6d., postage 6d.  $\frac{1}{2}$  and  $\frac{1}{4}$  carriers, 6d. the two.

## ADAMS & CO.'S 'VESTA' Pocket Camera

A folding Hand Camera for  $\frac{1}{2}$  by  $\frac{3}{4}$  plates that may be carried in the pocket. Complete with Dark Slide, Lens, Shutter, Focussing Screen, and Reversible Finder. WRAY Lens, Pneumatic Shutter, properly timed, and Swing Back for upright pictures. Only  $\frac{1}{2}$  in. thick, and ONLY WEIGHS 1 lb. WITH Double Dark Slide and two Plates. Must be seen to be believed. One of our many great photographic triumphs.

Complete, in case with 3 Double Backs ... .. £7 7s. net.

## ADAMS & CO.'S NEW OPAQUE LANTERN SCREEN

A new Screen of stout linen, with beautifully even surface and QUITE OPAQUE. Can be fixed to any wall in a moment, and is complete with rollers, cords and pulleys for raising and lowering.

Prices—6 by 6, 20s.; 7 by 7, 23s.; 8 by 8, 28s.; 9 by 9, 35s.; 10 by 10, 45s.; 12 by 12, 65s.; 15 by 15, 110s.

# **Christmas Mounts.**

JUST PUBLISHED,

Our New Series of **50** Endless Variety for  
Mounts, giving all kinds of Prints.

IN THIS SERIES MOUNTS WILL BE FOUND SUITABLE FOR PLATINOTYPES,  
BROMIDES, GELATINE-CHLORIDE, AND SILVER PRINTS.

No. 21 Box.—Containing the complete variety of Christmas Photo Mounts from Midget to  $\frac{1}{2}$ -Plates.  
Price 7/6, Postage 6d. extra.

No. 22 Box.—15 Selected Christmas Mounts, all different, for  $\frac{1}{4}$ -Plates only. Price 2/-, Postage  
3d. extra.

No. 23 Box.—12 Selected Christmas Mounts, all different, for Cabinets and  $\frac{1}{2}$ -Plates. Price 2/-,  
Postage 3d. extra.

New List of Christmas Mounts, just published, sent Post Free.

**Special Mounts for Gelatine - Chloride Prints.**  
**NEW DEPARTMENT—CUT-OUT MOUNTS TO ORDER.**

We keep the Largest and Best Selected Stock of LATEST MOUNTS in the Market.

Our New Illustrated Catalogue of Mounts Post Free. All our Goods can be had through respectable Chemists and Photo Dealers at prices  
stated therein, and when compared will be found lower than any others in the Trade.

ENGLISH MEASURES.

[illegible]

In the above tables  $f$  = the solar focus.  
 $\Delta f$  = the correction for actinic rays.

We have given here the metric table and the English equivalents, and with regard to the latter we may point out that some of the fractions for the correction are absurd, because in practice one could not measure such distances, but one may always strike a fraction which will without appreciable error be accurate enough. Let us take as an example the fifth series, viz., a lens of  $11\frac{1}{8}$  in. solar focus; and carrying our eye along the line we find that when focussing an object so that the image is  $\frac{1}{5}$  of the natural size, the focus is lengthened to  $15\frac{1}{8}$  in., and the necessary corrections for the actinic focus, or the distance that the lens has to be racked in towards the plate, is  $\frac{1}{8}$  in.; well, this is a fraction which none of us are likely to measure in practice, but if we say that the correction is  $\frac{1}{8}$  in. =  $\frac{1}{16}$  of an inch, we can measure that, and we shall only be  $\frac{1}{16}$  of an inch in error, a distance which will not make much difference one way or the other.

SOUTHPORT SOCIAL PHOTOGRAPHIC CLUB SOIREE AND  
EXHIBITION.

THE second annual soiree was held on the 26th ult., when there was a very good muster of members and friends. Mr. R. J. Parkes, the President, commenced the proceedings with an address, in the course of which he reviewed the progress of the club since its formation, and alluded to its present satisfactory condition. Mr. George Cross then, by means of his limelight lantern, exhibited a number of slides which had been sent for competition, and a few others lent by Mr. Heaton and Mr. Kiddie.

The President, in a eulogistic speech, presented Mr. Cross, on behalf of the members, with an illuminated address and a very handsome book-case in celebration of his recent marriage, and in recognition of his services to the club during the present year. Mr. Cross suitably thanked the members. Messrs. Kay, Longmaid, and Thorp, who were the judges at the exhibition of the club, were cordially thanked for their most efficient services, and Mr. Kay, in replying on their behalf, complimented the members on the general excellence of the work sent in.

Refreshments were provided during the evening, and a number of lantern and stereoscopic and photographic views were on view and attracted considerable attention, having been lent for the occasion by Messrs. Cave, Dickin, and Heaton. Songs and recitations were given by Miss Wale, Miss Wilson, Miss Krause, Mr. Parker, and Mr. Depree, Mr. Arnold Cooke being the accompanist.

The annual exhibition of the club was held in Mr. Cross's Rooms, 156, Abchurch Lane, from October 24th to 29th inclusive, when the following were the successful competitors:—

Lantern transparencies, set of twelve, any subject: First prize, Mr. Heaton; second prize, Mr. Atherton; certificate, Mr. J. C. Smith.

Landscapes, set of four, any size: Prize, Mr. Dickin; certificate, Mr. Heaton.

Portraits, untouched, set of four, any size: Prize, Miss Unsworth; certificate, Mr. Smith.

Animals, set of four, any size : Prize, Miss Unsworth ; certificate, Miss Dunmore.

Instantaneous, 5 by 4 and under, set of six: Prize, Mr. Heaton; certificate, Mr. Thorp.

Decorative transparencies, half-plate and over, set of two: Prize, presented by Mr. J. R. Cave, Mr. Dickin.

Competition, for ladies only, set of four pictures, any size or subject: First prize, Miss Smith; second prize, Miss Dunmore.

Best exhibit (transparencies and enlargements excepted): Special prize, presented by Mr. Cross, Mr. Heaton.

Best set of six pictures, any size or subject, taken at the outdoor meetings of the club during the summer 1892: Special prize, presented by the President Mr. R. J. Parkes, Mr. Atherton.

## Reviews.

*The Art Annual for 1892: Prof. Hubert Herkomer, R.A., his Life and Work.* By W. L. Courtney. Published by J. S. Virtue and Co., Ltd., 26, Ivy Lane, Paternoster Row, E.C. Price 2s. 6d.

This work, which forms the annual of the *Magazine of Art*, is always looked for and eagerly welcomed, and the one before us does not fail to come up to those which have preceded it. Professor Herkomer is without doubt the most versatile of all our Royal Academicians, and his life and work given here is at once both interesting and instructive. Graduating in the school of Frederick Walker, he has long struck out a distinct masterly style of his own, and now stands in a position possibly attained by no other artist. He is at once an etcher, a mezzotint engraver, a carver, a worker in iron, a master in oil and water colours, and also a playwright, actor, and musician. Besides these he is the head of the famous Bushey School of Art, and no one but those who had the privilege of seeing the works exhibited by him and his students at the Fine Art Society's Gallery in New Bond Street can appreciate the excellent work done at his school.

It is interesting to note that Professor Herkomer—and we state this on very good authority—recommends the use of the camera obscura for the purpose of learning correctness of colouring.

The story of Herkimer's life and work, written by W. L. Courtney for this book under review, is evidently written by someone who knows both the artist and the artist's work well, and the illustrations in the book are exceptionally fine, particularly the original etching by the artist called "Summer." The book is well worth buying.

## Hints on Posing.

At a recent meeting of the Foochow Camera Club, the following concise and useful hints were given by Mr. Rentzsch :

"The first thing to consider is the background. Trees, as far as possible, should be avoided; the light falling on the leaves causes white spots in the picture, producing a very disagreeable effect. A light-coloured wall is as good as anything, or, better still, the front of a house; only then the group should be placed well in front of it, so that the building may be slightly out of focus, and not by its detail detract from the figures, which, be it remembered, should be portraits.

"The members of the group should be cautioned on no account to look higher than the top of the camera, and those on the right and left should look at it, not with the eyes only, but by slightly turning the head.

"As far as it possibly can be avoided, do not have two heads next to one another on the same level, and do not have two ladies in light-coloured dress one besides the other; separate them by some one in the dark clothes.

"Arrange the group so that tall persons are in the middle and short persons at each end, and in the case of ladies wearing white dresses or colours which are white to the photographic eye, place them in the front row.

"The professional photographer frequently says, 'Please put on the beginning of a smile,' but as this usually results in a complete grin, and, in some cases, even a grimace, it seems to me far better to tell people to lightly close the lips, for nothing looks worse than to see a lot of people with their mouths half open in a semi-slobbering condition.

"It is impossible in a short paper like this to enter into the deeper portion of the subject regarding the balance of the picture and so on, but if the foregoing rules are remembered, there may be some hope that the average group taken in Foochow will be somewhat improved.

"The preceding rules may be summarised as follows :—

"No trees in the background.

"No looking higher than the top of the camera.

"No two adjoining heads on the same level.

"And no mouths open."

## Notes on the Permanency of Gelatino-Chloride Prints.

BY WALTER E. WOODBURY.

THE use of gelatino-chloride papers has now become so general, especially amongst amateurs, that it would not, I feel certain, be out of place to turn our attention to the probable permanency of prints made upon them. As one who has worked with this class of paper long before it was first placed upon the market in Germany, and as the first introducer of the process commercially in this country, I can claim to discuss the matter upon a practical basis. The matter interested me from the very first, and I have had the advantage of time to assist me in my experiments in this direction. My opinion is that *under certain conditions* gelatino-chloride prints are as reasonably permanent as could be expected, far more so than albumen pictures. I have gelatine prints by me now that have been made seven years. Some are as perfect as the day they were made, others are hopelessly faded. To begin with, then, it is well known that the albumenate of silver formed in albumen paper is an exceedingly unstable salt, and one of the chief causes of fading. In gelatino-chloride paper this is done away with, and silver citrate or acetate substituted. It is in the manipulation, however, that so much lies. In toning, for instance, prints toned with certain baths are not likely to be so permanent as others. In my experiments I have found those containing the most gold to last the longest, so that it is to be seen that economy in this respect is by no means advisable if lasting results are to be desired. Only recently I was shown an album of gelatino-chloride prints, every one either yellow or brown. They were toned and fixed together in a combined bath. Here I consider lies one of the chief causes of fading, not in the use of this kind of bath, be it understood, but in the misuse of it. I have prints toned and fixed with Liesegang's combined bath five years ago that are perfect to-day. But, as I have already said, it is in the misuse of this bath where disaster arises. The toning and fixing actions do not always work together; thus it happens that a print is removed because it is toned to the required colour, but no thought is given as to whether it has remained in the solution sufficiently long for the hyposulphite to complete its action, and this, as it will be seen later on, is

a very important consideration. Then, again, with these combined baths, when the toning action is weak, more gold is added, but the addition of more fixing salt is usually forgotten. It is to be regretted that fixation is practically invisible, as in insufficient fixing lies the chief cause of fading. Most of the emulsions used are hardened with alum, and fixing is a much slower action than with albumen prints. I should recommend a bath not weaker than 3 oz. to 20 of water. Fix in this for fifteen minutes, and then remove to a fresh bath of the same proportions, and allow the prints to remain therein for ten minutes or so to dissolve the otherwise insoluble hyposulphite of silver. This may be said to be the only natural method of fixation, although very little used. Nevertheless I am convinced that if permanency is desirable this matter will tend very largely to secure it. We next come to the washing and freeing from hypo. A lot of twaddle has been written about the necessity of washing out all the hypo, this being the one and only cause of fading. It is not so, however. Of course, it is desirable to thoroughly remove all traces of the fixing salt, but after this *the longer gelatino-chloride of silver prints are washed the less permanent are they.* This may appear a startling statement to some, but it is nevertheless a true one. An hour in several complete changes of water serves to eliminate the hypo, and the prints should not be left in any longer, as the risk of decomposition of the gelatine setting in, and once the germs are laid the process continues afterwards, and it may be but a question of weeks before a marked change is discovered in the print. In mounting it need hardly be pointed out that an inferior mountant or bad quality boards will have a disastrous effect. The last point to be considered, however, is the keeping. Gelatine is peculiarly sensible to moisture, and if it is allowed to act upon it, decomposition rapidly sets in. Gelatine dry will keep for years, but moisten it, and it goes bad in a few hours. The advisability, therefore, of keeping the prints in a dry atmosphere cannot be too strongly pointed out.

From these remarks the conclusion we must arrive at is, that gelatino-chloride prints may be considered permanent (giving a reasonable interpretation of the word), provided that proper precautions be taken in their manufacture. These are—Gold should not be stinted in toning. The prints should be thoroughly fixed in two fixing solutions. The hypo should be freed by washing in several changes of water, and not by long immersion tending to decompose the gelatine. Pure mounts and mountant should be used. Lastly, reasonable precautions should be taken to protect the film from foreign action, particularly that of moisture.

## Societies' Notes.

THE BORDER AMATEUR PHOTOGRAPHIC ASSOCIATION.—Patroness, Lady Gibson Carmichael; Hon. President, Mr. George H. Gibson Carmichael; President, Rev. W. Burnet Thomson, M.A., B.D.; Vice-President, Mr. F. A. Blair, F.C.S.; Hon. Secretary and Treasurer, Mr. Jas. Walker, 50, High Street, Galashiels; Council, Messrs. Henry Fleming, Jas. Lewis, Robert Stewart, and John Wishart. This association has been formed for the purpose of meeting the needs of amateur photographers, by bringing together those interested in the subject, providing them with a common meeting-place, and promoting the study and practice of the art by meetings, discussions, excursions, and exhibitions. The work of the society will during the winter months be carried on by a monthly meeting on the first Friday of each month at 7.30 p.m. At this meeting papers will be read, discussions entered upon, and demonstrations given by members on subjects of interest, and especially on those likely to be of help to beginners. In addition part of each night will be set apart for question and discussion, by means of which the experience of the various members will be brought out. It is expected that during the season several evenings will be devoted to lantern lectures and the exhibition of the prize slides sent out by the photographic journals to societies on loan. As a meeting-place the society has been able to secure the studio belonging to Mr. Sanderson, High Street, which will be at the disposal of members every weekday at all hours. The studio contains a dark-room, enlarging apparatus, studio camera, backgrounds, etc., and ought to be of service to those whose home accommodation is limited or who desire to study portraiture. A considerable number have already joined, and Mr. Walker, 50, High Street, Galashiels, will be glad to enrol others. The subscription is 5s., and for apprentices 3s. 6d. per annum. The first meeting will be held on Friday, 4th inst., at 7.30 p.m., in the studio, when the President will deliver an opening address on "The History and Progress of Photography," after which a discussion on development will take place.

It is proposed to form a society in Scarborough. Mr. N. Todd is the Hon. Secretary *pro tem*.

THE following are the newly-elected officers of the Uttoxeter Amateur Photographic Association: President, the Rev. F. C. L. Barnwell; Treasurer, Mr. R. T. A. Hardy; Committee, the Rev. F. C. L. Barnwell, Messrs. R. T. A. Hardy, A. Parker, F. Udale, S. B. Bamford, G. C. Wallis; Hon. Secretary, R. T. Walker, Balance Street, Uttoxeter.

**CORNISH CAMERA CLUB.**—The annual supper and meeting of this club took place on the 24th ult. at the Union Hotel, Penzance. The following officers were re-elected: President, W. E. Baily, C.O.; Vice-President, B. Vivian. Council, N. H. Symons, Barnes, Richards, R. Pearce Couch, J. Branwell, jun.; Hon. Treasurer, W. Herbert Percy; Hon. Secretary, H. Tonkin.

THE annual exhibition of the Glasgow and West of Scotland Amateur Photographic Association was opened in the rooms on 24th ult., remaining open till 7th November. Owing to the special effort put forth in connection with the international exhibition last year, the number of exhibits is smaller than usual. This was anticipated, and the number of classes was reduced. The following is a list of awards:—Landscape: 1st prize, silver medal, John Morrison, jun.; extra silver medal, John W. Eadie; 2nd prize, bronze medal, Adam G. Brown. Instantaneous: 1st, W. Snell Anderson; 2nd, A. Lindsay Miller. Portraiture and figure studies: 1st, A. G. Reid; 2nd, John W. Eadie. Enlargements: 1st, Archd. Watson; 2nd, Stewart Smith. Transparencies: 1st, Archd. Watson; 2nd, A. Lindsay Miller.

THE Hackney Society should have a really good show, for from what we learn the following will compete, among a good lot:—Messrs. A. R. Dresser, Lyddell Sawyer, Mr. and Mrs. Welford, J. E. Austin, W. W. Winter, Bryne of Richmond, Post of America, Warneke, Gottlieb, Adam Diston, etc. In addition to those announced in the apparatus section will be the following: Adams, Marions, Paget, Wray, Platinotype, Wormald, Park, Platte, Watson, Lund, Hannam, etc., etc.

AT a meeting of photographers held on Friday last at Burlington Hall, High Street, Aston, it was decided to establish a photographic society for Aston and district. Mr. Councillor Sydney Fisher presided, and spoke of the desirability of forming a means of social and mutual intercourse between those who practise the "dark art." There were also present Messrs. Tylar, Cracroft, Wollaston, Priddin, Casson, Cole, Wimwood, Dent, and other gentlemen. Among resolutions passed were the following:—"That a photographic society be formed; that it admit amateurs and professionals; that it meet fortnightly; that it meet at Burlington Hall; that we approach the Aston Natural History and Micro Society with a view to affiliating the Photographic Society with theirs, but taking alternate Thursdays for our separate meetings." The meeting was then adjourned until Thursday, 10th inst., to decide upon future business then. Twenty members actually joined. Fee, 5s. per annum, or 2s. 6d. half-yearly, payable in advance. Communications to Fred W. Pilditch, Acting Secretary *pro tem.*, 133, Wells Street, Aston.

THE Oldham Photographic Society are able to show this year a very satisfactory account of their working programme during the last twelve months. They have now an excellent limelight lantern, and the nucleus of a library. The following are the members elected to the various offices at last meeting:—President, John Chadwick; Vice-President, Wallace Thompson; Treasurer, William Schofield; Committee, S. Ashton, J. Dawson, J. S. Dronsfield, J. P., J. Greaves, jun., T. Heywood, W. Jackson; Librarian, Thomas Birch; Hon. Secretary, Thomas Widdop, 16, Burnaby Street, Oldham; Assistant Secretary, J. Hilton Ashton, 114, Shawside, near Oldham.

AT the ordinary meeting of the P. S. G. B. at Pall Mall on the 8th inst., the President, Captain Abney, will deliver an address and present the medals, and Mr. Howard Farmer will read a paper on "Some Remarkable Properties of Silver and Gelatine."

THE attendance at Pall Mall still keeps up. Last week there were 1,213 visitors, making a total of 7,490 since the opening. We hear that the lantern evenings especially have increased in popularity, and, with the exception of 1889, this year's exhibition heads the list up to the present.

OUR readers are requested to note that Mr. Harry Pritchard, 162, Oxford Lane, Warrington, is the Hon. Sec. of the Warrington Am: Phot: Soc;

## Societies' Meetings.

**Cardiff Photographic Society.**—The winter session was inaugurated on the 28th ult., with a lecture by Mr. F. Treharne. The lecturer gave his experiences of "A Trip to South Africa," and illustrated his remarks by some capital lantern slides. The different industries of gold mining, ostrich farming, and diamond finding were dealt with in a graphic manner, and the statistics referring to the staple products of the colony, proved most instructive. Mr. Faulks ably manipulated the limelight.

**Croydon (Camera Club).**—31st ult., Mr. Maclean in the chair. Messrs. Diamond and J. B. Hartlewell were elected members. In consequence of a failure in the gas supply, it was impossible to show members' slides, as intended. It was, however, arranged to do so on Wednesday, November 2nd, instead. Mr. C. E. Whitaker exhibited a large number of views of good quality, and Mr. Bray a striking example of picture-making, entitled "The Hay-nest." On Friday, November 4th, Mr. Robinson's slides will be shown at Braithwaite Hall, and on Monday, November 7th, Mr. Charles Hussey will read a paper on stereoscopic photography at the club rooms.

**Davenport (Camera Club).**—The session opened with a lantern evening, the views being supplied mostly from work of the members, and thrown on the screen by one of the Vice-Presidents, Mr. E. J. Seymour, whose fine lantern was used for the purpose. The collection was a good one, and the quality was of considerable merit. Several new members were nominated and a number of visitors were present. A special evening was devoted to viewing the hand-camera prints (1892). The club will for the future hold its meetings at rooms in Granby Buildings, being more commodious than those formerly used.

**Fairfield.**—This club held its first fortnightly meeting for the season on the 25th ult., when, in the absence of the President, Mr. R. J. Sutherland was voted to the chair, the subject for the evening being a practical demonstration on bromide paper by Mr. J. W. Welch, who treated the whole subject in his usual interesting and amusing style, but giving full details, and showing how to manipulate the paper in such a style that the merest tryo could follow. During the evening an ingenious contrivance, the invention of one of the members, was exhibited, whereby stereo pictures could be taken with a single camera.

**Glasgow High School.**—The society met on the 28th ult., Mr. McCall in the chair. There was a large attendance of members. The subject of the evening was an address by Mr. Haddow, on "Amateur Photography." He treated his subject in an exceptionally skilful manner. First, he touched briefly on the history of photography, and afterwards gave a very humorous account of a beginner's difficulties.

**Harlesden and Willesden.**—A meeting was held on 25th ult., J. Naylor in the chair. After the usual business of the Society, election of new members, etc., Mr. Woodbury gave a demonstration on gelatino-chloride printing processes. The Secretary handed round some samples of the new Paget Prize lantern plates kindly sent by the Company, and instructed the members in the methods of making lantern-slides by contact and reduction. The next meeting on the 22nd inst., will be a lantern evening.

**Hackney.**—Weekly meeting held on 25th ult., Mr. F. Houghton presiding. Mr. R. J. Fry was nominated for membership. Mr. Gosling asked for experience of gelatino-chloride paper. The Chairman was rather in favour of over-printing and long toning. Mr. Beckett said plenty of gold should be used. A discussion then ensued on the new platinum paper. Mr. Grant found it required more printing than the hot bath. Mr. Gosling asked for a better mountant than starch for P.O.P. prints. Mr. Barker advised Houghton's "Excelsior" as being always ready for use. Mr. P. Beckett then proceeded to give a demonstration on "Flashlight Photography." He did not recommend such explosives as chlorate potash, etc., as they were apt to cause the sitter to start. Portraiture was not eminently adapted for flashlight. It did not come near electric light. For interiors, such as churches, it was quite at home, so to speak, and for caves and subterranean matters invaluable. Its defects were that it was apt to cause people to blink their eyes, another was getting rid of the smoke, and again there were generally unburnt particles flying about which would grind into carpets, etc. Demonstrations were then given, and the lecturer showed the way of placing lamps, using two pairs of steps, reflectors, etc. The lights must be placed so that there was softness in the shadows and reflections in the eyes avoided. Mr. Dando had seen good pictures obtained by using platinotype lamp. Mr. Hudson showed his flash lamp (continuous). He used magnesium powder, which was blown through the centre of a spirit lamp, and gave a continuous and powerful light.

**Liverpool (Camera Club).**—At the meeting held on the 26th ult., under the presidency of Mr. Jas. Smith, a demonstration was given by Mr. W. Anderson Brown on "Ilford P.O.P., and How to Obtain

the Best Results." Mr. Brown, who made the demonstration practical and therefore more interesting, made up baths of sulphocyanide of various strengths, explaining the action of each. The lecturer then proceeded to tone prints on Ilford P.O.P. in each of the baths, the results being very satisfactory. Mr. Brown also explained a novel method of squeezeprinting on glass. The second annual fancy dress ball is to be held on Monday, 12th December, and promises to be a great success.

**Liverpool (A.P.A.).**—The ordinary monthly meeting was held on the 27th ult., the President (Mr. W. Tomkinson) in the chair. Messrs. A. Bradbury and E. V. Swinden were appointed to audit the annual accounts. Mr. B. J. Sayce exhibited two fine platinum pictures of "The Strid" and "The Meeting of the Waters," Bolton Woods, from negatives taken direct on 26 by 23 plates, by Mr. William Brown, of Leeds. Mr. C. B. Reader brought before the meeting an invention by himself and Mr. Potter, consisting of a new method of artificial lighting specially adapted for enlarging and reducing. Taking equal quantities of magnesium powder and chlorate of potash, Mr. Reader explained that by means of a piece of perforated zinc he distributed it equally over a sheet of pyroxyline paper, and upon this he pasted another sheet of the same paper. A piece of this preparation about ten inches square produced, when ignited, a flash sufficiently bright and lasting to make a lantern slide by reduction from half-plate. Mr. Reader showed a slide made in this way which was equal in all respects to those made by daylight. The next business was the exhibition of the AMATEUR PHOTOGRAPHER Prize Slides, which were explained by the President. The show was much appreciated by a large gathering of members, the figure studies by Mrs. F. Clarke drawing forth great applause.

**Margate.**—The members met on 25th ult., to inaugurate their monthly meetings, and spent a pleasant evening. Specimens of recent work done by members were upon the table (most of them contributed by the President, Dr. Elliott), which led to a discussion upon the merits of the many makes of plates, papers, etc., and the results of different developers. The first business of the evening was to appoint a successor to the late Hon. Secretary, Mr. A. King, and Mr. W. S. Harvey accepted the post. Later on it was decided to meet once every month during the winter, when members of this, or kindred societies will be invited to give demonstrations of practical work, or contribute papers on photography; the first to be given by Mr. Tweedie on lantern-slide making. Although quite young, the society offers to its members (ladies or gentlemen) many advantages, including free use of Mr. Tweedie's laboratory for its monthly meetings, a circulation of weeklies, monthlies, and annuals to the value of £1 per annum, and the use of a dark-room at the Central Pharmacy on special terms.

**P.S.G.B.**—Technical meeting, on 25th ult., Mr. T. R. Dalimeyer in the chair, who announced that he had brought another view of Mont Blanc by M. F. Boissonnas, taken with the tele-photographic lens, which, if members would compare with that in the exhibition at Pall Mall, they would find to be far superior in definition, owing to the weather having been windy when the first view was taken. The Hon. Secretary exhibited and explained Messrs. Watson and Son's new Alpha hand-camera, for use with double backs, and stated that the parts were interchangeable. The Chairman then called upon Mr. F. P. Cembrano, junr., to open the subject of the evening, "Architectural Photography." Mr. Cembrano subdivided this subject into three parts—apparatus, process, and subject. For the first he recommended a tripod with sliding legs, with some device to prevent them slipping about; a square bellows camera, as with the ordinary conical bellows he found there was a difficulty when using short-focus lenses. Another point was to employ a camera with a perfectly square back, so as to be able to draw the shutter from right, left, top, or bottom. He had never found any use for swing-front, and exhibited a level which could be placed on the top of the camera, and the position of the bubble seen without having to look down on the instrument. He did not recommend taking the picture from a high point of view, as when taken from a height of 10 or 12 ft. One did not get the representation of the subject as one was accustomed to see it. The best point of view was the height of one's eyes. He then proceeded to project on the screen a number of slides illustrating his remarks, to the first of which he had given an exposure of twenty-eight minutes with  $f/45$ , and then a further exposure of fifteen minutes with  $f/16$ , and had not found any doubling of the image, but in addition to the importance of giving further exposure, it was necessary to be very careful in development, and he exhibited a number of slides in which the deep shadows had been brought out by development with a brush. He started with a weak developer to bring the image out, and when once it showed, washed the plate thoroughly, and then, using a stronger developer, applied with a brush, developed up the heavier shadows, washing for a minute or two, and strengthening the developer. In taking interiors it gave pictorial effect to the picture, in his opinion, and a better idea of depth, if it was taken, when possible, facing the light. In conclusion, he

indicated the suitability of an optical lantern, with a large screen, for showing architectural photographs to advantage. Mr. Chapman Jones exhibited some examples of distortion obtained by tilting the plate, and the partial cure of the same by copying, tilting the negative or plate again when doing so. He had never heard how the difficulty of restoring the proper proportions, caused by the varying distance of the various parts of the plate from the lens, could be overcome. Mr. Sebastian Davies thought Mr. Cembrano's method of development was applicable in more instances than architectural photography only, and in reply to a question by the latter, the Chairman stated that it was impossible to obviate the exaggerated perspective caused by tilting the camera, as it depended upon certain laws of true monocular perspective which was an absolute science, and these laws could not be got away from. He quite agreed with Mr. Cembrano as to the applicability of the optical lantern with a big screen for architectural subjects.

**Richmond.**—At the meeting held on the 24th ult., the President in the chair, Mr. G. Ardaseer showed Cowan's lantern-slide printing frame, a most convenient piece of apparatus for making slides by contact, and very suitable for collodio-bromide plates, as, with it, there is little risk of damaging the film by abrasion. Mr. F. P. Cembrano, junr., gave a demonstration on "Transparency Making without a Dark-room." He said that it was his aim that evening to demonstrate that no dark-room, nor even a developing lamp, or the use of non-actinic media, were at all necessary for the pursuit of that fascinating branch of photography, transparency-making. The reproach that amateurs were selfish because no sooner they returned home from work they shut themselves up into their dark-rooms could no longer be cast upon them. Long winter evenings could be socially spent at home without giving up lantern-slide work, and provided a little care was used when developing, and the table was covered with a piece of oil-cloth, no damage need be feared for the furniture or carpets. Mr. Cembrano followed his remarks by developing several plates by the light, and within three feet of an ordinary Argand gas burner, several of the gas jets in the room remaining alight. An ordinary dish was used, and the plates while in the developer, were not screened from the light. The resulting transparencies showed absolutely clear glass in the parts that had been protected by a mask during the exposure. The exposure (contact) was one inch of magnesium at distances from three to ten inches. The first slide was made on a Cowan's chloride plate, and was developed with pyro and carbonate ammonia, and bromide and acetate of soda. The second one, also a Cowan's chloride plate, was developed with hydrokinone, caustic potash, and carbonate of ammonia, the resulting colour being a nice brown. A collodio-bromide plate also gave equally good results. The demonstration was brought to an end by exposing two of Marion's Bartolozzi opals, one of which was developed with amidol and the other with hydrokinone. The former gave a black image, while the colour obtained with the second developer was light sepia. Mr. Ennis asked which would be the best way to obtain warm tones on slides. Mr. Cembrano replied that with gelatine as well as with collodion plates any colour, from black to red, could be obtained. He had not been able to get warm tones with eikonogen, but with pyro or hydrokinone a good rich colour could be got by giving a prolonged exposure and using a well-restrained developer containing carbonate of ammonia. Mr. Ardaseer added that he had obtained a warm tone with eikonogen by using carbonate of ammonia. Subject for discussion at the next meeting, "Preparing Work for Exhibitions."

**The Lantern Society.**—On the 24th ult. Mr. Taylor exhibited an improved form of Lawson's Saturator, which gave a very brilliant light. Mr. Askew exhibited his portable lantern and stand of ingenious construction, and capable of being carried on a bicycle; it is made by Messrs. Newton. The Hon. Secretary then showed a lantern of a novel description, which he had designed for his own use. In its construction aluminium was used wherever practicable. Instead of the metal-lined mahogany body, there was a cloth curtain lined with asbestos; the condenser, mounted in aluminium, was held between two thin plates of the same metal, and the slide-carrier was held rigidly in position by means of an aluminium plate and two screws. The lens was mounted in a plain aluminium tube, and was carried by a small saddle, moving along the front board by means of a rack and pinion, and connected to the lantern body by a small camera bellows. For packing away, the whole thing folded up, and together with all the necessary fittings and two regulators, stowed away in a box 18 by 12 by 5½ in. The total weight, including the box and regulators, was about 21 lb. the corresponding weight of the lantern which it has superseded being 38 lb. The space for the jet was practically the same as in an ordinary lantern, so that any jet, or an oil lamp, could be used with it.

**Torquay.**—This association held its annual meeting on 26th ult., Mr. A. R. Hunt (Vice-President) in the chair. The report of the year's work was adopted, and the accounts showed a satisfactory balance to the good. Several of the rules were amended. The following officers and Committee were elected for 1892-3:—President,

Mr. E. Vivian, J.P.; Vice-Presidents, Messrs. A. R. Hunt, M.A., and T. Willoughby; Committee, Dr. Briggs, Messrs. C. E. Robinson, G. Edwards, Gregory, W. H. Baynes, Tozer, and Mayne; Hon. Secretary and Treasurer, Mr. H. C. Howell, Nutley, Torquay. It was announced that a very satisfactory programme had been arranged for the coming session. It includes a four-day exhibition in February, at Iredale's Picture Gallery. The AMATEUR PHOTOGRAPHER'S Monthly Competition Prize Prints, which included some very fine pictures, were also on view.

### SOCIETIES' FIXTURES.

### TONING BY ACETATE OF LIME.

ACCORDING to M. Hermitte of Marseilles, the operation of toning constitutes one of the greatest difficulties for amateur photographers. The acetate of soda bath behaves very well when it is new; but unfortunately it spoils quickly, it acts then very slowly, and the tones it gives leave much to be desired. The opposite is the case with the acetate of lime, which tones very quickly, even too quickly for an inexperienced operator. It keeps a long time with its initial energy, if one resorts to the dodge indicated further on.

The principal quality of this toning bath is to reduce easily the persalt of gold into the proto salt, yet leaving it a sufficiently necessary stability not to injure the print in toning.

In toning with acetate of soda, the proto salt of gold is by use gradually reduced, which is clearly indicated by the colouring of the toning bath and the black deposit which is formed. Too much prolonged, the toning with acetate of soda gives almost always disagreeable grey tones even with very vigorous negatives; it eats into the print, and may later give rise to yellowish tones.

This inconvenience is not to be feared with the toning bath of acetate of lime. When toned quickly and thoroughly, the image keeps all its pluck and brilliancy; it does not lose sensibly. Conse-

quently the proof ought to be printed very little more than desired at the finish. Even toned to black, the colouring of the paper undergoes no modification, the whites are very pure, and the proof is better than with all other toning baths.

Here is the formula based on that of acetate of soda, and replacing this by its equivalent in acetate of lime.

#### Solution No. 1.

Distilled water	...	...	...	500 parts
Brown chloride of gold	...	...	...	15 "

#### Solution No. 2.

Distilled water	...	...	...	1,500 parts
Acetate of lime	...	...	...	27½ "

It is prepared in the same way as the acetate of soda bath. As to the tint of the proofs, it is essential to always keep below the shade finally desired, because, although undergoing no appreciable change in this sense in fixing, it is certain that in the final washing, and above all in drying, the proofs tend to rich grey tones, especially in the half-tones. This action continues even after mounting the prints.

Finally this bath will keep well, and when it is desired to use it again it is only necessary to add to it one-tenth of its volume of distilled water and a little gold, half or three-quarters of an hour before using. After toning filter through chalk.

**Discovery of Three New Planets by Photography.**—M. Perrotin has communicated to the French Academy an account of the discovery of three small planets by M. Charlois, of the Nice Observatory, by the aid of photography. The apparatus employed consisted of a Hermagis portrait lens of 15 cm. aperture and 80 cm. focal length, mounted provisionally on M. Loewy's equatorial coude. The instrument was being employed for the photography of the region of the ecliptic. With exposures ranging from two hours and a half to three hours, the eight negatives obtained since September 12th cover a region 80 deg. long and 10 deg. broad, and show all the stars visible through the 38 cm. refractor. A careful examination of the plates reveals the presence of three unknown and eight known planets. The former, now known under the names 1892, D, E, and F, are all of about the twelfth magnitude.—*Nature*.

**Photographs of Prehistoric and Ancient Objects.**—The report of the Committee, consisting of Mr. E. Seward (Secretary), the Marquis of Bute, Messrs. G. T. Clark, R. W. Atkinson, Franklen G. Evans, C. Tanfield Vachell, James Bell, and T. H. Thomas, and Dr. J. G. Garson, appointed to report on the Prehistoric and Ancient Remains of Glamorganshire (drawn up by the Secretary), stated that the work of registering the localities of the prehistoric and ancient remains of Glamorgan has proceeded. Important help to the Committee's work has been rendered by the Cardiff Naturalists Society. The Cardiff Amateur Photographic Society, by means of prizes offered to their members, have produced some hundreds of valuable original photographs of prehistoric and ancient objects in the county, most of such objects within the county having thereby been illustrated. This collection, which is believed to be the most extensive yet formed in any district, is stored at the Cardiff Free Library. The Corporation have given good aid to the work by important grants to the Prize Fund.

**Liquid Ammonia.**—At one of the recent meetings of the Franklin Institute (Chemical Section) a paper was read, by Dr. Hans von Strombeck, on "The Composition of the Liquid Ammonia of the Trade, and how to Manufacture Liquid Ammonia of really 99.995 per cent." In the course of this some interesting particulars were given. For example, the so-called anhydrous ammonia was found to yield, on evaporation, crystals of ammonia sesquicarbonate—not much, certainly, but it was there; and more noteworthy still was the presence of from 0.004 to 0.035 per cent. of mineral oil, to which the faint yellow colour of anhydrous ammonia is due. There was present also from 0.117 to 2.88 per cent. of a colourless fluid, having a specific gravity of 0.7948 at 60 deg. F. This, on fractionation, was found to consist of methyl, ethyl, and isopropyl alcohols, acetone, and methyl-ethyl-ketone, besides traces of ethers. In the process which the author has devised for making the almost absolute ammonia (it contains 0.005 per cent. of mineral oil, but nothing else than NH<sub>4</sub>HO), the author removes these alcohols and ketones by passing the ammonia-gas through a vessel containing fused sodium, the result being that sodium derivatives of the organic bodies are formed with the elimination of hydrogen, and the ammonia sesquicarbonate is decomposed according to the following equation:—

The hydrogen is absorbed on passing the mixture of it and ammonia gas through palladium. It looks costly to speak of sodium and palladium in connection with a commercial process, but, as a matter of fact, the increased cost is less than 1c. per lb.—*Chemist and Druggist*.

**Mr. Paul Lange** is to give his popular lecture, "Norway Revisited in 1892," at the Picton Lecture Hall on Sunday, December 4th, in connection with the Liverpool Sunday Society.

**M. Marey**, the well known investigator of animal movements by means of instantaneous photography and the zoetrope, has now succeeded in rendering the beating of a living heart visible to the eye. All the phases of the movement can be followed and properly examined by this new method. The heart employed in his experiments was that of a turtle.

**M. Gaston Tissandier** has recently drawn attention to what he calls "Photographic mirage." Three years ago M. Paul Roy photographed his young son in the open day, and on developing the picture found to his surprise a vague image of himself in the background, as he stood in the act of removing the cap from the lens to take the photograph. As a matter of fact, his image had been formed on the atmosphere haze, and although invisible to his eyesight, it was strong enough to affect the plate. Another instance occurred to M. Le Corbeiller, member of the Photographic Club of Paris, who, in developing a view he had taken of the statue of David by Michael Angelo, at Florence, discovered that a gigantic shadow of the figure had been projected on the clouds behind, after the manner of the Spectre of Brocken. He saw nothing of this shadow while taking the view, but it was strong enough to affect the gelatine-bromide plate.

**Star-Photography.—Largest Instrument Made.**—News reaches the Astronomer-Royal at Greenwich Observatory of a remarkable lens just made for the purpose of photographing the stars. It has been made for Harvard Observatory, and is the present of a lady named Crush. There are four photographing lenses, and in front of these is the prism for photographing the spectrum of stars. Its thickest edge is three inches, and the thinnest seven-eighths of an inch in thickness. The lenses are all made of the finest kind of optical glass, and their average weight is 100 lb. each. The bed-plate is 10 ft. 4½ in., and its breadth is six feet. This swings on a great steel axle ten feet long and weighing 2,200 lb. The wheel to which the clockwork is attached, regulating the movement of the instrument to the motion of the earth, is five feet in diameter, and the gearing is exceedingly delicate and nicely adjusted. It is expected that with this instrument, the largest ever made for the purpose, some interesting results will be obtained. It is a pity it

was not ready in time for use when Mars was in its most favourable position for observation.

**The Photography of Colours.**—At a meeting of the Academy of Sciences on Monday, October 24th, great attention was paid to a paper read by M. Lippmann on his researches concerning the photography of colours. The many coloured negatives shown were passed round, and appeared to convince the assembly of the valuable results obtained by the learned Sorbonne professor. M. de Freycinet, the French Minister of War, who was present, evinced great interest in the subject. The tints of these new coloured photographs are obtained on bichromate albumen or gelatine. A thin layer of the substance is spread and dried on a glass plate, and then exposed in the dark-room, backed by a film of mercury. The operations of developing and fixing are performed by simply washing with pure water; the colours then become very brilliant. The theory of the new experiment is the same as that on which M. Lippmann obtained his previous results.

**The Staffordshire Photographic Survey Society.**—A very well attended general meeting (the first of the season) of the above Society was held at the head-quarters, the Stoke-on-Trent Free Library, on the 24th ult., Mr. Chas. Lynam occupying the chair. An excellent collection of lantern slides of places of historic interest in the county of Staffordshire was exhibited, the major part of them being made by Mr. W. A. Meigh, including a very fine set illustrative of Croxden Abbey; also views in Hanley, Caverswall, Stoke-on-Trent, Madeley, Cheddleton, Keele, and others. There were also several slides from West Bromwich, by Mr. Thompson, and from Wolstanton by Mr. J. W. Turner. The Chairman gave a most interesting account of the ruins of Croxden Abbey, and a hearty vote of thanks was passed to him for his kindness. The Secretary (Mr. A. J. Caddie) pointed out the desirability of forming a good collection of lantern slides of Staffordshire in connection with the Society, so that at some future date a public exhibition might be held. A fairly good number of photographic prints were sent in by the members for the Society's collection, and several new members were elected. It was resolved that the offer of the Platinotype Company of a lecture on the platinotype process, to be delivered on December 12th, be accepted with thanks, the lecturer being Mr. Buchanan Wollaston. A vote of thanks was passed to Mr. Hammond, who kindly gave his services with lantern free; and also to the gentlemen who had sent in slides.

## To Correspondents.

All communications for these columns are to be addressed to **The Editor, "Amateur Photographer," 1, Creed Lane, Ludgate Hill, London, E.C.**

### RULES.

1. Write clearly and distinctly on one side of the paper only.
2. Write each Query or Answer on a separate sheet of paper.
3. Write the name and address legibly on the back of each communication, and sign all Queries and Answers with name or *nom de plume*.
4. All matters for these columns MUST be received by TUESDAY MORNING'S POST.
5. The Editor does not undertake to answer questions by post.
6. In answering Queries, correspondents are requested to mention, in every instance the number and full title of the query referred to.

### QUERIES.

5850. **Altering a Group.**—I want to take out a person from a group and put in someone else. Will any reader kindly show me how to do this?—HIRCUS.
5851. **Neutralising Clearing Bath.**—Would any reader be so kind as to tell me through these columns if it is possible to neutralise the acetic acid used to clear bromide paper after development with ferrous oxalate, so as to preserve the prints with less or no washing before fixing?—LANTERN.
5852. **Lantern Screen.**—Would any reader kindly tell me through these columns how to make a strong portable wooden frame to stretch a lantern screen on?—LANTERN.
5853. **Three-Ply Fretwork.**—Where can this be obtained in London?—ST. BRIEUC.
5854. **Biarritz.**—Can any of your readers inform me if there is any dealer at Biarritz who keeps the English size plates, quarter-plate size, for snap-shot work, and is a dark-room to be had anywhere there?—E. D.
5855. **Plain Papers.**—Can any reader tell me where I can get Rives' or W. A. Man's drawing papers?—AMATEUR.

5856. **Toning Slides.**—Can any of your readers tell me of a good formula for toning lantern slides with chloro-platinite of potassium; and is there any harm in intensifying them with bichloride of mercury and ammonia if they are at all weak in density?—PERPLEXED.

5857. **Toning Bath.**—Can any of the toning baths recommended for Eastman's Solio paper be returned after use to the bottle of stock solution, and then kept till required next time; and if so, what precautions are necessary to prevent the gold from depositing in the bottle?—J. W. W.

5858. **Vulcanite Sheets.**—I have used the above for some time to burnish my small prints on, but have just recently had great difficulty in removing them when dry, some portion of nearly all the prints sticking firmly. I have tried cleaning the vulcanite with ammonia, but without success. The surface of the vulcanite is not so glossy as formerly. Can this be the cause of the sticking, and if so, can I repolish it?—J. W. W.

Correspondents not seeing their queries inserted are requested to look for the same under "Editorial."

### QUERIES UNANSWERED.

Oct. 24th.—Nos. 5847, 5849.

### ANSWERS.

5827. **Transferring Albumen Prints.**—The only possible method of doing this would be as in the chrysotelem process, that is by using freshly made starch paste, applying to the face of the print, and squeegeeing down well, allowing to dry, and rubbing off the paper with fine pumice powder at first, and then with the finger. Positives may be made on china, however, by flowing the same with salted albumen, allowing to dry, and then sensitising the film with nitrate of silver, and printing out in the ordinary way. But unless films were used it would be difficult to obtain absolute contact all over, and there might be the danger of fracture of negative.—EDITOR.

5834. **Accidental Exposure.**—The only explanation possible is that the slide was not open sufficiently long for the plate to be affected by the light in the room.—EDITOR.

5835. **Enlarging.**—At the beginning of this year a series of articles called "Notes on Enlarging" were published in our columns which would give all the necessary information.—EDITOR.

5841. **Mounting Solio Prints.**—Provided the prints are backed with black waterproof backing paper whilst on their glazing support they may be

mounted with ordinary starch paste in the usual way when stripped. Some use indiarubber solution, others spirituous gelatine mountant, which are quite safe.—EDITOR.

5844. **Toning.**—The formula given will certainly tone chloride prints, and gives them good tones.—EDITOR.

5846. **Portraits on Plain Paper.**—The illustrations in our columns are reproduced from prints by what is called the half tone or half tint process block. As these may be obtained commercially of excellent quality at a very reasonable rate, and the process is not easy for an amateur to take up and succeed with in a reasonable time, it will be far better for the querist to send us stamped addressed envelopes, and we will give him the address of one or two firms.—EDITOR.

5848. **Sensitising Silk.**—Better to buy it, I should think. You can get it from Adams and Co., 81, Aldersgate Street, E.C.—R. A. R. BENNETT.

### EDITORIAL.

**SPECIAL NOTICE.**—We are very pleased to find that replies in this column are so much appreciated, but we should be very grateful if those requiring advice would send their letters to us BEFORE TUESDAY MORNING'S post if possible. The time occupied in replying in this column is very considerable, and owing to the often late receipt of letters, many matters have to be left over each week. This we much regret.—ED. AM. PAOR.

**DEVELOPER.**—Easy, friend, you set us no mean task. Will you do your part of it—that is, will you press the button if we'll do the rest, will you expose the plates if we develop them. You cannot lay down a hard and fast rule and say that under certain conditions the image will appear in so many seconds, and be completed in so many minutes, because you must suit your method of development to the subject. However, we will try and help you. If we send you some plates, will you press the button if we do the rest. Let us hear from you again.

G. P. S. SCOTT.—It would not be fair for us to give any opinion on your print, as it is more than likely we may have something to do with the judging. However, send it in by all means, and try your luck. The small camera you name is a very efficient and capable instrument, and has a very good lens. It is merely a question of practice to be able to judge the distances correctly, and it is not more difficult with the camera you specially name than with any other. Amidol is a good developer, especially for hand-camera shots, but, like everything else, wants learning how to use.

MRS. E. CLEASBY. — The cause of iridescent fog may be either (1) a fault in the emulsion, which is not likely to occur; (2) or stale developer; (3) or stale films; (4) or to the films having been exposed to fumes of some kind, such as gas; (5) or a very slight trace of hypo in the developer. This peculiar fog is not detrimental to the negatives, and we should say would rather improve the printing quality of yours, as they are too thin. The fact of one dozen having developed up denser on one side than the other, is, we must confess, beyond our powers of explanation. It may be due to some fault in the film, but we do not like to state that definitely without knowing a little more. It may be due to too strong a light having access to the plate during development, though this does not seem feasible, because the edges are clean. Can we help you by offering to develop one or two films for you?

NEMO. — (1) We must confess that this is quite beyond us, nor do we think anyone could tell you except a retoucher, and he would not probably. (2) Yes, there is yet room at the top for good men and good work.

HIRCUS. — (1) You might cut nearly an inch off the right side, and half an inch off left and top. It would stand enlarging. The print is all right. (2) Negative too thin, wants intensifying, much over-printed. (3) Over-exposed and flat, less exposure or weaker developer and more bromide would help you. (4) Ditto. Colour too grey. (5) Negative wants intensifying. A very good copy though. It is possible to take out or put in a figure of a group, but it is no easy matter. We insert query, and if not answered, we will do so.

D. M. — We know of no portfolio club with headquarters in Scotland. See p. 299—letter by F. G. Reader.

TUM-TUM. — Use distilled water, or else boil your water, and allow to cool. Do not expose quite so near the light and use less bromide.

F. YOUNG. — Quite welcome to anything we have done for you.

D. J. NEILL. — We may include animals in instantaneous. Two slides only required in each competition. We shall have stereo competition next year.

ST. BRISCO. — Harger Bros., Sattle, Yorkshire, is the only firm we know. We have inserted as query.

BOTANY BAY. — Always very glad to see you and help you, as far as we can. You will see in this week's issue, p. 327, an article on spectacle lenses. The darker screen requires double the exposure of the light one. Benham and Froude's Perfection lamp is the one. The print you enclose is one of those curiosities which are met with sometimes. The explanation is that the shadow side of the face is so dark as not to interfere with the brightly-lit side of the previous exposure. Place your sitter further from light, and use a sheet over clothes horse as reflector for shadow side.

W. R. GOULD. — There is no firm that makes printing lantern plates, but Tylar, of Birmingham, sells a print-out emulsion, which you could use for making the same.

M. E. — Probably you have not yet been able to disabuse your mind of the long exposures necessary for wet work. Over-exposure and fog is the cause of the poor print No. 1. Nos. 2 and 3 are alright, but are they not from wet plates? No. 4 is also alright. You will find in "Photographic Procedure," pp. 170, 244, 250, full instructions for using pyro and ammonia.

ALPHA. — (1) To find the equiv. focus of your lens, focus the sun, or, if, like us, you have not many opportunities of seeing that—the clouds. When sharp, measure the distance from lens to screen, then divide by the diaphragm aperture. In taking a portrait at close quarters the lens is necessarily racked out, and the *f*/*22* aperture becomes temporarily reduced. (2) The advantage of having lenses of different focal is that from the same standpoint you can get images of different sizes; for instance, let us say you are going to take a house from one side of a river, and you have 4, 6, and 8 in. focus lenses, then with the 4 in. you presumably get an image 1 in. in height, with the 6 in. you get an image 1½ in., and with the 8 in. 2 in. in height. For a 9 in. lens the camera should rack out at least to 12 in. (3) The expression that has puzzled you means practically this, that with the full aperture of the lens the definition in the centre of the screen is sufficiently good for portraits and groups, but that to obtain sufficiently satisfactory definition at the edges of the plate, for landscape work the lens must be stopped down. Always glad to help you.

AMATEUR. — Tylar's metal slides may be fitted to Lancaster's cameras.

INSTANTOGRAPH. — (1) When the gold is exhausted, the half-tones of the prints have a sickly greenish hue. (2) Glycerine, not gelatine, is used to prevent prints cockling, but its use is certainly not to be recommended with chloride papers. (3) The "Todd-Porter" lamp sold by A. H. Baird, 15, Lothian Street, Edinburgh, gives the more powerful light, and we prefer it to the one you name.

ECCELESIASTICAL. — Either the one you name, or Merlini's hand-camera with dark slides—the latter has rising front and swing back, hence useful for difficult interiors. Merlini, 34, Red Lion Street, Clerkenwell, E.C.

ABYDOS. — (1) We should prefer a longer focus lens of 5½ in., but the one you name is a very good instrument; you must not expect too much from the

full aperture. (2) If you are satisfied with that focus, you could not get a better lens. (3) Yes. We have used a camera on this principle for over two years, and never found any want of sharpness from the cause you name. (4) You want clouds in your print, and it would be then a very good but not artistic shot.

J. FLEMING. — Keep all your solutions at as nearly the same temperature as you can. When does the frilling appear.

W. H. B. — Yes, the slides should be marked copy-right, but not necessarily so, as to snow on the screen. Probably the fact of the slide not being marked would reduce damages, even if it did not make suit null.

W. H. WHITTARD. — The ferrocyanide of uranium, which is the cause of the brown tone, is soluble in water, especially that containing a trace of alkali—therefore the remedy is to wash for about half an hour only, and in water slightly acidulated.

FOCAL LENGTH. — We should advise a rapid view lens of 10 in. focus, and a good landscape of 14 in. focus.

J. D. PEMBERTON. — Any of our readers are at liberty to send prints to be criticised.

TRIX. — (1) Local reduction is best managed with a wash leather over the top of the finger dipped in turpentine. To reduce locally by the aid of chemicals is not so easy; it is usually done on a half dry negative with the aid of a camel's hair brush. (2) The stops are not difficult to manage, and always included in the price. What are the difficulties?

P. C. L. — Stocks, Ironmonger, Rye, Sussex, is the address.

T. ARNOLD. — Eikonogen would certainly give you more transparent results than hydroquinone. You may be trying to obtain too large a disc, or the lamp may be defective, this is the most likely. What lamp is it?

BLANCHE. — The ordinary ferricyanide and hypo is the best reducer before intensifying. The negative should be merely dipped in it so as to clear off the superficial fog, and then wash well before intensifying.

PLATINA. — Magnesium ribbon would be our choice about 12 in. according to density of negative burnt behind the ground glass, and kept moving about should give you the result you desire. Probably you are under-exposing with gas—black shadows point to this. Daylight can be used, but as it is so uncertain there is no estimating exposure.

C. JACKSON. — Robinson and Abney's "Silver Printing" is about the best book on the subject. To be had from our publishers.

E. M. — We start by saying that all your prints suffer from having been printed in the sun. (1) Too much foreground, and insufficiently toned. (2) Not enough foreground, and insufficiently toned. (3) Over-printed and over-toned. (4) Over-printed and under-toned. (5) Over-printed and over-toned. (6) Wants life, and under-toned.

W. E. A. — There is no finest printing process. You must suit your process to your negative. Possibly, however, photogravure is the best. Send us up some work, and we may help you further.

R. W. C. — The answer to your query is so long we are compelled to hold over till next week. The wet process is used, and iron developer.

F. J. CLARKE. — (1) Road. Technically very good, but why you could not raise the front and cut the lower foreground off we do not see. It would have been improved too by some figures issuing from the gate. In the bridge scene there is a possibility of improvement—that the picture might have been taken the other way of plate. Technically it does not want improvement. We will write you by post.

J. B. — There is not the slightest doubt about the stain being almost ineradicable, nor of its disappearing and then coming back. The only way to prevent it is to place the plate in alum and citric acid after developing. Send us up a negative to look at and try.

V. R. I. — Your card received and will be duly attended to.

## Sale and Exchange.

### RULES.

**CHARGE.**—Twelve words or less for Fourpence. Every additional three words, one penny. The name and address of the sender must be paid for. (A single figure, or group of figures undivided by letter, space, stop, or words, counts as one word; compound words count as two words.)

**DEPOSITS.**—The money for goods forwarded on approval may be deposited with the Publishers of the AMATEUR PHOTOGRAPHER, who will hold the amounts deposited until they are satisfied that the transaction has been completed to the satisfaction of buyer and seller.

**ADVERTISEMENTS** can be inserted under a number, the name and address being registered, and letters forwarded for a fee of 5d. to cover postage.

**PAYMENTS** should be made in Postal Orders or Postage Stamps.

**ADDRESS.**—All advertisements (which can be received up to Tuesday mid-day) and other commu-

nications having reference to the "Sale and Exchange" column, must be addressed "Sale and Exchange, AMATEUR PHOTOGRAPHER, 1, Creed Lane, London, E.C."

**COMMISSION.**—A charge of 2½ per cent. will be deducted from all deposits whether a sale is effected or not. Minimum charge 1s.

**PAYMENT.**—All payments are to be by cheques of Postal Orders, made payable to Hazell, Watson, and Viney, Ltd., 1, Creed Lane, London, E.C.

**CARRIAGE** must be paid on all apparatus sent for report, and they will be returned carriage forward.

**REPORTING.**—Apparatus may be sent to the EDITOR, AMATEUR PHOTOGRAPHER, 1, Creed Lane, London, E.C., who will report upon the apparatus to the buyer for a minimum fee of 2s. 6d., or a commission of 2½ per cent., upon the sale price of the apparatus.

**Burnisher.**—Adams' 9 in. Star burnisher, cost 14s. 6d., good condition, price 7s. 6d.; exchange.—Hare, Photographer, Sutton, Surrey.

**Cameras, Lenses, etc.**—For sale, a quarter-plate camera by Shew, with slides, and a splendid lens by Sands and Hunter, the set complete in a stiff waterproof case, price £3; a prize has been taken with this set.—Apply to J. Ramsden, Eton College, Windsor.

For sale, whole-plate mahogany box camera, two double dry plate backs, two single wet plate backs, and 12 by 10 single view lens, price 40s.—Elphick, 57, Stonefield Road, Hasting.

**Dark room.**—Overend's portable dark-room (out-door), can be used indoors, sink, ruby and orange windows, shelf, etc., new in July, 35s., cost 50s.—Dr. Dammann, 154, Walton Street, Oxford.

**Electrical Apparatus.**—Electric light, 4-cell battery, lamp, complete, for dark room, 30s.; two telephones, 12s., complete; other electrical apparatus. F. Handcra, 66, Peckham Road, Camberwell.

**Print-china.**—Large Kodak for sale, 4 by 5, including about 50 unexposed films, excellent order, only eighteen months in use, original price £10, will take £6.—Lady A., Forghen, Turiff, N.B.

Climax hand-camera by McGhie, Glasgow, fitted with Taylor lens, carries 12 plates, first-class condition, cost in April (with camera case) £8 10s., will take £6 10s.—Norman Sloan, Crown Circus, Glasgow.

Adams' new Vesta pocket camera, quarter-plate, closes to only 1½ in. thick, and weighs, including slide, focussing screen, and two plates, 1lb. Wray lens, 5 in., five stops, adjustable focus, adjustable speed shutter, reversible finder and swing back, complete with three double slides and leather slung case, just bought for 7 guineas net, will take £6 10s. Any evening by appointment.—C. H. Warwick Gardens, Kensington.

Quarter plate hand-camera, two view finders, six double slides, complete, 22s.; also Dallmeyer's quarter-plate triplet lens, 15s., or exchange for half-plate camera set.—S. Williams, Secretary L.E.C.C., 35, Silver Street, Leicester.

**Lanterns, etc.**—Binial lantern, dissolving taps, safety jets, cog-wheel arrangement, cylinders, standards, nipples, unions, key regulators, screen 12 ft., case, 45 coloured slides (India), 7 Africa, £19.—B. 21, St. James' Street, Wandsworth Common.

Magnificent triple lantern by Steward, together with microscopic attachment and two apophengoscopes, etc.; will take part exchange in electric apparatus, telescope, or engine models.—For full particulars, Lyndon, West Park, Clifton.

**Lathe.**—To be sold, an excellent lathe by Buck, 4ft. iron bed, 5 in. center, iron standards, over head motion by Evans, dividing plate, ornamental slide rest, compound's idler rest for metal, 3 jaw self-centering key chuck, drill, bell, and a many other chucks, eccentric and horizontal cutting instruments, a large assortment of tools for ivory, wood, and metal turning, price £35, a bargain. Can be seen by appointment.—S. "Mayfield," Chase Road, Southgate, N.

**Lenses, etc.**—Lenses, portrait and view, 8½ by 6½, works at f/4, brass mount, rackwork adjustment with double dark slide, 50s. On view, Burton's, 3, Broadway, Ludgate Hill.

Half-plate rapid rectilinear lens, with iris diaphragms, good as new, only 17s. 6d.; camera case, 5s.—Cheltenham House, Stroud.

Hockin's half-plate single lens case, Waterhouse's stops, cost 3s., quite new, 5s.—J. Underwood, Devonshire Square, Loughborough.

**Sets.**—Chapman's whole plate camera, in waterproof case, swing back, rising and falling front, three double slides, Wray's R.R. lens, iris diaphragm, triangle top for stand, Thornton-Pickard's instantaneous shutter, almost new, perfect condition, £12.—Mellor, Roy-house, Bolton.

Morley's light model half-plate camera, three double dark slides, tripod and case, complete, Hockin lens, splendid condition, 45 10s.—No. 350, office of this paper, 1, Creed Lane, E.C.

Quarter-plate hand and stand camera, three double mahogany book slides, view finder, and enryscope lens, working f/6, ash folding tripod and bass top for use with above doubly useful set; exchange safely bicycle or 12 by 10 R.R. lens.—G. A. Knight, Seaford, Sussex.

Half-plate square leather bellows camera, two best double slides, all movements, and in new condition,

landscape lens, and mahogany stand with brass top; exchange safety bicycle, or good 12 by 10 R.R. lens.—G. A. Knight, Seaford, Sussex.

**Relinquishing photography.**—£6 will purchase my half-plate camera, splendidly made, with three double dark slides, a whole-plate London Stereoscopic rapid landscape lens, long focus, Black Band series, in conical mount, splendid definition, Decondun's photometer, and an Ashford patent folding tripod; the lot cost £10 5s.; I will send on approval on deposit.—Williams, Liberal Club, Saffron Walden.

**Lancaster's quarter Instantograph**, complete, four metal slides, adapter and screen to fit, also Chronolux shutter, exposures  $\frac{1}{2}$  to 3 sec., price £2 10s.—Apply, E. C. Davis, 23, Walker Street, Burdett Road, E.

**Quarter-plate Optimus set**, complete, perfect order, 35s.—Miss A. Jones, Chelmsford.

**Lancaster's quarter-plate special brass-bound Instantograph**, four slides, Optimus landscape lens, stand, bag, etc., new, never used.—5, Milon Grove, Stockport.

**Shutter.**—Kershaw half plate shutter for sale, good condition, Gs.—Wall, Welstor, Ashburton.

**Underwood's pneumatic drop shutter**, 1 $\frac{1}{2}$  in. hood, cost 5s., bargain 3s.—Underwood, Loughborough.

**Stereoscopic Apparatus.**—Two 4 in. Ross' P.S. lenses with iris diaphragm, paired for stereo work, £5 5s. the pair; two 6 in. do. do., £8 6s.; two  $\frac{1}{2}$  in. Dallmeyer's 2A stereo landscape do., £2 15s.; Thornton-Pickard foreground stereo shutter, 20s.; solid leather case for lenses and shutter, Gs.—Francke, St. Saviour's Road, Jersey.

**Sundries.**—I will exchange geared Facile bicycle, reversing handles, King road lamp, balls everywhere, splendid condition, can be seen by appointment, for half-plate camera outfit, or sell £5; Fallowfield's Facile hand-camera, used but once, as new, 25s., cost 75s.; Shew's Eclipse hand-camera, three double slides, and Shew lens, quarter-plate, 50s.—Young, 19, Lambourn Road, Clapham, S.W.

**AMATEUR PHOTOGRAPHER**, No. 191 to 273, and about 150 numbers, mostly later, price 4s. 6d.—D. B., 18, Marine Street, Bermondsey, S.E.

## WANTED.

**Enlarging Apparatus.**—Enlarging apparatus for natural or artificial light, any make, must be cheap.—Lawther, Rochester, Otterburn, Northumberland.

**Enlarging apparatus, Optimus preferred.** Letters only.—C. E. Thorne, 29, Calabria Road, Highbury, N.

**Hand-Cameras, etc.**—Wanted, a good Facile or Shew's Eclipse hand-camera, quarter-plate. Send description, and state lowest price to Reinspach, Langham Hotel, London.

All above guaranteed finest order. On view, City Sale and Exchange Rooms, 54, Lime Street, corner Leadenhall Street, City (late Goy's Medium). Second-hand apparatus bought, sold, or taken in exchange. Inspection invited.

**Lanterns!! Lanterns!! Lanterns!!!** Slides!! Slides!!! The largest and most varied selection in the whole kingdom. Before selecting elsewhere, call and inspect the stock of the City Sale and Exchange, 54, Lime Street, Leadenhall Street, City, where we have no hesitation in saying you will find all that you require in this way. Lanterns for sale, lanterns lent on hire, lanterns sold on commission, or taken in exchange for other apparatus. Write for special supplemental lists, Manager, City Sale and Exchange, as above.

**Magic Lanterns and Slides.**—Walter Tyler's Helioscopic is perfection of all lanterns, supplied to Indian Government, School Boards, science classes, clergy, and exhibitors throughout the world. Impossible to have lanterns give better definition or more satisfactory results; specially constructed lens, which no other lantern possesses.—Walter Tyler, 48, Waterloo Road, London.

**Walter Tyler's Best Triples and Binuals** are unsurpassed, and perfect in every detail. Good binuals, mahogany bodied, brass fronts, and all improvements, £7 10s.; single lantern, with 4 in. condensers, portrait front lens, 4-wick lamp, complete, in case, 27s. 6d.—Walter Tyler, 48, Waterloo Road, London.

**Lantern Lenses.**—Specially constructed. Walter Tyler's new Helioscopic portrait combination lantern lens gives the most perfect definition and brilliancy, can be fitted to any lantern, and for excellence cannot be surpassed. No other maker has this lens, which is manufactured expressly for Walter Tyler, Waterloo Road, London.

**Regulators and Gauges.**—Great reduction, in price. Either can now be had of Walter Tyler for 14s. each. The largest stock of gas cylinders in England. Best seamless steel, tested and valved, and all sizes at very low prices.

**Slides from Negatives and Pictures.**—Walter Tyler manufactures and colours slides on the premises, thus ensuring speedy delivery, and prices are most moderate.—Walter Tyler, 48, Waterloo Road, London.

**Binual Lanterns.**—If you are in want of a really good binual lantern, perfect in every respect, call and see Walter Tyler's entire brass fronted, mahogany-bodied, lined with Russian iron, and fitted with new best quality lenses, and sold at a most moderate price. The top lantern will take a 4-wick lamp. These are great bargains.—Walter Tyler, 48, Waterloo Road, London.

**Hire Department** is now perfect. Largest and best collection of slides in the world; over 200,000 always in stock. Temperance, travels, Scripture, educational, comic, tales, etc. Cheaper than any other house, no extra charge for coloured slides or effects. Special terms for large quantities.—Walter Tyler, 48, Waterloo Road, London.

**Lanterns and Slides.**—If you wish to hire, purchase, or exchange, you cannot possibly do better than go to Walter Tyler, who makes this business a speciality, and you will thus save dealer's and all intermediate profits.—Walter Tyler, 48, Waterloo Road, London.

**Second-hand Lanterns and Slides** at very moderate prices, also all kinds of apparatus. Send for large catalogue, 420 pages, with instructions for working lanterns of all kinds, and costing an immense sum to produce, sent free for 6 stamps. Small catalogue and second-hand list, post free.—Walter Tyler, 48, Waterloo Road, London.

*It is unnecessary to send an advertisement for the "Sale and Exchange" column for more than one insertion, as the goods are usually disposed of when the first advertisement has appeared.*

**ENLARGING APPARATUS.**—Hume's enlarging apparatus, 5 in. condenser, without objective, 61s. 6d.; with 8 in. condenser, 123s. 6d., carriage paid.—Hume, 1, West College Street, Edinburgh.

**COLLOTYPE Printing** for Amateurs or Trade, also instruction given in Collotype or Zinc through post or by appointment.—Lingard, 2, Holmes Street, Derby.

**WANTED.**—Gentleman with £50 to join advertiser in Suburban Business. Half profits and taught profession. Takings since April, £100. Capable of great extension. Thoroughly good chance. Investigation invited. Apply personally, if possible.—Windsor Studio, Sutton, Surrey.

## THE BOOK OF THE LANTERN

By T. C. HEPWORTH, F.C.S.

A Practical Guide to the Working of the Optical (or Magic) Lantern—either as an Educational Instrument, for Exhibition Purposes, or as an Enlarging Apparatus for Photographers. With full and precise Directions for Making and Colouring Lantern Pictures. Price 3s. 6d., post free.

"Here we have something like a lantern manual! A handsomely bound, comprehensive work, written by an acknowledged master in lantern operations."—*Photographic News*.

"Comprehensive, and is characterised by an excellent literary style."—*British Journal of Photography*.

"It is without exception the best book that has been published."—*The Amateur Photographer*.

SALE and EXCHANGE Advertisements (at the charge of Three Words for One Penny) must be received by Tuesday evening's post to ensure insertion in the same week's issue.

**"Amateur Photographer" Monthly Competition, No. 42.**—"SEA PIECES AND RIVER SCENERY." Latest day, November 21st.—Prizes: Silver and Bronze Medal, with ribbon and clasp. One mounted print only to be sent in. Entry forms, etc., on receipt of stamped envelope. Address: Editor, AMATEUR PHOTOGRAPHER, 1, Creed Lane, E.C. (Prizes will be announced and photographs reproduced and criticised in the AMATEUR PHOTOGRAPHER Supplement, December 9th.)

With reference to our reminder (on page 298) of Messrs. Wormald and Co.'s second "Photomnibus" (Pin-ho'e) Competition, we are now enabled to announce the prize winners as follows:—

First prize, £2 2s., awarded to W. L. F. Wastell, Fuller's Road, S. Woodford, Essex, for photograph of a "Group of China." Second prize, £1 1s., awarded to Henry Staynes, 41, Avenue Road, Clapton, N.E., for photograph of "Harold's Bridge," near Waltham Abbey. Third prize, 10s. 6d., awarded to Frank W. Robinson (age thirteen), 140, High Street, Lewes, Sussex, for his photograph of "Hamsey Bridge," on the Ouse, Sussex.

We understand the prize and other pictures will be on view at the following exhibitions:—Leytonstone Camera Club, 10th to 12th November; Hackney Photographic Society, 15th to 17th November; South London (Peckham) Society, 24th to 26th November.

The next (third) "Photomnibus" competition is returnable on June 30th, 1893, when the same prizes are to be repeated.

THE fifth annual exhibition of the Photographic Society of India will be held in Calcutta early in December. The exhibition will embrace every branch of art and manufacture connected with photography, and will thus afford to those who make a study of the art-science, whether professionally or otherwise, an opportunity of becoming acquainted with all the most recent improvements and developments introduced by home and foreign firms. Provided the judges deem the exhibits of sufficient merit, the following medals will be awarded, viz., five gold medals, fifteen silver medals, and fifteen bronze medals. Of these some will be reserved as follows:—For professionals of the world, one gold medal; for amateurs of the world, one gold medal, five silver medals, and five bronze medals; for amateurs of India and Burma and amateur members of the Photographic Society of India, one gold medal, five silver medals, and five bronze medals. In addition to the above, a special medal will be given for the best photograph in the exhibition.

It is proposed, provided they fill, to medal the best in each of the following classes:—Class 1, landscapes, architecture, and interiors; Class 2, portraits and groups; Class 3, genre pictures and studies; Class 4, photographs of objects in motion; Class 5, lantern-slides; Class 6, photo-mechanical processes; Class 7, apparatus and appliances.

No exhibitor is to be allowed to take more than one gold medal.

The undermentioned gentlemen, elected by the members of the society to act as judges, have consented to serve:—The Hon. Sir Comer Petherham, Q.C., Chief Justice of Bengal; Colonel J. Waterhouse, S.C., Assistant, Surveyor-General of India; Colonel M. W. Rogers, R.E., Assistant, Surveyor-General of India; Mr. W. H. Jobbins, Superintendent, Government School of Art, Calcutta. There will be no appeal from the decision of the judges.

Photographic lantern-slides will be shown by means of the society's optical lantern during the exhibition. The loan of slides for this purpose is invited; they must not exceed  $3\frac{1}{4}$  inches in height, and, to enable the committee to select and arrange them, must be delivered not less than one week before the opening of the exhibition.

THE Photographers' Benevolent Association, or P.B.A., as it is irreverently called, is in luck's way this year. The entire receipts of Mr. Fred Hollyer's exhibition of prints, now on view at the Dudley Gallery, will, on the last day, the 12th inst., be handed over to the above Association, as

also the proceeds of the catalogues. Our readers can now kill two good birds with one stone, namely, go and learn a good lesson from Mr. Hollyer's work, and help the P.B.A. as well.

MR. MASKELL'S first lecture and demonstration in Paris on Monday last on Platinotype and kindred photographic subjects appears to have given great satisfaction, and was well received. The experiments in printing by the light of the oxy-magnesium lamp were particularly well appreciated.

OUR illustration this week represents the results of a railway accident at Spring Gardens Junction, Barnard Castle and Bishop Auckland branch, North-Eastern Railway, on October 1st. One line has been completely torn up, and the trucks are piled up in great confusion.

A most artistically designed diploma of merit is being given in the photographic competition promoted by the Stanley Cycling Club, at the Royal Agricultural Hall. The right-hand side of the diploma is occupied by the figure

of Fame; on the left-hand is a figure emblematic of photography, and a cyclist, with a camera and other photographic paraphernalia attached to his machine, occupies the centre. We understand a copy of the diploma will be presented with each medal awarded, in addition to those presented separately.

THE new photographic exhibition and competition, promoted by the Stanley Cycling Club, in connection with the Stanley Show, which takes place at the Royal Agricultural Hall from 18th to 26th inst., promises to be very successful. Sir Albert K. Rollit, M.P., opens the exhibition at noon on Friday, the 18th inst. Among the firms exhibiting photographic apparatus are Messrs. R. and J. Beck, B. J. Edwards and Co., Sands, Hunter and Co., Dallmeyer and Co., Lonsdale Bros., City Sale and Exchange Rooms, Elliott and Sons, W. Wray, Platt and Witte, Morley and Cooper, Autotype Co., A. and J. Smith and Co., H. Park, and others. The picture competition and the attractive list of entertainments, combined with the conveniently accessible location of the exhibition, should ensure its being a great success.

OF late years cycling and photography have in a measure gone hand in hand, and so at the Stanley Show there has been each year an increasing contribution of photographs and photographic apparatus, until now the executive have deemed it advisable to make special provision for a competitive exhibition of pictures, as well as apparatus and appliances, and no doubt the Committee of Management are actuated by a desire to meet the tastes of the average cyclist more than anything else, otherwise some of the rules and conditions seem a good deal out of harmony with contemporary photographic ideas, and are not calculated to evoke the sympathy of the serious and advanced workers.

IN the first place the five classes will seem to many particularly inadequate; thus Class A, *Instantaneous Cycling Subjects* (sets of four), and Class B, *Instantaneous General Subjects* (sets of four), will be surely rather difficult to divide. "Cycling subjects," at least, seems to demand a little explanatory definition, but none is forthcoming. Class E is for "Pictures by Platinotype Process (any subject)." Why wasn't there a class for "Pictures taken on Ilford Plates," or "with Ross's R.R. lens,  $f/32$ "? Surely it would be as rational.

THE judges are Messrs. J. Traill Taylor, Henry Sturme, and Andrew Pringle, and we note that in all fifteen medals are placed "at the disposal of the judges for artistic and technical excellence." No offence, good sirs, but will you who are so eminent in sciences and sports also assume the rôle of art critics? Look to it, ye artists in monochrome!—the simple photograph which cost you so much patient care and thought, and which your painter friend applauded, is to be subjected to the analysis of the expert in optics, the bacteriologist, the genial tourist and scribe. "Duplicate prints of prize-winning pictures are to be furnished to the Stanley C. C." Evidently those who framed the regulations are under the impression that photographs are but machine-made pictures which can be turned out by the dozen. Had they ever set themselves the task of pro-

ducing a picture from two or three negatives, conscientiously aiming at a definite effect, they would probably regard less lightly the production of a "duplicate print."

WELL, we wish the Stanley Show all legitimate success, but doubt the advisability of dragging in the artistic. Surely art in our days is forced to find strange yoke-fellows, and now it is to be associated with pneumatic tyres, safety brakes and the like. Even "artistic snap shot" competitions do not seem wholly satisfactory in result, to judge from the amount of controversial correspondence which sometimes follow.

AMONGST the many Christmas supplement plates which are just now enlivening the appearance of railway book-stalls and newspaper shops, we are pleased to notice one very pleasant picture which bears a signature well known in photographic circles, that of Henry Van der Weyde. It is the Christmas picture of *Black and White*, and is from an original pastel by Mr. Van der Weyde, copied by photography. It needed not this additional proof of the artistic ability of the author of the Photo Corrector and other works.

LAST week, in the columns of a contemporary, Mr. George Davison, the writer of a leading article in which certain Pall Mall pictures were instanced as examples of errors in cloud combining, replies to Mr. Karl Greger's defence in no uncertain phrases, and thinks this gentleman's pictures "were the most glaring examples of inconsistencies shown in any of the pictures at Pall Mall worthy of criticism and examination." The last five words of the sentence are of a very qualifying nature, for there were probably very few pictures which the critic in question thought "worthy," and Mr. G. Davison is never too lenient when he thinks he has found a fault.

So far this is very well, and we have no doubt that Mr. Greger will take the criticism in good part, and value it more, perhaps, than his self-constituted champion who in the same contemporary's correspondence pages uses "the supposed faults in others," to wit, Greger, Bedford, Gale, etc., as a foil wherewith to thrust at Mr. Davison. Is it that some old sore has been long rankling in his gentle bosom? Strange how combativeness is developed in some constitutions. Some folks will rush in where angels fear to tread.

WITH the increasing use of rough-surfaced papers and brown "tones," may be noticed a greater tendency towards large sizes—not but what the name of quarter-plates is legion, and probably always will be so long as hand-cameraism is a fashionable craze—but the middle sizes of half-plate and thereabouts seem to be much rarer in the present day exhibitions than formerly. Probably this is to some extent accountable to a more widespread desire to make "pictures," and because with broader methods of treatment large prints come more naturally than if microscopical definition were practised, and close inspection of minute details necessary. It is, however, to be feared that "press notices" have had a baneful effect in this direction, the craving for notoriety and an exaggerated notion of the superior attractiveness of large pictures. It is said that a certain Hon. Secretary wants to quarrel with someone as to whether as much great art cannot be got on a postage stamp as on a whole-wall fresco. We are not sure whether Messrs. Elliott and Son's "Wave Study" of this year beats previous records in

point of size, but it is to be hoped that not many exhibitors will emulate these, mammoth achievements, else the P.S.G.B. may be expected to become the successors of Imre Kiralfi's Venice as tenants of "Olympia."

FROM all one can learn, and some exhibitors are not too communicative as to their methods of working, the large pictures are by no means chiefly what are known as "direct" photographs, but the results of making enlarged negatives, the best things being obtained with a carbon transparency made from the original negative and then enlarged in the usual manner. In the forthcoming exhibitions which are announced in our columns, a good deal of this kind of work will, we understand, be seen.

OUR friends at Leytonstone and at Hackney, whose exhibitions will be noticed in next week's issue, are by no means content to trust to the mere display of photographs to "draw" the public, but have arranged quite elaborate programmes for each evening. At the former there will be half-hourly events in the form of lecturettes, music, etc., and the latter will so far indulge popular taste as to introduce theatricals in the form of a comedieta entitled "Amateur Photography, and what Came of It."

BOTH the above exhibitions are being worked most enthusiastically, and success in each case is pretty well ensured.

THAT in photography the artist is the slave of circumstances, the machine and his materials, and that for this reason it cannot be ranked as a creative art, is a reproach likely to be removed so soon as such methods of altering the original subject as Mr. Van der Weyde's patent promises, and Mr. Willis's latest platinotype process are thoroughly known and understood and practised.

AS was announced in reviewing the Camera Club Exhibition, Mr. Van der Weyde has patented a method which he calls the "Photo Corrector," whereby he is able to modify, change, and in such manner control the relative parts of his model that practically out of an ill-proportioned figure he can construct on the photographic plate the form of an Apollo or the perfect symmetry of the classic Venus. The feature which is undesirably prominent he can suppress, and exalt others, according to the dictates of the operator's artistic taste. This power alone in proper hands might be enough to give photography a new position and to revolutionise its entire status.

But with it is the "New Cold Bath" paper of the Platinotype Co., now generally known, but, as we think, not fully appreciated; and although what is known as the Glycerine Development has been pretty freely spoken of and described, we find comparatively few know what its advantages are, or what an enormous artistic power this method places in their hands, so that we have jotted down without any claim to originality our own procedure when a few weeks ago we for the first time essayed to put into practice the hints we had gathered, and were happy in producing what we considered a very satisfactory print from a negative which had hitherto defied our efforts with any other printing process.

FROM Mr. J. E. Ellam, the Hon. Secretary of the Stockton Photo. Soc., we have received some stereograms of the Thirsk disaster, one of which we shall hope to reproduce,

## Chit-Chat.

In his last article upon "Field Photography" Mr. Hinton strikes at the root of the principal shortcoming of photography viewed as a graphic art, *i.e.*, its failure in representing the true tonality of the subject. It is well that the unthinking and careless should have this fact brought home to them, but if Mr. Hinton could go a step further and show how this photographic falsification of nature could be avoided, he would do more for photography than man has yet done. The practical solution of the difficulty will probably be found in further improvements, which yet remain to be discovered, in colour-sensitive plates.

THE thanks of your readers who are unacquainted with the German language (in which category, by the way, I must include myself) are due to you, Mr. Editor, for your translation of Professor Watzek's and Herr Haschek's articles upon "Spectacle Lenses." From a few hasty experiments of my own, and an inspection of some more thoughtful work so produced by others, I am led to the belief that the method will prove exceedingly valuable in certain branches of work, notably for large heads and studies of the human figure. A diffused softness of effect is produced difficult to obtain by other means.

*"Everything I say is right; if you do not believe it now, you will when you grow wiser!"*

WHEN will the craze for new developers cease? The latest, which has been christened "Mixtol," contains no less than *nine* ingredients. Surely "Mixed-all" would be a more appropriate designation. Notwithstanding its competitors, pyro remains the best all-round developer extant, and is still used by almost all *practical* men. If beginners would learn to appreciate this fact, their work would be better and their difficulties fewer.

WHY, Sir, do you and your brother editors devote space which could be far more usefully occupied, to the so-called reports of Society Meetings? I like to read a good report, I confess, but few of those to whom the duty is assigned appear to understand the art of reporting. I can understand Brown, Jones, and Robinson liking to see their names in print, but why should their gratification be considered at the expense of the mass of your readers?

WHAT edification is there for the general reader in the statement that "The Cribbing Camera Club" met on the 1st inst. when Mr. Bore, the President, gave an address in his usual monotonous and heavy style. Mr. Smart said he thought he had heard the same statements before, and the President in reply said that that was probably so, as, in a laudable endeavour to maintain the tradition of the club, he had copied his remarks from previously published addresses. The Secretary then announced that Mr. Emulsion would attend on the 14th to describe his own productions, when he hoped there would be a good attendance, as Mr. Emulsion had promised to present free samples of plates to all present. The Secretary also said that he had received a quart of the new developer "Fogemall," which he said he had taken home to try. After some discussion upon the propriety of such a proceeding on the part of the Secretary, the meeting was adjourned.

SERIOUSLY, Mr. Editor, I think this question is well worthy of consideration, and I for one shall be glad to hear the opinions of your readers upon it. CHATTERBOX.

## Letters to the Editor.

### NOXINOL.

SIR,—We think, perhaps, that the following experiments made just recently by Mr. A. Bently Smith, of 189, Maida Vale, would certainly be of interest to your many readers.

Mr. Smith exposed an ordinary Ilford plate under usual conditions. Afterwards in the dark-room he cut the plate in two portions. The first half he introduced into a developing bath (hydroquinone) containing about half an inch in depth of developing solution, to which had been added a small quantity of our Noxinol.

The tray was then placed on a chair in the broad daylight out of doors (time, 12.50) for three minutes, during which time the progress of the development was followed with the greatest clearness. A bright sun was shining, but the chair on which the developing tray was standing was placed in the shade. When the development was completed this half portion of the plate was taken into the dark-room and fixed. Then the second half of the plate was subjected to exactly the same treatment under precisely the same conditions, but without any Noxinol being added to the developer. The result of the latter test may be easily imagined. Mr. Smith, of course, obtained a black impenetrable film without the slightest trace of any image, whereas the first half which had gone through the same fire of this most heroic ordeal came out without any sign of fogging whatever.

These experiments only independently corroborate our own investigations with Noxinol before we offered to the public a product which may in our advertisement appear to be somewhat exaggerated to those who have not had any experience as to the remarkable results that can be obtained with its use.—Yours truly, G. WRIGHT AND Co.

### THE WORLD'S FAIR.

SIR,—I enclose a copy of the official letter just received from Chicago in regard to the photographic privilege at the World's Columbian Exposition, which may interest many of your readers. The spelling of word "stereoscopic" is just as it is in the letter.

By agitation and concerted movement the amateurs of America have thus been successful in changing the sentiment of the authorities, which was at first strongly against the admittance of any camera, and I desire to express through the medium of your valuable journal my sincere thanks to all of our foreign friends and societies for the aid they so kindly gave us. The minor restrictions that now appear may be removed by the time the exhibition opens.—Yours, etc., F. C. BEACH.

"The World's Columbian Exposition, C. D. Arnold, Official Photographer.

"Office of D. H. Burnham, Director of Works, World's Columbian Exposition, Jackson Park, Chicago, Ill. "October 25th, 1892.

"American Amateur Photographer, 239, 5th Avenue.

"GENTLEMEN,—Hand-cameras using plates up to and including 4 by 5 in. without tripods, will be allowed within the grounds of the World's Columbian Exposition on and after this date, on payment of a fee of two dollars in addition to the regular price of admission for each day.

"Cameras using *stereoscopic* lenses will not be admitted, however small the plate may be.—Very sincerely,

"C. D. ARNOLD (Official Photographer)." \* \* \* \*

### TONING BATH.

SIR,—I beg to thank those readers of the AMATEUR PHOTOGRAPHER who, having tried my new toning bath, have given their experience with the same; I also offer you some further notes on the subject.

First, as to my own experience.

The bath I first made (some months ago now) I am working with to-day. The proportions were exactly the same as published, and after toning about two dozen prints, I also was bothered with the pink tones. I filtered the solution and returned it into its bottle. I next made up:—

Sodium chloride .. .. .	64 gr.
Ammonia sulphocyanide .. .. .	15 "
Water .. .. .	2 oz.

This I placed along with the bath I had been using. Next day I tried the bath again, but only added 1 gr. gold chlor., and found the bath worked to perfection.

I now add gold chlor.  $1\frac{1}{2}$  gr. for every sheet to be toned, and the above solution of salt and amm. sulph. as needed, viz., whenever the bath begins to work slow, or when the pink tones appear. Gold may be added any time during toning.

For Eastman's paper (my experience has been entirely with Ilford) I would suggest using 100 gr. salt (or more) per 10 oz. of solution.

I have not been troubled with acidity, or yellowing of prints, but I think it would be caused by using common or very acid gold chloride.

I can get any tone, from sepia to deep warm black, and have never had a single case of uneven toning.

Perhaps your readers may be more successful with the following:—

Sodium chloride (salt) .. .. .	80 gr.
Ammonia sulphocyanide .. .. .	15 "
Gold chloride .. .. .	$1\frac{1}{2}$ "
Water .. .. .	10 oz.

Used the same way as bath in No. 417, p. 225.—Yours, etc.,  
ED. MASON.

#### "HINTS ON POSING."

SIR,—As an amateur I am much indebted to your paper for various bits of information which have appeared in its columns of late, and I cannot help making remarks upon the same. I am sure it gives credit to such persons as Mr. Rentzch to favour the amateur with such information as appears in this week's AMATEUR PHOTOGRAPHER. I cannot help thanking Mr. Rentzch for his "Hints on Posing." As I have a group to take and was somewhat in a maze as to the proper way of fixing, I should be much obliged to Mr. Rentzch if he could further such information more in detail, or state some particular book which treats on the subject. Thanking him in anticipation for such valuable and practical information.—Yours, etc.,

POSING.

NOTE.—The "hints" were extracted by us from a report of the Foochow (China) Camera Club, and Mr. Rentzch will hardly have time to send us a reply within the next month or two. H. P. Robinson's book, "The Studio, and what to do in it," price 2s. 6d., is the authority on the subject.—EDITOR

#### INTENSIFYING LANTERN-SLIDES WITH SILVER.

SIR,—In a paper read before the London and Provincial Photographic Association, and given in your issue of the 28th ult., Mr. George T. Harris gives it as his experience that it is possible—nay even easy—to intensify gelatine lantern-slides with the old collodion acid silver intensifier. A process of that sort is a great boon to the lantern-slide maker who is in the habit of preparing slides from book illustrations, in many of which there is little enough contrast. On seeing Mr. Harris's paper I tried the process. I made my silver solution according to his formula, using distilled water. On mixing it with the pyro solution I got a white precipitate which dissolved slightly in excess of the sulpho-pyrogallol. I added the silver till I got a permanent precipitate, filtered it off, and used the filtrate for the intensification process. It intensified considerably a lantern-slide that had been freed from hypo by washing in running water for twelve hours. The process was rather slow, taking perhaps a quarter of an hour. The lights of the lantern-slide remained clear. Now what I should like to ask is this, is Mr. Harris's paper correctly reported when it says that one or two minims of the acid silver solution are to be added to half a dram of the usual 10 per cent. sulpho-pyrogallol? Should it not read that half a dram of the sulpho-pyrogallol be contained in the ounce of water? I am sure that the experience of your readers on this subject would be valuable, and perhaps Mr. Harris will be good enough to tell us how he avoids the formation of a precipitate when mixing the intensifier. I do not think the precipitate is silver chloride, since the sulpho-pyrogallol was made up in distilled water.—Yours, etc.,

G. E. BROWN.

\* \* \* \*

#### MEDAL HUNTERS.

SIR,—Being a recipient of the following awards in the recent exhibition of the East London Photographic Society—first medal in open class, special medal and challenge cup for best picture in the exhibition, first medal in "landscapes," "river scenery," "portraiture," "instantaneous," and "architecture," and third

certificate in "landscape" and "instantaneous"—I wish to say a few words in reply to your remarks in last week's issue.

I was one of the first to join the E. L. P. S. upon its formation in April, 1891, being at that time quite a beginner in photography.

I quite agree with you that one man should not be allowed to sweep the boards, but at the same time I may inform you that previous to our exhibition in 1891 I proposed and was fortunate enough to carry, one man one prize only, the next best to follow up in succession. Through this proposition being carried, myself and others encountered a storm of remarks, from one or two in particular who received a higher prize than the picture was thought worthy of at the close of the first exhibition.

It was then decided to make new exhibition rules to obviate a second experience of the same thing. Now we come to our recent exhibition to which you refer, and in which I competed, considering myself only a third-rate worker at the result of last year's work.

If my memory does not fail me, our present rules run thus:—"That in the event of one member receiving more than one award of equivalent value the same to be inscribed upon one medal, and in the event of a member receiving more than one award in one class, the first will be awarded and the second, as the case may be, will be withheld." Speaking financially, the Society only has benefited by me sweeping the boards; and not myself, regarding the number of medals I receive, as I only receive one bronze medal for four first and two third awards.

I trust our worthy Hon. Sec., Mr. Wilkinson, who has received one first and four second awards, and will receive but one large bronze and one small, upon seeing this will forward you a copy of our exhibition rules, as I am sure you have not been acquainted with them, judging from the reading of last week's issue.

The question now arises as to whether or not one bronze medal is of sufficient interest to try and sweep the boards for.—Yours, etc.,

CHARLES TYLEE.

SIR,—Referring to your note in your last issue, relating to the rules of competition of the East London Photographic Society, I think you are under some misapprehension, and that your remarks are likely to reflect unwisdom on the part of the committee.

The principle which guided the committee throughout, was that every member should have what he earns, with this provision: in the event of a competitor earning an equivalent prize in more than one class, *only one medal* would be given, bearing the inscription of the classes in which he was successful. If it were otherwise, as you seem to favour, that a prize winner in one class should be debarred from taking a prize in another class competitors fourth or fifth in order of merit would obtain the first prize in some cases. I could quote an instance in which this really was the case. This I think, you will agree, is grossly unfair. If you would kindly publish this letter, possibly other readers of your admirable journal will ventilate their views on the subject.—Yours, etc.,

M. M. E.

SIR,—With reference to your views *re* distribution of medals, I beg to call your attention to the rules regarding same in the East London Photographic Society, viz., That in the event of a member earning more than one award in one class, the first will be awarded and the second or third withheld; and in the event of a member earning more than one award of equivalent value, the same shall be inscribed upon one award.

In our recent exhibition it so happened that one member received no less than four first and two third awards, and I myself received one first and four seconds in the various classes for competition amongst the members, so that according to exhibition rules the member mentioned above will only receive *one medal* containing the inscriptions of the other three awards, the two thirds are withheld on account of being in the same classes in which he receives the first awards. In my own case I receive two medals, viz., one first and one second, containing four inscriptions.

Under these circumstances, I do not consider it worth a member's while to enter with the idea of *sweeping the boards*, neither can I see why he should receive the title of *medal hunter*.—Yours, etc.,

M. A. WILKINSON  
(Hon. Sec., E. L. P. S.)

We may state that our remarks were not levelled at one exhibitor in particular. The rule of the East London Phot. Soc. would obviously prevent medal hunting. At the same time we think that as all society exhibitions are presumably for the encouragement of young workers there should be some limitation as to one member taking all the first places. If the East London or any society's rules provide that in the case of any member winning two firsts he shall have one medal and two inscriptions, and the medal in the second case shall be passed on to the next competitor, all well and good. If not, then the position remains the same, namely, one competitor may sweep the board, and the society is in pocket by the non-awarding of medals, and the other competitors have not the slightest chance against the champion worker, who, in somewhat analogous hobbies, cycling, running, etc., would be handicapped heavily. We shall be very pleased to hear what any of our readers have to say, only please take the principle—not individual cases.—EDITOR.

\* \* \* \*

## THE PHOTOGRAPHERS' BENEVOLENT ASSOCIATION.

SIR,—I am pleased to say that my letter in the last week's papers has brought one or two offers from employers which have enabled us to fit good men into situations. I have one offer which is rather peculiar. A gentleman who has a good portable saloon studio, which he has worked profitably both winter and summer up to the present, but which he is now working in the summer time only, and settling in a small town during the winter, offers to let it to a thoroughly reliable man on condition that he will retouch a few negatives for the owner, and hand him as rent all money taken over 30s. per week. As I have a very great number of assistants on my books, any one of whom might be willing to entertain this offer, I ask you to let me make it public through your medium, which will save me an immense amount of correspondence. One employer says that he supposes we have only "lame ducks" on our books, and others seem to have this notion. This is quite a mistake, for we have the addresses of operators and retouchers, managers, and others, who are only just out of best berths, for the men whose names are on the Employment Bureau are in no way connected with those who apply to the Benevolent for monetary assistance.—I am, yours, etc.,

H. SNOWDEN WARD, Hon. Secretary.

Memorial Hall, E.C.

**Walton Phot. Soc.**—Ordinary meeting on the 2nd inst., Mr. J. Kennedy in the chair. The President announced that the evening would be devoted to the second lantern-slide competition held by the society. There were seven members who competed with sets of six slides. The slides sent in show some very excellent and careful work. Mr. F. Murphy and Mr. John Parke kindly consented to act as judges. After all the competition slides were passed through the lantern, the judges then retired and consulted together. Upon the judges returning they announced that "Red Centre" had won the first prize, and "Red Spot" had won the second prize. Upon the respective envelopes being opened it was found that Mr. George Latimer was first, and Mr. Henry Shurrock was second. After the competition slides were finished several members brought extra slides, which were passed through Mr. Kennedy's lantern. The President announced that the subject for the next meeting (Dec. 7th) would be "The Ferricyanide Process," by Mr. H. E. Burn.

**The Largest Photograph.**—Baltimore will have the distinction of presenting to public view in her Columbian parade the largest photograph in the world in the shape of a picture 9 feet long and 6 feet high, of "Columbus before Ferdinand and Isabella," after V. Gribayedoff's engraving of Brozik's celebrated painting. This photographic feat will constitute the float of St. Pius' Parish in the parade, and will be furthermore unique as the pioneer experiment of adapting photography to this purpose. The idea originated with Mr. William H. Weaver, of Weaver and Son, No. 1,151, East Baltimore Street, an artist of recognised ability, to whom the whole design for the float was entrusted. The design is remarkable for its artistic grace and beauty. The two colossal pictures on either side of the float will be framed in ornamental panels, also photographed, taken from the representation of "Columbus before the Council," on the bronze doors of the Capitol at Washington, the work of Randolph Rogers. Surmounting the float is half of the globe, on the summit of which stands Columbus and his two captains, catching the first glimpse of the New World, one eagerly pointing to land, and the other as eagerly gazing towards the goal of their hopes, while the great discoverer himself stands wrapt in a silent ecstasy of grateful prayer. These figures will be in relief, about 5 feet in height. Great dragons, with twisted bodies, their tails curving upwards, support the four corners, and at the end is to be a large photograph of Cardinal Gibbons. Four strong lights within the float will illuminate the pictures, thus making them splendidly effective and bringing out every perfection of detail and finish.

## Photographic Procedure.

By E. J. WALL.

(Author of "The Dictionary of Photography.")

### SECTION VI.

### DEVELOPERS AND DEVELOPMENT.

(Continued from page 260.)

**Pyro and Fixed Alkalis.**—To many operators the fumes of ammonia are offensive and even harmful, and therefore the fixed alkaline carbonates are used. In America the fixed alkalis are nearly always used, and undoubtedly in England they are steadily gaining favour.

The alkaline carbonates used are those of potash and soda, and it will not be out of place to briefly call attention to these salts. The carbonate of potash which should be used is the pure, known to chemists and dealers as Potassii carbonas P.B. A still purer kind may be had, but as this is of an excessive price it is not worth the extra cost. Carbonate of soda is made in several degrees of purity, the commonest, cheapest, and most impure being the ordinary "washing soda" of the household. The only disadvantages attendant on the use of this is that the negatives are stained much more than with the purer varieties, and also from the fact that, so it is said, the men engaged in the manufacture of it are paid by the amount of water they can make the salt crystallize with, without liquefying. It is carbonate of soda plus a variable amount of water, it cannot be relied upon for absolutely the same strength, when bought at different times. A purer variety, and one which I always use, is crystallised carbonate of soda, the Sodii carbonas P.B., which contains ten molecules of water,  $\text{Na}_2\text{CO}_3 \cdot 10\text{H}_2\text{O}$ , and may be assumed to be a fairly constant quantity. The third variety of this salt is the anhydrous, which is the above-named salt partially or wholly deprived of its water of crystallisation by heat. But as the anhydrous carbonate of soda is very prone to absorb water and become carbonate of soda,  $\text{Na}_2\text{CO}_3$ , plus an indefinite quantity of water  $x\text{H}_2\text{O}$ , it is, I think, preferable to use the crystallised variety.

Before proceeding to consider the different fixed alkaline developers, it may not be out of place to consider what is the difference in practical results to be obtained by using ammonia or a fixed carbonate. The main difference, and one which will appeal most strongly to the beginner, is that with the fixed alkalis there is far less likelihood of chemical fog or fogging by development, and also, although I am not prepared to defend this second statement, except upon one particular ground, there is a possibility of, if not actually greater contrast when using the fixed alkalis, especially with soda, than when using ammonia. The extra freedom from fog is probably due to the fact that bromide of silver is not soluble in the fixed carbonates, whereas it is soluble in ammonia, and when using the latter the shadows are apt to be fogged. With the fixed alkalis there is certainly, in the hands of a beginner, more control over development.

**The Potash Developer.**—We are indebted for this developer to Dr. Stolze, and it is one which has found considerable favour. There is, perhaps, not much advantage in the use of potash over soda. With the former we can make more concentrated stock solutions and a somewhat quicker printing negative, which is an advantage sometimes. On the other hand, the developer itself turns brown quicker than the soda, which turns the characteristic yellow colour for which it is celebrated.

There are, of course, innumerable formulæ extant, but I shall merely content myself by giving two formulæ, both of which are well proved in practice:—

#### EDER'S FORMULA.

1.

Distilled water .. ..	100 parts.
Neutral sulphite of soda .. ..	25 "
Pure sulphuric acid .. ..	3 to 5 drops.
Pyrogallol .. ..	10 parts.

2.

Distilled water .. ..	200 parts.
Carbonate of potash .. ..	90 "
Neutral sulphite of soda .. ..	25 "

Dissolve in the above order. For use mix

Water .. ..	100 parts.
Pyro solution 1 .. ..	3 "
Potash solution 2 .. ..	3 "

I must say that I do not quite see the advantage of putting the sulphite of soda in the alkali; this is, however, probably done so that when mixed there shall be the proportion of five of sulphite to one of pyro.

*Beich's Developer.*—Although I call this the chemist's shop, on account of the curious mixture, it has done right good service in many hands.

1.

Hot distilled water .. ..	2 oz.
Sulphite of soda .. ..	2 "

When cool add:

Sulphurous acid .. ..	2 "
Pyrogallol .. ..	$\frac{1}{2}$ "

2.

Carbonate of potash .. ..	3 oz.
Sulphite of soda .. ..	2 "
Distilled water .. ..	7 "

Dissolve the salts separately and mix. For use mix:

Pyro solution .. ..	1 dram.
Potash .. ..	1 "
Water .. ..	1 oz.

The following remarks apply both to the potash and soda developers. Bromides act much more energetically with the fixed alkaline accelerators than with ammonia, and, in fact, where under-exposure is suspected it may be as well to leave it out altogether. It is advisable to use an alum bath after both soda and potash developers, if negatives without great contrasts are desired, as leaving the stain in the film increases the contrast.

Further considerations of modifications of the developer will be deferred till the conclusion of our notes on the fixed alkali.

(To be continued.)

**Tunbridge Wells Phot. Soc.**—The ordinary meeting on the 3rd inst. Mr. E. R. Ashton in the chair. Mr. Gunner, of Tonbridge, was duly elected a member. The evening was devoted to examining and criticising the prints which had been sent in to the AMATEUR PHOTOGRAPHER Figure Study Competition, in which one of the Vice-Presidents, Mr. E. R. Ashton, was successful in gaining the second award (bronze medal); consequently there was more than ordinary interest attached to the prints, which were considered of a much higher average than some that had been seen before.

**Edinburgh Phot. Soc.**—The annual business meeting was held on the 4th, Professor Crum Brown in the chair. After letters of regret had been read from Dr. Drinkwater and Professor Balfour at their being unable to attend, the Secretary and Treasurer submitted their annual reports, which were adopted. Some alterations to the rules were effected, and several new members were enrolled. The election of office-bearers for ensuing year was then proceeded with. The society now possesses a studio ready for use (we believe the only amateur club studio in Edinburgh), and an enlarging room nearly so. There was an exceedingly good exhibition of work, over 150 pictures being sent in. Considering the small subscription, the society seems to be doing very well and worthy of support.

## Catalogues.

"FALLOWFIELD'S PHOTOGRAPHIC REMEMBRANCER" FOR OCTOBER AND NOVEMBER.

THIS welcome little sheet is this issue devoted to winter requisites, and every novelty is included—all the latest things in the lantern and lantern requisites. Flash lamps and print and slide colouring materials are offered, and some rare bargains in job lots, which probably will soon be snapped up.

## Review.

*The Lantern-Slide Manual.* By John A. Hodges. Published by Hazell, Watson, and Viney, Ltd., 1, Creed Lane, E.C. Price 2s.

In this work the author has given us a complete guide to lantern-slide making. We have first "Slide-making by reduction," including "The apparatus," "Reducing by artificial light," "Cleaning and preparing the glass," "The negative." Section II. is devoted to the process of wet collodion and gelatino-bromide; Section III. to "Lantern-slides by contact printing," and working by artificial light, "The gelatino-chloride process." Section IV. treats of "Emulsion-making by the gelatine and collodion processes." "The albumen and carbon processes" next claim attention, and Section V., "The final treatment of the slide," shows how to tone and intensify, print-in clouds, mount, bind, and finish the slide.

Mr. Hodges is well known for his slides, and so complete a work from him will be useful to tyro and expert.

## Apparatus.

### THE "OPTIMUS" ARTIFICIAL LIGHT ENLARGING APPARATUS.

Messrs. Perken, Son, and Rayment, of 99, Hatton Garden, have just introduced an improved form of enlarging and projection camera, available either for lime or lamp light.

As will be seen from the diagram, it has practically three parts—the lantern body, with bellows front, the central portion carrying the condenser, connected by bellows with the front carrying the objective. The condenser is inserted in the central chamber through the side door, and a very important gain is that, by the aid of special carrier frames, the condenser may be placed quite close to the light when using short-focus condensers, and also a 4 in. or 4½ in. diameter condenser may be used for projection in

the same apparatus as a 12 in. or 16 in. diameter condenser is used for enlarging.

The back and front are both fitted with the patent "Optimus" rack and pinion, so that by merely pulling out the front by the brass handle seen in the diagram, the approximate distance

between lens and negative, whilst the distance between light and condenser may be obtained in the same manner. Having thus obtained the approximate distances, the pinions may be, by a slight pull, placed in action with the racks, and fine focussing may be at once effected. Not only can the objective and light be thus moved, but the condenser also is moved to and fro by the central milled head.

The apparatus is strongly and substantially made, with either the necessary lime jet and fittings or the ordinary three or four-wick lamp. The objective is a portrait lens of the Petzval type, with large diameter back lens. This instrument will be of very great value to all those who wish to combine a lantern and enlarging apparatus, and it is one we can strongly recommend to photographic societies, as it can be used both for enlarging and projection.

## BUTCHER AND SON'S LANTERN NOVELTIES.

W. Butcher and Son, photographic chemists of Blackheath, S.E., have placed two novelties on the market which are well

Fig. 1.

Fig. 2.

worth attention. The combination cover glass and spot binder, shown in figs. 1 and 2, is a decidedly practical idea, and consists of a specially selected thin glass with a gummed binding strip attached, so that one has merely to wet the strip and place the slide in position and turn the binder down. The front of the binder is provided with a blank white space for title and two spots, thus saving the operator trouble.

Fig. 3.

## THE REFLECTOSCOPE.

This, as its name implies, is an instrument for the table exhibition of lantern slides by day or artificial light. It is provided with a lens of 3½ in. diameter, thus rendering the examination of slides very easy, and allowing the operator to

judge of the tone and density of the slides without the bother of getting out the lantern. Both novelties strike us as extremely useful and well worth the attention of every lantern slide maker.

## MEZZOTYPE PAPER.

With regard to our notice of this paper last week, the Carlotype Company call our attention to a slip. We say that they recommend a 1:5 fixing bath, but they do not do so, and say—“The fixing bath we use is 1 to 10, and we leave in this for fifteen minutes. We find that with this bath no appreciable reduction takes place, and the prints dry very brilliant and vigorous looking. Our paper of instructions does not give a fixing bath, and is not as complete as it might be, perhaps. But when we issued the paper we had supposed that most people using it would already have a knowledge of silver printing and the effects of fixing baths of different strengths. With a fixing bath of 1 to 5, the reduction of image is very rapid (unless toning is very thorough). A knowledge of this fact is extremely useful, as an over-printed specimen can be reduced by a prolonged fixing, but there is a danger that by this method the half-tones will be tinted with yellow unless there is a heavy deposit of gold.” The error arose through a correction in ink on their bill of instructions.

## BRUN'S GLOSSY TRANSPARENT COLOURS.

Messrs. Schwarz and Co., of Dashwood House, 9, New Broad Street, E.C., are placing upon the market the above.

The colours are concentrated and moist, and merely need diluting with water before laying on, without any previous preparation of the paper or slides. After colouring, prints may be burnished by the hot or cold process without in any way damaging the colours.

In conjunction with these colours a special competition is to be held by the *Practical Photographer* under the following conditions:—

1. £5 5s. and a handsome framed certificate of merit will be given for the best, and £1 1s. and a handsome framed certificate for the second best portrait coloured with Brun's colours. £2 2s. and a

handsome framed certificate will be given for the best set of three lantern slides, coloured by the same means. Handsome framed certificates will be given to the competitors who run close to the winners.

2. Each competitor to send in one coloured mounted portrait, not

smaller than cabinet size, or three coloured lantern-slides, which will become the property of the editor of the *Practical Photographer*.

3. The competition will close on February 25th, 1893.

4. The judges will be three experts chosen by the editor of the *Practical Photographer*, and their decision will be final.

5. All prints in competition must be mounted on plain mounts, marked with a symbol or *nom de plume*, and must be accompanied by an envelope bearing the same distinguishing mark and containing the name and address of the competitor. Slides must also be marked with a symbol, and the name be sent in a separate envelope.

6. All work entered for the competition must be done with Brun's Glossy Transparent Colours, and must be accompanied by a printed form from the dealer from whom the colours were bought certifying the sale.

7. Any competitor may send in more than one coloured photograph, or may enter for both the print and the lantern-slide competition, but cannot take more than one prize.

8. The prizes will be in cash.

## TYLAR'S "UNIVERSAL" LANTERN SLIDE PRINTING FRAME.

Mr. Tylar, of High Street, Aston, Birmingham, has introduced a new lantern-slide printing-frame, as shown in the accompanying figure. The negative is held in position by the clamping bar A, and can be moved either up or down over the plate-holder B, which is so adjusted as to slide from right to left up to the extreme edges of the negative used. The sensitive plate is

placed in at the back of the sliding holder B, in the same way as in an ordinary printing-frame. There is no chance of breaking the negative, as no springs press on it. The sensitive plate can be changed without interfering with the negative in any way. The price of the frame is 5s. 6d., and we can thoroughly recommend it to all lantern workers.

# ILLUSTRATED SUPPLEMENT,

## Monthly Competition, No. 41, "Inland Scenery, with and without Figures."

IT is with much pleasure that we have again to record a distinct advance in the quality of the work sent in to this competition. We have no hesitation in saying that many of the prints now placed in Class III. would in previous competitions have ranked in Class II., and some of the prints which, though placed in Class I., received no award, are superior to some which have in previous competitions taken the prizes.

The most noticeable features about the best prints are, first, the beautiful skies printed in; secondly, the rough matt-surface papers which lend themselves so readily to artistic effects; and thirdly, the superior style of the mounts. We trust this improvement will be continued in our succeeding competitions.

### CLASS I.

1. BROOMHALL, P. B. (Twickenham). — "The Last Resting Place." Ross' Portable Symmetrical,  $f/22$ ; 1 sec., August, diffused light, 4.30 p.m.; Fitch film; Mezzotype paper, extra rough. We have absolutely no fault to find with this picture, though personally we should have liked a sepia instead of the warm purple tone. It is one of the finest prints ever sent into our competitions.

2. KING, C. G. (London). — "Sunset after Storm." Single combination of 9 in. French R. R.,  $f/22$ ; 8 sec., March, dull and stormy, about 4.30 p.m.; Thomas' thickly-coated landscape; Ilford slow bromide rough-surfaced paper. "This is a combination print, the negative was taken and kept till suitable cloud negative could be obtained." Our block by no means does justice to this print, which is a very bold yet striking picture.

3. FULLJAMES, H. J. (Wimbledon). — "A Kentish Farmyard." Ross R. R.,  $f/32$ ; 2 sec., June, sun, 4 p.m.; Edwards's inst. Iso.; mezzotype; combined hypo, 1 oz., gold (15 gr. in 4 oz.) 12 drops, water 10 oz. "Fully exposed, in order to get detail in shadows, which, however, does not show on the rough paper." The suppression of the detail does certainly not detract from the very artistic result obtained.

4. MORISON, J., JUNR. (Glasgow). — "Loch Katrine and Ben Venue." Dallmeyer R. R., 12 by 10,  $f/32$ ; about 2 sec., September, sunlight and shadow, 1 p.m.; Castle plate; sepia platinotype rough, no toning. A very fine print, which would have been improved by clouds.

5. PRESTON, G. (Cornwall). — "Sand and Water." Lancaster's half-plate Rectigraph,  $f/30$ ;  $1\frac{1}{2}$  sec., August, diffused, 4 p.m.; Ilford ord.; Ilford P.O.F., squeegeed on to ground glass. A happy little bit of composition, though printed a little too deep.

6. GLASEBROOK, F. — "Devonshire Cottages." Sepia platinotype, Ross lens; taken about 4 p.m. in July, good light, exposure full, about 12 sec., stop  $f/32$ . Our block is the exact size of the print, which is a very delicate, soft little study.

HARVEY, C. J. (Kidderminster). — "Dying Leaves." Single lens,  $f/30$ ; 3 p.m. "I took this subject in a very yellow light, thinking thereby to get the same result as if a yellow screen was used in white light." A pretty little quarter-plate, very simple yet pleasing, and although our competitor's knowledge on the subject of colour correctness is not very extensive, he has managed to turn out a good result. There is no advantage in using either a yellow screen or yellow light with an ordinary plate—rather the reverse.

VULLIAMY, E. P. (Glasbury). — "Maesclough Castle." Dallmeyer's Tele-photo-graphic lens, No. 5 stop; 30 sec., August, sun and cloud, morning. This is the first example of work done by this lens sent in to our competitions, and it is very good, though rather spoilt by over-printing. The operator was half a mile from the castle.

MOSS, C. (London). — "Sunset." R. R.,  $f/22$ ; 5 sec., June, very dull light, 6.45 p.m. A half-plate platinotype cold-bath print of great excellence, but showing, so the judges thought, evidence of having been touched up.

MCCLEERY, J. (Bel-fast). — "In Early Spring." Single lens at  $f/20$ ; 1 sec., June, diffused light, at noon. A half-plate matt chloride print; study of sheep, of great beauty, and highly commended.

BRADSHAW, T. C. (Ramsgate). — "On Loch Etive's Shore." R. R.,  $f/16$ ; 1 sec., sunshine. A matt chloride whole-plate print, which would be improved by a little less foreground.

D'AETH, C. C. H. (Wincanton). — "Salisbury Cathedral." Back combination of 7 in. R. R.,  $f/32$ ; 2 sec., May, good light, 4 p.m. A 10 by 8 platinotype print, excellent both artistically and technically, and highly commended.

GROOME, R. T. (London). — "The Path to Church." R. R.,  $f/22$ ;  $2\frac{1}{2}$  sec., September, dull light, 11 a.m. A little quarter-plate chloride print, much admired by the judges, who suggested a rough printing-out paper.

HOLT, H. (Liverpool). — "Rydal Water." R. R.,  $f/32$ ; 8 sec., April, very dull light, 3 p.m. "Taken in most wretched weather, between heavy snow showers; clouds in original negative. Dull cloud, just what I wanted to get the effect." A  $7\frac{1}{4}$  by  $5\frac{1}{2}$  matt chloride of great delicacy and softness, and very highly commended.

BULMER, P. (Durham). — "Derwentwater and Skiddaw." R. R.,  $f/64$ ; 4 sec., May, good light, 3 p.m. "A long bit cut from a whole-plate, and very effective, the distant mountains being exceptionally good.

HIRST, E. (Cleckheaton). — "Solitude." Single lens,  $f/20$ ; 1 sec.,

No. 1.

"THE LAST RESTING PLACE."

[P. B. Broomhall.]

SILVER MEDAL.

August; good diffused light at 4 p.m. "The negative was taken on a half-plate, and portions of it masked out." The actual print measures about  $2\frac{1}{2}$  by  $5\frac{1}{2}$ , and had a little more been included of the trees on the left-hand side, a better picture would have resulted.

BERRY, A. R. (Brockley).—"Porchester Castle." R.R.,  $f/32$ ; 2 sec., February, sunlight, 11 a.m. Rough-surface silver paper. Too warm in tone, and sky far too deeply printed.

### CLASS II.

BAILLIE, W. W. (Oundle).—"Frost and Fog." R.R.,  $f/22$ ; 2 sec., on dull, foggy day, at 11 a.m. in December. A very fine frost study, which would look far better on a matt-surface paper.

BATTY, A. C. (Liverpool).—"Eventide." 8 by 5 Beck R.R.,  $f/16$ ; 1-10th sec., 4.30 p.m., August, mean; Marion ordinary, pyro ammonia, cold bath platinotype. Far too black and white. An exquisite sky, but the foreground is too black, and the light on water too white to be true.

SNOWBALL, G. L. (Newcastle-on-Tyne).—"The Old Smithy, Killoonockie." F.L.R. lens,  $f/32$ ; 2 sec., August, good light, 12.45 a.m.; Castle; Ilford P.O.P., combined toning and fixing. Highly commended by the judges, showing very careful and excellent work.

SANDERSON, F. H. (Cambridge).—"On the Cam." French R.R.,  $f/16$ ; 1-10th sec., soft sunshine, 12.30; Ilford slow; Solio paper. This could easily have been improved by raising the camera front, and cutting off some of the unnecessary foreground, and taking in the tops of trees.

ROBERTS, DOWEN (London).—"Walberswick, Suffolk." Swift's rapid Paragon,  $f/16$ ;  $1\frac{1}{2}$  sec., August, bright light, diffused, noon. Fry's K.S.; cold-bath platinotype. "Cloud obscured the sun at the moment of exposure." Nearly an inch less foreground, and clouds would have improved this vastly.

SEEVERS, JOSEPH (Kendal).—"Coniston Valley from Lake Bank." Beck's R.R.,  $f/32$ ; 1 sec., August, sunshine, 4 p.m.; Marion's ordinary; Ilford P.O.P. The surface of the lake was ruffled by a strong breeze, which, however, did not at the moment disturb the foliage in the foreground. A pretty little quarter-plate study, which is printed just a trifle too deep.

POTTS, W. E. (Manchester).—"View in Miller's Dale, Derbyshire." Wray's single lens, 12 in. focus,  $f/45$ ; 15 sec., August, sun, 4 p.m.; Ilford rapid; platinotype. Although the branches and leaves in the foreground are far too black and heavy, they throw up the distance very well.

MAXWELL, J. PRESTON (London).—"Auld Brig o' Isla, Keith, N.B." R.R. lens, half-plate, by Morley and Cooper,  $f/16$ ; 12 sec., August, dull light, leaden sky, slightly raining, 3 p.m.; half-plate, Ilford rapid; Ilford P.O.P., gelatino-chloride. "Taken rather in a hurry, between two heavy showers of rain, from under trees." The print is flat and poor. We would suggest a rough-surface paper for this.

NEWLAND, A. (Burmah).—"Troops Encamped on the Chin Frontier." A clever bit of work, and a really artistic view.

MCCLINTOCK, R. L. (Woolwich).—"An Old Mill." Lancaster's Silver Ring rectigraph,  $f/22$ ; 1 sec., June, diffused light, about 4 p.m.; Ilford ordinary; platinotype, cold. "The light was failing rapidly, but was pretty fair, although the day was cloudy." The right-hand side is a little too black and heavy, but it makes an effective print.

LONGMORE, H. A. (Sydenham).—"In Hermitage Woods." R.R.,  $f/22$ ; 12 sec., July, dull light, 3 p.m.; Ilford ordinary; platinotype (new cold-bath). "Having focussed and being ready to expose, I had a wait of twenty minutes before I could do so, owing to a troublesome wind which rustled the leaves about; a lull coming I seized the opportunity." A very good print, but we should have liked to have seen the foreground sharper and the distance less so.

LINGING, H. F. (Newcastle-on-Tyne).—"Flint Mill, Blaydon-on-Tyne." Optimus,  $f/22$ ; 4 sec., September, bright light, 2.30 afternoon; Castle; Solio paper. Far too heavily printed and thus spoilt.

JONES, W. LLOYD (Cheshire).—"Rigg Mill, near Whitby." Dallmeyer R.R.; time exposure, August, diffused light, about 1 p.m. Paget xxx; P.O.P. Print over-printed, flat, and heavy.

BOOTH, JAMES A. (Reading).—"Clifton Bridge." Half-plate rectilinear,  $f/22$ ; 20 sec., September, dull, misty distance, about 5.30 p.m.; Thomas T.O.L. A very effective study, which would lend itself well to artistic results on rough or matt paper.

COULTHURST, S. L. (Manchester).—"An Irish Lane." Wray's  $5\frac{1}{2}$  in., R.R.,  $f/11$ ; slow shutter, July, soft and clear, about 11 a.m.; Castle, developed pyro-ammonia; P.O.P. A capital little quarter-plate shot, very soft and delicate.

BROOK, T. MORLEY (Manchester).—"Rigg Mill." Wray's single,  $f/22$ ; 10 sec., August, dull light, raining heavily, 3.15 p.m.; Ilford special rapid; Blanchard's platinum. A little less foreground and more sky would have improved this.

BROWN, A. (Waterloo).—"Stepping Stones, Raby Mere." Eureka R.R.,  $f/22$ ; 2 sec., April, sun shining, 1 p.m.; Ilford ordinary, half-plate; P.O.P. A good picture simply spoilt by over-printing.

SPIERS, W. R. (Haltwhistle).—"The Morning Boat." Optimus Euryscope,  $f/32$ ; 1 sec., August, 6.30 a.m., dull light, misty. Edwards' Isochromatic instant. A very good result has been obtained, considering the early hour. The distance is very good.

TODD, R. (Heaton).—"Waiting to be Shorn." French R.R.,  $f/11$ ; half sec., June, sun behind cloud; Ilford White Label; P.O.P. A very soft delicate print, but just wanting in brilliancy.

WEBLING, A. H. (Brighton).—"Returning from Work." December, 4 p.m.; Ilford; Taylor R.R.,  $f/22$ ; 3 sec.; Soltype. A very good print, commended by the judges, but the figure a little too central.

WOODS, V. S. (Chelsea).—"Glen Artle." R.R.,  $f/40$ ; 3 sec., August, bright sun, 5 p.m. Thomas's Iso.; mezzo-type. Printed too deep, and wants clouds; could be made a picture though.

## The Object of Photography.\*

By CATHERINE WEED BARNES.

HAVING been asked to open the discussion to-night, the above subject has been selected as being important, and as permitting considerable difference of opinion. Let me indicate at once the broad, liberal lines on which it seems to me the discussion should be pursued. As long as human beings are not created free and equal, although a certain well-known document says so, they will differ materially in their objects and their pursuit of them. Especially is this true of mental processes, among which, I claim, photography holds no mean place. The object which each worker has in view may, and often does, differ widely from that which he should pursue in order to obtain the greatest possible benefit, and in thus striking the keynote of my paper I hope to point out in some degree the ideal all camerists should keep in sight. We all know the great moral axiom that we best help ourselves by helping others; indeed, it cannot be otherwise, and this help can be given in many ways, only seen by those whose minds are trained to receptivity of all progressive movements. The human mind is an organ, a function, an intangible, incomprehensible force—what you will; but it is great or small, not only according to the impulse behind it, but the use we

Andrade, E. ... London, N.

make of it. We may look at photography through a narrow or wide-angle lens, through the telescope or ordinary view; there is plenty of choice, all depends on the will of the individual worker. Those who are able to learn by everything teachable in the realms of mind and matter will find that in photography these two forces join hands with greater or less energy according to the object of each worker. Those will gain the most whose ideal is the highest, and, as in union there is strength, so photographic workers accomplish most when organised into societies, provided the standard is held high over men's heads and never lowered from fear of criticism, for any purely personal or selfish motive. What if any individual worker should come more prominently than another into the brilliant electric light of public opinion or approbation. Is that a reason for discouragement or lowering one's own flag? Rather should it be an impetus forward on the principle of the fairy in one of Jean Ingelow's stories. "Don't you know," she said, "that in Fairyland what you can do you may do?" The trouble is we carry on the fight somewhat on the free-lance principle, and "each one for himself" does not advance the general standard of progress. If individual preference be on the high plane of real altruism, well and good; but, usually, the ordinary human being is more exercised in raising his own special average than the general one of humanity.

Let us consider then what photography can do to elevate this

ment, and many never get any further. They can be left out of the question; but to those who once begin to make a study of the work and find it broaden into one field after another, filling one's utmost limit of mental effort, the interest grows more absorbing as they realise that, however great may be their progress, they will never know all there is to be known. The object which at first is pleasure only in the sense of recreation, becomes then something far nobler as a powerful factor in training, what we speak of so often, and comprehend so incompletely, the human intellect.

If we accept the object of photography as being a mental education, how can it best benefit us? In every study those gain most who come equipped for work by natural or acquired gifts. Perhaps no one faculty in photography is more quickly called into exercise, or more rapidly improves, than that of observation. As this grows keener, the eyes stimulate the brain to act, and in landscape work alone, a fuller, richer appreciation is daily given us of the world of nature. The shortest journey shows us what we might otherwise pass by unheeding, and extended travel sends us home benefited by a wealth of experiences which many of our fellow-travellers lose. We do not need to go on land and sea for such; often near our own doors we learn to see a constantly varying panorama of change. I do not believe that in any more efficient way can we be helped than by aiding this very faculty of observation, especially in the young, when it can be made a fixed habit.

Passing from the world of nature to that of man, we find, although we are usually gifted with the same physical organs and general appearance, that such are capable of infinite variety when looked at from different standpoints. In portraiture the object should be to truthfully and kindly represent the sitter's best aspect. We have in this to struggle against preconceived prejudices, as people always think they know for themselves what the old woman called her "congregation side," and it is well occasionally to see ourselves with others' eyes. Once in a portrait gallery I heard a lady say, looking at her proof, "I don't like it at all, but it looks just like me." Another time, the photographer said to me, "There's Mr. A. has been here four times this week to sit, and yet is not satisfied." Do we all know our best side? Every portrait photographer who properly knows his business understands that the first grand requisite of success is to make the sitter feel at ease under far different circumstances from his usual ones. It would be well if this was more carefully considered and made a more striking feature in our studios, but it draws heavily on one's nerve force, and necessitates more of a strain than most operators are willing to endure, unless really in love with their work, which the majority are not. I have had occasion to see a good deal of the inside of a professional studio, and a day's observation of the different sitters gives an entertaining study of human nature. I have often thought it would pay to have a regular adviser or art director in the studio to advise sitters, men and women, for one is no wiser than the other, what to wear and how to wear it to obtain an effective picture. If the operator attempts this, he too often meets a sharp rebuff. The amateur, if he be willing to use time and patience, has often a great advantage over the professional in respect to this question of being at ease, as his work is done usually amid familiar surroundings. I undertook once to photograph an old artist friend, who would not assume any but the stiffest possible pose of the shoulders, until I placed a palette and brushes in his hand, when his whole attitude became at once perfectly easy, because natural. Figure studies, to one who has a taste for them, are the most fascinating and, at the same time, most trying and difficult branch of photography. There is always something to learn in it, and its difficulty is, to me, its greatest charm. What is easy presents no attractions.

Every worker is more or less influenced by others, therefore he best utilises his own efforts, and in his turn exerts influence, by joining, as before suggested, a photographic society. The ideal one has yet to be invented or evolved, as the tribes of men increase in not merely technical knowledge, but common sense. As at present constituted, they form, in the main, excellent schools as regards practice for those workers already somewhat proficient, but should do more for the beginner than is the case. As managed here and in America, they vary greatly, and each might gain by adopting some of the others' methods. I differ from my compatriot, Dr. Mitchell, in his advocacy of the club system, believing in the work as a mental education, not as a mental recreation. One point generally lost sight of in such organizations, as soon as they become pros-

[J. Morrison, jun.

general average. If nothing, it is worthless, but it can do much and it is worthy of thoughtful consideration.

The adage that "beauty is its own excuse for being" does not entirely cover photography. The latter adds to the cultivation of the beautiful, that of the useful. Thousands of feet below the earth's surface, as regards land and sea, has the keen eye of the lens revealed to us once hidden mysteries, and beyond the systems of worlds heretofore unknown has it opened limitless possibilities. What other art or science can claim so much? In the astronomical equipment of Harvard University, near Boston, is being set up the largest photographic lens ever made, to be electrically controlled in correspondence to the motion of the earth. The lens has a 24 in. aperture, and will be used on a 14 by 17 plate. The time is fast approaching when photography will be utilised in all the countless ramifications of human knowledge, and there is no use in artists or scientists denying what will soon be an undeniable fact. Even on the lowest plane of merely personal help to each individual worker, photography is a pursuit embodying in itself broad scope for cultivating the powers of the keenest brain. Much more is this increased when we take into consideration our fellow-workers. Every thought which finds effect in word or act is a stone dropped into the stream of human life whose widening circles touch and influence countless others.

Speaking of the individual worker, what is and what should be his object in this work? We know they are not always the same thing. He begins, we will say, because it is suggested to him as an amuse-

perous, is the great law of majorities—the greatest good of the greatest number. Few human beings are capable of self-abnegation under such circumstances, and when they are, it is often to meet criticism, if not opposition, on the part of those less disinterested than themselves. The true worker should, however, like the Alpine climber on the glacier, be so busy in cutting steps for his feet, that he cannot watch the progress of others, but must attend to his own. When comparative success is gained, then comes the danger common to success, believing the summit has been reached, than which there is no more fatal delusion. It is possible, in tracing out the various by-paths of photography, to make the pursuit in large measure a liberal education, and the widest culture can be used advantageously. I believe in a sound technical training in optics, chemistry, and mechanics, and elementary, if no more, art training, and a wide reading of the best general literature. Here is where so many photographers—more professionals, perhaps, than amateurs—fail to realise the importance of cultivated intelligence in what claims, and rightly so, to be ranked among the fine arts. One should also make a point of keeping in touch with all that is being said and done through the various photographic journals in different countries, not work on blindly in one's own little special pathway.

If the object of photography is to educate, that means liberalise, and for this a thousand ways are open through literature, science, and art. Decrying the increase of illustrations by photography as injuring wood-engraving, for instance, is like the rebellion of hand-work as against machinery. The world does move if people will act as did some Indians once on the American prairies who attempted to stop a train by holding a long leather lariat across the track. The Indians suffered, not the train. Photography is a most important adjunct in nearly all mental studies, and will become more so as its facilities for work increase. Let each one, therefore, follow out his or her own salvation, grateful for criticism or praise, whichever best aids in keeping high the standard already indicated. Lenses, cameras, instruments of all kinds are only means to an end, discussions upon them and upon methods of work are only valuable as they conduce to the further elevation of photography itself.

I feel strongly on this subject, believing firmly that photography can be of incalculable benefit to all who pursue it with singleness of purpose, or with a desire to help others. In this connection let me heartily endorse and offer hearty co-operation to the affiliation scheme recently proposed by the Cheltenham Society. It is a move in the right direction, and deserves the endorsement of similar organizations, wherever located. While not criticising those who look at the object of photography from a different standpoint than my own, I merely place myself on record as regarding photography in the light of a vital, educational force; a responsibility, and not a plaything; a power which can be used in so many ways when seriously considered that I cannot but feel it a privilege to be numbered among its adherents. Time and conscience prevent my wearying you with a longer paper, and yet I feel the subject has been very inadequately treated, my only consolation being that, in presenting it to you, I am enabled to emphasise my strong interest in the work to which my time and energies are devoted.

## The Reflection of Light.

In the current number of the "Philosophical Magazine," Lord Rayleigh communicates the results of his researches on the reflection of light, which cannot but be of interest to all photographers. The object of the research was the photometric comparison of the direct and reflected rays from a glow lamp. Photography was used, and the integration of the effect during an exposure of several minutes allowed the adjustments to be made with greater facility. Owing to striæ in the glass bulb it was necessary to cover it with tissue paper, and as the rays proceeding from the lamp in opposite directions were used, it was rotated slowly during the whole time of exposure. At first ordinary plates were used, but as these plates are scarcely sensitive to yellow and green light, the effective light was liable to considerable variation with the current used to light the lamp.

Isochromatic plates were then employed, and a yellow glass was used. The spectrum was photographed and was well defined, lying

with almost perfect symmetry between the sodium and thallium lines. The effective wave length was therefore about 5,620. Under favourable circumstances it was possible to deduct the difference of  $3\frac{1}{2}$  per cent. in the photographic records.

A few experiments could therefore be expected to give the required result within one per cent. Lord Rayleigh's photographic method of photometry, the value of which depends on the observance of these simple but important conditions, may be expected to be of considerable value in ordinary photometric work.

With the reflective power of water, viz., 0.02076 to 0.022, as measured by Lord Rayleigh, we are not much concerned, but the efficiency of mercury, 0.753, is of considerable importance in connection with the use of reflectors for electric light. It is not probable that reflectors coated with metallic silver are materially better than the best mirrors with mercury amalgam, and allowing for the glass and for tarnish, it must not be expected that more than 70 per cent. of the light falling on such reflectors could be returned. Accurate determinations of the reflective power, according to Lord Rayleigh's method, would be vitiated by however small departure from strictly plane reflectors; but a very small surface would suffice.

The efficiency of metal reflectors is not so important for practical purposes as that of silvered glass, because of their liability to tarnish. The following figures may, however, be of interest:—

Zollner gives the reflecting power of mercury at 0.648; speculum

No. 5.]

"SAND AND WATER."

[Geo. Preston.

metal, 0.535; glass, 0.040; water, 0.021. The last of these agrees well with Lord Rayleigh's determination, but there is a considerable divergence in the first. Sir J. Conroy found silver to be 0.70; speculum metal, 0.66; steel, 0.54; and tin, 0.4; but from the account of his experiments in "Proc. Roy. Soc.," xxxv. and xxxvi., he does not appear to have made his observations immediately after polishing the mirrors.

Herschel gives 0.6 as the reflective power of mercury, and puts silver as high as 0.9.

**Bath Phot. Soc.**—The first indoor meeting of the winter session was held on the 26th ult., Mr. Austin J. King, President, in the chair; a paper was read by Mr. George Norman, entitled "The Camera as an Aid to Archaeology." The lecturer said his special object that evening was to show the use of the camera in making permanent records of the forms of ancient buildings, many of which were fast disappearing from the land. For this purpose there were exhibited upon the screen pictures of Irish architecture from the earliest to mediæval times, mostly from the lecturer's own photographs taken at meetings of the Royal Society of Antiquaries of Ireland, commencing with the primitive lake dwellings and underground caves, and passing on to the beehive cells and oratories. He then described the various forms of the early Christian churches, which reached their highest development in Cormac's Chapel at Cashel, with its barrel vault and high-pitched roof of stone, and concluded with a series of illustrations of mediæval abbeys and cathedrals.

## Out-door Winter Photography.

WHILST at the present season of the year a large number of our readers turn their attention to the fascinating pursuit which the making and showing of lantern slides offers, yet to a good many it is a time when the camera is practically shelved for three months at least, under the impression that photography, especially landscape photography, is an occupation of summer time only.

As, however, attention has of late been increasingly directed to picture making in its higher sense, and an artistic perception of things more and more generally cultivated, so some have sought the picturesque, not only in out of the way places, but also at unlikely times and seasons, and have found nature beautiful when previously they had imagined her void of attractions or without interest. Still, we believe too many are content to let the winter, and with it the months of late autumn and early spring, slip by without ever venturing out into the fields and countryside, or, at least, without ever attempting to discover whether at the less inviting periods of the year the spots which gave such delight when the sunshine was warm, and flowers and green foliage made so bright a summer picture, may not in the barrenness of winter present to the artist or photographer something worthy of study; and hence, perhaps, a few suggestions at the

present moment, as we cross the threshold of November, dreariest month of all the year, may not be without some practical good.

To commence with, what may be called the mechanical difficulties can hardly be brought forward as a reason for not practising photography during winter. The increased facilities which science has placed in the artist's hands, such as plates of greater rapidity, lenses of large aperture, and so forth, leave him in a position of which photographers of but a few years ago never dreamed, and make him practically independent of the weather.

That an excursion across marshy lands in November, or a tramp across the bleak moorland on an average December day is as *enjoyable*, from an ordinary standpoint, as the same ramblings would be when the soft and genial air of summer carries with it the memory of newly-mown hay over which it lately passed, and very gently stirs the rich foliage of the trees, musical with bird voices and grateful environment of cool shade, yet we do not hesitate to say that a picture at the present season is often possible, and even very desirable, when, except as a pleasant spot to visit or a quiet place wherein to rest awhile in leafy June or sultry August, it would have been without attraction for the serious artist. To face a cold, damp wind, and encounter pools of water, tracts of soft mud, beds of wet decaying leaves, and such things as must be anticipated on a country

walk when for weeks the sun has not had sufficient power to evaporate the excessive rainfall, may not be either enjoyable or pleasant, and yet there are thousands who think such matters quite inconsiderable as compared with the passing and, contrasted with our more serious pursuit, we may say trivial pleasures of shooting, golfing, or hunting, so that if we are in real earnest in our photographic work the mere inclemency of the season and personal inconvenience will be insufficient reason for keeping the camera within its case and ourselves in the easy-chair.

Probably the real reason with many is not so much a reluctance to turning out of doors and donning overcoat and shooting-boots as the fact that the idea of seeking for the picturesque in the flowerless and forsaken fields, or where the trees, leafless and barren, stand black and gaunt against the dull sky, has never occurred to them; and then again, just as everyone of us accustomed for years to travel by the same road, may be hardly conscious of the existence of many a notable place scarcely removed from the well-known path, so there are some whose observations have always as

it were travelled by the high road of general and conventional taste, and who never thought to diverge a little from the beaten track and see what beauty may lie hidden where circumstances have not led us before, and where custom prevents the ordinary man.

For such there is, indeed, a store awaiting. We are not

No. 6.]

DEVONSHIRE COTTAGES.

[F. Glasebrook.

of course, addressing ourselves to the knowing ones our more advanced readers, to whom the mysteries of a winter landscape are already known, but to those whose only idea of a winter picture is the representation of the phenomenal whiteness of a snow scene or the fantastic, and withal beautiful, coverings of hoar-frost; and to such, if a hint of ours can only prove an incentive to study the picture possibilities of landscape in winter, we shall have opened up a field perhaps more boundless in opportunities than when the land is warmed by summer sunshine, and made radiant with the long daylight hours.

The natural disposition of photographic methods to exaggerate the shadows of the scene, and to lower the general tone of the picture, and also the tendency of nearly all photographers to "over-print," and so to carry the error still further, may to some extent account for the great number of sunset, twilight, and similar low-light effects being present at all photographic exhibitions and displays. The inseparable characteristics of photographs will often make them appear very true to the early morning or late evening effects, when, as a matter of fact, the negative was exposed at quite a different time of day, and the altitude of the sun, and the consequent position of the source of light in the picture, is the only thing which betrays the truth. Hence, the darkness of photography should, and, as we think, does lend itself peculiarly to the truthful rendering

of winter subjects. Moreover, who that has watched nature with a sympathetic eye has not noted the beauty of the landscape when the sun climbs down the heavens towards the horizon? And so in the winter, when the sun never approaches anywhere near to the zenith, we have constantly the broadening result of a low source of light.

And then as to what subjects are most likely to prove satisfactory in winter, is a more difficult and extensive question to deal with, and we can hardly do more than suggest some of the things which are likely to prove satisfactory as pictures.

There is an immense field for work in woodland scenery, a locality hardly possible for camera work when the trees were clothed with summer foliage, and little light could penetrate into the deep umbrage. Moreover, the foliage does not often render pleasantly by photography, and the eye seems to require relief and variety; so now that the branches are becoming leafless, and the fascinating forms of branches and tall stems are revealed, is the time to attempt the forest glade and woodland path.

Now in a forest, clearing an open space, where trees have been felled—or, perhaps, have never grown—the ground is covered with undergrowth of bramble furze and bracken, patches of brown grass and heather intervene, and, perhaps, some dark pools of stagnant weedy water, with tufts of round-stemmed rushes and plantain. For variety we may find little protruding knolls of bare soil, red earth or yellow gravel. In such a spot the trees are often smaller, slighter in growth, or torn and twisted by wind and storm. The grey-white stem of the silver birch is here a conspicuous feature, forming nice contrast with the dark background of the adjacent forest, and, oh! the glory of the touches of brown and amber where the withering leaves still cling to blackened branches. Is there not a picture here with the trees not so near and tall as to shut out all the sky, but just enough of soft cloud effect above, and just sufficient light amongst the dark forest trees to prevent their coming out on our print a black and heavy mass. The carpeting of bracken fern in all the beauty of summer greenness is not so satisfactory to the picture-maker, as, now seared and broken, they form strong patches of bright yellow and ruddy browns and greys, their form less mechanical, their arrangement more scattered. Here and there a withered frond, which was a giant amongst its fellows, ere the petals of the bramble blossoms fell away at the swelling of the coming fruit, protrudes from amongst the darkest recesses of the tangled bushes, and forms a bright spot amidst the blackness. No lack of picture subjects here. Back through the deeper forest huge trunks of centenarian oak and beech trees moss-grown and weirdly twisted may suggest a picture, especially if gipsy figures or rustic children are at hand and are deftly posed. Out of the forest and down the breezy hill slope, oak and ash and hedgerow elm stretch their almost naked limbs into the grey air, and darkly cast reflections in the pool of rain-water which has gathered so inconveniently at the gateway below. Here, heedless of wet feet and muddiness, cattle await the coming of the farm man to take them home for milking. Through the gate and down the lane the odour of wet decaying leaves is everywhere, and then the scent of a wood fire tells of the close vicinity of the cottage or farm. Do you know these two peculiar odours, never met with anywhere as in our English rural places, and never so sweet as in late autumn? What have odours to do with picture making? Well, if not directly, indirectly they have much to do with it. One must be thoroughly in love with the country (most Englishmen are), and must be in just that frame of mind which can greet and welcome every sign and characteristic of rustic life, if one would succeed in catching Nature in

her most picturesque aspects. Well, then there's the cottage with its wreath of blue smoke, its swing gate approached by two or three stone steps, under which a tiny stream of water finds a way and makes a playground for ducks and geese. The doorway and latticed porch is not so gay as when roses and honeysuckle embowered it and scarcely left space for entrance, and the trim garden looks a trifle neglected. Still, there is wonderful colouring and cause for pause. But we are bound further down the lane, which, steeply descending, passing another cottage or two, reaches the level that lies at the foot of the hill. Here winds a river, with perhaps a bridge or a ford. Reedy fenland and water meadows extend on either hand; willow trees flourish here, and a wild confusion of water plants and greater trees of statelier growth bend over the stream, which, with many a streak and ripple, reflects them. The grass sward on either bank, which in June was smooth and velvety as a well-kept lawn, in the fall of the year gives way to the production of rank weeds—thistles, with tufts of downy seed, nettles still green and full of vitality, broad leaves of comfrey, and the whitened stems of coarse grasses. And all the long regiments of upright reeds, in summer so green, so regular, almost monotonous, are severed and broken, worsted in the fierce conflict with wind, rushing water, and their own expiring strength; but to the artist they are more beautiful beaten down, matted together, some still remaining upright—such variety, irregularity, contrast! Beautiful as is the riverain at all seasons, it is never so charming as in the dying year. Woodland, hillside, moor, and marsh have all good claim for attention at this time of year. We have only suggested a very few aspects amongst the many.

And what opportunities the autumn skies present! At early morning, when the horizon is bright and like a curtain, heavy brown and purple clouds lift and roll off, suggesting for a moment the appearance of a photograph in which the cloud negative has been badly joined to the landscape, and a little space of white left between; and as the sun gets higher we have dark effective masses of cloud broken up with strong lights, or long rolling columns of grey cumulus, with little light about them, dull, heavy, and low, until later in the day the sun sets in a manner which forecasts rain, soft and yellow, behind a bank of mist or amidst long bars of red and gold, with radiating beams which, high above, tinge the dappled sky with purest hues.

And amidst all the localities hinted at, in every scene be ever on the alert for the thin grey mists which rise and float upwards, a delicate film of tenderness grey, or stretch out across the glebe, gathering thicker and whiter, enveloping each object by degrees, then growing duller with the failing light, and we seek the nearest road home through the gloaming.

If you would amongst your pictures secure the most precious things of Nature, get rid of the idea that she is only beautiful in the heyday of summertime, and go forth into the light of things and seek for yourself at the nearing of winter or in the fall of the year,

When autumn woods breathe not a sound,  
And Nature's self finds sweet repose.

## A Dark-room.

By KENNETH ANDERSON.

MR. C. H. BOTHAMLEY truly says, in his excellent book entitled the "Manual of Photography," that the dark-room is a bad name and one that is apt to be misleading to a beginner. All so-called dark-rooms have either a red or an orange light, so they cannot be really dark. But we must howl with the wolves, and call the developing room the dark-room in future. A dark-room is essentially a room that is dark, that is, a room from which all

actinic light is excluded. Then the question of how the place is to be illuminated may arise. Artificial lamps, I think, are undoubtedly the best way of giving light to work with. Lamps having ruby or canary glass are the ones to be used. Red light is best, as very sensitive plates, such as isochromatic, may be affected by the other colour. Then comes the question of what lamp should be used. For those whose purse is not of the largest, I can recommend the hock bottle lamps, in which candles should be burnt. For the more expensive, Lancaster and Fallowfield have several good sorts. If your dark-room should have a window, it must be carefully stopped up if you intend to work by artificial light. Suppose your window be a yard square, buy some ruby and canary fabric; two sheets of ruby, 38 in. by 38 in., and one sheet of canary of the same dimensions. Nail first one sheet of ruby fabric, then the canary, and then the other sheet of ruby. Now, the light that comes through this ought to be non-actinic in the highest sense of the word; but as you intend to use a lamp, you must cover the whole over with two thicknesses of fine brown paper. If this is all nailed on properly I may safely say that not a single ray of any light will enter the room even in the brightest sunshine, and even if any does it would hardly affect your plate.

Now as regards a working bench and sink. You may buy both combined at Adams's for £2 12s. You can set up an ordinary table or long bench for working on, and fix up a sink, with a pipe leading into a hole in the ground out of doors. It is best, if you cannot take your drain into one of the drains from the house (supposing the dark-room to be away from the house), to dig a hole about two feet deep just outside the wall of the dark-room. The water will be well out of the way there, and, provided you cover up the hole, your drain will not be in the way. Living in Kent, I use the water supplied by the West Kent Water-works, which contains a fair quantity of chalk, but I never found that it affected the negatives in any way. But as regards water there is one point I would caution any who live in this county—that they should always make up their developers with distilled water. I find that hydroquinone and caustic soda cause a precipitate in conjunction with the chalk. I have a working bench eight feet long, which I should recommend be divided up as follows. Four feet of it should be partitioned off for wet work, such as developing; two feet of the remainder should be used for dry work, such as filling dark-slides, etc.; the remainder should be used for storing plates and papers.

On the wall, above the wet work division, should be placed a shelf three feet long and six inches wide. On this shelf should be stored developers, etc. The door should be behind and to the right of the operator, and should fit tightly so that no draught may get to the photographer while at work, and no light to the plate. Indeed, it is often desirable that there should be a curtain thrown across the door to protect both. Immediately on your right, as you enter, should be the sink, if it is separated from the working bench as mine is. A space should be left between the sink and the wall against which is the working bench. This space should be filled by a sloping, grooved board, on which dishes should be left to drain. Above, or better below, so that none may spill into the dishes, should be a shelf for hyposulphite of soda *only*. Near this shelf may be another for a tin to hold the hypo crystals, or for a bottle to hold a stock solution. Over the dry work bench should be another shelf to hold hydroquinone, pyrogallie acid, caustic soda, chloride of gold, etc., in salts or in bottles of stock solution, which are not always in use.

Now comes the question, "What developer am I to use?" There are so many different developers at the present day that it is hard to know which is the best one to use. I believe that for all-round work you can get nothing that will beat hydroquinone. Though I have never used it, I believe that eikonogen is very good. Pyrogallie acid, with soda or ammonia, is very good, though it requires considerable care. For plates Rodinal gives satisfactory results, but ferrous oxalate is the best for papers.

In the dark-room (working with quarter-plates) should be three ebonite dishes for developing, water, and alum; one shallow half-plate porcelain dish for hypo; one deep ditto for toning; one 1 oz. measure; and a 2 drm. ditto. If you can manage it, it is advisable to have a ventilator in the wall; but it is difficult to prevent the light entering. If you have no ventilator, you must leave the door open as much as possible, or else you will suffer from bad air, which will soon put an end to your proceedings. I trust these hints will be of use to some one.

## To Arcadia with a Camera.—IV.

BY LIEUT. G. HARVEY.

DURING the whole course of their educational career, probably not one photographer out of a thousand ever heard of Glynde, and yet it should have been mentioned both in history and geography. To the photographer the neighbourhood for many a mile round must possess unbounded interest, for quaint subjects, old-time houses, valuable curiosities, majestic views, and snap-shots are scattered in luxurious profusion, and is truly a dream of exquisite beauty. Glynde is fifty-eight miles from London, and, luckily for the photographer, possesses a railway station. It is on the L. B. and S. C. Railway, and can be done in one day, or Saturday to Monday trip. If one should decide on the former, a train leaves London Bridge at 6.30 a.m., reaching Glynde in time for a half-past eight breakfast, and the last train home leaves at 9.16 p.m., giving a nice long day, and comparatively speaking, plenty of time to get about. Do not on any account miss the great treat in ascending Firle Beacon. The view is simply astounding, almost comprising the whole county, and including a fine expanse of ocean with Seaford and Newhaven shipping. There is no properly called road, but the track is good, and if you hire one of the happy-go-lucky native vehicles, perfectly practicable for even their procedure. Firlie Church (near Firlie Place, the seat of Viscount Gage) contains some brasses and tombs, and you may with advantage expose a few plates. But the "happy hunting ground" is Alfriston, a large and interesting agricultural village. (The snap-shot man would revel in Alfriston.) I won't go deep into particulars, as our Editor's space is valuable, but will only mention objects of most interest, and which could not possibly be left out. Make straight for the centre of the village and you will see the quaintest inn in England. It is called The Star, and dates from 1520, and here you will do more exposing in one hour than is ordinarily possible in half a dozen hours, for let me tell you that divers curious wood carvings decorate the house inside and out. Do not forget to ask, and you will be shown over the interior. I stayed a night here and the surroundings so impressed me that I dreamed I also belonged to 1520. At the corner next a lane is a large red wooden lion, once the figure-head of a Dutch ship wrecked somewhere near Beachy Head during the last century, and doubtless brought here as a savage adornment to the village. If you can only master the broad tongue of the natives, you will hear more of this beast, and some of the yarns will almost make your hair stand on end. Now cross over the river—there is a bridge half a mile N.E. of Alfriston—and make for Lullington. Expose a plate on Lullington Church, which, measured externally, is twenty feet square, a very small place of worship, nice, I should say, in winter, but a veritable bake-house in summer. At one time, I was told, it was a large building.

Passing through Litlington—nothing to detain you here—you will reach West Dean. On the south wall of West Dean Church (Norman) there is a very fine mural monument, about ten feet high, date 1625. In the opposite wall is a canopied tomb of Robert de Dene (Sackville family). The font is extremely curious, and is of unusual size, permitting baptisms by immersion. Expose three or four plates. Put on your armour, and gird up strength for exposing on an old parsonage house of the fourteenth century. It adjoins the churchyard, and is now partitioned off into labourers' cottages, and a crying shame it is too, for some of the rooms contain some very fine old stonework. You can get access to this, and take my advice and expose a plate or two. It will be difficult, but such an opportunity is not to be lost. Returning through Litlington you will notice, a little from the road, Charleston House, at one time residence of an old Sussex family. An Early English building, said to have been the chapel, remains in fair condition. Expose. The road from here to Beachy Head, twelve miles, through Crow Link and Birling Gap, will be fatiguing, because of the numerous ascents and descents, but if time is of no consequence, you will receive ample compensation, for the views both seaward and inland are glorious. There are also remains of an old British camp, tumulus, and cemetery. If you should be in Alfriston later in the day, go into the church and secure a negative of the east window, which is very fine and worth a plate. One word in conclusion. If you only go for the day don't attempt any interior work, of which there is so much, but be contented with outdoor work, and leave the villages further away, until some time that you can spend a few days and do it thoroughly.

## Exhibitions.

SOCIETY.	ENTRIES CLOSE.	OPENS.	CLOSES.	ADDRESS OF SECRETARY.
P.S.G.B. ... ..	—	Sept. 26	Nov. 10	The Assist. Sec., 5a, Pall Mall East
Camera Club... ..	—	Oct. 17	Dec. 8	G. Davison, The Camera Club, Charing Cross Road, W.C.
Totmorden Scientific Assoc.	—	Nov. 5	—	Jno. T. Binns, 3, Garden Terrace, Totmorden
Hackney Photo. Soc. ...	Oct. 29	Nov. 15	Nov. 17	W. Fenton Jones, King Edward Road, Hackney
Leytonstone Camera Club...	Oct. 25	Nov. 10	Nov. 12	A. E. Bailey, Rose Bank, South West Road, Leytonstone

## Societies' Notes.

WE have received, at the moment of going to press, the catalogue of the Leytonstone Camera Club Exhibition, from which it appears all the best workers intend to exhibit, such as Austin, Kidson Taylor, Hodges, Gear, Court Cole, Harding, Mrs. Clarke, Leeson, Dresser, Karl Greger, Byrne, Mendelssohn, Winter, Alfieri, Hinton, etc. The exhibition will be held on the 10th, 11th, and 12th inst., and will be well worth visiting. A very good diversity of entertainment is offered. Musical and lantern items figure in the bill. Refreshments can be obtained on the spot, and the exhibition will be opened by Lady Brooke on the 10th at 6 p.m., and on Friday and Saturday at 7 p.m.

THE Birkenhead Photographic Association are holding their annual competition of prints and lantern slides, and have a good show of talent as judges.

THE Jersey Amateur Photographic Society has flitted, and their address is 19, Queen Street, St. Heliers. Mr. J. Andrews, B.A., is Acting Secretary.

UNDER the auspices of the Uttoxeter Amateur Photographic Society, Mr. Gambier Bolton gave his lecture on "Wild Animals in Captivity and Domesticated Animals," on Friday evening last in the town hall. The lecture was illustrated by over 200 of Mr. Bolton's well-known and celebrated slides. The lecturer, who was introduced by the President of the Society, was most enthusiastically received by a large and appreciative audience. The slides were shown by a powerful limelight lantern, most ably operated by Mr. G. C. Wallis, a member of the Society. The general arrangements were carried out by Mr. R. T. Walker, Hon. Secretary.

THE improvement in the attendance at the Pall Mall Exhibition continues. The number of visitors in the past week was 1,842, making 8,799 since the opening day. On Wednesday night last, in spite of the heavy downpour of rain, there were 190 in the gallery to see the slides lent by the Amateur Photographic Field Club.

ON the third day, Thursday, 17th inst., the Hackney exhibition will be opened at midday, to allow of those living at a distance to see the same. The company at the opening ceremony promises to be very good. As already announced, Sir Albert K. Rollit, M.P., will open, and numerous well-known men, including Sir Charles Russell, M.P., are to be present.

THE annual exhibition and dance of the Holborn Camera Club will take place at Anderton's Hotel on February 18th and 20th, 1893.

A PHOTOGRAPHIC section of the Malton Field Naturalists' Society is in course of formation, and a special committee has been formed for obtaining photographs of geological interest.

THE Brixton and Clapham Camera Club have secured the services of Messrs W. Bedford, F. P. Cembrano, and Andrew Pringle as

judges for their exhibition, which is to be held on the 17th, 18th, and 19th inst., at The Clarence Rooms, 376, Cold Harbour Lane, Brixton.

MR. F. W. PILDITCH, Hon. Secretary for the new Aston Photographic Society, requests us to correct a slip of last week. His address is 133, Wills Street (not Wells), Aston, Birmingham.

THE Tunbridge Wells Amateur Photographic Association have secured the services of Messrs. Gale, Davison, and Mayland as judges for their exhibition, which will be opened from the 23rd to 25th inst. The latest date for entries is the 12th inst. Some very fine work from some of the most prominent exhibitors is to be shown. Mr. Shapoor N. Bhedwar's fine Indian pictures will also be there. In the apparatus section, Messrs. Watson, the Paget, Smith and Son, Dore, Gotz, Powell, etc., will be *en evidence*.

THE Fairfield (Liverpool) Camera Club had a very successful lantern exhibition on 31st ult., by Mr. Fred. Clibborn, entitled "Two in Touraine." Their annual Club competition for prints and slides is to be held on December 9th.

THE Newcastle-on-Tyne and Northern Counties Photographic Association will hold a *conversazione*, with exhibition of prints, stereo and lantern slides, on the 11th inst., the occasion of the opening of the new rooms at the Art Gallery, Newcastle.

A COURSE of practical instruction in photography, under Messrs. Howard Farmer and O. W. Gamble, will be held at the Birkbeck Institution, commencing Monday, November 14th. The fee for the complete course is very low, only 7s. 6d. to non-members.

A NEW society has been formed at Scarborough under very good auspices. Mr. N. Todd, 18, Victoria Road, is the Hon. Secretary.

THE latest date for sending in entry forms for the Exeter Amateur Photographic Society's exhibition is the 12th inst.

THE Sunderland Camera Club has held its first social. The room was tastefully decorated with curtains, fans, etc., and there was ranged round the walls a collection of photographs, some of which had been lent by the Editor of the AMATEUR PHOTOGRAPHER. These and a number of stereoscopes attracted considerable attention. Among those who lent exhibits were Messrs. F. S. Cowper, Oscar Gad, W. Milburn, H. A. Brown, and Councillor J. G. Addison, who lent a very valuable collection of American photographs. A concert followed, over which the President of the club, Mr. W. Milburn, presided. There was a large attendance of ladies and gentlemen. Miss Beatrice A. Armstrong opened with a piano-forte solo, and she was followed by a song by Miss Laidman. Mr. Hardy's mandolin solo was much admired, and Messrs. W. Cranston and James Tait were very successful in their efforts to entertain the company. The same ladies and gentleman, with the addition of Messrs. H. T. Hardy and G. T. Brown, provided the second portion of the musical programme. During an interval some limelight views of Borough Hill Horse Fair were shown by Mr. W. Milburn. There was also a selection of views from photographs taken by Mr. Edgar Lee, of Newcastle, and some of which gained the prize medal at the recent Pall Mall Exhibition of the Photographic Society of Great Britain. The social was in every respect a success.

## Societies' Meetings.

**Barrow.**—A meeting was held on the 3rd inst., about 170 persons being present. Mr. J. Edge occupied the chair in the absence of Mr. A. Blechynden (the Chairman of the section) through illness. The Prize Lantern Slides from the Editor of the AMATEUR PHOTOGRAPHER were shown on the screen by Mr. J. Timms with his triple lantern, and were very much enjoyed by the audience, especially the slides contributed by Mrs. S. F. Clarke, which were gems and elicited much applause, the general opinion being that they were certainly the best in the class of portraits. The sailing yachts and many of the architectural pieces were very fine. The sea pieces and mountain scenes in Arran also had many admirers, as did the slide "Waiting." Several of the American slides were very fine, but the one with sun on was considered to be rather odd (to put it mildly). Mr. W. Dunlop (Vice-Chairman of the section) gave a clear and lucid description of the pictures as they were shown on the screen, and also gave information for the benefit of the members as to the

plates used and the method of development by which they had been produced. The lantern was well managed, and both curtain and dissolving effects were introduced. A vote of thanks was accorded to the Editor of the AMATEUR PHOTOGRAPHER for the use of slides, also to Messrs. Edge, Dunlop, and Timms. These public exhibitions are becoming more popular every time they are held, and we may soon be obliged to have larger accommodation.

**Blackheath.**—The second ordinary meeting was held on the 1st inst., when a lecture and demonstration on "The Eastman Company's Products" was given by Mr. A. C. Baldwin, Mr. J. T. Field being in the chair. The lecturer described the rollholder and the various kinds of Kodaks, and then gave an interesting description of the method of manufacturing celluloid films. The factory is fitted with twelve glass-topped tables, each 80 ft. long and 41 in. wide; these are coated with liquid celluloid by means of a machine which travels the whole length of the tables, running on steel rails at the sides, and being drawn along by endless chains, worked by an electric motor. The coat of celluloid is next dried by means of fans, and then coated with the sensitive emulsion, which is spread in the same manner as the celluloid, but at a slower rate. When the emulsion is dry the film is stripped from the tables, and at the same time wound upon a large spool, from which it is re-wound on to another similar one, passing in the meantime over a table of ruby glass lighted from the underside by an electric lamp. During its progress it is carefully examined, any defective portions being cut out or marked. After this it is re-wound on to a series of small spools, being slit by knives during the process. Each of these small spools, of course, contains 80 ft. of film of the width of the spool, and this is again re-wound in the proper lengths required for certain numbers of exposures on the spools that are used in the rollholders. After mentioning bromide paper, Mr. Baldwin then spoke of the gelatin-chloride paper made by this firm and called "Solio" paper. He toned two batches of prints, one in the combined toning and fixing bath and the other in the sulphocyanide bath, giving some valuable hints while doing so. With regard to the depth of printing, if the prints are to be toned in a sulphocyanide bath they should not be so deeply printed as for the combined bath, while for the latter they should be rather less deeply printed than for any other bath, such as borax. When toned and fixed in separate baths, an alum bath is necessary between. If prints are to be glazed, they should be printed deeper than for a matt-surface. Squeegeeing on matt-surface celluloid is recommended for matt finish, and on glass or ferrotype plate for glazed surface. In the combined toning and fixing bath the fixing takes place first, and is complete in about two minutes; therefore, by the time the required tone is obtained the prints are sure to be properly fixed. They should be toned face downwards in this bath. The sulphocyanide bath must be freshly made from pure chemicals, and with this very fine purple tones can be obtained, the combined bath only giving warm tones. The prints must be thoroughly and quickly washed; excessive washing destroys the gelatine. The printing frames should be filled in subdued light or in the dark-room, and should be backed with waterproof paper. To mount prints that have been squeegeed on to a support of any kind, apply a thin solution of Scotch glue to the back with a piece of flannel when print is nearly dry. When quite dry, strip off print, damp mount, and lay print down. When waterproof backing of any description is applied to a print it must not be done until print is nearly dry, as otherwise the moisture will be unable to evaporate.

**Croydon (Camera Club).**—On 4th inst. the Robinson slides were shown by Mr. Hastings to an audience of members and friends, numbering between two and three hundred. The lecture was enlivened by music from a string band under the direction of Mr. Isaac. The lantern was as usual very efficiently handled by Mr. G. R. White. Subsequently a number of slides by members were thrown on the screen by the lanternist, and described by the President, Mr. H. Maclean. Mr. C. F. Oakley's "Sweetmeats" and "Hever" (developed with Rodinal), Mr. C. Bray's "Bracken" and "Hay Pie," Mr. H. E. Neeve's "The Binder," "My Dog," and "Ploughing" (the last a very successful view taken during a club excursion), Mr. Packham's "Young Thief," Mr. Corden's "Lord Mayor," "Army," and "Lightning" views, Mr. Burrow's Landseer views, and those of Mr. Sargeant taken at Portsmouth seemed most appreciated. November 7th Mr. Charles Hussey gave a graphic sketch of the delights of stereoscopic photography, and a complete resume of the chief operations requisite and of the various kinds of apparatus used. He also showed and described the making of a printing frame, newly devised by himself, by means of which stereoscopic positives may be printed by contact without necessitating any cutting and transposing of the prints. This improvement will be fully appreciated by all stereoscopic workers.

**Croydon (Microscopical, Photographic Section).**—Ordinary meeting on 4th inst., Mr. Sparrow in the chair. The attention of those present was drawn to the annual soirée of the club to be held on the 23rd inst. The evening was devoted to a discussion on hand-cameras, the practical advantages and defects of various

systems. For purely hand-camera work, such as street scenes, the type known as the "magazine" with a lens of short focus,  $4\frac{1}{2}$  to 5 in., was considered the most convenient; whilst for general work a camera with plate-holders a longer focus lens was preferred. The Chairman, in the course of his remarks, described a novel form of plate-holder he had used for several seasons, constructed from the designs of Mr. Sargeant. The shutter, instead of sliding out, was hinged and laid down on the bottom of the camera, the opening and shutting being effected by a small lever outside. The advantages claimed were that it could be made lighter and more compact than the ordinary form of dark-slide, that it could be manipulated quicker, that no light could reach the plate when in the camera, as the form of construction allowed it to be entirely closed in; it was, however, not possible to use a lens of short focus, as the lens front could not be brought up sufficiently near.

**Hackney.**—The weekly meeting was held on 1st inst., Mr. J. O. Grant in the chair. The Society decided to enter for competition slides as per *Hand-Camera and Lantern Journal*, slides to be selected at the first meeting in December. The Hon. Secretary said he had tickets for the Benevolent Association, and he hoped the members would support it. The result was that all the tickets were sold. The Hon. Secretary showed Lund's varnished label-book, and book for holding unmounted prints made by same firm. The members then passed a resolution that Mr. Hensler carries with him the best wishes of this Society in his trip to New Zealand. The Hon. Secretary hoped that he would soon return, and safely, as he had been associated with Mr. Hensler from the founding of the Society. Mr. Hensler was much affected by what had been said, and said he should never forget the many happy hours he had with the Society, and would communicate with them. Members' work was shown by Messrs. Dean, Nunn, Moore, Sodeau, Rooft; and Mr. Beckett showed the pictures he had taken by gaslight at the last meeting. A question was asked as to whether Ilford lantern plate (black tones) was a chloride or bromide paper. Mr. Beckett said it was a bromide. Mr. Wilks was nominated. Mr. Wise asked which was the best way to use Amidol. Mr. R. Beckett advised using it dry. Mr. Carpenter then read a paper and gave a demonstration on "Lantern-slide Making." He said a very great point was to get purity in the whites. He covered about one-eighth of an inch of rebate with black paper so as to detect fog. His own formula was: Eikonogen  $\frac{1}{4}$  oz., carb. potash  $\frac{1}{4}$  oz., bromide potash 5 gr., sulphite soda 1 oz., boiling water to 10 oz.; allow to cool. Generally diluted it with equal weight of water. For warm tones he preferred hypo, and mentioned the ten per cent. formula given by Thomas; advised plenty of good yellow light, and objected to intensification. Some lantern plates of Thomas's were then developed. Mr. Gosling asked whether chloride plates could be satisfactorily developed with pyro. Hon. Secretary said he had done some. The Hon. Secretary announced that next meeting was a lantern night.

**Holborn Camera Club.**—The meeting on November 4th, Mr. Fred. Brocas in the chair, had an interesting discussion, opened by Mr. Bayston, on "Hand-cameras."

**Huddersfield.**—The fourth annual general meeting of the above Society was held on 3rd inst., Surgeon Major Foster, the President, in the chair. The Secretary read the report and balance sheet, the latter showing a balance in hand of £1 6s. 3 $\frac{1}{4}$ d., as against £1 17s. 7 $\frac{1}{2}$ d. on the other side last year. Mr. Clarke then proposed the amalgamation of the Society with that of the Huddersfield Naturalists' Society, which after some discussion was carried.

**Kensington and Bayswater.**—A meeting was held on the 7th inst.; Mr. Seal's presided. Mr. G. Bursnell gave a demonstration on "The Platinum Toning of Silver Prints." He clearly explained the difference between a print on platinotype paper and silver paper toned with platinum; the former consisting of platinum only, and the latter—however well the toning may have been effected—of an alloy of silver and platinum. He claimed that a platinum-toned print will keep longer than a gold-toned one, that in toning more of the silver is replaced than in toning with gold, and that the platinum toning bath will keep almost indefinitely. The bath he has found of most use is one composed of chloroplatinite of potassium, 1 gr.; citric acid, 10 gr.; water, 4 oz. This is an improvement over the old bath, which contained nitric acid; this last, even when diluted, having a more or less injurious effect on the gelatine. If a warm tone is desired, add ten more grains of citric acid and dilute to eight ounces of water. In printing for warm tones it is necessary to overprint more than for black tones. The fixing-bath should be made slightly alkaline with ammonia. Mr. Bursnell proceeded to give his formula and method of preparing a paper specially suited to platinum toning. Plain Saxe paper should be obtained and first salted with the following solution:—Gelatine (Nelson's No. 1), 12 gr.; water, 1 oz.; chloride of ammonium, 4 gr. When dissolved add 2 dr. of negative varnish. The paper should be hung up to dry, and then sensitised with the following solution:—Citric acid, 50 gr.; nitrate of silver, 2 dr.; water, 2 oz.

**Lewes.**—The monthly meeting was held on the 1st inst., the Pre-

sident (Mr. J. Tunks) in the chair. It being a members' lantern night, a number of slides were shown in the society's lantern, the makers giving the description as they appeared. Among the most admired were those by Messrs. Bedford, Tunks, and Young. It was announced that the December meeting would be on Friday, the 2nd, instead of on the first Tuesday, as usual. Any friends of members interested in photography will be welcome.

**Lewisham.**—On the 1st inst. the Hon. Secretary (Mr. R. W. James) gave a demonstration, "Lantern Slides by Reduction." He showed three different forms of apparatus. The first was a frame at one end of a board to hold the negative and ground-glass, with an ordinary quarter-plate camera on guides at the other, and is for use with artificial light only. The second was an ordinary fixed focus apparatus, and the third an ordinary camera placed on a board so that it could be shifted backwards and forwards. On the other end of the board was a wooden tunnel with negative in end. The two latter methods could be used with artificial or day light. As, of course, daylight was not available at the time of meeting, Mr. James could only show how to use the apparatus with artificial light. He made two lantern slides from whole and quarter plates by the aid of magnesium ribbon hung in strips on a frame about 7 in. from negative.

**Liverpool (Y.M.C.A.)**—The weekly meetings of this club during the past month have been favoured with increasing interest, due to the excellence of the lectures given by Mr. G. T. Blenkinsop and Mr. T. Crosbie. The usual monthly meeting was held on 2nd inst., when Mr. L. Hill gave a short history of photography, followed by a demonstration of photographic enlarging by magnesium light. Mr. J. Fowler Shone occupied the chair. The winner of the prize in the October competition for the best set of six silver prints—landscapes—is Mr. Eben. Smith, who received high praise from the judge, Mr. Wm. P. Christian, for the all-round merit of the prints submitted.

**London and Provincial.**—At the meeting on the 3rd inst., Mr. G. W. Atkins in the chair, Mr. Haddon gave an account of an experiment he had carried out as to the action of the red end of the spectrum on the haloid salts of silver, and with gelatino-bromide paper. His results proved that the red light had neither undone the work effected by white light nor increased its action. With gelatino-chloride paper there was in red light a distinct change in colour of the image caused by white light, but on toning and fixing there was no difference to be detected, the conclusion being that the change was not a chemical one but physical. Mr. Foulkes-Winks' paper on "Printing-out Papers" was read in his absence by the Hon. Sec. Considerable exception was taken as to the results arrived at, and an interesting discussion ensued.

**Llanelli.**—On the 2nd inst. a lecture was delivered by Mr. John Daniell, the Hon. Secretary, on "Photography a Recreation." The chair was occupied by Mr. Ernest Trubshaw, J.P. In his opening remarks the lecturer referred to the need for recreation, and the desirability of selecting such methods of spending leisure as were harmless and at the same time pleasant and profitable. He recommended photography for this purpose with much confidence, giving several reasons for doing so. He then proceeded to give a short account of some apparatus, ancient and modern, and explained their use, and then touched lightly upon the history of the modern dry-plate. The principle of development was illustrated experimentally by throwing the image of an exposed plate on a screen, the progress of development being witnessed by the whole room. The difference between positive and negative pictures was explained, and two slides showing the distinction were shown by the lantern. The lecturer recommended the smallest size of plate for general use, on the ground of portability, moderate prime cost, small cost of maintenance, and suitability for lantern-slide making and enlargement. The ease and simplicity of the latter process were demonstrated; an enlargement of a negative of a barque in full sail was made at the lecture table by Mr. Ernest Samuel, who ably assisted the lecturer. This was framed, and at the close was handed round and was much admired. A large number of slides were then thrown on to the 15 ft. screen, by the oxy-hydrogen biunial, owned and ably manipulated by Mr. Major, F.C.S. These were illustrative of North Devon scenery, taken by the lecturer, and were fully appreciated. Some local scenes and celebrities were also included, the local "bits" causing much amusement. There was a large, select, and appreciative audience.

**North Surrey.**—The exhibition of the work of members and the competition for the Whitby prize of a guinea each for the two best sets of six prints and the society's certificate for the set next in order of merit were held at the last meeting on the 1st inst. There were sixteen entries for the competition, and the prints sent in, with those for exhibition only, made quite an imposing show. The competition was very keen, the result of the judging showing only a difference of five marks between the first and third best sets. Mr. Lewis Wolff, under the *nom de plume* of "Achromatic," was awarded the first prize, Mr. H. Senier ("Columbia") the second, and Mr. W. Rouch ("Pyro") the certificate. The six prints shown by Mr. Wolff

were bromide enlargements of church interiors and village scenes; those by Mr. Senier, 5 in. by 4 in. prints on bromide and Eastman Solio paper, landscapes and interiors, the best being the banqueting room, Haddon Hall; and those by Mr. Rouch, bromide enlargements of marine and forest scenes. Taking the exhibits as a whole, they reflected the greatest credit upon the members, and proved that the idea to hold the combined competition and exhibition was fully warranted. It may be remarked that ordinary albumen prints were conspicuous by their absence, eight-tenths of the exhibits being either platinotype or bromide. Among the pictures sent in for exhibition only, those by Mr. T. J. Bright were universally admired, his "View from London Bridge," and "A Pastoral Scene in Essex," being of rare merit. By the courtesy of the Committee of the West Norwood Constitutional Club, in whose rooms the society holds its meetings, the exhibits were allowed to remain on view for a week, and many friends of the members, and others interested in the art of photography have availed themselves of the opportunity thus afforded.

**Oxford.**—A meeting was held on 31st ult. Mr. C. J. Mead-Allen, S. Catherine's, gave an interesting lecture on the Isle of Wight, illustrated by lantern views. The next meeting will be held Wednesday, November 16th, when Mr. F. W. Brown, B.A., University, will give a demonstration on "Solio Paper." All communications should be addressed to the Hon. Secretary, A. Eglington, Lincoln College.

**Putney.**—A special meeting was held on the 24th ult., Dr. Shepard in the chair. In spite of the unfavourable state of the weather a very fair number of members and visitors had assembled to hear Dr. Jeserich's paper on "Photography Applied to the Detection of Crime." The paper was, in the absence of the author, very ably read by Dr. Farrar, and was followed throughout with unflinching interest by everyone present. It was illustrated by a series of striking lantern slides, which clearly showed that photography is well ahead of the *fin de siècle* criminal. A series of lantern slides from Australia, South Africa, and India was then shown. In addition to a high standard of technical excellence the slides had the advantage of representing views of scenery and life quite new to many of those present. Altogether the slides reflected the highest credit, both artistically and technically, on the gentlemen who have been kind enough to forward them to this country for the use of photographic societies. The paper and slides were lent by the Central Committee of the Affiliated Societies of Great Britain, and are part of a programme provided for the use of those who have joined the Affiliation. The programme, which is of a varied character, will be found of invaluable help to Secretaries in filling up their cards of fixtures, and will be a practical inducement to other societies to join the Affiliation.

**Richmond.**—At the meeting held on the 31st ult., the President in the chair, Mr. Ramsay showed Middlemiss's frame for printing slides by contact from part of any sized negative; a very simple and useful adjunct to the dark-room. Mr. J. D. Gibson brought some slides which he had made on chloride plates, following the formula, etc., as demonstrated at a previous meeting; the slides were very patchy, and many of them too red in colour. He wanted to know the cause of the patchiness. Mr. Cembrano thought that the magnesium must have been held too close to the negative and not moved about during the exposure, thus causing uneven illumination. The subject for discussion, "Preparing Work for Exhibition," was opened by Mr. P. Ennis, who said that foremost of all the quality of the work must be the very best, and he emphasized the necessity of being original in one's style. Most workers left the printing and mounting of their exhibition work for the last moment, which was certainly not always conducive of the best results; he therefore recommended that one should start early preparing one's exhibits. A great deal of care was necessary in suitably mounting and framing, as quite a number of prints were often spoilt by unsuitable framing. Mr. Williams thought the whole question lay in a nutshell; first get a good negative and then a good print. Mr. Ramsay added that exhibits were often too much prepared; in other words, that too much hand-work was put on them. Mr. St. John Hunt inquired which would be the best kind of frame to have. Mr. Cembrano replied that the frame should be simple, and that it should harmonise with the print. The object of the frame was to separate the picture from the surroundings; indeed, it might be called the boundary line of the picture. It was a great mistake to have much gold in a frame for a photograph. It was fatal to use a moulding which by its richness or colour should attract the eyes before the picture was seen or thought of. Mr. Alabaster showed a frame he had sent to an exhibition. He thought that the mounts should be made to suit the prints; he preferred toned mounts. Mr. Gibson remarked that it was a difficult thing to find suitably toned mounts. Mr. Such suggested that the size and shape of the frame should be considered. He believed that some sizes had a better chance of being hung, because they fitted better. He further remarked that "hangers" should endeavour to harmonise the colours of the frames as well as the

tones of the prints on the walls of an exhibition. The President read a question which had been put by one of the members: "A negative having been imperfectly washed and put away, a mouldy deposit appears on the film after a few months. This deposit seems insoluble in water, the plate having been soaked three days without result. How can it be cleared?" Mr. Williams advised soaking in hot water. Mr. St. John Hunt suggested rubbing the film with cotton wool. Mr. Harris doubted the efficiency of this treatment, as he had been unable to remove the deposit with a sponge. Mr. Cembrano thought that re-soaking in hypo, and then washing thoroughly, might answer.

**Rotherham.**—Monthly meeting on 1st inst., Dr. Baldwin (President) in the chair. Good attendance of members. Several volumes were promised for the society's library. In view of the lantern season it was decided to form a representative collection of slides of members, and to make the selection at the December meeting. Photo literature, etc., were distributed. Mr. W. Firth afterwards gave a paper on "Amateur Experiences."

**Sheffield.**—The ordinary monthly meeting was held on the 1st, Mr. B. J. Taylor in the chair, when after the routine business the question of a dark-room was brought before the members, and after a very heated discussion it was resolved to postpone the matter until next meeting and decide by ballot; after which a series of lantern slides was passed through the lantern by Messrs. Furness, Hibbert, Camp, and Bromley, showing the effects gained by the different developers now in use amongst photographers. Mr. J. W. Charlesworth operated the lantern.

**South Manchester.**—The monthly meeting was held on 31st ult., the Vice-Chairman, Mr. W. Linnell, presiding. Messrs. Hutton, Macbeth, and Wade were elected members of the society. Mr. Lawson, of Newton-le-Willows, exhibited a new saturator invented by himself. The instrument in its present form can be placed inside the body of the lantern, as the nipple and lime holder form part of the saturator; it is intended to burn the ordinary commercial benzoline, thus doing away with hydrogen, an oxygen bottle only being required. Among the advantages claimed for it are its perfect safety in use, and that a better light can be obtained than with any other limelight apparatus with either one or two jets. Mr. Wade read a paper on "The History of a Lantern Slide," in which he gave an account of his method of making it. He said the making of a lantern transparency required the greatest technical skill, but, when obtained, the beauty of the picture was much enhanced, and when thrown on the screen usually gave rise to expressions of the warmest admiration. The lecturer proceeded to give an account of the various ways by which a lantern transparency could be produced, the best negative for this work being one "full of detail, rather thin and clear." He considered the gelatino-bromide plates the best for general use as capable of giving a great range of tones from black to red, transparent shadows, delicate half-tones, and as being very free from technical defects. A very thin negative is better printed on a gelatino-chloride plate. With regard to the diversity of opinion as to the best developer, he thought all developers were good if you only knew how to use them—that was the chief point. Information was given as to various little technical details; for example, how to get moonlight effects, or to print in clouds. The lecture concluded with a practical demonstration, a lantern slide being exposed and developed by Mr. Wade.

**West Surrey.**—Usual fortnightly meeting held on the 2nd inst., Mr. J. L. Lyell in the chair. Owing to the inclement weather there were only about thirty members present. The subject of the evening was a paper by Mr. A. R. Dresser entitled "Hints on Hand-Cameras." Mr. Dresser was absent through indisposition, but the

paper was kindly read by Mr. George H. James. Mr. Dresser remarked that a wide-angle lens was preferable for hand-camera work, and that the camera should be one with dark slides, and not one of the magazine pattern. In conclusion Mr. Dresser said that he hoped his hearers would not bring discredit upon hand-camera work by "snap-shooting" persons under conditions likely to cause unpleasantness, as many were very apt to do. An exhibition of lantern-slides by Mr. Dresser was then given, some very fine sea studies and his popular "Wild West" series being shown. A short discussion followed, which, owing to the lateness of the hour, could not be finished.

### SOCIETIES' FIXTURES.

- Nov. 10.—**BIRKENHEAD.**—Annual Meeting.

### To Correspondents.

All communications for these columns are to be addressed to **The Editor, "Amateur Photographer," 1, Greed Lane, Ludgate Hill, London, E.C.**

#### RULES.

1. Write clearly and distinctly on one side of the paper only.
2. Write each Query or Answer on a separate sheet of paper.
3. Write the name and address legibly on the back of each communication, and sign all Queries and Answers with name or *nom de plume*.
4. All matters for these columns MUST be received by **TUESDAY MORNING'S POST**.
5. The Editor does not undertake to answer questions by post.
6. In answering Queries, correspondents are requested to mention, in every instance

the number and full title of the query referred to.

### QUERIES.

5859. **Platinotypes.**—If I print platinotype paper (cold-bath process) too deeply, can I do anything to make the prints lighter, after development and clearing?—**MANFIELD.**

5860. **Gelatine Lantern Slides.**—Does any firm supply lantern and stereo slides with gelatine as a foundation, instead of glass; or is there any other substitute for glass, suitable for use in India?—**R. H. B.**

5861. **Loan of Negatives.**—Can anyone oblige with loan of one or two whole-plate negatives of Irish scenery? All charges will be paid, and value of negatives deposited with Editor if desired.—**TREFOIL.**

5862. **Metal Plates.**—Will someone tell me if it is possible to re-name the metal plates sold by Adams and Co., at home, and if so, how? The other day I was in a hurry and heated the print, which, on being stripped, brought away all the enamel to which it was fixed. An answer will be much appreciated.—**J. T. BISCOE.**

5863. **Toning Trouble.**—Will someone tell me why my prints on being removed from the toning bath and put into the hypo fixing solution, give forth a

most disgusting smell? I am using the Ilford P.O.P. and the gold toning bath. I may say that all do not do the same, but about four out of a batch of ten, say. Has anybody had the same result, and what is the cure?—**J. T. BISCOE.**

5864. **Platinum Toning.**—Could any reader of the **AMATEUR PHOTOGRAPHER** tell me whether Ilford P.O.P. can be toned with platinum? If so, what formula?—**NEMO.**

5865. **Lead Toning.**—Should be glad of a formula for toning bath of lead and gold.—**NEMO.**

Correspondents not seeing their queries inserted are requested to look for the same under "Editorial."

### QUERIES UNANSWERED.

Oct. 28th.—No. 5849.

Nov. 4th.—Nos. 5850, 5851, 5852, 5854, 5856, 5857.

### ANSWERS.

5847. **Isochromatic Plates.**—A yellow screen is entirely unnecessary with isochromatic plates when the subject contains a good deal of green or yellow light, but may be used to advantage when taking evening or early morning views, and also for copying subjects with strong contrast of colour. They may be obtained from any agent of Ilford Company, by

whom they are made, and can be fixed to any camera or lens. They are coated with a thick dull emulsion, which renders them free from halation in ordinary landscape and architectural work, but for interiors requiring an hour or so exposure they are better backed. They require about the same exposure as Ilford's and Marion's ordinary plates.—J. H. RHODES.

5853. **Three-Ply Fretwork.**—Messrs. Henry Zilles and Co., of 24 and 26, Wilson Street, Finsbury, E.C., used to keep this about two years ago, and most likely do so still.—M. H.

5855. **Plain Papers.**—Whatman's drawing papers can be obtained from Hudson and Kearns, stationers, 83, Southwark Street, London. I cannot inform you as to Rives' papers.—F. W. WALTER.

5855. **Plain Papers.**—Messrs. Reeves and Sons, of Cheapside, will supply you with Whatman's paper. If they do not keep it in stock they will be able to get it for you.—THE LUBBER.

5858. **Vulcanite Sheets.**—You have very probably kept your prints in standing water for some time, and then allowed them to become almost dry, wetting them a second time before squeegeeing on to vulcanite. Keep them thoroughly wet until ready for squeegeeing, and do this under water.—P.

## EDITORIAL.

**SPECIAL NOTICE.**—We are very pleased to find that replies in this column are so much appreciated, but we should be very grateful if those requiring advice would send their letters to us before TUESDAY MORNING'S post if possible. The time occupied in replying in this column is very considerable, and owing to the often late receipt of letters, many matters have to be left over each week. This we much regret.—ED. AM. PHOT.

R. MACKIE.—The point to which you draw attention was a slip, which has been corrected.

AMATEUR.—Carbon tissue may be obtained from the Autotype Company, 74, New Oxford Street, W.C.

BOTANY BAY.—Probably you are using the lamps without globes. This is wrong. The lamps we use are provided with cheap ground-glass globes, the outside of which can, if desired, be coated with thin varnish containing aurania dissolved in it, so as to act as yellow screens. You put too much varnish on your negative. Get a pneumatic holder and practice on a few old glasses. Don't warm your negatives. If the varnish sets so quickly, use the square-cut penholder without anything over it to scratch varnish off. The varnish on film may be removed with methylated spirit. The fact of portions of your negatives refusing to blacken in the cyanide may be due either to its not being free from hypo, or to the formation of a particular compound of silver and mercury. It really does not matter if the lights do not blacken right through.

H. J. H.—Your slides are at present on loan; as soon as they come back we will criticise.

W. G. HENDERSON.—The article and illustrations will appear in "Our Lantern Screen," November 25th.

P. W. C.—We can only briefly indicate here the leading operations necessary to make a ferrotype or collodion picture on glass. The chemicals required are collodion, silver bath, developer, intensifier, fixing solution. The collodion may be bought, Mawson's positive collodion being a good brand, though some operators use negative collodion. It may be made from the following formula:—

Ether .. .. .	2 oz.
Alcohol .. .. .	2 "
Pyroxylin .. .. .	20 "
Iodide of cadmium .. .. .	10 "
Bromide of ammonium .. .. .	4 "

Having coated the glass or ferro plate with collodion, when set immerse in the silver bath—

Silver nitrate .. .. .	1½ oz.
Distilled water .. .. .	20 "
Potassium iodide .. .. .	1 gr.
Nitric acid .. .. .	1-2 drops

After exposure develop with

Distilled water .. .. .	20 fl. oz.
Iron sulphate .. .. .	1½ "
Barium nitrate .. .. .	1 "
Alcohol .. .. .	1 "
Nitric acid .. .. .	40 drops.

The developer is poured carefully on the plate so as not to run off. If the image is weak and thin, it may be intensified for ferrotypes by adding a drop or two of tincture of iodine to the fixing bath, which is made by dissolving—

Potassium cyanide .. .. .	25 gr.
In water .. .. .	1 oz.

After fixing, wash well and dry, and then varnish with crystal varnish. The above are the outlines of the process, but you will find it worth while to invest the modest sum of ninepence in "The Practical Ferrotyper," by Snowden Ward, to be had from our publishers.

A. H. DUNCAN.—Many thanks for article and prints.

LEWES.—The formula you want is

Paramidophenol hydrochlorate ..	4 parts
Sodium sulphite .. .. .	80 "
Distilled water .. .. .	1000 "
Carbonate of soda .. .. .	80 "

Dissolve the sulphite in the water, add the paramidophenol, and then the soda.

H. R. LLOYD.—Letter by post.

H. H. B.—The solubility of sodium sulphite in water at 58 deg. F. is 1 in 37, or practically 1 in 4.

DOZEY, G.—Many thanks for "Doings in Dutchland," which we will use for the "Annual."

F. H. (Cirencester).—The cause of your trouble is not very far to seek. The orange deposit is ferrous oxalate precipitated on the paper, and it points either to (a) weak oxalate solution, (b) too much iron, (c) too much acid in developer, (d) not enough acid. Now which was it? The deposit can easily be removed by applying strong oxalate solution acidified with oxalic acid and rubbing gently with cotton wool.

E. L. THOMAS.—Spiritous gelatine mountant, such as Houghton's Excelsior or Wormald's Photopaste, is what you want.

HOELCATT.—Yes, we do not think you will better the india tint plate junk mounts; they are very suitable both for bromides and platinos. Hannam and Co. (see advertisement pages) will satisfy all your requirements. As present we do not intend to institute any other competitions. Always glad to have your help and assistance, and shall be pleased to welcome your slides.

J. H. M.—Yours is rather a poser, as the idea of what is an ordinary room is different to every one. We would suggest an R.R., working at f/5.6, and one of Cadett's very latest high speed plates. It would be even worth while writing to Cadett and Neall, of Ashstead, Surrey, asking them to let you have the very fastest plates they can. Whether anything would be on the plate which would be of any value to a detective or in a court of law is another question altogether. Still, there would be no harm in trying.

DRY.—We write you by post.

B. B. H.—Our method is to develop the landscape, wash well in strong clearing solution, roughly cut out a mask of opaque paper made by mounting deep ruby paper on black waterproof backing paper, and then exposing under a cloud negative. We will have an article on the subject this month. Always glad to return prints when stamps enclosed.

A NOVICE.—We write you by post.

H. M. S.—Your idea of enlarging is quite feasible, and you will find it recommended in the earlier issues of this year, in a series of articles, "Notes on Enlarging."

W. R. P.—(1) It is possible to get all detail in a setting sun picture. Use isochromatic plates, medium rapidity, with a shutter working about 1/10th of a sec. In developing use very little pyro, so as to keep negative thin. (2) The reason of a silver print not being sharp in some places is due to the want of absolute contact between the paper and negative. The remedy is to place sheets of clean blotting paper between paper and printing-frame back, and thus ensure absolute contact. (3) The yellow screen must be used with a good deal of discrimination. It is usually unnecessary in the morning and evening, when the light is yellow. The main idea of the yellow screen is to cut down the action of the blue rays, and it should therefore be used when copying objects with a lot of blue in. It is useful with landscape work when the distance is hazy, and in the height of summer.

WINTERSETT.—No, there is no difference between a landscape and a view lens. Of the lenses you name B is the more suitable.

T. ARNOLD.—It requires a good lamp to give a brilliant 5 ft. disc. Send us a slide or two up.

ANTI.—A lens ought to be able to cover the plate sharply when the centre is in focus. Focus for about one inch from the centre. You will then split the difference.

ILEX.—The metabisulphite being an acid salt, will on keeping evolve a considerable quantity of free acid, and unless this is neutralised by the addition of more alkali it will prolong development very much. The action of the metabisulphite is to keep the developer, the plate, and the hands clean, and it does this also, some say at the expense of the shadows, keeping them too clean also.

AMBROSE.—(1) Over-printed, too much foreground, not enough over chimney. (2) Under-printed and over-toned. (3) At least an inch less foreground, wants clouds. We cannot understand how you work to get such curious results. Can you call on us and bring some negatives with you?

F. M.—(1) Flat, and wanting in brilliancy. (2) Camera not straight, over-printed, flat and poor. (3) Over-printed, flat, and wanting in brilliancy. These three prints strike us as having been printed in the sun, there are no pure whites in the prints, probably due to the weak gold bath. (4) Decidedly better, though still flat. (5) Water too white, and the sky wants clouds badly. (6) The best of the lot, a very fair print. No. 3 could be made something off with judicious printing and a suitable surface. We should like to see some more work. You are rather inclined to attempt too much; little bits pay better in results than panoramic sweeps.

YARDLEY.—Let your friend make his windows dirty, or allow them to get so, and then photograph them; you will get no reflections then.

TINY MOUTH.—We presume that all your prints are untuned, if not the sooner you abandon that hot tone the better. (1) The cathedral is falling over, in consequence of camera not being held straight. (2) Good, both these are eligible as river scenery. (3) The white spots, we should say, were caused by unequal drying of the plate. (4) Far too white in the water and sky;

with a good cloud, and the water toned down, and a rough paper, this would be good. (5) Yes, like too many sunsets, the blackness of the trees is awful, such as you never saw even at midnight, do a little bit of dodging here, and you will get a good result. (6) Too flat, and plate too crowded. (7) Suffers from flare-spot, too much foreground, too much blank sky. (8) Nothing artistic in this. (9) Ah! here's a chance for you to make a real picture by using the knife well and printing in clouds. Just see if you cannot improve on it, and if not, send us up a print, and we will show you how.

F. P. PEMBERTON.—(1) Wants clouds, and might be developed a little longer. (2) Over-exposed, flat, and foggy. No. 3 Missing. (4) Over-printed and too harsh. (5) Ditto. (6) Too much uninteresting foreground. (7) An inch less foreground, too deeply printed.

MRS. E. A. CLEASBY.—We will develop films, and then write you.

F. C. HERDEL.—The Ubique is fitted with an R.R. of 5½ in. equivalent focus, with stops of f/8, f/12, f/16, f/24, f/32, f/48, and f/64. The blind-shutter we are not quite sure about, but we estimate it at 1-60th sec. If you require greater speed it can be easily obtained by increasing the tension on the spring, and this the makers would do for you at once. The comparative speeds of the two plates you name are extra rapid 80, lightning 127½.

## Sale and Exchange.

### RULES.

**CHARGE.**—Twelve words or less for Fourpence.

Every additional three words, one penny. The name and address of the sender must be paid for. (A single figure, or group of figures undivided by letter, space, stop, or words, counts as one word; compound words count as two words.)

**DEPOSITS.**—The money for goods forwarded on approval may be deposited with the Publishers of the AMATEUR PHOTOGRAPHER, who will hold the amounts deposited until they are satisfied that the transaction has been completed to the satisfaction of buyer and seller.

**Burnisher.**—Half-plate burnisher, very little used. What offers?—T. N. L., 8, Hardwick Terrace, Stockton-on-Tees.

**Cameras, etc.**—Pearson and Denham's reducing camera, from half-plate to lantern slide, price 20s.—B., 44, Wood Street, Leek.

**Gas Bag.**—Gas bag, extra good, pressure boards, retort, purifiers, sell cheap, bargain.—Alston, 211, Ladypool Road, Birmingham.

**Hand-Cameras, etc.**—Quarter-plate Rouch's Eureka hand-camera, adjustable shutter, detached plate chamber, focussing screen, £4 10s.—G., 61, Waldegrave Road, Brighton.

Facile, superb R.R. lens, latest pattern, new, £3 15s., cost £5 5s.; also Talmer quarter-plate, splendid R.R. lens, new, £3, cost £4 12s. 6d.; solid leather Facile case, 17s. 6d., cost 25s.—No. 351, office of this paper, 1, Creed Lane, E.C.

**Lanterns, etc.**—I will exchange my high-class mahogany-bodied single lantern (originally cost £15) for a first-class half-plate camera and lens, with extra long-extension bellows body and usual accessories.—Tweedie, 54, Hawley Square, Margate.

Magic lantern with Newton's 8-wick lamp, several slides, cheap, or exchange hand-camera.—Copeman, Henstridge.

Pair old-pattern lanterns, 3½ in. condensers, recently fitted with 8-wick mineral oil lamp, complete in box with dissolving fan, 25s.; also Phoenix pneumatic shutter, 7s. 6d.; and burnisher, 3s. 6d.—W. Gibbard Junr., 48, Cambridge Road, Barking.

**Magic Lanterns and Slides.**—Walter Tyler's Heliographic is perfection of all lanterns, supplied to Indian Government, School Boards, science classes, clergy, and exhibitors throughout the world. Impossible to have lanterns give better definition or more satisfactory results; specially constructed lens, which no other lantern possesses.—Walter Tyler, 48, Waterloo Road, London.

**Walter Tyler's Best Triples and Binoculars** are unsurpassed, and perfect in every detail. Good binoculars, mahogany bodied, brass fronts, and all improvements, £7 10s.; single lantern, with 4 in. condensers, portrait front lens, 4-wick lamp, complete, in case, 27s. 6d.—Walter Tyler, 48, Waterloo Road, London.

**Lantern Lenses.**—Specially constructed. Walter Tyler's new Heliographic portrait combination lantern lens gives the most perfect definition and brilliancy, can be fitted to any lantern, and for excellence cannot be surpassed. No other maker has this lens, which is manufactured expressly for Walter Tyler, Waterloo Road, London.

**Regulators and Gauges.**—Great reduction, in price. Either can now be had of Walter Tyler for 14s. each. The largest stock of gas cylinders in England. Best seamless steel, tested and valved, and all sizes at very low prices.

**Slides from Negatives and Pictures.**—Walter Tyler manufactures and colours slides on the premises, thus ensuring speedy delivery, and prices are most moderate.—Walter Tyler, 48, Waterloo Road, London.

**Binocular Lanterns.**—If you are in want of a really good binocular lantern, perfect in every respect, call and see Walter Tyler's entire brass fronted, mahogany-bodied, lined with Russian iron, and fitted with new best quality lenses, and sold at a most

moderate price. The top lantern will take a 4-wick lamp. These are great bargains.—Walter Tyler, 48, Waterloo Road, London.

**Hire Department** is now perfect. Largest and best collection of slides in the world; over 200,000 always in stock. Temperance, travels, Scripture, educational, comic, tales, etc. Cheaper than any other house, no extra charge for coloured slides or effects. Special terms for large quantities.—Walter Tyler, 48, Waterloo Road, London.

**Lanterns and Slides.**—If you wish to hire, purchase, or exchange, you cannot possibly do better than go to Walter Tyler, who makes this business a speciality, and you will thus save dealer's and all intermediate profits.—Walter Tyler, 48, Waterloo Road, London.

**Second-hand Lanterns and Slides** at very moderate prices, also all kinds of apparatus. Send for large catalogue, 420 pages, with instructions for working lanterns of all kinds, and costing an immense sum to produce, sent free for 6 stamps. Small catalogue and second-hand list, post free.—Walter Tyler, 48, Waterloo Road, London.

**Bijou Enlarging Lanterns.**—Finest results with Hughes's patent rectangular condensers, half the size of ordinary make, superior definition, proper diffusion of light; several whole and half-plate for sale, cheap.

THE well-known optician, Zeiss, has now completed the series of his lenses, with the introduction of Series I., II., and IIIa. Series I. is an anastigmat with front combination of two lenses and rear combination of three lenses, and works at an aperture of  $f/4.5$ . The second series is also a doublet of five lenses, working at  $f/6.3$ , and Series IIIa is a doublet working at  $f/9$ . We hope to be able to give a little more information about them next week.

To judge from the three letters in our correspondence columns of last week, "Our Views" in a previous issue of the medal question have been a little misunderstood, and we are sorry Mr. Charles Tylee should have imagined that our remarks on "medal hunters" were intended to apply to him or such as he.

PERSONALLY we were very pleased with Mr. Tylee's works at the East London Photographic Society, and congratulate him upon the success with which he met there, but the number of awards which worthily fell to his share suggested our remarks as to the "limitation of medals that can go to one man," and gave us opportunity of pointing out the danger that *might* arise. Mr. M. A. Wilkinson, Hon. Secretary E. L. P. S., has now told us that his society's rules are so framed as to meet such a contingency, and we are very glad to know that such is the case. What we have said about the "medal hunter" we have said deliberately, and have no desire to unsay it. We are not to blame if those appropriate it for whom it is not intended.

We understand that a collection of photographs representing the best artistic work of this country will find its way to the great exhibition at Chicago. The difficulties of transit and the prices charged for space would doubtless in the ordinary way debar our amateur exhibitors at least from contributing to the photographic section, hence it is well to know that some arrangements are contemplated whereby the New World and all the hosts who will visit the World's Fair will have an opportunity of seeing examples of photographic work of the "modernist" character. We believe this collection is being formed by a limited number of special invitations to known photographers, and is in the hands of a substantial committee representative of the Royal Commission for the Chicago Exhibition.

We go to press too early to notice fully the doings of photographers at the Hackney Exhibition, but things were

(Prizes will be announced and photographs reproduced and criticised in the AMATEUR PHOTOGRAPHER Supplement, December 9th.)

well in hand on Monday morning when Mr. Fenton Jones, the indefatigable Hon. Secretary, looked, together with his committee, quite equal to the Herculean task of hanging and arranging—work which had commenced long before many of our readers had opened their eyes to the tardy light of the November morning.

By about eleven o'clock Mr. W. E. Debenham arrived in accordance with his promise to give the Hanging Committee the benefit of his advice as to the placing of pictures with regard to respective merit. So those of our readers who are pleased at the position accorded to their pictures will know to whose good judgment they are indebted, and, on the other hand, exhibitors who find themselves "skied" but who think they are entitled to places "on the line" will doubtless suppress any demur, knowing that the matter has been in the hands of one so well known and so capable. We should think that "Hanging Committee" must be

IRISH BEAUTIES.

Taken by Mr. F. W. Hindley, in the Miall Hand-Camera.

very thankful to have such responsibility removed from their shoulders.

To-night (Thursday) Capt. W. de W. Abney will distribute the medals, on which occasion, it is whispered, the energetic services of Mr. Fenton Jones will receive graceful acknowledgment from the admiring and appreciative members of the society.

NORTH, south, east, and west, town and country, are interested in it. Professional, trader, amateur, journalist,—all are to be included in it. No photographic interest will be omitted. Polypus, like its many arms, will embrace every section, and when duly organised it will be a matter of perhaps national importance. What is it? Well, we are not, perhaps, at liberty to divulge particulars as yet. It is not exactly new, but having existed in a sort of nebulous state for some time a process of concentration has commenced, and we shall shortly be able to announce the birth of a new body in photographic space

SOMETHING to do with the Camera Club Exhibition and its promoters? Oh dear, no—nothing whatever. We may know something of that too, but sometimes "silence is golden."

THE Leytonstone Camera Club has every reason for congratulation on the success of its efforts. The attendance on each day far exceeded expectation, and on the last evening (Saturday) the hall was crowded to excess. On that evening the medals were distributed to the respective winners by Mrs. Pickett Turner, assisted by Dr. Pickett Turner, the President of the club. Mr. Horsley Hinton (Vice-President), in proposing the vote of thanks to Mrs. Pickett Turner, alluded briefly to the increased use of rough-surfaced papers, as was instanced by the present exhibition, but pointed out that the blind use of such papers or any similar methods, simply because others had obtained artistic results thereby, was an entirely wrong course of action. He was himself in favour of all surfaces and all methods being used according to the requirements of each subject, and he hoped that as he was newly connected with the club it would not be supposed that he only had sympathy for one class of work.

"The unmitigated photographer" is a useful addition to modern photographic nomenclature. Many thanks, Mr. "G. D.," for its suggestion. The term will not require definition; we all know what is meant. There's an advantage in concise descriptive names, and we are still waiting for something equally descriptive of the other section—the unmitigated something else! Modernists, artistics, fuzzys, none of them will do. Will someone suggest?

QUITE right, good *Photography*, "wonders will never cease," and, with all possible diffidence, we venture to suggest that they don't all originate in the Midlands. We do not for a moment begrudge our contemporary his due credit for having been useful in the "Amateur versus Professional" question. We would give our Coventry friend his due, but remind him at the same time that a certain description of praise is no great recommendation.

THE REV. G. WRIGGLESWORTH, of St. Mary's Rectory, King's Lynn, desires to make known to his brother priests that having made a series of ninety odd lantern slides illustrating the Roman Catacombs, he is willing to lend them gratuitously to such as may desire to lecture on the subject, "for the advancement of Catholic truth," during the present season.

MR. A. R. DRESSER is evidently not in harmony with modern ideas as to the desirability of using long-focus lenses on hand-cameras as well as on other kinds of instruments. He recommended his hearers at the West Surrey Society to use a wide-angle lens for the hand-camera.

RECENTLY at Richmond a useful discussion was opened on the subject of mounting and framing photographs for exhibitions, and in one case it was suggested that "size and shape" would influence a picture's chance of being hung. Not to harp too much on the same chord, we have evidence this year that size—what was it again, 7 ft. by 5 ft.—does not debar a picture sometimes, and we never heard of shape preventing either. So long as it was not circular or elliptical, we should suppose shape mattered little.

THE subject of preparation of work for exhibition reminds us of another aspect of the case. We often hear possible exhibitors conning over the names of the judges, and as we know in some cases deliberately selecting such subjects and printing methods as they suppose will specially appeal to the tastes of the particular judges. Why, it's a worse form of "medal hunting" than the "unmitigated pot-hunter," and is certainly playing very low for the sake of a little notoriety.

If photographers would but regard the art which they have at their finger tips with a little more respect, and thereby invest it with its proper dignity, they would then perhaps see that in their works truth to himself and his own instincts is the first duty of the artist. Recognition on the part of others will follow in due course. Truth will stand, etc.!

MR. MASKELL has gone from Paris to Brussels, where he will again lecture and demonstrate on Platinotype printing, etc. In a letter he speaks very flatteringly of the extreme kindness and courteous attentions of M. Bucquet, the President of the Photographic Club of Paris, and of the members of the club generally, whose hospitality to strangers is well known to all who have had the honour of being their guests.

YET another gelatine-chloride paper is promised to dispute the ground with the P.O.P. and Solio. The Paget Prize Plate Company, we learn, purpose shortly issuing another printing-out paper of this character. The Paget Company also have some striking novelties at the Hackney Exhibition which we refer to elsewhere.

"PHOTOGRAPHS OF THE YEAR" is out, and is meeting with very great praise. One subscriber writes:—"I really must congratulate you on the excellence of the reproductions. They are splendid, and are in my opinion a vast improvement on the effort of last year. . . . It ought to be in the hands of everyone interested in photography as a record of the progress of our art, and what is of more importance, as an instructor."

THIS is merely one opinion, but we modestly refrain from any more self advertisement. Still, we really think we have to congratulate all concerned on a great success.

SOME little mistake seems to have arisen, however, as we have received two letters from subscribers complaining that they have not received their copies of "Photographs of the Year," and on looking into the matter we found they had ordered our "Prize Album," not "Photographs of the Year."

"PHOTOGRAPHS OF THE YEAR" is totally distinct from the portfolio which we shall issue at the end of the year, and which will contain permanent reproductions of the prize-winning pictures in our Monthly Competitions. If any other of our readers have been confounding the two, we hope they will write and let us put the matter straight.

OUR competitions are very well supported, but we may still draw the attention of some to the same. They are:—

Nov. 31: "Optimus" Competition, £105 prizes.

„ 21: Sea Pieces and River Scenery.

Dec. 10: Monthly Lantern Slide.

„ 19: Portraiture and Figure Study.

„ 31: Holidays with the Camera.

#### THE MADDOX TESTIMONIAL FUND.

After a good deal of accidental but unavoidable delay the Testimonial expressing the sentiments of the subscribers to the above fund has been sent to Dr. Maddox, the cheque alluded to having been handed over to him many months ago. The actual sum is somewhat in excess of £400, as a few subscriptions came in after the fund was closed; but these amounts have been passed on to the solicitors of Dr. Maddox, and have been added to the subscription list, which was not circulated among photographers of Great Britain and the United States, but covered the Continent of Europe, India, etc. When the latter list is closed we hope to intimate to the photographic public the result of the appeal to countries other than those included in this present notice. The Committee thank the subscribers heartily for their handsome response to the appeal, and it must be a pleasure to all to know that the gift was of much use to Dr. Maddox, and is accepted by him with great gratitude. The following is a copy of the document, which is on parchment, and neatly illuminated:—

"This testimonial is presented to Dr. Richard Leach Maddox with a cheque value £400 raised by voluntary subscriptions in Great Britain and United States of America, in recognition of his services to photography, and especially of his investigations in connection with gelatine emulsion. Signed of behalf of the subscribers by the Committee:—James Glaisher (Chairman), W. de W. Abney, W. S. Bird (p.p. the Autotype Co.), G. Davison, A. Haddon, A. H. Harman (for the Britannia Works Co.), Charles W. Hastings, T. C. Hepworth, A. Clifford Mercer, Henry Sturme, J. Traill Taylor, W. H. Walker, H. T. Wood, Frederick York, Thomas Bedding, Francis Cobb (Hon. Treasurer), Andrew Pringle (Hon. Secretary)."

#### NEW COLD-BATH PLATINOTYPE.

WE are not by any means satisfied with the details of the method described below, the whole arrangement being carried out with little forethought or provision, and the details may therefore be modified as the operator may find desirable. The paper is exposed to light in the usual manner, but printed *considerably deeper* than previous platinotype experience would have taught, and, indeed, in some cases with some negatives the image may be nearly visible through-out. The paper is then removed and fastened to a stout drawing-board with drawing pins. Our own experiments were with large-sized papers, 12 by 10 and 15 by 12, and a little difficulty was experienced in keeping the entire paper *perfectly flat*, an important preliminary item. However, in whole-plate size and thereabouts a pin at each corner would probably be enough to keep the paper flat. We now arrange three little china saucers, such as are used for mixing water-colour washes in, or any similar vessels would, of course, do equally well, and in the first of these we put two parts of saturated solution of oxalate of potash and two parts of pure glycerine; into the second we put one part of the oxalate of potash solution and four parts of glycerine; and in the third a little glycerine only. Thus we have—

1.	Saturated solution oxalate of potash	..	2 parts
	Pure glycerine	.. ..	2 „

2.	Saturated solution oxalate of potash	..	1 part
	Pure glycerine	.. ..	4 parts

3.	Pure glycerine		
----	----------------	--	--

We form a little "dabber" with some cotton wool screwed up in the corner of a silk handkerchief, and proceed to rub over the entire surface of the print with plain glycerine. Rub evenly and smoothly. No alteration will take place in the print, so reasonable time may be taken. Now see that the whole surface has been treated with the glycerine, and remove any superfluity which may be standing on the surface. This done, take a fairly strong flat camel-hair brush, say half inch to one inch in width, and having charged it with the solution in No. 2, pass the brush quickly and evenly over the least visible portions of the image, or such parts as you believe likely to be too white and wanting in detail. No change probably will be immediately visible; this is as it should be. Charge the brush again, and passing over the portions already done, extend the treatment to such parts as are slightly more visible. After an interval of a few seconds you will notice those parts which have been treated with the solution commence to develop up and grow gradually darker. When this has continued for a little time, re-charge the brush, and pass the solution over the entire print, except, perhaps, some limited spaces which are very dark, which may be left yet a little while. The whole picture will now commence to gain depth, and the contents of saucers Nos. 1 and 3 will be called into requisition—No. 1 to stimulate the growth of the image when it seems likely to be left behind by the rapidly darkening portions of the shadows; and No. 3, which is plain glycerine, may be laid on by a smaller brush to check and restrain too rapid development. In this manner hand and eye are busily engaged watching development, accelerating and retarding the action of each application of solution. At just the moment which is thought advisable the extreme darks may receive their share of solution, and some of the very obstinate whites may be touched with a little plain oxalate of potash solution. Glance quickly over the whole, and if you consider the result is what you desire lift the bath from the board and plunge it in the acid clearing print—hydrochloric acid 1 part to 60 of water.

Now, if we have conveyed a clear idea of what should be done, it will have become apparent that by the proper use of the oxalate of potash solution and the glycerine in various proportions and degrees, the whole image is under the control of the operator's brush. Dark objects may be held in subjection and never allowed to proceed beyond a light grey, and lighter portions, such as sky, water, or distances, which would come too light because of over-density in the negative, may (if the whole picture be printed fairly deep) be developed up to the desired depth by constantly stimulating with larger proportions of oxalate solution by the time the darker regions have caught up. In every other respect as to storing of the paper, the acid clearing, washing, and drying, the new paper in no way differs from the older and better known hot-bath papers. The finished print is much brighter than formerly, probably owing to the glycerine keeping the image from "sinking in," and the colour is a clear black, sometimes even a cold blue-black. This colour is, we find, capable of great alteration, and we will return to this part of the subject at a later date.

#### NOTES ON COLOUR.

##### IV:—COLOUR PRODUCED BY ABSORPTION.

(Continued from page 208.)

WHEN speaking of opaque and transparent substances we find that gold, though opaque when thick, became, when suitably diminished in thickness, capable of allowing some light to pass through, which was bluish-green. We shall now proceed to try and give an explanation of this phenomenon.

Let us take three pieces of glass, one deep red, one a deep orange, and one deep blue. Laying these three pieces of glass flat on a piece of black cloth, we find then that they all reflect white light, and we have no indication of their respective colours, but if these glasses are raised and placed between the eye and the source of light, we at once discover their colour. What is the reason of this? Has the red glass power to change white light into red, the yellow the power to change it into yellow, and does blue glass convert it into blue? The answer to this we must seek by the aid of our prism or prisms. As we tested white light in our first chapter, so we must test our coloured light. For this purpose it is only necessary to place over the hole in the shutter a piece of the coloured glass, and then examine our spectrum to see what happens. The result is shown in the following diagram.

FIG. 2.

We know that when white light falls upon the prism we obtain a spectrum of all colours, but when red glass is placed over the slit, we obtain a result as shown above fig. 2; when the yellow glass is placed over the slit a result fig. 3 is given; when blue glass is used, a result fig. 4. Therefore we must arrive at the conclusion that red glass does not convert white light into red, but merely holds back, refuses to admit, or absorbs all but the red rays and a few orange. In the case of the yellow glass, the orange and yellow rays are most prominent, the blue, violet, and blue-green being refused admittance; and in the case of the blue glass, the red and the yellow are no longer visible, only the violet, blue, and bluish-green, the latter more faintly. To make this point still clearer, let us obtain the ordinary spectrum in the usual way, but instead of examining it by the naked eye, let us look through the red glass at it, when only the red is visible, as shown in fig. 2, a, and when viewed through the yellow and the blue glass, we see results like fig. 2, b and c respectively.

We have thus far considered one thickness of coloured glass only. The point arises as to what is the effect of using different thicknesses. This point was carefully considered by Sir John Herschel in his "Treatise on Light," and he states that if we know that a given thickness of any medium absorbs a given proportion of light incident on its surface, then a second thickness of the same medium will absorb the same proportion of light that is left; that is to say, if in passing through one sheet of red glass one-tenth of blue light is absorbed, so after passing through a second sheet of red glass one-tenth of the blue light that the first allowed to pass through is absorbed. To make it plain let us turn to our table of the amount of coloured light in 1,000 parts of white light, and assuming that we have a sheet of glass which will allow, for every centimetre of thickness, nine-tenths of the visually active rays to pass and will absorb only one-tenth, whilst for the chemically active rays this given thickness of glass absorbs one-half of the chemically active rays, and therefore only allows .5 of these rays to pass, we may draw up a table which will represent the action of any number of thicknesses of glass,

if we take the amount given in the above-mentioned tables as the values of the different colours.

Thickness.	Intensity.	
	Red.	Blue.
0	769	231
1	692.1	115.5
2	622.8	57.75
3	560.6	28.8
4	504.6	14.4
5	454.2	7.2
6	408.8	3.6
7	368.0	1.9
8	331.2	.9

Further than this we need not carry our table, but this will show us how it is possible for a certain coloured glass to so far absorb the blue and violet rays to make it fit for use in a dark-room, if we suppose also that the first thickness of coloured glass is very minute. Reasoning from this we may see that if we take, for instance, a very pale yellow glass, and gradually increase the thickness, we absorb an infinitely greater proportion of blue and violet rays to what we do yellow and red. The practical application of this will be seen when speaking of coloured screens. If we go on increasing our thicknesses of yellow glass the hue changes gradually from yellow to orange, from orange to orange red, and finally from orange red to deep red, till, if we could increase the thickness sufficiently, we should obtain perfect darkness. A proof of this is seen in the case of water. When of immaterial thickness it is white or colourless, allowing all rays to pass equally; increase the thickness and the red rays are absorbed, the water becoming blueish; increase it still further, and we obtain perfect darkness.\*

If we wish to obtain a graphic representation or picture of the action of certain substances on the spectrum, it is extremely easy to do so. It is difficult to do this by shading on paper, but it is possible and easy by drawing a rectangular figure which shall represent the solar spectrum and drawing a curve through it, agreeing at the same time that the height of the curve above the base line shall represent the luminosity of the spectrum at this particular point. Fig. 2 will thus show the action of red (fig. 3) and orange glass (fig. 4) on the spectrum.

FIG. 3.

FIG. 4.

If we consider now the question, not of coloured glass,

but natural objects, such as green leaves, scarlet geraniums, a white lily, or any other object, we shall find the subject much simplified by the above statements, and also by the following experiment which is taken from Glazebrook's "Physical Optics," p. 269:—"Let us suppose that we enclose a perfectly clear solution, sulphate of copper, for example, in a black vessel open at the top, so that no light can be transmitted through it or reflected from the sides of the vessel, and look at it from light from above. The solution looks black, and if we examine the image of a white object seen by reflection at the surface, the image is colourless. All the rays are reflected according to the same law and so nearly in the same proportion that we cannot distinguish any alteration in colour. The clear transparent blue liquid reflects all rays practically alike, and itself looks colourless. But now suppose we make our solution slightly turbid by introducing some fine powdered chalk. The solution appears to be a brilliant blue. Let us follow the course of an incident white ray; some of it is reflected from the surface, but the rest is refracted into the liquid. Now our blue solution absorbs all red light which falls on it, and, therefore, after passing through a very small thickness of the liquid this refracted ray is practically a blue ray. This blue ray falls on a small particle of the powdered chalk, and is reflected by it upwards, and on emerging again from the surface reaches our eye. The blue light which we see, and which gives to the solution its colour, has been reflected to us, not by the surface of the liquid, but by the small particles in its interior. It has passed through some thickness, greater or less, as the case may be, of the solution, and thus the red and yellow constituents in the incidental white light have been removed; the blue alone remains to emerge and reach our eye. And just this has happened in our leaf or flower."

In the case of the green leaf the colouring matter acts, as we have seen, precisely like the chalk in our copper solution, except that the green rays are reflected. In the case of the scarlet geranium, the red rays, mixed with some orange, are alone reflected. In the case of the lily, although the rays are absorbed and irregularly reflected, they are all reflected in about equal degree, hence the white colour. To prove this as an actual fact also, let us again return to our spectrum and pass our lily slowly along. In the blue it appears blue; in the green, green; in the yellow it turns yellow, and finally looks red in the red. If, however, we treat our scarlet geranium in the same way, we find that it looks black in the blue, black in the green, showing slightly as we near the orange, and glowing with increasing brilliancy as we pass into the red.

We may thus agree with Tyndall and accept his statement as a conveniently expressed law. "Natural bodies possess the power of extinguishing, or, as it is called, absorbing the light that enters them. This power of absorption is selective, and hence, for the most part, arise the phenomena of colour. When the light is wholly absorbed the body is black; a body which absorbs all the waves equally, but not totally, is grey; whilst a body which absorbs the various waves unequally is coloured. Colour is due to the extinction of certain constituents of white light within the body; the remaining constituents, which return to the eye, imparting to the body its colour. It is to be borne in mind that bodies of all colours, illuminated by white light, reflect white light from their exterior surfaces. It is the light which has plunged to a certain depth within the body, which has been sifted there by elective absorption, and then discharged from the body by interior reflection, that in general gives the body its colour.\*"

## Letters to the Editor.

### GELATINO-CHLORIDE PAPER.

SIR,—I read in your journal, November 4th, "Notes on the Permanency of Gelatino-Chloride Prints," by Mr. W. E. Woodbury. While generally agreeing with Mr. Woodbury in his remarks, he claims to have introduced the gelatino-chloride process into this country. Allow me to point out to him that he is mistaken, and that he has not introduced the gelatino-chloride process into England.

The late T. B. Obernetter was for many years *the only* maker of the collodio-chloride paper which bore his name, and still does now. It was in 1885 that Obernetter produced his first issue of gelatino-chloride paper, before the name of Aristotype had been heard of. At that time he offered me the consignment of this paper, and I accepted and introduced into the English market then, and held stocks of it early in 1886.

If Englishmen owe anything to any one for the introduction of this process it is to me and to the excellent quality of the article as manufactured by Obernetter.

As with plates and many other commodities of the photographer, the cult of cheapness set in, and with starved plates go hand in hand sparingly silvered emulsion papers. Quality is too slow a thing in these days of competition. —I am, yours, etc.,  
J. R. GORTZ.

\* \* \* \*

### MASON'S TONING BATH.

SIR,—Further experiments have convinced me that better results are obtained with this bath by mixing the salt and sulphocyanide just before use—not keeping them ready mixed. I get better colours and I think less tendency to pink tones. I send you some prints, which are not so black as some, but are, I think, of a pleasing colour.—I am, yours, etc.,

CLIFFORD E. F. NASH.

NOTE.—The prints sent are a very good tone.—EDITOR.

\* \* \* \*

### ENAMELLING SILVER PRINTS.

SIR,—I have been trying lately to enamel some old silver prints, and have got on very badly indeed. I have not succeeded in stripping a single print out of some seven which I have put through the process, each one on a separate occasion, and I want some help or advice.

I have taken an old negative glass, washed it well with soap and water, dried it, and then treated it either with turpentine or with French chalk, or with both of them. I have then coated the glass with enamel collodion, allowed it to set until it would take the impression of the skin upon any part of its surface, and immersed it in water, sometimes cold, sometimes warm, and sometimes direct into the gelatine solution mentioned below.

I have prepared a solution of Nelson's No. 1 gelatine, 16 gr. to the ounce of water, in the usual way, soaked the print in it for from one to three minutes, sometimes direct, *i.e.*, dry, and sometimes after a preliminary soaking in water only, keeping the gelatine solution at about 100 deg. more or less. I have now immersed the collodionised glass plate in the solution, underneath the print, and withdrawn them both together, placing them generally upon something rather warm. I have then got a "rubber cloth" and squeegee, and pressed as lightly as possible consistent with the removal of air-bubbles, blotted, and set away for twelve hours or more to dry. I have generally then given the plate and print a final warming just before attempting to strip, and, as I have stated above, I have not succeeded in a single instance in getting the print to leave the glass at all.

I should be extremely glad to know the cause of my failure, and to know what mode of procedure will ensure a good chance of success. I have used two different samples of enamel collodion, but the results have not been affected by the change. I may say I am accustomed to finishing gelatino-chloride prints with enamel surface.

### EARLY PHOTOGRAPHS.

SIR,—If not already recorded, may I call your attention, for insertion in your valuable journal, as a contribution to the history of photography, to the following extract from page 87 of "Elements of Experimental Chemistry," by Wm. Henry, M.D., F.R.S., eighth edition, vol. ii., published by Baldwin and Co.,

THERMO.

and H. Hunter, in London, in the year 1818. A year or two ago some photographs were discovered in an old shop in London which were evidently very old, and as they answer to the description of the process described in this extract, were probably the work of Mr. T. Wedgwood. The English discoverers in photography are comparatively a neglected race, but this should not be. Even the inventor of the gelatine dry plate process is hardly known by its numerous followers. Had he been a Frenchman, a statue would have been erected, and fresh glory claimed by that nation.—I remain, yours, etc.,  
WM. LONDON.

November 9th, 1892.

"White paper, or white leather, when stained with a solution of nitrate of silver in the proportion of ten parts of water to one of the salt, undergoes no change in the dark, but when exposed to the light of day it gradually acquires colour, and passes through a succession of changes to black. The common sunbeams passing through red glass have very little effect upon it; yellow and green are more efficacious, but blue and violet produce the most decidedly powerful effects. Hence this property furnishes a method of copying paintings on glass, and transferring them to leather or paper. The process is described by Mr. T. Wedgwood in 'Nicholson's Journal,' 8vo., iii., 167. By a similar process ivory may be covered with silver. Let a slip of ivory be immersed in a dilute solution of pure nitrate of silver till the ivory has acquired a bright yellow colour. Then remove it into a tumbler filled with distilled water and expose it to the direct light of the sun. After two or three hours' exposure it will have become black, but on rubbing it a little the surface will be changed into a bright metallic one resembling a slip of pure silver. As the solution penetrates deep into the ivory, the bright surface, when worn away, is replaced by a succession of others."

An account of Wedgwood's experiments was contributed by Davy to the "Journal of Royal Institution," 1802.—EDITOR.

### THE LEYTONSTONE EXHIBITION.

SIR,—May I venture to ask you to kindly allow me, through your columns, and on behalf of the Leytonstone Camera Club, to thank those numerous ladies and gentlemen who sent pictures to our exhibition, and we assure them that their general excellence was duly appreciated by the hundreds of spectators who thronged the halls. The vast number of exhibitors renders it impossible to thank each person individually, moreover the unprecedented and unexpected success has given me so much extra work that any little failing on my part as to prompt answering of the numerous letters that I have received, and other shortcomings, will, I trust, be excused. Once more sincerely thanking one and all who contributed to one of the most successful exhibitions that has yet been held,—I am, etc.,

Rose Bank, South-West Road, ALBERT E. BAILEY  
Leytonstone. (Hon. Sec., Ex. Com.)

\* \* \* \*

### WINTER PHOTOGRAPHY.

SIR,—The paper by Miss Barnes in last week's AMATEUR PHOTOGRAPHER will appeal to all who read it. I am a clergyman's wife in a busy town, and very restful and helpful do I find my half hours in my dark-room or out with my camera. I am only a very lowly amateur yet, although I intend to struggle on until I win a gold medal from you, but I am so convinced of the physical and moral good to be gained from photography in earnest that I am trying to interest my children in it and bring them up as enthusiastic and real workers. Your paper is a help to me. I am a lonely worker with only very limited time to spare, an hour here and there, and this week's issue has been a special delight, the paper on outdoor winter photography echoes so many of my thoughts and experiences. A kind friend has taken me and my beloved camera out for a two hours' drive once a week the last three weeks, and, oh! the beauty of the leafless trees, battered undergrowths of ferns and hemlocks, and straggly briars, and the reflections in still pools and mists over the river! I send you a rough print taken about ten days ago, which will show you that I have cause to rejoice in the subjects I find, although I cannot get far from the town. Of course, it is cold and wet, but a cup of hot tea before starting and a pair of snow boots and wide open eyes make me forget all minor inconveniences; and then when I can steal an hour and get to developing, how happy am I! I have thoroughly taken to pyro developer (3-solution), and, except for lantern slides or occasional snap-shots, I use no other, and although I am an unskilled worker yet, you

will understand that a result like the enclosed, faulty as it is, does stir one up to try harder, and I am finding these autumn mornings a revelation of beauty and instruction. I see a good deal said about dark-rooms. I had to study economy, but I have such a cosy little one; just a few shelves and a thin deal roof closed in by turkey-red twill (part of an old bed hanging). The door is a framework of deal covered with turkey-red, and the little room is at the end of our big bath-room. I have a tin basin as sink, with an india-rubber tube to carry off dirty water down the bath waste pipe, and the whole thing cost very little and is most cosy, and my chemicals are never ice-cold, for the hot-water cistern for the bath is also in the room. I wish your readers, both ladies and gentlemen, would try what can be done with a few laths and shelf boards and two thicknesses of turkey-red twill.—I am, yours, etc.,

SELF-HELP.

\* \* \* \*

#### "PHOTOGRAPHS OF THE YEAR."

SIR,—Amongst the pictures reproduced in "Photographs of the Year" (upon the success of which I congratulate you and your publishers), one that in my humble judgment calls for special admiration is "In the Pool." The cloud effect in this is really grand. What I particularly wish to call attention to, however, is the peculiar greenish-blue tone so admirably adapted to the subject. Of course, in a reproduction, one cannot judge of the tone as in the original, but this would certainly convey the idea of being something more than a bluish-black platinotype. If this be the case, and my surmise that some special process of toning a bromide print was employed be correct, would it be going too far to ask Mr. Bennett to tell us how it is done?

I am sure he would greatly oblige many of your readers, besides,—Yours, etc.,

HENRY J. KNIGHT.

The original was a uranium-toned bromide, we believe, a very rich warm brown, but we thought the green would be more suitable. A brief note on green tones appears in editorial.—ED.

\* \* \* \*

#### LANTERN SLIDE PRINTING FRAME.

SIR,—In your notice last week of the lantern slide printing frame, introduced by Mr. Tylar, there were several particulars omitted. This frame is the invention of Mr. J. Ashford, 179, Aston Road, Birmingham who has patented it in conjunction with Mr. Tylar, the latter having the sole agency for its sale. This being a protected article, it is just as well that it should be known, as it might prevent misunderstanding in future.—Yours, etc.,

J. ASHFORD.

\* \* \* \*

#### CURIOUS OLD CUSTOMS.

SIR,—I am desirous of making up a set of lantern slides illustrative of old and modern curious customs, and shall be pleased of the co-operation of any of my brother amateurs. Any photographs or negatives sent to me bearing on the above subject will be thankfully accepted, and in exchange I shall be pleased to offer a lantern slide of the "horns dance" at Abbots Bromley, or the scene of "Dr. Johnson's penance."

As a guide, I might say that any of the following subjects will be most suitable: May-pole dancing in olden and modern times, trial by ordeal, witch burning, gull swarming, bull baiting, village stocks, Lord Mayor's procession, hanging in ye olden days, well dressings, Guy Fawkes celebrations, coaching, etc.

The above will be sufficient to indicate the nature of the photographs required.—Yours, etc.,

GEO. ELLIS.

Utttoxeter, Nov. 13th, 1892.

\* \* \* \*

#### CHLORIDE PAPER.

SIR,—In reply to Mr. W. F. Wilkinson (p. 300), I should define "a small scraping of chalk" and "a small bit of washing soda" as a sufficient quantity to neutralise any acidity that might be present in the chloride of gold and the hypo solution.

Testing for acidity is made by blue litmus paper, which is reddened by acids. Speaking approximately, 10 or 15 gr. of chalk for the 15 gr. of gold, and 2 or 3 drms. of soda to the 3 oz. of hypo will be sufficient. Prints will be fixed in fifteen to twenty minutes if moved about from time to time. There are no means by which one can tell when fixation is complete. Untoned prints on this paper are durable, but are not a pleasant colour.—I am, yours, etc.,

EDWIN UNDERWOOD.

## Apparatus.

### THE "IMPERIAL" PLATES.

THE Imperial Dry Plate Company have made a very important advance in dry plates. Only a few months ago the most rapid plates on the market only registered eighty on Watkin's scale. Now this firm are turning out in quantity plates which show 150 on Watkin's scale, equal to 100 on Hurter and Driffield's scale. This advance in speed is a great boon, and we really may assume that we shall have instantaneous shots taken at times and in lights which heretofore would have been impracticable.

### BLACKWOOD'S VARIOSCOPIIC LENS.

MESSRS. F. DARTON AND Co., of 124, St. John Street, Clerkenwell, are placing upon the market the above lens, which consists of an ordinary rapid rectilinear lens with convergent or divergent lenses of varying power which can be placed between the combinations, thus giving great range of covering power and foci.

The set is packed in a neat leather case, and it will form a very useful set for those desiring to use various foci lenses without much trouble.

### SMITH'S PATENT PLATE WASHER.

SMITH AND SON, of 102, Parade, Leamington, have introduced a very practical washer. The makers point out the fact that the requirements for washing prints are different from those for plates, and their washer is intended for plates only.

As will be seen from the illustration, the plates are placed with the film sloping downwards, a position which ensures rapid removal of the heavy hypo-saturated water, whilst also preventing any dirt or mechanical impurity settling on the films. The water inlet is so arranged that the bottom of the tank is kept clean and free from deposits, and a large syphon empties the tank every five minutes.

This washer is very practical, well thought out, and acts very efficiently, eliminating the hypo in a really very short time, with as little expenditure of water as possible.

### THE "LECTURER" CANDLE LAMP.

MESSRS. BENHAM AND FROUD, of Chandos Street, W., have introduced a new lamp for lantern readings. As we shall have an opportunity of practically trying it this week, we shall report on the same in "Our Lantern Screen" next week.

### ALSTON'S SYPHON AND WASHER.

MR. F. ALSTON, of 211, Ladypool Road, Birmingham, has sent us a sample of his new automatic syphon and washer. It is a convenient and effective little piece of apparatus, which allows one to utilise any vessel, bath, or pail for print or plate washing. The water is kept in continual motion, and a syphon takes off the hypo-laden water.

We have actually tested this, and find that it eliminates the hypo in a surprisingly brief space of time. It is effectual and cheap, the price being only 3s.

**Photographic Paper for Copying Tracings.**—A photographic paper for copying tracings, which gives black lines on a white ground, is being put on the market by Schwenke, Kirk, and Co., of 26, Church Street, New York. Not only has this paper the obvious advantage over ordinary blue prints of giving more suitable colours for the ground and lines, but after exposure in the printing frame the only treatment required for developing and fixing is a plain water bath. A paper of this sort has long been desired by engineers, and many inventors and chemists have searched for years for some compound which could be used in the preparation of such a paper. The compound appears to be an organic substance, which can be bleached by the sun, but is precipitated as a dark purple powder when it and its suspending medium are brought into water. This powder forms a black deposit in the paper and is quite permanent. The price of the paper is not any higher than the best blue-print paper, and it entails no expenditure for developing chemicals.

## How to Make a Set of Photographic Apparatus.

By H. J.

(Continued from page 286.)

### CHAPTER XI.

#### A WALKING-STICK TRIPOD AND A DEVELOPING TRAY.

It is sometimes difficult to hold a hand-camera sufficiently steady for time exposures especially, therefore it is convenient to have a screwed nut inserted in bottom and side of camera, so that a tripod can be used if necessary; but then another difficulty comes in, the ordinary tripod being too heavy, and requiring too long a time for erection to suit the ideas of the hand-camerist. In order to meet this difficulty, light tripods have therefore been introduced, and as a walking-stick is nearly as useful as the tripod, the most popular form is capable of forming both articles, and this being the case, I have arranged the subject of this paper "a double debt to pay," and I hope that it will be properly appreciated by my readers.

The height of the article must be regulated by each individual maker according to his own requirements. As I am fairly tall myself, the following measurements are such as suit me. The stick when closed is 2 ft. 9 in. high, and, as a tripod, is adjustable from the same height to 4 ft. 2 in., and can be fixed at any height between the

FIG. 87. two instantly, as well as being opened and closed very quickly. Fig. 87 shows the stand when closed as a walking-stick, and fig. 88 shows it in use as a tripod, only two legs being drawn, for the sake of clearness.

To make it, we shall want first a piece of wood 6 in. long and  $1\frac{1}{4}$  in. square—this can be any kind of tough wood (American white wood answers the purpose very well, being both tough and light); also a piece of brass tubing 2 ft. 9 in. long and  $\frac{3}{8}$  in. outside diameter. A hole must be bored through the centre of the 6 in. block lengthways, so that the brass tube will just slide to and fro in it easily but not loosely. The block can then be rounded up, so that the hole is straight through the middle. This block is marked A in the figures, the brass tube being marked B.

The legs must be prepared. They will require to be 2 ft. 3 in. long, but had better be cut off 3 in. longer, for a reason to be given later on. Cut them out  $1\frac{1}{4}$  in. by  $\frac{1}{2}$  in., and plane the edges so that the three will fit together as shown in fig.

89, the marks CCC showing the joints. Do not plane either outside or inside yet, but make each joint fit perfectly the whole length, and both inside and outside. This is rather a ticklish job for an amateur, but it can be done, and it is worth doing well, as upon it depends the look of the walking-stick when finished. The inside of the three pieces must now be hollowed out, so that when they are all placed together there is a round hole through them, slightly larger than that through the block A. After the inside is finished, the three legs must be screwed together about an inch from each end (this is what the extra 3 in. in length is for, so that the screw-holes can be cut off when

FIG. 89.

FIG. 90.

done with), sinking the heads of the screws well in; then plane them to a circle, tapering them towards the bottom according to the fancy, and finish it off with sand paper, and then mark them so that they can be put together the same again. The ends can now be cut off, doing away with the screws, and a brass tongue inserted in the large end of each leg as at D, fig. 90, fixing them there by two rivets as shown at E, fig. 88, and leaving about an inch of the brass plate projecting above end of leg. Corresponding slots must now be cut in the block A, and the legs hinged by means of pins passing through the block and through the brass plates; these pins are shown by dotted lines in fig. 90. The brass plates and pins can now be filed off level with the wood, and if my instructions have been followed carefully, the whole will now form a stick 2 ft. 9 in. long when closed up.

In the centre of each leg, at about an inch from the bottom, a small screw must now be inserted as at F, fig. 89, and in one end of the brass tube mentioned above cut three slots, so that when the legs are closed and the tube pushed down, the slots will slide over the screws, and bind the three firmly together. The slots can be widened at the end so as to slide on easily, and to work tight only at the bottom, or, when in use, the top of the slot.

This finishes the leg of the stand, and we will now get on with the handle of the stick, which also forms tripod top, unlike most of the walking stick stands in the market, which are furnished with a small triangle and which has to be carried separately. For this handle we shall require a piece of wood 5 in. long,  $1\frac{1}{2}$  by 1 in., also a piece the same length and width but only half the thickness, also a brass plate  $4\frac{3}{4}$  in. long,  $1\frac{1}{4}$  in. by  $\frac{1}{16}$  in.; this brass plate must be cut in three pieces, as shown in fig. 92 at G. One of the small pieces can be screwed on at one end of the thickest piece of handle and the other one towards the other end, leaving space enough between them so that the longest piece will fit between the two, as in fig. 92. Now hinge the two pieces of handle together at the end where the brass plate is level

FIG. 91.

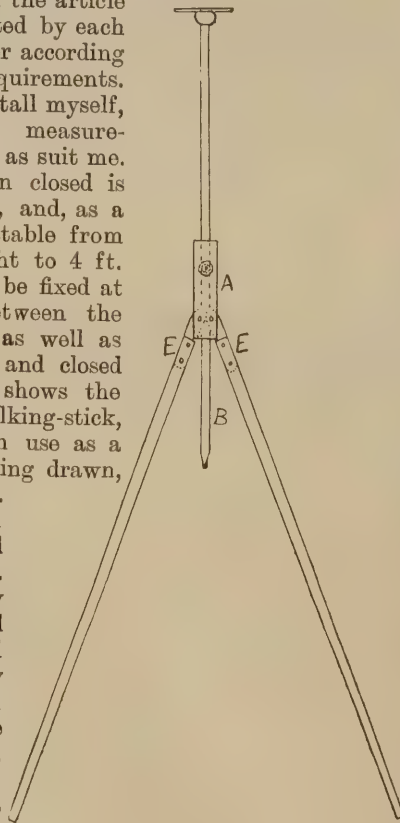

FIG. 88.

The latter of course will have to be filed away, to allow the hinge to be sunk in. A hole must also be drilled in the small plate at the other end, and a pin inserted in the top hinged piece to fit it (the hole is shown at H, fig. 92); this is to keep the two together when closed. The small plate at the free end must now be unscrewed, and a hole bored to take the end of brass tube, which can be fixed after it is cut

FIG. 92.

to the exact length to reach from bottom of legs when closed to the top of thick part of handle by slitting it down about an inch with an old saw, and then countersink the hole in handle (that is, make it larger at the top), and place the tube in position and wedge it open with wooden edges so as to fill the hole; this forms a dovetail and makes a firm job of it, but care must be taken not to wedge hard enough, to split the handle. The hole I must now be drilled through the loose piece of brass plate, and also through the thick part of handle; this must be exactly in the centre both ways, and must be the right size to take a small milled-head screw, the nut of which must be inserted in the top part of handle, so that the screw will hold all the parts together. A

nut must also be inserted in the camera fitting the same screw, as it is the means by which the camera is fixed to stand. A recess must be cut out underneath the handle for the reception of the above screw, as shown at fig. 91. A plug nut must now be inserted in the block A; this is for the screw which holds the stand at the height required and also keeps it closed when in use as a stick.

The stand can now be closed and fixed by the above mentioned screw, and the handle finished off to the size required. The brasswork will have to be filed; indeed, it will be the best way, after taking the wood roughly to the size, to finish both wood and brass with the file; a touch of glass paper will then make it right, after which it will only require staining and polishing.

It is a good plan, in order to prevent the bottoms of legs wearing when in use as a walking stick, to insert a metal plug in the bottom of tube, allowing it to project about

FIG. 94.

half an inch beyond the legs. Care must be taken to keep the plug away from the slots, or it will prevent the legs from closing properly.

I will now say a few words as to the manner of using this stand, and then I have finished. We will suppose that we are just arrived at a spot where a plate is to be exposed and require the stand, which so far has done duty for a walking stick. First slacken the screw in block A, and draw out the tube to the requisite height, and tighten the screw

again; spread open the legs, and plant them firmly on the ground; then unscrew the screw in handle until the top part can be folded back out of the way, turn the brass plate round at right angles as shown by dotted lines in fig. 92, and insert the screw in camera and tighten up. The three pieces of brass now form a good broad basis for the camera to rest on, and it will be found to be quite firm, while the ease with it can be changed from stick to stand, and *vice versa*, and also that it has no loose parts, being absolutely self-contained, will I think recommend it to all. The fittings required are very few, and can be obtained almost anywhere, but for the benefit of my readers I will give my

FIG. 95.

usual list of necessities and prices of same, which will compare very favourably with those charged for similar stands, many of which are not half so serviceable and handy as this one.

List of fittings required:—

	s.	d.
Two milled-head screws .. ..	0	9
Three brass plates for hinges to legs ..	0	9
Brass plate for handle .. ..	0	4
Hinge for ditto .. ..	0	1
Brass tube, 2 ft. 9 in. long, $\frac{3}{8}$ in. diameter..	1	6

#### A GLASS BOTTOM DEVELOPING TRAY,

These trays are so easily and cheaply made that I often wonder why there is any sale for the ordinary kind at all, especially the more expensive ones, though I suppose the reason is the same as with the rest of the apparatus, the more money that is paid for it the better it is supposed to be. To make good, serviceable developing trays it is only necessary to prepare a piece of wood 1 in. by  $\frac{3}{8}$  in., of the section shown in fig. 93, and long enough for the tray you wish to make; then cut it in four pieces and prepare the corners for putting together in the same way as I recommend for the camera body in Chapter I.

When ready for putting together, nail one side on the two ends, then fill the grooves all round with white lead or putty, and slide a piece of glass in them and nail on the other side. Now clean off the outside at the joints, also wipe away all the surplus putty which has squeezed out of the grooves, and then give the rim and the glass all round, about half an inch, two coats of good enamel both inside and out. This finishes the tray, and it will be found perfectly watertight, and will last for years. If a well is required to the tray, it can be formed by simply nailing a piece of wood about an inch wide on top of the frame at one end, and enamelling it well inside. By doing this the tray can be turned on end with the developing solution in it, for the examination of plate, which need not then be touched with the fingers during development; this will be found to do away with the principal cause of stained negatives.

The above is a good form of tray for developing one plate at a time, but it is often necessary to do three or four at once especially by hand-camera workers. The following tray is designed so that it will take eight quarter-plates or four half-plates, or both quarter and half plates at the same time, and of course the same can be adapted to take quarter and lantern plates or any other sizes, though the sizes I am about to give are for the first mentioned.

First prepare sufficient material for the sides and ends, of the same section as mentioned for the first tray, but of double the thickness; fit it together at the corners so as to form a frame 2 ft. 6 in. by 4½ in.; before nailing together level the long pieces so that they are of the same section as K K, fig. 95. The frame can then be nailed together, bedding in the glass bottom with putty as before, and cleaning off and enamelling as well in the same way.

When the enamel is set hard, make seven pieces for divisions, as at L, fig. 95. As will be seen, they must be cut so that when the projecting pieces at the ends are resting on the sides (K), both the ends and the bottom are a bare eighth of an inch away, or, in other words, there is a clear space of an eighth of an inch (bare) between the ends and bottom of division and the sides and glass bottom of tray.

A piece of india-rubber must now be fixed round the division, so as to form a water-tight joint, then on each end a clip hinge must be screwed, so that the clip catches under the bottom of tray and holds the division down tightly.

I have only mentioned one division, but the tray will require seven when filled with quarter-plates, though only three when developing half-plates. They must be all made exactly alike, so that they will fit at any part of the tray. It is then quite possible to be developing different makes of plates at the same time and in the same tray, thus giving a better chance of comparing the various virtues and faults of each much easier than when done separately, or different developers can be compared in the same way and yet kept quite separate.

This tray can be still further improved by the addition of a pair of rockers, one of which is shown at M, fig. 95. A slight touch will then keep the developer in motion much better than rocking by the hands, and it will also leave the hands free for making notes, etc., the reason the latter is so much neglected being often through both hands being fully occupied with other things.

The necessary fittings for this tray are as follows:—

India-rubber for divisions, per foot .. .. .	d. 8
Clip hinges for ditto, per pair .. .. .	4

In my next paper I shall give a description of more novelties in dark-room fittings, etc., and this will conclude the series, for the present, at any rate.

#### CHAPTER XI.

##### DESCRIPTION OF FIGURES.

- Fig. 87. Walking stick tripod, closed.  
 " 88. Ditto, erected.  
 " 89. Section of ditto, at bottom, when closed.  
 " 90. Ditto, ditto, at top of legs, showing joints.  
 " 91. Ditto of handle, showing camera screw.  
 " 92. Detail of handle when forming top.  
 " 93. Section of side of developing tray.  
 " 94. Plan of improved ditto.  
 " 95. Section of ditto.

 K. Sides of improved tray.  
 L. Division of ditto.  
 M. Rocker for ditto.  
 N. Clip hinge to hold division in position.  
 O. India-rubber.  
 P. Glass bottom of tray.

## Review.

*Lumière, Couleur, et Photographie.* By Louis Calmette. Published by Société d'Éditions Scientifiques, 4, Rue Antoine-Dubois, Paris. Price 2 fr.

In this work the author has been working on the same lines as in our leading articles "Notes on Colour." He first considers the composition of light and colour, and then treats of the different action of coloured screens, etc. A succinct summary of the principal features of orthochromatic photography and the method of sensitising plates follows, and very clear directions on the practical use and application of the plates are included. Finally the author includes a brief summary of Heliochromy. The work is well written, and includes the most recent developments.

*Guide to the Science of Photo-micrography.* By Edward C. Bousfield, second edition. Published by J. and A. Churchill, 11, New Burlington Street, W.

Mr. Bousfield has brought his well-known work well up to date, and it will now form a very useful text-book, both for the microscopist or photographer who desires to take up photo-micrography. He is not afraid to give explicit directions how to photograph or how to use the microscope; and to the young worker his exposure table will be found of very great value as saving many failures. A final appendix on the preparation of sections for photo-micrography and an excellent index complete the work.

*The Gentlewoman Christmas Number.* Published at Howard House, Arundel Street, Strand, W.C. Price 1s.

The chief literary feature is somewhat novel. "A Story of Seven Christmas Eves," or "A Social Evolution," is the life of two waifs, of gentle birth, who pass through many vicissitudes to positions of honour and distinction. The chief incidents of their lives are supposed to be narrated on Seven Christmas Eves, at intervals of seven years, by the characters who themselves take part in the story. The authors who tell the tale are Clo Graves, G. Manville Fenn, Mrs. Campbell Praed, B. L. Farjeon, Florence Marryatt, Justin H. McCarthy, and Clement Scott, the illustrations being by Dudley Hardy. Sir Walter Scott's seasonable verse, "Christmas in the Olden Time," is illustrated by five pages of appropriate pictures by distinguished artists, and there is a double page drawing of Cat Life, "Snap Dragon at Pussey Cat's Christmas Party," by Louis Wain.

The special pictorial feature is a very fine reproduction in colours on satin by means of three process blocks. This in itself is specially interesting as an example of heliochromy, and with the literary matter and the ordinary black and white illustrations the whole is a very good number.

*The Young Gentlewoman, No. 1.* Monthly, price 6d.

This has evidently grown out of "The Children's Salon," the well-known corner usually devoted to the younger fair sex in the *Gentlewoman* weekly. Bright, readable, and well illustrated, it bids fair to become a great success, and it has our heartiest good wishes. Some of the illustrations are from photographs taken by members of the "Salon," and they show evidence of careful work and good artistic taste on the part of the competitors.

# THE LEYTONSTONE CAMERA CLUB.

The first annual exhibition of this club was opened by Lady Brooke on 10th inst. at the Masonic Hall, Leytonstone. The President, Dr. W. Pickett Turner, introduced Lady Brooke in a few well-chosen words, and after the exhibition had been declared open, a vote of thanks to Lady Brooke was unanimously passed, which was suitably acknowledged by Lord Brooke.

The pictures got together are, taking them on the whole, decidedly good. The judges, Rev. F. C. Lambert, Messrs. A. Horsley Hinton and E. J. Wall, were busy the whole afternoon, and we give the awards and some notes on the classes. Class A: Landscape, Seascape, and Architecture (members only)—Silver medal to H. H. Summers for Nos. 27 and 28, two good platinotypes of landscapes; bronze medal to A. E. Bailey for No. 73, an "Interior of Wells Cathedral;" highly commended to No. 42, a fine sea piece, by D. G. Riddick; and commended to No. 4, "Norman Doorway, Kilpeck Church," by A. P. Wire. Class B: Portraits and Figure Studies (members only)—Silver medal, No. 91, "In the Clover Fields," by A. C. Frost; bronze medal, No. 81, "Young Essex," by G. S. Manuell; highly commended, No. 84, "The Arab and his Steed," by H. H. Summers; and commended, to No. 88, "Gipsies," by D. G. Riddick. Class C: Enlargements (members only)—Silver to No. 111, "Barnborough Castle," by D. G. Riddick; bronze to No. 119, "When the Tide has Gone," by A. E. Bailey; highly commended to No. 109, "Young Farmer Giles," by G. S. Manuel; commended, No. 106, "Lord Rothschild's Boathouse," by G. S. Manuel. Class D: Lantern Slides (members only)—Silver to No. 122, a set of six landscapes, by H. H. Summers; bronze to No. 127, by D. G. Riddick; highly commended to No. 125, by Tom Symmons; commended to No. 130, by A. E. Bailey. Class E: Landscapes, Seascapes and Architecture (open)—Silver to No. 217, "On the Marshes, Hackney," by F. J. Clements, a very fine study; bronze, No. 196, "Handel's Organ," by J. H. Gear, an exquisite interior; highly commended, No. 182, "Sunset," by G. W. Ramsay; and commended, No. 192, six technically excellent interiors, by C. H. Oakden. Class F: Portraits and Figure Studies (open)—This class contained only nineteen exhibits, and of these, eight by Mrs. Francis Clarke, Messrs. Austin, Leeson, and Spiller were disqualified as having gained prizes elsewhere; silver medal to No. 231, "A Portrait," by G. H. James, a very good study which deservedly took top; bronze to No. 241, "Aha," by Mrs. S. Francis Clarke; highly commended to No. 229, "Forty Winks," and commended to No. 228, "At the Well," by P. R. Salmon. Class G: Enlargements (open)—Silver to No. 255, "Fishermen's Cottages," by J. H. Gear; bronze to No. 248, "A Misty Day on the Thames," by A. R. Dresser; highly commended to No. 250, "Corn Flowers," by J. Carpenter; and commended to No. 256, "The Lowing Herd," by J. H. Gear. Class H: Lantern Slides (open)—In this class a set by J. E. Austin were disqualified; silver medal to No. 263, by G. Hankins; bronze to No. 271, flower studies, by J. Carpenter; highly commended to No. 268, architectural, by H. E. Farmer; commended to No. 283, photo-micrographs, by J. Freshwater.

A fine collection of prints by such well-known workers as Karl Greger, Byrne, Horsley Hinton, Alfieri, Winter, etc. Messrs. Elliott and Sons showed their famous wave study, and also some 15 by 12 carbon enlargements from hand-camera shots. The London Stereoscopic Co. have a very good exhibit, but possibly the finest work was an enlargement by a member of the club, Mr. Tom Symmons, an almost faultless sea piece. Webber and Sons showed collotypes, and Waterlow and Sons specimens of various printing processes.

The apparatus includes a fairly comprehensive list. Messrs. W. B. Whittingham and Co., of Gracechurch Street, E.C., have a good show of cameras, lenses, chemicals, and apparatus generally, and some very good examples of printing in Mezzotype, which show that it is suitable for small work. Braine and Sons, Holloway, have some well-made cameras and enlarging and reducing apparatus. Messrs. Platt and White make a special feature of fittings, flash lamps, and lanterns, and stereo slides, etc. Percy Lund and Co. have a complete and varied show of books. A. R. Wormald and Co. make a brave show of Photomnibus cameras and results, and masks and binding strips, and all the requisites for lantern work. An exhibition of microscopes, stereoscopes, and Thaumatrope, etc., was also in the small room, and during the three evenings lectures, lantern shows, and musical entertainments were given.

# EDINBURGH PHOTOGRAPHIC SOCIETY.

An exhibition was opened in the rooms of the Edinburgh Photographic Society in Castle Street on 10th inst., and will remain open for a fortnight. The exhibition is open all day, and is free to the public. As an opening ceremony the members of the society held a smoking concert, at which Mr. Alexander Ayton, the senior Vice-President, was Chairman. Of the pictures which are exhibited there are nearly 200 by members of the society. These are as yet under mottos, waiting to be judged in competitions for prizes. Mr. F. P. Cembrano, jun., has sent four landscape studies, printed in

platinum, on rough paper, which have taken first-class awards at exhibitions in London, New York, Amsterdam, and Brussels. Mr. W. Bedford, London, has sent duplicates of three pictures which were exhibited in the Pall Mall exhibition. Mr. George Davison sends twelve landscape pictures of the Emersonian school, about the effects of which there has been much controversy in photographic circles. Mr. Ralph Robinson, London, sends three large pictures—landscapes with figures—which will be useful to the members as studies in composition. Mr. Lyddell Sawyer, Newcastle, sends two large figure composition subjects, which illustrate the charming effects that may be produced by attention to lighting. Mr. F. Sutcliffe, Whitby, sends a series of very beautiful landscape enlargements; and Mr. Adam Distin, Leven, Fifeshire, a few exhibits of composition genre subjects. Of the work of the members the most striking is the large group of the Photographic Convention, by Mr. Ayton, the Chairman.

# HACKNEY PHOTOGRAPHIC SOCIETY.

From the hasty glance only which we have been enabled to give to this exhibition, we can heartily congratulate the Exhibition Committee on the show both of apparatus and pictures they have got together.

Mr. Herbert Robinson, in a few well-chosen words, introduced Sir Albert K. Rollitt, M.P., who, in a speech of some length, congratulated the Society on its exhibition and declared the same open. A vote of thanks to Sir A. Rollitt was duly accorded.

The exhibition of apparatus is decidedly good, and taking these in order we find—

Adams and Co., of 81, Aldersgate Street, have an excellent show of their well-known specialties, such as the "Ideal," Club camera in aluminium and brass, Torsioscope, etc. A novelty is the new opaque lantern screen, mounted on roller to wind up and down, and covered with a protective cover. Also a new biunial lantern of elegant make and design. Some new colours, both oil and water, for lantern slides. A very neat and striking exhibit is the "Vesta" camera in Russia leather case.

T. and H. Doublet, of 11, Moorgate Street, have a miscellaneous show of lanterns, masks, lenses, and several well-known specialties for which they are agents, such as Watkin's meter and Tylar's goods.

Grant and Cocks, of Copthall Avenue, E.C., show some electric dark-room lamps of very neat construction with adjustable screens of different colours, accumulators being used instead of batteries, thus saving all mess and trouble.

Hannam and Co., of 25, Soho Square, W., have an excellent show of their well-known artistic mounts. Iliffe and Son have an assortment of photographic literature. Percy Lund and Co., of Memorial Hall, Farringdon Street, E.C., also have a very varied assortment of books of all kinds, and also Brun's glossy colours.

Marion and Co., of 23, Soho Square, have novelties in the shape of the Radial hand-camera in lantern and half-plate sizes. Also a patent rocker actuated by water, the dish being held in position by suckers. The dish, too, is new in that, though glass, the title is on the bottom in raised letters, e.g., Toning, etc. A new hand-camera for twenty-four lantern plates, the "Beaumont," is also well worth attention, the whole striking us as a good thing, and we shall take the opportunity of examining this more critically.

The Paget Prize Plate Company, of Watford, besides their well-known plates, have some real novelties in the shape of printing-out lantern plates and opals, to which we shall recur again.

Messrs. Platt and Witte, of Birkbeck Road, Kingsland, show lanterns, flash-lamps, and camera fittings.

Mr. H. Park, of Station Buildings, Acton Street, Kingsland, has some good and cheap cameras, bamboo stands and fittings.

Mr. T. H. Powell, of 116, Denmark Hill, S.E., shows his compressed developers, toning baths, and the novelty is Amidol in compressed and portable form.

The Platinotype Company, of Southampton Row, W.C., have some very fine specimens of their process, and propose to give demonstrations of the same. They also show some new forms of the Key Camera with new shutters and new prices.

W. Watson and Sons, of 313, High Holborn, E.C., have their well-known Acme camera stands, lenses, and all accessories.

W. Sharman, of Mare Street, Hackney, shows special forms of developers very neatly packed and sundry apparatus.

A. R. Wormald and Co., of Sutton, Surrey, show the Photomnibus and results, lantern masks, binders, spots, a new and useful print-cutting table, etc.

W. Wray, of North Hill, Highgate, has a splendid show of lenses, both in aluminium and brass.

We shall give a brief note on the pictures with the judges' awards, next week, as the same were declared after we go to press for this issue.

## Societies' Notes.

THE following are the officers of St. Bartholomew's Hospital Photographic Society for the ensuing year:—President, Dr. Russel, F.R.S.; Vice-Presidents, Dr. V. D. Harris, Dr. Lewis Jones; Hon. Secretaries, Dr. W. Collings and J. Hussey, St. Bartholomew's Hospital; Additional Committee, W. B. Jones, M.R.C.S., L.R.C.P., S. E. Gill, G. A. C. Calvert.

A. PHOTOGRAPHIC society has been formed at Gosport, with the following officers: President, the Rev. — Matthew; Vice-Presidents, R. E. Froude, T. E. Williams, G. Churcher; Treasurer, W. B. Smith; Hon. Secretary, C. R. Wright (47, High-street, Gosport); Council, H. Fisher, S. Morrish, R. Tucker, R. E. Green, Moss, and Misslebrook. The society will meet at 46, High Street. The subscription is to be 2s. 6d per quarter.

THE formal amalgamation of the Aston Natural History Society and the new Photographic Society took place at Burlington Hall, High Street, Aston, on Thursday evening last. A large number of both sections were present, the chair being taken by J. W. Neville, Esq., President of the Microscopical Society. The future name will be "The Aston Natural History and Photographic Society," the management of which will be entrusted to a general committee, with sub-committees of eight to manage the respective branches. Dr. Hill Norris, M.D., and W. Tylar, Esq., were elected Vice-Presidents, and Mr. W. Wallis Treasurer to general fund. The subscription will be inclusive, and the library open to all members. The communications anent the Natural History Branch should be sent to Mr. Parker, Nursery Road, Aston, while letters, etc., to Photographic Section must be addressed to Fred W. Pilditch, 133, Wills Street, Aston.

THE P. B. A.—We hear that Mr. Hollier's benefit day on Saturday last realised the handsome sum of £21 12s. 6d. for the funds of the Benevolent.

THE Exhibition in Pall Mall, which closed on Thursday last, may be considered as the most successful the Society has ever held. The number of visitors to the gallery from September 24th to last Thursday night reached a total of 10,361; the lantern evenings especially showing a very decided increase. On Wednesday the last lantern display brought over 300 visitors together, and the very fine slides shown by Capt. Abney, Mr. F. P. Cembrano, junr., and Mr. B. Gay Wilkinson, junr., were much appreciated. Amongst others, the President exhibited a slide of a flying bullet, by Prof. Mach, the different features of which he pointed out. One by Mr. Cembrano, showing a very extraordinary combination, brought about by the same plate having accidentally received two exposures, and Mr. Wilkinson's "Sunset Calm," were received with enthusiastic applause.

THE South London Photographic Society will hold their annual exhibition and competition on the 24th, 25th, and 26th November, at the Peckham Public Hall, Peckham, S.E. There are eight classes—six members' and two open to members of South Metropolitan photographic societies. Silver and bronze medals are offered in each of the latter. Messrs. F. P. Cembrano, jun., A. Pringle, and A. Horsley Hinton have consented to act as judges. A large number of entries are expected. The latest novelties and appliances in photographic apparatus will be exhibited by Messrs. Adams, Burr, Henry Crouch, Ltd., Dollond, Howell and Son, Percy Lund and Co., Moody and Cottams, Noakes, Photographic Artists' Supply Stores, Powell, Rice Slater, Wormald, and others. Demonstrations will be given at intervals of the working of photographic processes by the Platino-type Company and others. Lantern displays and instrumental music each evening. On Saturday at 8 p.m. a concert by talented artists will be given, followed by Mr. H. G. Banks's popular lantern entertainment, "A Tour in the Channel Islands," and a series of dioramic effects by the triple lantern by Mr. Leonard Greaves. Particulars of spaces for exhibit can be had on application to the Hon. Secretary, Chas. H. Oakden, 51, Melbourne Grove, East Dulwich, S.E.

THE following are some of the fixtures and exhibitors of the Stanley Show:—*Lantern Entertainments*—Saturday, 19th, 3.30, "Racing and Cycling Celebrities," by G. Lacy Hillier. Tuesday, 22nd, 7.30, "The Evolution of the Cycle," by G. Lacy Hillier; "Snap Shots," by Lewis Medland and Austin C. Edwards, Dr. W. B. Richardson in the chair. Thursday, 24th, 5.30, "Ditto to Ripley in Thirty Minutes," by G. Lacy Hillier; 8, "The Great North Road and the Record Country," by F. Bidlake. Saturday, 26th, 3.30, "The Southern Counties Cycling Camp;" "The Use of the Hand-Camera," by Conrad Beck; 8, Stanley Photo Competition Lantern Slides,

Photography Cyclist Slides. *Exhibitors*—W. J. Anckorn, J. E. Austin, E. Benson, T. M. Brownrigg, F. Boissonas, J. Carpenter, S. F. Clarke, L.D.S., C. Court Cole, A. R. Dresser, F. Downer, T. E. Freshwater, F.R.M.S., A. W. Gottlieb, J. A. Hodges, E. G. Lee, H. R. Leech, Lewis Medland, Viscount Maitland, Robert Terras, Warneke, Walter D. Welford, Mrs. Jeanie Welford.

## Societies' Meetings.

**Accrington.**—The first annual general meeting was held on the 7th inst., and was well attended, Mr. Cheney presiding. During the time the society has been in existence, ten monthly meetings and four Saturday afternoon excursions have taken place, and these have been well attended and much appreciated. The financial position of the society, though not of the best, is fairly satisfactory, considering the number of members and the short experience of the officers. There are a few items of expenditure in the balance-sheet which might have been reduced, or almost avoided entirely under similar circumstances in the future. The officers for 1893 session were elected as follows:—President, Dr. Clayton; Vice-Presidents, Mr. Jos. Barnes and Mr. J. Cheney, Dr. Geddis, Rev. J. R. Rendell, and Mr. T. Stanley; Council, Messrs. F. Bradshaw, Wm. Clayton, W. J. Clayton, J. Oldham, and B. T. Westwell; Hon. Treasurer, Mr. John Hanson; Hon. Secretary, Mr. Isaac Hanson. It was also announced that arrangements are being made for demonstrations of the most modern and popular photographic processes, and the loan of prize lantern slides and pictures has already been secured for the winter months, and an exhibition of members' work is in contemplation. The society is endeavouring to establish suitable permanent headquarters, with a well-appointed dark-room and enlarging lantern for the use of members at any time. After the business of the evening the President and Mr. Barnes gave an exhibition of local views by the aid of the optical lantern, and these were very much admired, particularly the slide representing the recent shipwreck at Blackpool.

**Ashton-under-Lyne.**—At the ordinary weekly meeting on the 10th inst., the President (Dr. A. Hamilton) in the chair, a lecture was delivered by Mr. J. L. Lees (Dukinfield) entitled "A Visit to the Riviera." The lecturer exhibited about 160 slides descriptive of a tour made by himself and two friends in August 1891, through France, calling at Avignon, Amiens, and on to Marseilles, then along the Mediterranean coast, stopping at Cannes and Nice, thence travelling to Monte Carlo. The lecturer here exhibited many views of the interior and exterior of this great gambling place and of the surrounding district. The party having obtained special permission to photograph the interior, Mr. Lees showed a diagram of the tables and explained the methods of play adopted for gambling at Monte Carlo. From here the party went to Mentone, Genoa, Milan, Lake Como, and other towns in Italy. The slides were very good and proved enjoyable to the members present. The Rev. Thomas Green, in moving a vote of thanks, said he only came to the rooms to spend ten minutes, but he was so pleased with the lecture and slides that he stayed the whole evening. Although many long years had elapsed since he visited the places, the pictures thrown on the screen brought back to his mind bygone pleasures. Mr. Greenwood seconded the motion.

**Belfast (Y.M.C.A.).**—The monthly meeting was held on 7th inst., Mr. J. E. Pim, in the unavoidable absence of the President, occupying the chair. There was a large attendance, which included several new members. The prints and lantern slides in monthly competition were passed round for inspection, the awards falling to J. A. Pollock, first, a fine whole-plate yachting study; A. George, second, a good half-plate river scene; J. McCleery, third, yachting at Bangor. In slides, J. McCleery first, W. H. McCleery second, and J. A. Pollock third. Mr. Pollock afterwards proceeded with his "Notes on Enlarging," describing his method of enlarging by daylight very fully, by the aid of a darkened room and the ordinary camera, the negative being placed in a frame (of which there were certain sizes to suit different negatives), at an opening in the window, through which the light was projected by means of a sheet of opal glass placed at an angle of 45 deg. outside. A series of beautiful enlargements, 24 by 19, were then shown to the meeting, and were greatly admired, an exposure of three minutes having been given (from whole-plate negative), using stop  $f/16$ ; an exposed sheet of slow Ilford bromide was then developed, and successfully finished; an enlargement from same negative was then made by the club's lime-light apparatus. An adjournment was then made to the large hall of the association, where the competition and other slides were shown on the screen.

**Blackburn and District.**—First lantern night of the season, Nov. 10th, where eighty slides of the Holy Land and forty of Balmoral by G. W. Wilson, were shown by S. J. Mitchell. The Holy Land slides were more interesting than beautiful, but some of the Balmoral

ones were very fine, the interior views of the Castle especially. A few slides by members were afterwards put through, including some snap-shots of local bits taken in the "Facile," both the negatives and slides being developed with Amidol.

**Bolton.**—The general monthly meeting was held on the 9th inst., Mr. William Banks in the chair. After the usual formal business of the society had been transacted, Mr. S. G. Buchanan Wollaston gave a lecture on the powers of the Platinotype Co.'s new paper for cold development, illustrated with a practical demonstration of the various methods of modifying the developer, and showing how completely the image could be held in control.

**Bristol and West of England.**—On 11th inst., the usual club business having been transacted, Mr. J. J. Hill put through the lantern his slides illustrating his holiday trip to Norway. They were very interesting and of good tone. Mr. Frederick Ashman was elected a member.

**Burslem.**—Monthly meeting held on 11th inst., Mr. E. B. Wain (President) in the chair, and a good attendance of members. The President exhibited a simple apparatus of his own construction for making lantern-slides by reduction, giving a full description of its construction, which could be done at a cost of two or three shillings by any carpenter, and demonstrated its working by making a slide with it. Details of apparatus will appear in our next issue. At the conclusion of the demonstration, the lantern was started, and a number of slides made by the members were passed through first. Afterwards about 150 slides kindly lent by the Editor of the AMATEUR PHOTOGRAPHER were shown, and greatly enjoyed by all present; most of them were criticised, and their faults (if any) noted; on the other hand, many afforded considerable instruction to slide makers.

**Cornish (Camera Club).**—Meeting on 7th inst. A large number of prints on Eastman and Ilford gelatino-chloride paper were toned. The members find that these papers do not tone so evenly as the old albumenised papers.

**Darlington.**—The usual meeting of the Photographic Society was held on 7th inst. Mr. Howlett presided. The Secretary read the annual report, which showed the society to be maintaining its position very well. The balance-sheet showed a small deficit caused chiefly by the expenses of the late exhibition. The following officers were elected for the year:—President, Rev. C. G. Davis; Vice-President, Mr. W. G. Brewis; Treasurer, Mr. A. Sanders; Hon. Secretary, Mr. Walter Hildreth, Coniscliffe Road; Council, Messrs. W. F. K. Stock, T. Howlett, L. W. Williamson, and James Robinson. Mr. Howlett, in the course of some remarks, said he hoped members would induce beginners to join the society, in which the older members would be only too glad to help them through their difficulties, and give them the benefit of their experience.

**Durham.**—A well attended meeting was held on 11th inst., Vice-President Councillor E. White in the chair. Mr. W. Wilkinson, photographer, Durham, gave an interesting and instructive demonstration on "Enlarging." The prize hand-camera prints of a contemporary were also on exhibition, and were pronounced to be superior to the 1891 prints.

**East London.**—Ordinary meeting 8th inst.; the chair was occupied by the President, Mr. G. S. Pasco. There was a good attendance of members. The subject of the evening was a demonstration on "Carbon," by Mr. C. Tylee. Mr. Tylee detailed and fully illustrated the single transfer process, which he recommended for beginners. In the first place he stated the plant recommended by books oftentimes deterred amateurs from entering into this process. The plant used for the demonstration was of a make up description consisting of the following:—Three enamelled iron baking dishes, one chopping board covered with blotting paper as a squeegee board; an ordinary spirit lamp with stand, and a sixpenny thermometer; the actinometer used was of the cheapest type, costing 2s. 6d., and answered the purpose of the most expensive plant. The demonstration was most successful and highly appreciated. During the evening a hearty vote of thanks was accorded Messrs. E. J. Wall and R. Horsley Hinton, for kindly acting as adjudicators in the recent exhibition.

**Edinburgh (View Finders' Club).**—The second meeting of the session was held on 14th inst., Dr. Drinkwater in the chair. After some discussion the rule regarding the presentation by each member of twenty prints was rescinded. After some other formal business, Dr. Drinkwater exhibited a number of prints on rough drawing paper for criticism. The convener intimated that there were three vacancies in the club.

**Fairfield.**—The ordinary monthly meeting was held on 8th inst., when the President, Mr. J. L. Mackrell, occupied the chair, and after the usual business had been transacted, he announced the forthcoming annual competition, the prizes for which are the club's silver medal and clasp and three bronze medals. After this announcement Mr. W. J. Suherland was called on and proceeded with his demonstration on "Kallitype," in which he treated the subject fully, developing several fine prints and fixing same. The simplicity of the process and the ease and uniformity with which he worked

were ample proof both of his ability and of the capabilities of the process.

**Glasgow (Phot. Assoc.)**—The opening meeting of the session was held on 3rd inst., Mr. Wm. Lang, jun., F.C.S., President, in the chair. Messrs. A. B. Fulton and James McGlashan were elected members, and the office-bearers for session 1892-93 were appointed. Mr. J. Craig Annan, Vice-President, read a paper, "Progress of Photography, a Critical Inquiry." A discussion followed. Proceedings terminated with an exhibition of lantern slides.

**Hackney.**—Meeting held 8th inst., Mr. A. Barker in the chair. Mr. Riley and Mr. Gildersleve were nominated for membership. The Hon. Sec. announced that Sir Charles Russell (Attorney-General) had consented to come to support Sir Albert Rollitt at the opening of the exhibition. Mr. W. Smith showed Tylar's new form of lantern-slide carrier (which was afterwards successfully worked in the lantern) and lantern-slide printing-frame. A question was asked as to why a reduced slide showed unevenly and dark in centre. The Hon. Sec. said if artificial light was used, probably it was caused through the light being held too near to the negative. Mr. Smith asked whether opal was better than ground-glass for this work. Mr. Beckett observed that it stopped the light somewhat more, but the illumination was better. Mr. Nunn showed a photographic accessory. Lantern-slides were then shown by Messrs. Hawkins, Beckett, Moore, Dear, Gosling, Hutson, Nunn, Carpenter, Roofe, Sodeau and Pollard. The Hon. Secretary worked the lantern. The Hon. Sec. announced that the next ordinary meeting would be on the 22nd, when the Autotype Co. have promised a demonstration.

**Halifax.**—On the 11th inst. a practical demonstration on "The Wet Plate Process" was given before the members, by Mr. T. Illingworth, photographer, Vice-President of the club. There was only a moderate attendance, but the demonstration, which was both interesting and instructive, was highly appreciated by all present. A hearty vote of thanks was accorded to Mr. Illingworth at the close. The President, Mr. J. Ingham Learoyd, occupied the chair.

**Kendal.**—The monthly meeting was held on the 9th inst. A large number of very interesting slides were passed through the lantern, being the prize sets of the Fifth Annual AMATEUR PHOTOGRAPHER Lantern Slide Competition. Among those specially admired were some Californian sea pieces and sunset cloud effects, the work of Mr. Post, of New York. Mrs. Francis Clarke's figure sketches and portraits were, as usual, a prominent feature; and a set of street studies in Newcastle were particularly interesting as having been taken with a home-made hand-camera.

**Leeds (Y.M.C.A.)**—The fortnightly meeting took place on the 4th inst. The evening was devoted to an exhibition of members' lantern-slides. A large number of slides, including most of Yorkshire and the local spots of beauty, and a very interesting collection of nearly fifty Norwegian views were thrown upon the screen, the latter being the work of one of the members. The following members contributed slides:—Messrs. Willey, Noble, Slade, Eastwood, and Pallister.

**Leicester.**—A meeting was held on 9th inst., the President, Mr. F. G. Pierpoint, in the chair. Minutes of last meeting read and confirmed; five members proposed for ballot at next meeting. Mr. Thos. Scottow, of the Derby Society, then proceeded to give a demonstration of the cold-bath platinotype process, prefacing his demonstration with a lucid description of the various processes. The demonstration was perfectly successful and exceedingly interesting and useful, the principle of retarding development locally by the use of glycerine applied to the part desired to be retarded was very markedly demonstrated, and the whole was of a practical and exceedingly acceptable character. After the demonstration, the President, Mr. Pierpoint, read a paper entitled "A Tour through the Dukeries," illustrated with some well-executed slides. The Hon. Secretary presided at the lantern, assisted by Mr. G. Spell, and the exhibition was much enjoyed by the company of members, and those lady friends who were specially invited on this occasion.

**Leigh.**—The fortnightly meeting was held on 10th inst. Mr. J. H. Stephen presided. A demonstration on lantern-slide making was held, there being a large attendance of ladies and gentlemen. Mr. Crouchley exposed by contact, and developed with Amidol. Mr. A. R. Moore exposed with a Griffiths lantern-slide making camera, and developed with pyro-ammonia. Mr. W. Hampson exposed with the use of two cameras, and developed with hydroquinone. The demonstration was much enjoyed. The society have now over forty members, and has a promising future.

**Liverpool (A. P. A.)**—On 10th inst. Mr. C. F. Budenberg, of the firm of Schaeffer and Budenberg, Manchester, gave a most interesting lecture before the society upon the subject of "High Pressure Gas Gauges," illustrated by experiments with apparatus, which the lecturer brought for the purpose. Mr. Budenberg explained that there was no occasion for the least risk of danger in the use of a gauge, so long as the user took care to ascertain that he got a well-made article. He stated that while inferior gauge tubes were made

out of ordinary drawn steel tubing roughly finished, the reliable instruments were made from pressed octagonal steel bars, bored and afterwards carefully turned and polished inside and out. By fixing one of each kind of instrument upon a pressure pump, he showed that the first was strained and rendered unreliable by being submitted to the ordinary pressure, and would easily have burst if the pressure had been slightly increased, but the second, after a pressure of several tons, returned to its original position without showing a fraction of displacement. Mr. Budenberg then referred to chemical explosions which had been caused by turning the full force of oxygen into a gauge in which traces of oil remained. The intense heat generated by the sudden rush of gas rapidly consumed the oil, and an explosion was the result. This action was shown by placing a piece of wood in a brass tube which was attached to a cylinder charged with air. When the valve was suddenly opened the rush of air ignited the wood. The best gauges, the lecturer explained, were now made with a check to prevent this sudden inrush of gas, so that even if they were charged with inflammable oil an explosion could not result. His firm, however, did not allow oil to touch their gas gauges. Mr. Budenberg strongly deprecated complicated connections with cylinders, his opinion being that the connection between the cylinder and the regulator should be as short and as simple as possible.

**Leystonstone.**—Mr. A. T. Cufley lectured on the 5th inst. upon lenses, before a large attendance of members of the Camera Club at the Assembly Rooms. Within about 1½ hours Mr. Cufley succeeded in condensing an astonishing amount of interesting and instructive information, illustrating some of his points upon the blackboard. A particularly animated discussion followed the essay, certain data and conclusions of the lecturer being contested by Mr. A. P. Wire and Dr. Turner. Messrs. Fox, Browne, Wates, Orme, Overton, and others took part in the debate, Mr. Cufley replying at considerable length.

**Louth and District.**—A well-attended meeting met on the 8th inst., Mr. W. G. Smyth (President) in the chair, to hear and discuss a most interesting and instructive paper by the Rev. J. M. Coates, of Welton-le-Wold, on "What is a Perfect Negative?" The lecturer approached his subject from the strictly scientific side, taking for the foundation of his arguments the theories and discoveries of Messrs. Hurter and Driffield. Although to the younger members especially the subject was one beset with many difficulties, the salient points of the lecture were clearly and forcibly brought home to all present. The lecturer had prepared a set of very instructive diagrams, which were passed through the optical lantern by Mr. Clarke, and which added much to the interest of the proceedings.

**Liverpool (Camera Club).**—The usual meeting was held on the 9th inst., Mr. James Hawkins occupying the chair. The subject for the evening was a paper by Mr. W. Tansley on "The Lantern for Home Use." Mr. Tansley, in his opening remarks, stated that he thought all amateurs ought to possess a lantern, and he proceeded to describe as the cheapest and simplest for home use, an ordinary oil lantern. In order to more fully demonstrate, the lecturer brought a four-wick oil lantern, the working of which he fully described, and which proved very interesting to the members. Mr. Tansley afterwards passed through the lantern a number of slides brought by members.

**Manchester (A. P. A.)**—The regular meeting was held on the 8th inst.; the President, Mr. J. W. Wade, occupied the chair. It had been announced by circular that members were requested to produce lantern slides for criticism. Some 400 slides had been submitted to a committee, and their report on each picture was read by the President as it appeared upon the screen. Each set of slides was introduced by the *nom de plume* of the sender, so that anything personal was entirely avoided. Some of the slides were the work of beginners and call for no special remark. Others were evidently the work of past masters in the art; such, for instance, as the set of views from Madeira and Holland, and a set representing the divisions of the day from sunrise to midnight, the latter set being very much admired. The lantern was manipulated by Mr. J. Davenport with his customary dexterity. There was a fair attendance, which consisted of members only.

**North Middlesex.**—Nov. 14th, Mr. F. W. Cox in the chair. About forty-five members were present. Mr. J. Traill Taylor addressed the society on "Photographic Optics." He said that in preference to giving a lecture he would have a gossip with the members on the various types of photographic lenses. The gossip took the form of an intensely interesting historic account of the different forms of lenses which had from time to time been evolved. Beginning with the simple bi-convex lens used in the camera obscura, he exhibited examples of the various lenses in the chronological order in which they have been produced, the earlier examples having been ground, the crown from window bull's-eye, and the flint from bottoms of tumblers. He explained by aid of the examples and by the blackboard, the effect of the different curves and combinations, and showed that in the earliest examples some of the latest inventions

had been forestalled. He showed the telephotic lens and the lenses from an opera glass, with which he had made his experiments in 1868, and the results of which were given in a year-book for 1869, and gave valuable information to those who desired to modify their lenses for emergencies. He pointed out that in constructing a telephotic lens it was necessary that when the image forming lens and the lens of negative focus were laid one on the other the combination should make a diminishing glass. Prints of breaking waves taken with a spectacle lens were shown. Much interest was evinced in the types of lenses, and particularly in the uncorrected meniscus spectacle lens used by Mr. Taylor when he first began photography. Several questions were asked and fully answered, and a vote of thanks to the lecturer carried with acclamation. The remainder of the evening was devoted to making arrangements for the annual exhibition to be held on Monday, the 28th inst. A vote of thanks to the Chairman concluded the business.

**Putney.**—An ordinary meeting was held on 7th inst., Dr. Shepard in the chair. Mr. Buchanan Wollaston gave a lecture and demonstration on platinum printing processes. The lecturer stated that the "hot bath" was now practically a thing of the past, being superseded by the new cold-bath process. He claimed for the latter several advantages, among which were superior keeping qualities, greater simplicity of manipulation, and more control over the results. Unlike the hot-bath process a good print could be made from practically any negative; in fact, he had found that by modifying the method of printing, the developer, and its application an excellent result could be obtained from a negative that would not give a passable print by any other process. Mr. Wollaston laid special stress on the absolute necessity of keeping the paper bone-dry before, during, and after printing, if full advantage were to be taken of its capabilities to give brilliant results. For this purpose the paper must until development be stored in special boxes containing calcium, care being taken that as soon as the calcium becomes softened by the absorption of moisture it should be taken out and thoroughly dried. In order to keep the paper dry during printing, it is also absolutely necessary to use a vulcanised rubber pad placed in contact with it in the frame; results depend very largely on these precautions being carefully observed, for should the paper have absorbed moisture there will be a corresponding tendency to mealiness, appearance of grain in the shadows, and a general lack of vigour and brilliancy in the print. In the hot-bath process the difficulty of judging the depth of printing was not infrequently found to be a stumbling-block to the beginner, but as the new paper may be printed until full detail is fairly visible, no great difficulty should be experienced in this direction. Mr. Wollaston said that very thin negatives might with advantage be printed under blue, and hard ones under signal-green glass, and that printing generally be done in a bright diffused light by preference. The prints can be developed by immersion, floating, or by brush; the two former require no explanation, but it should be noted that they usually give cold tones; the lecturer evidently prefers to develop by the brush, as by this method he has more command over the development, and thereby obtains a fuller scope for the artistic treatment of the subject. The normal developer consists of oxalate of potash 1lb, dissolved in 54 oz. hot water; for use this should be diluted by adding an equal quantity of water. For brush development the addition of glycerine in the proportion of one part normal oxalate developer (1lb to 54 oz.), one part of glycerine, and two parts of water was recommended. Mr. Wollaston then proceeded to develop prints by the brush method; in order to keep the paper flat it was temporarily mounted on a slab thinly coated with plain glycerine. The developer was then applied by means of a camel-hair brush, which was wetted with fresh developer between each stroke, care being taken that each succeeding stroke should overlap the previous one. Should any part of the print now be seen to require strengthening, a developer without glycerine should be used for the purpose; should it be anticipated from the nature of the negative that any part has been over-printed, detail and transparency in the shadows can be retained by first covering those parts of the print with a thin layer of plain glycerine, rubbed on evenly with the finger, the development being afterwards proceeded with in the usual way. Still further control can be obtained by covering the whole of the paper with plain glycerine previous to development. It will be understood that the glycerine acts as a retarder, much the same as bromide acts in an ordinary developer, and it should also be noted that length of development tends to produce warmth of tone. Should it be desired to vignette the picture, it can be done to any shape in an artistic manner and with great ease by simply omitting to apply the developer to the parts that are desired to remain white, the softening of the edges being done gradually or by cross-hatching in the manner of a crayon drawing; the vignetting may be done after the picture has been printed to the edges. When development has been completed, the prints, without previous washing, are immersed, face downwards, in a bath of dilute pure hydrochloric acid (one part to sixty parts of water);

and allowed to remain for five minutes, then removed to a second acid bath for about ten minutes, afterwards to a third for about fifteen minutes. The prints must be finally washed in at least three changes of water for about a quarter of an hour; a pinch of washing soda should be added to the second water; the prints are then dried in the usual manner. During the course of a general discussion which followed the lecture, Mr. Wollaston passed round some beautiful specimens of platinum prints, and also kindly criticised work of a few of the members, some of which clearly showed the evil results caused by dampness. Dr. Sheppard, in proposing a hearty vote of thanks to Mr. Wollaston for his able and very interesting lecture and demonstration, said that after their experience of some other printing processes, what they had seen that evening would be a pleasant revelation to them, and taking into consideration the absolute permanency of the prints, the ease of manipulation, the perfect control under development, they, as serious workers, would give this beautiful process a thorough trial, especially as it also so readily lends itself to individual artistic treatment.

**Stockport**.—The ordinary monthly meeting was held on the 9th inst., the President (Mr. Thos. Kay, J.P.) in the chair. Thirty-two new members were elected, bringing the total membership up to 128. The Secretary then read a report on the recent exhibition, stating that thirty-two members contributed, altogether between 500 and 600 prints, etc., and that between 600 and 700 slides were shown during the evenings, and that the profit realised was about £10. The Secretary (Mr. B. S. Harlow) then proceeded to demonstrate the working of the new cold-bath platinotype paper, and was attentively followed by those present.

**Stockton**.—There was a crowded gathering of the members and friends of this Society on 8th inst., when Mr. Downs gave a highly interesting lecture on a recent trip to Norway, illustrated by fifty lantern-slides and shown by the lime-light lantern manipulated by Messrs. Fothergill and Moul. Afterwards Mr. Ellam, the Hon. Sec., exhibited by the lantern a number of photographic views which he took of the terrible railway catastrophe near Thirsk.

**South London**.—On 7th inst. ordinary meeting, the President, Mr. F. W. Edwards, in the chair. The prints from negatives on Barnet plates were handed in for competition for the President's award. Mr. E. J. Lester was declared to be the winner with three quarter-plate prints. The remainder of the evening was devoted to the testing of slides previous to their being entered for competition at the annual exhibition. Over 150 were tested.

**Todmorden**.—On 5th inst. the first exhibition in connection with the above Society was held in the Corporation Hall, and was visited by a large number of people. In the evening a lantern exhibition was given, Messrs. A. and H. Thompson manipulating the lantern kindly lent by Mr. Ormerod, one of the Vice-Presidents. The slides were described by Dr. Measures. There was an audience of about 230, and some of the slides were loudly applauded. The slides and a collection of competition pictures were lent by the Editor of the AMATEUR PHOTOGRAPHER. The chair was occupied by Mr. Ormerod, and the first exhibition proved a successful one.

**West London**.—11th inst., the President, Mr. J. A. Hodges, in the chair. Five new members were elected. Mr. E. J. Wall read a very interesting paper on "A Comparison of Printing Processes." A long discussion ensued, and many useful hints were picked up by those present.

**York**.—The lantern season was inaugurated on the 8th inst. by a show of members' slides. The quantity and quality of the exhibit gave promise of a successful session.

### SOCIETIES' FIXTURES.

- Nov. 17.—WIGAN.—"The Carbon Process," Mr. J. H. Atherton.  
 " 17.—LONDON AND PROVINCIAL.—Monthly Lantern Night.

**Interesting Discovery in Photography**.—Experiments in photography, made by the Duc de Morny in his amateur studio at Levallois-Perret, have led to a useful discovery. He has been able to photographically impress paper of any size or thickness. By this means, a likeness can be fixed like a monogram on note-paper and on railway or other tickets. Eighty different *silhouettes* can be taken in a minute, and at small cost. The Duc de Morny has communicated his discovery to the Minister of War, who intends to utilise it in the "books" carried by soldiers, and in which their descriptions, records of service, and so on are inscribed. The Russian Grand Dukes now in Paris have also decided to adopt the invention in the army of the Czar, and have asked the inventor to send one of his "collaborators" to St. Petersburg.

**Photographic Soc., Philadelphia**.—A meeting was held on the 12th ult., the President in the chair. Mr. Frederic E. Ives read a paper on the "Helichroscope," exhibiting the apparatus and also the special camera in which the negative, with the necessary triple image taken through a single lens, were made. Dr. C. L. Mitchell showed a portable divided hand-camera, made by Ross and Co., of London. Mr. Wm. H. Rau gave a demonstration of the process of making bromide enlargements, using the new apparatus belonging to the society, in connection with the Welsbach incandescent gas-light. In order to overcome the jarring occasioned by heavy machinery in other parts of the building, it was necessary to construct the apparatus with this end specially in view. The stand supporting the apparatus, with the exception of the condensing lenses, rests upon four springs of pure india-rubber. To counteract any motion which might pass through the springs, weights aggregating about 300 pounds rest on the framework of the stand. A second frame is supported on the top of the stand on another series of six springs, about 100 pounds of iron weights being placed on this frame. The enlarging camera and board for the paper are rigidly attached to the upper frame. By this contrivance the vibration is entirely overcome, perfectly sharp work being done while the machinery is in active operation. A member stated that in photographing in Florida, the Yellowstone Park, and other places where the sky was intensely bright, the skies were almost always overtimed and thin, and asked for a remedy. Dr. Mitchell suggested holding the sky back with a colour-screen and orthochromatic plates. Mr. Carbutt recommended washing the plate off when the sky had reached the proper intensity in developing, and then with a tuft of cotton or soft brush continuing to apply the developer to the foreground until a harmonious result was obtained. Mr. Ives practised another method, which was to reduce the over-developed portion of the negative with Farmer's solution applied in a similar manner to that recommended by Mr. Carbutt. This he did after fixing, and in daylight, which was quite an advantage. Dr. Mitchell spoke in high terms of some interior views in the Alhambra, taken by Mr. Cembrano, Secretary of the late Photographic Convention, held in Edinburgh. These pictures had the strongest possible contrasts of light and shade, and he understood they had been developed on the plan described by Mr. Carbutt.

A meeting of the Council of the National Association of Professional Photographers, to which all professional photographers were invited, was held in Anderton's Hotel, Fleet Street, E.C., on Nov. 9th. Mr. Thomas Fall was in the chair. The Secretary, Mr. D. J. O'Neill, read the minutes of the annual meeting and of the last Council meeting. The President then said that it was most difficult to fix a time and place for meeting that should suit the convenience of all members, and that though there was such a representative gathering from all parts of the country, he regretted the unavoidable absence of many. Several of those who were unable to attend had written most hopefully and encouragingly. He then dealt with the case of a firm of enlargers who had refused to agree to the Association's terms, *re* prices "for the trade only." Several members strongly expressed their opinion on the subject, and while regretting that the Association did not include practically the whole of the profession, which would enable it to bring such a house to reason, pointed out that there was only one course for the members to adopt, and that even a couple of hundred of the principal men could exert some appreciable influence. Mr. J. Crosby (Rotherham), followed by Mr. J. Hubert (Hackney), strongly urged the necessity of increasing the numerical strength of the Association. Mr. Crosby said that Leeds, Sheffield, and Hull had formed local centres, but that until they had the substantial support of London, solid progress was impossible. The Secretary then read his report of work done since February last, in which time fifty new members had been added to the Association. He reported on the visit paid by the President, Mr. Whitlock, and himself to the Convention, which had resulted in the acquisition of a few members. He had personally canvassed Birmingham, Wolverhampton, Newcastle-on-Tyne, Sunderland, and other towns, and had three times met the executive in London without any expense falling upon the Association. Mr. W. Gill (Colchester) said that one volunteer was worth two pressed men, and that it was possible to do too much in the way of canvassing folks who were unwilling to join. He thought more attention should be turned to making the association of greater practical value, and to making its value more apparent, so that outsiders would not need pressing to come in. Mr. Martin (London) said that the idea of *esprit de corps* should be pressed forward more than mere money or business advantage. Mr. J. Hubert (Hackney), said that though a previous speaker had disparaged personal canvass he thought that a personal application would show the value of the Association to many men who had simply not troubled to consider about it. For his own part, he would canvass his own district, and report results to the next meeting. He urged other members, especially those in London, to do the same, and added that he was sure all the London men worth having would be solid in favour of the Association, if its objects were personally explained to them. If no other London men would undertake the work, he would devote all his spare time to it, and if necessary, continue his labours in evenings and other odd times, until he had worked the whole of London. Mr. H. J. Godbold (Hastings), Mr. Spink (Brighton), and other members promised to canvass their own districts. The President said that so far as he had been able to call upon the

men in the West End, his success had been beyond his anticipation. Perhaps the bill of fare presented by the Association had not been so attractive as it might have been. They had thought it well to simply attempt the gathering of a strong body of photographers who should decide the channel in which to direct their practical efforts, rather than to attempt to redress abuses before they knew what strength they had to rely upon. They had done some work in the past, which had been reported from time to time, but now, perhaps, they might offer further advantages. As Mr. Gill had said, they must look to the young men, and to these he would point out that membership of the Association, which enabled them to seek and to obtain the advice of many of the leading men in the profession, was in itself valuable. He (the President) would have liked to see professionals more generally eager to join the Association, but he was very well satisfied when he considered the character of the membership. They were not a heterogeneous mass, but representative men from all parts of the kingdom, and formed an excellent nucleus for a strong and vigorous organisation. A suggestion had been received from Mr. H. Snowden Ward, who was not a member of the Association, that the Commissioners of the World's Fair Congress on Photography would appreciate the appointment of one or more delegates from the N.A.P.P. It was proposed, seconded, and carried unanimously carried that the President and Messrs. Chas. H. Evans, W. Gill, and W. Battersby be delegates to represent the Association, and to report on the proceedings of the Congress. It was proposed by Mr. W. Gill, seconded by Mr. Bromwich, that the thanks of the Association be tendered to the Manchester *Spy* for its exposures of the doings of a Manchester photographer. The subject was commented on by several members, including the President, who said that though photographers were no better than other men, he thought that the photographers of London would not have suffered such a man to remain amongst them so long as the Manchester brethren had. If the rumour that this man had returned from his flight were true, he hoped that Manchester photographers would not rest until they had made it impossible for such a man to continue in business. The vote was unanimously carried. It was proposed by Mr. J. Crosby, seconded by Mr. Glaibsy, that the next annual meeting be held in Manchester. The proceedings closed with a vote of thanks to the Chairman, and on the invitation of the Photographic Club, several of the members adjourned to the Club's room to witness demonstrations of the use of Cresco Fylma (by Messrs. Hill Bros.) and of a new safety lime-light jet by Mr. R. Beard.

In connection with the Runcorn Brunswick Improvement Society, one of our competitors, Mr. C. A. Timmins, delivered a lecture on the Manchester Ship Canal, illustrated by lantern-slides from his own negatives.

Aldenharn Institute.—Usual fortnightly meeting was held on 8th inst., Mr. W. Vere Mingard in the chair. It was decided that the club should compete in the National Lantern Slide Competition. During the evening a set of one hundred selected prints, kindly lent by the Proprietors of the AMATEUR PHOTOGRAPHER, were on view, and greatly admired by all present.

## To Correspondents.

All communications for these columns are to be addressed to The Editor, "Amateur Photographer," 1, Creed Lane, Ludgate Hill, London, E.C.

### RULES.

1. Write clearly and distinctly on one side of the paper only.
2. Write each Query or Answer on a separate sheet of paper.
3. Write the name and address legibly on the back of each communication, and sign all Queries and Answers with name or *nom de plume*.
4. All matters for these columns MUST be received by TUESDAY MORNING'S POST.
5. The Editor does not undertake to answer questions by post.
6. In answering Queries, correspondents are requested to mention, in every instance the number and full title of the query referred to.

### QUERIES.

5866. **Galway.**—Any information about this town as a photographic centre will oblige. Is there a decent hotel at which ladies could stay? Is the coast scenery wild and rugged? I take it for granted the inland scenery cannot be beaten.—ISOCROMATIC.

5867. **Enlarging Apparatus.**—Can any reader send me details as to how I can make an enlarging

apparatus cheaply to use with artificial light? I have a 5-in. condenser and 10 by 8 Burr lens. I wish to have a flap shutter or some such arrangement. If my lens is unsuitable, what lens should I require?—ALPHA.

5868. **Alpha Paper.**—I have a packet of Ilford Alpha paper with no instructions. Would someone kindly tell me how to print it and tone it?—ROV.

5869. **Springs, etc.**—Where can I get the springs and wooden backs, without bevelled glass fronts, for photograph stands? I want to mount prints behind cleaned spoilt negative glasses, and then set them up in the springs.—H. M.

Correspondents not seeing their queries inserted are requested to look for the same under "Editorial."

### QUERIES UNANSWERED.

Oct. 28th.—No. 5849.

Nov. 4th.—Nos. 5850, 5851, 5852, 5854, 5856, 5857.

" 11th.—Nos. 5859, 5860, 5861, 5862, 5863, 5865.

### ANSWERS.

5864. **Platinum Toning.**—The following formula will give vigorous black tones on Aristotype or Ilford P.O.P., but if warmer tones wanted dilute with water and stop toning at any desired depth:—

Potash oxalate .. .. .	2½ oz.
" phosphate .. .. .	1½ "
Water .. .. .	25 "

Chloro-platinite of potassium ..	60 gr.
Water .. .. .	2 oz.

For use take three parts of A, one part of B, and two parts water. Fixing bath—1 oz. hypo to 10 oz. water, 10 minutes. Hardening bath—1 oz. alum to 10 oz. water,

10 minutes. This toning bath is very expensive, but yields beautiful results.—ROBT. HUNTER.

5852. **Lantern Screen.**—Frame of deal, two pieces each, top bar and sides, of 1½ by 1 for transit. Top bar buttoned centre, iron joint on under side, rising 1 in.; on each outer end of top bar a loop iron of thin 1½ in. hooping, shoulder down a rounding edge of top half of each side to fit into opening of loop iron. The lower end of top part of sides is cut out upward a long V, and a tin plate, hemmed, is put on over slot; lower part of side bars is cut V pointed, to go up in socket and fitting the slot. Thus the two sides are in four pieces, and top bar doubles together. If screen is large, say 12 ft., then leg pieces are needed, bored to match spaced borings in sides, and may be interchangeable, also adjustably holed for height. Sketch, stamped envelope.—SWAIN, Rothsay Road, Luton.

### EDITORIAL.

**SPECIAL NOTICE.**—We are very pleased to find that replies in this column are so much appreciated, but we should be very grateful if those requiring advice would send their letters to us BEFORE TUESDAY MORNING'S POST if possible. The time occupied in replying in this column is very considerable, and owing to the often late receipt of letters, many matters have to be left over each week. This we much regret.—ED. AM. PHOT.

W. B. D.—Arc light is of course the best, and the greater the candle power the shorter the exposure. A special incandescent lamp is made for enlarging, and in this the filament is coiled two or three times in a small space, so as to show a small source of light.

GLADYS.—The usual pronunciation is "Nee-aps;" some, however, say "Nee-apes."

R. M. W.—1, 8, 4, 2.

C. MOSS.—We have to apologise for the remark, but we must say that both the judges pointed out to us that they thought the print was touched up. If you can improve the final result we hold it to be legitimate to spot, retouch, paint out, paint in, or do anything to the negative, but when it comes to working on the print itself, well, we say that it is unfair and a crime. This is the general impression when a print is for exhibition or competition; when the print is for your own use, why, you pay your money and takes your choice. We shall be very glad to hand you the medal, and think our other competitors will have to look out in real earnest if you are going on in this way. There are some special bromide retouching pencils in the market which can be used for platinotypes, or you might use Indian ink. We will write you privately.

T. W. SCHOFIELD.—In an oil lantern the most important thing is the lamp. The lantern you name, fitted with a Stock's lamp, would give you every satisfaction. See "Our Lantern Screen" in our issue of October 28th.

EMERALD.—(1) The greenish stain is said to be due to traces of pyro, but this is not definitely decided. The best thing to do is to soak your negatives in an alum and acid clearing bath, wash well, half dry, and then reduce. (2) The only way to get green negatives is to dip them into a weak solution of aniline green. No plate maker sends out green glass plates; we are afraid the sale would be small, as they would not, as you suggest, prevent halation. (3) The simplest way to tone lantern plates or bromide paper is to dip them into solution of aniline dyes of the required colour. To obtain green images, immerse the well-washed plate or print in the old lead intensifier:

Nitrate of lead	.. .. .	4 parts
Ferricyanide of potassium	.. .. .	6 "
Distilled water	.. .. .	100 "

Wash well, and immerse in 10 per cent. solution of neutral chromate of potash; wash well, and immerse in 10 per cent. solution of ferric chloride. It is also possible to obtain greenish tones by leaving traces of iron in the film, and dipping into ferricyanide of potassium.

PUNJABI.—(1) Over-toned. (2) Ditto; the light from under the bridge has too much the effect of cutting the print in two. (3) Too much foreground, and not enough sky; over-printed. (4) Over-toned, and has not sufficient interest to warrant wasting a plate on. (5) Over-printed and over-toned; enlarged on rough paper, it would make an effective thing. (6) Over-printed, and too much on left and not enough on right hand. (7) Good of its kind, though it might have been printed deeper and toned more. We do not see much improvement in the last three. What developer are you using?

CAMBRIENSIS.—(I.) Over-toned, 1, 2, 3, 4; correctly toned, 5. (II.) We do not think you need invest in a burnisher, the prints you now send are far too much polished. (III.) Wash the aristotype prints for about a quarter of an hour, in five or six changes of water, or until the water is no longer milky. (1) The plate is fogged at the lower portion. (2) The negative is rather harsh in contrast, which is heightened by the paper you use; the dress is too black, the collar, etc., far too white. (3) In this the lens has not perfectly covered the plate, or else the camera bellows cut off the top right-hand corner; the camera was not straight; the negative is again too hard. (4) Camera again not straight, corner cut off one end, fogged, and print shows signs of sulphuration. (5) We should prefer this not quite so deeply printed and with less harsh contrasts. Your trees on left are far too black to be true. Considering the short time you have worked, No. 5 shows very good work. We should strongly advise you to give up hydroquinone, or else expose a little longer to reduce your contrasts. If you will let us know exactly how you work, and what the formula you use, we may suggest an improvement.

FOUR EYES.—The fault lies in not using distilled water. We have some solution which has been in use and made for over ten days, which is a pale sherry colour, and tones perfectly.

P. B. BROOMHALL.—We will post medal on to you as soon as ready.

R. W.—We regret that we cannot admit any correspondence on this subject. It is a difficult question, but we cannot cut down more than we do.

INTERESTED.—We thank you for your letter, but cannot insert. We have seen the prints, and were present at the judging, and are quite satisfied as to the order in which they are placed. We fully recognise the difficulty in pleasing all, but the judges do their best.

SELF-HELP.—Many thanks for your encouraging letter. The print you send is very good technically, but the line of trees in the centre cuts the picture in two. Try and avoid this in the future. It is difficult to say which is the best mount, but provided the tons of the print is not brown, brown mounts would do. We prefer the grey plate-sunk mounts, or else grey cut-outs. Your competition print has gone round the societies; when it returns we will look up and criticise. Try a rough-surface paper for your work.

LOST IN THE COUNTRY.—(1) Camera was not held straight; print fearfully over-printed. (2) Negative strikes us as being thin; print over-printed, and both this and 1 are hideous in tone.

UBIQUE.—The bicarbonates have very poor developing power, which is supposed to be due to the cause

you suggest. Our experience in large sizes is the same as yours, and we cannot get over the difficulty.

WINTERSETT.—Yes, equally good results can be obtained on rapid plates as on slow.

J. P. PEMBERTON.—(1) Print weak, flat and poor; should have been taken in diffused light. (2) A very good thing, spoilt by camera not being straight. (3) Good. (4) Would stand a little more printing. (5) Good. (6) Good; see note to 4.

J. L. L.—We have never seen the lantern referred to, and therefore cannot express an opinion one way or the other.

STANLEY BROOK.—We should say that platinotype or rough printing-out papers are most effective in the way you mention.

LUX.—See AMATEUR PHOTOGRAPHER, Nov. 11th, p. 343; just what you want.

PLATINA.—We are afraid you cannot do anything to prevent crack being seen—printing under a screen of tissue paper, with the frame attached to a roasting-jack, has been recommended. Do not use rapid plates, slow plates are best for enlarging. The exposure can only be found by experiment. Pyro ammonia is the best developer. The print you send is better, but too weak and washy. Enlargements are not allowed to compete.

MARCUS.—Yes, you are at liberty to send in two prints differently toned and mounted.

E. H. SEAMER.—Many thanks for print, which is certainly a curiosity. We may be able to use.

E. HURMAN.—We will look into the subject of your letter, and communicate with you.

ASHTON.—We must confess we are puzzled at the peculiar appearance exhibited in your negative. We will, if you like, send it on to the plate-makers, and see if they can throw any light on it. Who is it?

B. HILL.—Your print shows sufficient technical merit to warrant us advising you to enter in our competitions. But don't print in the sun, and see that there is absolute contact between the negative and paper during printing.

ARTHUR JANE.—Letter and fee received. The Studio may be had from our publishers, price 2s. 9d., post free.

ENGINEER.—(1) A swing front would certainly be an advantage under the stated circumstances, still if all the other movements are there, the swing front may be dispensed with. (2) In a conical bellows camera, the bellows will cut off some of the view. We should advise you to see Stanley's "Engineer" camera, and then Gotz's, which latter answers more nearly to your requirements than any other.

W. E. A.—Mezzotype paper is about the only rough surface printing-out silver paper in the market. Cut-out mounts are most suitable. Hannam and Co.—see advertisement—will supply. The paper is sold in two kinds, rough and extra rough, the former is useful for small work, half-plate and under, and the latter for larger work. You will see article on this paper in the AMATEUR PHOTOGRAPHER for Nov. 4, p. 324.

K. T.—Many thanks for your letter; glad you are pleased. In intensifying with silver nitrate; you can make up the stock solutions, and only mix enough to intensify one plate at a time, as it cannot be used more than once. It is usual to use this intensifier as in the old wet-plate days by flooding the plate with it, and letting it work, not putting into a dish and allowing the negative to soak.

C. R. BEAUMONT.—(1) It is far more difficult to get good results on bromide paper when exposed to daylight than to gaslight; daylight is too powerful. Your portrait is over-exposed, and should have been kept in violent movement so as to soften the vignetting shape. (2) Keep your printing-frame in motion during exposure, and fix outside the mask a sheet of tissue paper. (3) Boil and filter your tap water, and it will be all right.

TELKAH.—The articles ran from March 4th to June 24th, 1892, both dates inclusive.

W. F. PHASE.—(1) Cut an inch and half off the top; a very good print. (2) Camera not quite straight, and a little too black at the bottom, but a very good print. (3) Good. (4) Camera not straight, and a little too black in the seats. (5) Fair. (4) Wants clouds, and we think a better picture could have been made by looking up the road more. (7) Good. Your work on the whole is good; some of it better than what we get in our competitions.

J. W. K.—The Alpha print is far more pleasing than the other; it only wants clouds to make a decent little picture. Your negative wants intensifying, we should say. The Solio print is flat, weak, and poor; too much foreground, and a horrible pink tone.

A. H. WOOD.—Next Portraiture and Figure Study Competition closes on December 19th.

E. H.—Your negative reached us in about two dozen bits. Over-exposure and fogged in developing we should say was the fault, and dust caused the pin-holes.

## Sale and Exchange.

### RULES.

CHARGE.—Twelve words or less for Fourpence. Every additional three words, one penny. The name and address of the sender must be paid for. (A single figure, or group of figures undivided by

letter, space, stop, or words, counts as one word; compound words count as two words.)

DEPOSITS.—The money for goods forwarded on approval may be deposited with the Publishers of the AMATEUR PHOTOGRAPHER, who will hold the amounts deposited until they are satisfied that the transaction has been completed to the satisfaction of buyer and seller.

ADVERTISEMENTS can be inserted under a number, the name and address being registered, and letters forwarded for a fee of 3d. to cover postage.

PAYMENTS should be made in Postal Orders or Postage Stamps.

ADDRESS.—All advertisements (which can be received up to Tuesday mid-day) and other communications having reference to the "Sale and Exchange" column, must be addressed "Sale and Exchange, AMATEUR PHOTOGRAPHER, 1, Creed Lane, London, E.C."

COMMISSION.—A charge of 2½ per cent. will be deducted from all deposits whether a sale is effected or not. Minimum charge 1s.

PAYMENT.—All payments are to be by cheques of Postal Orders, made payable to Hazell, Watson, and Viney, Ltd., 1, Creed Lane, London, E.C.

CARRIAGE must be paid on all apparatus sent for report, and they will be returned carriage forward.

REPORTING.—Apparatus may be sent to the EDITOR, AMATEUR PHOTOGRAPHER, 1, Creed Lane, London, E.C., who will report upon the apparatus to the buyer for a minimum fee of 2s. 6d., or a commission of 2½ per cent., upon the sale price of the apparatus.

Bicycles, Tricycles, etc.—Exchange Safety bicycle, diamond frame, ball bearings all through, ½ sponge tyres, in good condition, cost £14, for Instantograph camera, leather bellows, double swing back, swing front, reversing back, landscape lens, in good condition.—J. Proctor, 19, Infirmary Street, Blackburn.

Burnisher.—Optimus whole-plate burnisher, cost 36s., accept 24s.—17, Sedan Street, Waltham.

Cameras, etc.—Lancaster's quarter Instantograph three double slides, in case, with focus clock, new, £3 cost £3 10s.—H. Watts, England's Lane, Gorseston Great Yarmouth.

For sale, whole-plate long-extension bellows studio camera, repeating back, one double slide, price £4 10s.—Photo, Woolhampton, Reading.

Cameras, Lenses, etc.—Chapman's whole-plate camera, Wray's R.R. lens, Thornton-Pickard's instantaneous shutter, complete, perfect condition, £12.—U. Mellor, Royhouse, Bolton.

Quarter camera and lens, cheap, great bargain.—J. Ross, Ildridgehay, Derby.

Dark Slide.—For sale, half-plate double dark slide, good condition, 6s. 6d.—A. E. F., 38, Lawrence Lane, Old Hill.

Hand-Cameras, etc.—For sale, Lancaster's detective camera, takes 12 plates, little used. What offers?—Bradshaw, Bishopstoke, Hants.

Kodak, new, takes pictures 4 by 3½, price £2.—Address, M. D., 1, Hungerford Villas, Long Ditton, Surrey.

Lanterns, etc.—Three-wick magic and enlarging lantern in box, 4 in. condensers, 34 slides in box, 12 ft. sheet, splendid value, 50s.—Biggs, Chemist, Stourbridge.

Hughes' £6 6s. Pamphengos lantern, good as new, Presto dissolver, 9ft. new sheet and 200 best slides, including two lecture sets on Holy Land and Switzerland, sell the lot for £10, great bargain.—G. E. Franklin, Rickmansworth.

Pair oxy-hydrogen lanterns, bronzed tin bodies, 1½ in. objectives, 4 in. focus, compound condensers (double convex and concave convex), 4 in. diameter, 4 in. focus, blow-through jets, six-way dissolver, and rubber tube, in painted look-up travelling case, £5.—Whitehead, 141, Manchester Street, Oldham.

Lantern Slides.—Lantern slides of Yorkshire, Derbyshire, Devonshire, Switzerland, Lake District, 6d. each.—Zero, Stoneleigh, Workington, Cumberland.

Lenses, etc.—No. 4D Dallmeyer lens, perfect, with diffusion arrangement, price £10; will take as part payment Swift's single landscape full-plate lens.—David Boyd, Kilmaurs.

Rapid rectilinear detective lens, equal to new, sell for cash or exchange for portrait lens.—Meadway, Vestry Hall, Bethnal Green.

Lancaster's half-plate Instantograph lens and shutter, specially corrected iris, f/10 to f/60, perfect, price 15s. 6d.—Hy. Jones, Buckingham House, 155, Cleveland Street, W.

Negatives.—Several whole-plate views (Yorkshire), 21s. per dozen.—Jones, 8, Wheelgate, Malton.

Thirty negatives, quarter-plate, packed in box, suitable for lantern slides, town and country views. What offers?—A. E. Reinspach, Langham Hotel, W.

Sets.—Camera, 7½ by 5, with stand, 8 by 5 Morley's rectilinear lens, three double blacks, price £10; maker, Sharp and Hitchmough, Liverpool; deposit.—T. W. Bateman, office of this paper, 1, Creed Lane, Ludgate Hill, London.

Camera, Lancaster's half-plate Instantograph, complete with lens, shutter, double dark slide, waterproof leather-bound case and tripod, in perfect order, scarcely used.—No. 352, office of this paper, 1, Creed Lane, E.C.

What offered for the following lot? Watson's Acme camera, 13 by 18 cm. (7 by 5½), all possible movements, double extension, three double dark slides, turntable, three-fold tripod, stand, instantaneous and time shutter, Ross' whole-plate rapid symmetrical, and a whole-plate wide-angle lens, the lot in splendid condition, cost £21.—Address, Robert Seglio, Mevagissey, Cornwall.

Lancaster's 1892 special brass-bound Instantograph, quarter-plate, with double slide, lens, iris stops, instantaneous shutter, pneumatic release, folding stand, and four printing frames, new September last, 40s.; no offers.—E. B., 130, Jamaica Road, S.E.

Lancaster's half-plate camera, lens, two double slides, and tripod, 50s.—Deacon, Mostyn Street, Llandudno.

Lancaster's quarter-plate Instantograph, including camera, lens, iris stops, two double slides, tripod in leather case, bag for camera, perfect, 40s.; also quarter-plate set by Watson, camera, lens, one double slide, strong tripod, complete with box for camera, in good condition except slide, price £20.—S. Williams, Secretary L.E.O.C.C., 35, Silver Street, Leicester.

Quarter-plate set, camera, three backs, rectilinear lens, four-fold tripod, case, £4, cost £8.—17, Sedan Street, Walworth.

Lancaster's Le Merveilleux camera, lens, stand, and dark slide, 7s. 6d.; good order; Lancaster's quarter-plate W.A. Rectigraph lens, cost 30s., sell 17s. 6d.; cabinet portrait lens, 15s.; whole-plate rollover, £1; whole-plate R.R. lens, £2, with Waterhouse stops and cap complete, good lens.—G. E. Franklin, Rickmansworth.

Lancaster's half-plate girder tripod, original price 15s., sell for 7s.; Optimus rapid rectilinear 7 by 5 lens, and shutter, excellent definition, £2 2s.; quarter-plate camera, lens, slide, and tripod, 17s. 6d.—Jackson, Hardman Lane, Failsforth, Manchester.

Underwood's quarter-plate Convention camera, 8 double backs, rectilinear lens, iris diaphragm, 4-fold stand, quite new, only used once, £4 18s., cost £5 12s.—W. Clare, Malvern Wells.

**Sundries.**—Violin, beautiful harmonious tone, in fine preservation, suit lady or professional, very handsome model, excellent silver-mounted bow and first-class baize-lined lock-up case, accept 16s. 6d. the lot, bargain; 20s. worth of good music given in gratis; absolutely certain to give satisfaction; approval willingly; references given if required.—Mrs. Graham, College Buildings, Ipswich.

For sale, first 13 vols. of AMATEUR PHOTOGRAPHER, ten bound, also first ten holiday numbers, the lot £3.—C. P., 24, Hazlitt Road, West Kensington.

I will post AMATEUR PHOTOGRAPHER on Mondays in exchange for another newspaper same value.—Metcalfe, Biddesden, Andover.

Two new quarter plate Lancaster (Merveilleux) double dark slides, 5s.; also Lancaster's instantaneous lens, iris diaphragm instantaneous shutter, only 12s. 6d.; No. 1 Rudge cushion Safety, 33lbs., accessories, good condition, £8, cost double.—Thompson, 16, Monastery Road, Liverpool.

**Tripod.**—Shew's bamboo walking-stick tripod, Universal top, cost 25s., perfectly new, 21s.—Grocott, Garstade, Tarporley.

## WANTED.

**Cameras, etc.**—Wanted, good portable second-hand 12 by 10 camera, all movements, double dark slide; must be cheap and in good condition.—Cpl. Greenham, Depot, Medical Staff Corps, Aldershot.

Don't fail to visit Stand No. 3, City Sale and Exchange, who will have the brightest, biggest, and best show at the Agricultural Hall, November 18th to 26th.

**Magic Lanterns and Slides.**—Walter Tyler's Helioscopic is perfection of all lanterns, supplied to Indian Government, School Boards, science classes, clergy, and exhibitors throughout the world. Impossible to have lanterns give better definition or more satisfactory results; specially constructed lens, which no other lantern possesses.—Walter Tyler, 48, Waterloo Road, London.

**Walter Tyler's Best Triples and Binials** are unsurpassed, and perfect in every detail. Good binials, mahogany bodied, brass fronts, and all improvements, £7 10s.; single lantern, with 4 in. condensers, portrait front lens, 4-wick lamp, complete, in case, 27s. 6d.—Walter Tyler, 48, Waterloo Road, London.

**Lantern Lenses.**—Specially constructed. Walter Tyler's new Helioscopic portrait combination lantern lens gives the most perfect definition and brilliancy, can be fitted to any lantern, and for excellence cannot be surpassed. No other maker has this lens, which is manufactured expressly for Walter Tyler, 48, Waterloo Road, London.

**Regulators and Gauges.**—Great reduction in price. Either can now be had of Walter Tyler for 14s. each. The largest stock of gas cylinders in England. Best seamless steel, tested and valved, and all sizes at very low prices.

**Slides from Negatives and Pictures.**—Walter Tyler manufactures and colours slides on the premises, thus ensuring speedy delivery, and prices are most moderate.—Walter Tyler, 48, Waterloo Road, London.

**Binial Lanterns.**—If you are in want of a really good binial lantern, perfect in every respect, call and see Walter Tyler's entire brass fronted, mahogany-bodied, lined with Russian iron, and fitted with new best quality lenses, and sold at a most moderate price. The top lantern will take a 4-wick lamp. These are great bargains.—Walter Tyler, 48, Waterloo Road, London.

**Hire Department** is now perfect. Largest and best collection of slides in the world; over 200,000 always in stock. Temperance, travels, Scripture, educational, comic, tales, etc. Cheaper than any other house, no extra charge for coloured slides or effects. Special terms for large quantities.—Walter Tyler, 48, Waterloo Road, London.

**Lanterns and Slides.**—If you wish to hire, purchase, or exchange, you cannot possibly do better than go to Walter Tyler, who makes this business a speciality, and you will thus save dealer's and all intermediate profits.—Walter Tyler, 48, Waterloo Road, London.

**Second-hand Lanterns and Slides** at very moderate prices, also all kinds of apparatus. Send for large catalogue, 420 pages, with instructions for working lanterns of all kinds, and costing an immense sum to produce, sent free for 6 stamps. Small catalogue and second-hand list, post free.—Walter Tyler, 48, Waterloo Road, London.

**Bijou Enlarging Lanterns.**—Finest results with Hughes's patent rectangular condensers, half the size of ordinary make, superior definition, proper diffusion of light; several whole and half-plate for sale, cheap.

**The Marvellous Pamphengos.**—Finest oil-lighted lantern, equals limelight, stood the test of over fourteen years against all imitations, elegant brass fronts, best lenses, from £2 10s. each.

**Magic Lanterns, Magic Lanterns.**—Largest assortment in the world, cheapest and best, nicely japanned body, 4 in. double condensers, portrait front lenses, rack and pinion, four-wick lamp, in case, £1 7s. 6d.

**The Docwra Triple Prize Medal**, highest award, supplied to Dr. H. Gurney, Madame Paté, and the Royal Polytechnic.

**The Malden Triples**, supplied to B. J. Malden, Esq.

**Fine Triple Lantern**; four set of large diameter lenses, £32, cost £60.

**Special Triple**; mahogany, brass fronts, £12 12s.

**Elegant Mahogany Binial**; brass fronts, £7 10s.; blow-through safety jets, 11s.; mix gas jet, 15s. 6d.; Malden double dissolving tap, 15s. 6d.; a number of grand effects; particulars free before purchasing. Send for Mr. Hughes's grandly illustrated catalogue, over 180 fine wood engravings, price 6d.; postage 3d.; separate list of 60,000 slides, price 6d.; postage 3d.; pamphlets free; second-hand lists of bargains.—W. C. HUGHES, Brewster House, Mortimer Road, Kingsland, London, N.

SALE AND EXCHANGE Advertisements (at the charge of Three Words for One Penny) must be received by Tuesday evening's post to ensure insertion in the same week's issue.

**"Amateur Photographer" Monthly Competition, No. 43.**—"PORTRAITURE AND FIGURE STUDY." Latest day, December 19th.—Prizes: Silver and Bronze Medal, with ribbon and clasp. One mounted print only to be sent in. Entry forms, etc., on receipt of stamped envelope. Address: Editor, AMATEUR PHOTOGRAPHER, 1, Creed Lane, E.C. (Prizes will be announced and photographs reproduced and criticised in the AMATEUR PHOTOGRAPHER Supplement, January 13th, 1893.)

THE Sixth Annual Exhibition of Photographs, open to all photographers of the world, under agreement between the Photographic Society of Philadelphia, the Society of Amateur Photographers of New York, and the Boston Camera Club, will be held by the Photographic Society of Philadelphia, April 17th to 29th, 1893. It is hoped that with this early announcement, it may be favoured with liberal exhibits from foreign photographers, to whom special inducements and facilities will be offered. Circulars, with rules and full particulars, will be issued early in December, and may be obtained on application to Robert S. Redfield, Chairman, Exhibition Committee, 1,601, Callowhill Street, Philadelphia, Pennsylvania, U.S.A. Exhibits should be made ready to forward at earliest possible date, as considerable time will necessarily be consumed in transit, etc. They will be required to arrive in Philadelphia probably about March 15th.

THE success of the Stanley Show will, no doubt, have amply fulfilled the hopes of its promoters, but how far art has smiled upon the attempts to woo her and induce her to enter its courts will be another matter. We recently commented upon the announcement that there would be a competitive exhibition of artistic and technical photographs, and, as we anticipated, the regulations have not apparently found favour with artistic workers, who have consequently refrained from contributing.

IF photography is not taken seriously, either as a science or an art, then it is nothing. As a plaything it lacks the essential characteristics of a "sport," and is inadequate as a "game." It must be studied from either the physical or aesthetic standpoint, and is ill-fitted to be associated with cricket, football, cycling, and similar admirable recreations. Of course, an artist or a scientist may, for the sake of exercise, ride a bicycle, but the serious pursuit of his life and his recreation are not to be viewed in the same light. Neither because a cyclist chances to use a camera does it follow, nor does it seem desirable, that an exhibition of "roadsters" and "racers" should be accompanied by an exhibition of pictures, and, unless some very distinct and especial provision be made, the incorporation of art work is likely to be a failure.

THAT a certain well-known provincial contemporary should think otherwise is perhaps only natural. We shall not be far wrong in saying that he owes his very existence to the cycling world, and is a graft of the original stock which has aforetime borne abundant fruit in cycling litera-

ture, the family likeness to which is observable throughout. Still, there is no harm in this, only it is an insult to the modern development of photography to suppose that what pleases and appeals to the average "snap-shot" tourist will be acceptable to the serious student.

UNLESS we are mistaken, the executive of the Stanley Show will endeavour to make some different arrangements in future, or abandon the "artistic" altogether.

A CERTAIN artist lately expressed himself rather forcibly upon "cribbing" in connection with "snap shots." We note that the characteristic of certain other "snap-shots" of a literary kind appears to be "cribs," or, to put it more politely, "excerpts" from standard and other writers—from H. P. Robinson to Ally Sloper! With some the scissors is mightier than the pen. Yet quotations from the presiding deity of Shoe Lane seem rather out of place in a photographic periodical. But perchance this sort of thing takes with the descendants of the great Leofric and Peeping Tom.

THE frequent exhibition lately of prints on rough paper, and of a very red colour, is, we think, likely to bring such papers into ill-repute. A very warm colour may be desirable enough at times, but if too often and indiscriminately repeated is likely to become distinctly monotonous; moreover, we are inclined to think that in many cases the reds and so-called Bartolozzi browns are after all subterfuges when the photographer has found himself unable to get the pure brown he desired; hence we hope that our few notes in the present issue on the subject may stimulate investigation towards the improvement and control of colour.

MOREOVER, we can hardly impress upon our readers too strongly the fallacy of using large stops and rough papers, imagining that they will thereby attain to artistic results. Such and similar methods in capable hands may be of untold assistance in overcoming some of the inherent faults of older photographic methods, but if used without the user fully appreciating *why*, or knowing well in just what direction it will help his picture, it is as great an abuse as to place a valuable Stradivarius in the hands of the average itinerant musician. The picture-making possibilities of photography have been abused through excessive sharpness and clearness. Let us hope that the opposite methods are not destined to be similarly cheapened, and the introduction of the serious and devoted few converted into an unintelligent craze.

THE Camera Club officials have graciously and worthily descended from the lofty platform which some have criticised them for occupying, and are offering elementary lectures and demonstrations to beginners, and during the present exhibition days they gallantly play the host to a numerous company of strangers and ladies, so that an afternoon at the Camera Club just now is quite a lively scene. Afternoon tea is in great request, whilst some of the elderly Club *habitués* who are known to value highly the seclusion and quietude of their club quarters may be seen escorting their fair visitors round the little picture gallery, and pointing out the *chef d'œuvres* of the show. The collection will remain open to the public until the first week of December.

A CONTRIBUTOR to the *Times of India* comments favourably upon the results obtained by Mr. Dallmeyer's tele-photographic lens, and is convinced that there is a great future before it for military purposes, especially in Indian mountain warfare, where a "long shot" can often be obtained with perfect safety to the operator. A "long shot," however, in this country

on any but perhaps half a dozen days in the year, does not seem to us to promise very favourably for survey purposes, though never such an effective yellow screen for absorbing the blue rays be employed.

WHICH is the plagiarist, the *Photographic Review of Reviews* or *Photography*? Both seem to resent our joining issue in the crusade against the separation of professional and amateur in open exhibition classes. But stay, perhaps it is not plagiarism after all, but the same pen writing the Birmingham "I" and the Coventry "we."

ON several occasions it has appeared probable that the wedding of scientific photography to electrical science has in store for coming generations some very astounding results. Professor W. W. Jacques, of the German Technical Society, Boston, speaks with evident conviction of certain experiments in sending photographic impressions over a wire by means of electricity. The description of what took place will be best given in his own words:—"The laboratory consisted of two rooms. In one was an ordinary photographic camera, a small developing closet, and a table on which was a cubical box, having on one side a slit of sufficient size to receive a postal card. From this box two wires stretched across the room, and, passing through the wall, extended to a similar cubical box in the next room. I was given an ordinary postal card and asked to write a short note on it, and wrote, 'Good morning! How do you do?' This my friend photographed by electric light, developed, and dropped the hastily-made negative into the slit in the cubical box in the middle of the room. I went into the adjoining room, and there, issuing from the corresponding box on the table, was a piece of thin paper the size of the card, on which appeared a facsimile of the words I had written: 'Good morning! How do you do?' There would seem no reason, adds Professor Jacques, why the sending and receiving boxes, instead of being in adjoining rooms, should not be placed one in Boston and the other in New York."

THE fascinations of lantern-slide making are likely to be greatly enhanced if the Paget Company's new print-out lantern-slide stands the test of general use, and there seems no reason to doubt that it will. These lantern plates, which we believe are ready for the market, are coated with a gelatino-chloride of silver emulsion, and are intended to be printed by daylight, toned and fixed in just the same manner as gelatino-chloride papers. Then goodbye to the many inconveniences of dark-room practice if we can make our lantern-slides in the comfort of daylight.

THE Hackney exhibition wound up very successfully. In addition to distributing the medals it devolved upon Captain Abney to present the Hon. Sec., Mr. Fenton Jones, with a very handsome clock, which the members of the society desired to hand Mr. Jones as a testimony of their high appreciation of his indefatigable and painstaking efforts on behalf of the society. It is a mighty fine clock, and Mr. Fenton Jones will no doubt value it on account of the expressions of esteem and admiration which accompany it. He has earned it too—*cela va sans dire*. Then followed some speech-making and votes of thanks. Captain Abney spoke in admirable terms of the society and exhibition. Someone said Captain Abney was a gentleman, though sometimes a sarcastic one. Someone else thought photographic societies a nuisance, which was no doubt meant to be funny but sounded rude. Lantern-slides followed, and it was very late before the doors of the Morley Hall were closed, and the latest of the officers and committee men

wended their way homeward with the consciousness of having won the sincere congratulations of everybody.

SOUTH LONDON EXHIBITION is for this week, Tunbridge Wells follows, then Exeter, to say nothing of minor or "close" exhibitions held by other clubs. Meanwhile, away down in the far west, the Cornish Camera Club are organising a display, and are inviting well-known photographers to send a few pictures on loan "to teach the young ideas to rise," and show those who are at a distance from the great centres what is being done by others.

IN our last issue we foreshadowed the birth of an all-embracing photographic institution. The few particulars which were known, we deemed it best to suppress. The *British Journal* the following day, however, is rather more communicative. It says:—

"We are informed that steps are being taken to discuss the advisability of forming in London a central photographic club, to which professional and amateur photographers, the trade, and, indeed, all sections of photographers would be eligible for election. The club would be open during recognised club hours, and many facilities not enjoyed by existing institutions—which it is intended rather to supplement than to rival—would be afforded. The idea is receiving influential support."

MR. WARNERKE is unexpectedly called away to Russia, and Mr. A. Horsley Hinton has consented to fill his place as one of the judges at South London Exhibition.

#### NOTES ON COLOUR.

##### V.—THE THREE PRIMARY COLOUR SENSATIONS.

(Continued from page 363.)

UP to this point we have seen that the spectrum consists of six colours, and that in consequence of this it might be supposed that the retina was provided with six nerve fibrils or sets of nerves which responded to the action of these six spectrum colours; but as at the same time we can distinguish thousands of tints in the spectrum, it would be also only justifiable on the same ground to suppose that the human retina was provided with as many nerve fibrils as we could perceive tints. Thomas Young suggested another theory which has been powerfully supported by Helmholtz, Maxwell, and other scientists; this theory assumes that each atom of the retina is supplied with three sets of nerve fibrils, which are capable of transmitting three colour-sensations, one set being excited by the long waves of red light, another by the intermediate waves of green light, and the other by the rapid waves of blue or violet. But although each set is excited by its particular kind of wave lengths, each set is sensitive in a less degree to the wave lengths of the other set of nerves. Helmholtz, in his "Physiological Optics," gives the following diagram of the action of these primary colour sensations on the three supposititious sets of nerve fibrils, 1 being the action of red light, 2 that of yellow, and 3 that of violet light, the letters below the diagram representing the colours of the spectrum.

If all three sets of nerve fibrils are simultaneously and equally excited, we receive an impression of white light. Helmholtz says that the choice of these three colours is rather arbitrary, and that any three colours which when mixed together would form white light may be chosen, but there must be two maxima of action, one in the red, the other in the violet. Young's theory of red, green, and violet as the primary colour sensations receives some support from the fact, the most common form of Daltonism, or colour blindness, is to red, whilst a less noticeable or less observed variety is to green rays, and a still rarer variety to purple, though in this last case the presence of red Daltonism would affect the precise estimation of the hue of purple.

If we work synthetically as it were, we shall find still further confirmation of this triad theory.

If we take the spectrum colours left after abstracting the three primary colours, we find, orange-red, red-orange, orange-yellow for one group; yellow, greenish yellow, and yellowish green for the second, and blueish green, greenish blue, and ultramarine blue for the third. Now let us try and form our first group of colours; this may be easily effected by mixing the red and green colour sensations in varying proportions. Supposing we throw a beam of red light on

to a white screen, and allow a shade of green to mix with the same, we then obtain orange-red. Increasing the luminosity of the green, gradually we obtain red-orange and orange-yellow; at this point we have obtained our maximum illumination with green light, and to continue our synthetic experiments further, we must reduce our red, which comes practically to the same thing as increasing our green; we then find we obtain a distinct yellow. On reducing the red still further, we obtain a greenish yellow, and then on still further reduction of the red, a yellowish green. On cutting off our red, or the first primary colour, altogether, we obtain of course the second primary, green. We have thus formed the whole of the spectrum secondary colours up to green, and our third group alone is left, and this may be formed in precisely the same way: by allowing a beam of green light to fall on a screen, and mixing with it violet light, we obtain blueish green, greenish blue and ultramarine blue, according to the mixture of the various proportions of green and violet light.

We have seen, however, that our three primary colour sensations excite not only their own individual set of nerve fibrils, but also in a minor degree the other nerve fibrils; thus the red rays excite not only the nerve fibrils sensitive to red, but in a minor degree the nerves sensitive to green and violet; and a mixture of the three primary colour sensations gives us the sensation of white; therefore the admixture of any two primary colour sensations yields a resultant colour which is less pure than the spectrum colour, because the whole of the nerve fibrils are excited, and we perceive the resultant colour modified by an admixture of white light. Arguing on the same lines, we are never able, under ordinary circumstances, to perceive any individual colour of the spectrum without this admixture of white light, or without the sensation of white light being also excited. As a proof of this, we may by an artifice, so as we cannot remove the green and violet sensitive nerve fibrils, so far put these fibrils out of play as to nullify their action when viewing the red of the spectrum. This artifice is very simple, and really consists of tiring the violet and green sensitive nerve fibrils by looking intently for a short time on an admixture of these colours, such as blueish green, when, if after this we examine the red of the spectrum, we shall note that it glows with increased brilliancy, because the tint is pure, there being no admixture of white light. The same experiment may be performed for green and for violet.

## A LEISURE HOUR IN WINTER.

THE most carefully exposed plate will sometimes have certain regions of nearly transparent glass, which print too rapidly and give trouble from first to last. The use of matt varnish, plain or stained yellow, is usually recommended, with which it is suggested the too rapidly printing portions should be painted.

Many will, however, have found that "matt varnish" is by no means easy to manipulate with a brush; either it dries too rapidly to allow of its being applied exactly to the desired spots, or it spreads too far, or if drying slowly it results in an irregular granulated film.

We have found a little "light red" or "chrome yellow" oil colour squeezed from its lead tube and allowed to partially dry, very useful when applied to the back of the negative, using the finger tip as a "dabber" with which it may be softened off at the edges in a very convenient manner. Still, it is not always possible to restrict the "dabbing" and softening to the precise figure of an irregular and sharply defined object, if such occasion should arise; moreover it may require repeated experiments before you will arrive at the right depth of "red" or yellow to restrain the printing of the particular regions to just the right degree. Smoking the back of the negative with smoke from a candle or other source of combustion so as to cover the glass with a thin black film, and then with a cloth to remove it from all parts except where it is required to retard printing, has been recommended, and no doubt has its good points—it would certainly be easily removed—too easily, we should imagine, if a number of prints are to be made from the same negative. We have recently found a small piece of red putty of just about the consistency of a piece of stiff dough exceedingly useful for this purpose, lightly dabbed on to the back or plain-glass side of the negative; a delicate veil can be produced over the thin portions of the negative, which can be increased in thickness by repeated "dabbing." The soft putty, if not too soft, can be rolled into little pencils, and with the edge or point the intricacies of an irregular and complicated outline followed with accuracy.

The reverse process, that of rendering more transparent the denser parts of a negative, is perhaps a more troublesome task, and certainly more likely to be attended with accident to the whole negative. The usual reducing formula of hyposulphite of soda and ferridcyanide of potassium is perhaps the most effective, but when local reduction only is attempted too great care cannot be taken. Whatever the object to be reduced may be—sky, or stream of water, a sun bonnet or figure in light draperies—the reducer applied with a brush is sure to spread beyond the exact space to which you would fain restrict it, and even though but little noticeable on the negative when viewed by transmitted light, the error will be startlingly revealed in the print.

Our advice would be to soak the negative in clean water until the film is softened, then remove superfluous water with a squeegee, or allow the negative to drain and partially dry. Outside the edge of the object or region to be reduced, draw with extreme care, by means of a camel-hair brush, a line or border of glycerine; the space now enclosed by the border of glycerine may be treated with a weak solution of ferridcyanide of potass. and hypo. of soda, and the result watched—the glycerine should prevent the flowing of the reducer beyond where its action is required. An alternative method would be, omitting the glycerine, to paint the part with plain hypo of soda solution, only keeping this exactly to figure to be reduced, and then subsequently to allow a drop or two of the

reducing solution to run into the painted area; by this means the indication of where the brush containing reducing solution has travelled may be avoided, and the edges softened.

In any case the action should be slow, that is to say, the solution should be weak in ferridcyanide, or an unpleasant yellowish-brown stain is likely to arise, the non-actinic character of which will probably more than compensate for the reduction in density.

At the present season many will find some hours of leisure at their disposal which might be turned to excellent account by seeing what can be done to improve some of those negatives which are amongst the less satisfactory of our summer's products. With a little "dodging," reducing, intensifying, spotting, masking, it is often surprising what can be done with an altogether discarded plate. By the way, a pyrogallic-developed negative is very apt to stain under the influence of ferridcyanide of potassium. If before developing a negative we anticipate having to reduce any portion, we use eikonogen, hydroquinone, or similar developing agent—stains don't come with these.

## Letters to the Editor.

### THE MEANING OF KODAK.

SIR,—It is interesting to note that the word "Codach" in the Ibero-Celtic or old Irish language signifies invention. I was in the Eastman Company's shop in Oxford Street the other day, and I asked if they knew the meaning of the word "Kodak." I was told that they thought it was an "invention" of the maker, or possibly taken from a town in America of a somewhat similar name.—I am, sir, yours, etc.,

W. E. ST. LAWRENCE FINNY, M.B.

\* \* \* \*

### "PHOTOGRAPHS OF THE YEAR."

SIR,—In answer to Mr. Knight's request in last week's issue, allow me to state the Editor's surmise was, as is usual, right. "In the Pool" is a uranium-toned bromide, and the green colour in which it is reproduced in *Photographs of the Year* suits it admirably, in the opinion of—Yours, etc.,

LIONEL C. BENNETT.

\* \* \* \*

### GELATINO-CHLORIDE PAPER.

SIR,—In reply to Mr. Gotz's letter in your last issue, this gentleman has evidently misunderstood my meaning. I claim to be the first to introduce the manufacture of gelatino-chloride paper into this country. Previous to this the sale was very limited.—Yours, etc.,

WALTER E. WOODBURY.

\* \* \* \*

### THE NEW COLD-BATH PLATINOTYPE.

SIR,—In your very able editorial on "New Cold-Bath Platinotype," your printer has, either by accident or possibly with a view to amuse your readers, so transposed the wording of one of your sentences as to give an impression which I imagine you hardly wish to convey.

The sentence reads as follows:—"If you consider the result is what you desire, lift the bath from the board, and plunge it in the acid clearing print." The bath could certainly be lifted from the board, if it were considered desirable; but what is an acid print? We have often seen a sweet picture, but the acid print is a puzzle, unless it be a print that is too sharp to the taste of those who C flat, and think it to B natural.—I am, yours, etc.,

ERNEST J. HUMPHREY.

We have to apologise for slip, and tender our thanks for note.—EDITOR.

\* \* \* \*

### AMUSING THE ORPHANS.

SIR,—May I ask your assistance in providing amusement for our 200 orphans? By publishing this letter you will be helping to bring a plan before the notice of your readers, many of whom would be glad of an opportunity of helping the fatherless little ones.

The Home is situated on the Chobham ridges, nearly three miles from the nearest village. I am anxious to amuse as well as instruct them during the long winter evenings.

Brother amateurs who may have a few lantern slides to spare and will post them to me will be helping to carry out my scheme. Any duplicate negative they may have from which I might make lantern slides would also be very acceptable. I hope that if they have only one to spare they will send it. Each negative or slide should have a label notifying what the subject is.

With the earnest hope that my appeal may be successful, I am, yours, etc.,  
A. MITCHELL, Head Master.

R.A.O.A., Camberley, Surrey.

\*\*\*\*\*

#### KEEPING PLATINOTYPE PAPER.

SIR,—The following little wrinkle may be of use to some of your readers. I have found it very successful, and have not seen it published:—

Procure a piece of closely-woven linen or fine canvas, cut about one inch broad, and long enough to go round the tin twice; rub well with india-rubber solution on both sides, roll firmly round lid of tin. This strip can be peeled off and put on at any time. If it gets too dry, moisten with a little benzine or naphtha. It is perfectly damp-proof.—Yours, etc.,

EMERALD.

\*\*\*\*\*

#### A SUGGESTION.

SIR,—Judging from the interest shown in photographic exhibitions, which are now in full swing, I should like to offer the following suggestion, which will no doubt elicit the opinion of several of your readers, especially those connected with societies: "That an annual exhibition should take place, in which every London and suburban society should be represented by one or two members, selected by their society committee, to compete each competitor having his own choice of plates up to a given size, and limited to six, which will be marked for the purpose by the manufacturers. The best set of pictures to receive the highest award, the next best to follow up in succession until, say, the best half-dozen competitors have been selected." Providing this suggestion is supported, I do not think there will be any difficulty in securing the necessary officers and council to consider the arrangement of the scheme. A subscription of 5s. from societies entering for competition, honorary subscriptions, and charge of admission to exhibition would no doubt leave a very handsome sum to be handed over to the Photographers' Benevolent Association. The fact of the first one or two best workers in each society being selected would in itself guarantee the quality of work on exhibition.

I shall have much pleasure in placing 5s. to this scheme, and will guarantee to take tickets to the amount of one guinea if my suggestion is carried out.

If there is no personal gain by this scheme, it will certainly bring unionism amongst societies.—Yours, etc.,

28, Shackleton Lane, Kingsland, N.E., M. A. WILKINSON.

Nov. 21st, 1892.

### The Stanley Show.

ESSENTIALLY a cycling exhibition, the executive have included as a fitting adjunct a photographic section. Photography can but add considerably to the pleasure of all cyclists by allowing them to obtain permanent records of spots they visit, and cycling enables the would-be photographic tourist to reach distant haunts with little expenditure, and with development of muscle and improvement of health.

The exhibition was opened on Friday afternoon by Sir Albert K. Rolit, who after a tour of inspection took the chair at a luncheon, at which success to the Stanley Show was most cordially received.

On entering the Agricultural Hall from the main entrance in Upper Street, the visitor desiring to see the photographic section must go up the inclined approach to the main hall, then as soon as this is reached turn to the left, then to the right, take the first staircase on the left, at the top turn to the right, and he will at once see the sign "Photographic Section." Entering this gallery the first exhibit to meet the eye is that of

B. J. EDWARDS AND CO., THE GROVE, HACKNEY. Here we have examples of work on ordinary and isochromatic plates from nature, as well as coloured objects, such as oil paintings, flowers, etc. Particularly noticeable are three landscape prints, showing the effect of the isochromatic plate, and also the over-correction by the use of a screen. Lantern slides and transparencies on Edwards'

XL. transparency plates speak well for the beautiful results to be obtained, and when these are lit up at night the attraction to the public is very great. The value of iso plates in the studio is shown by some very fine work by the Stereoscopic Company and Lambert Weston, and the exquisite softness and delicacy of white drapery is particularly noticeable in these last. Mr. Horsley Hinton's fine work, "An Essex Marsh," proves the correct rendering of "tone," both of sky and landscape, for which these plates are specially suitable.

Down a few steps, and

HAZELL, WATSON, AND VINEY, LD., 1, CREED LANE, E.C., have a good show of photographic literature, including the AMATEUR PHOTOGRAPHER, "Photographs of the Year," "Amateur Photographer's Annual," "Dictionary of Photography," etc. Free copies of the AMATEUR PHOTOGRAPHER are also to be had for the trouble of helping oneself.

THE SUN CAMERA Co., 40, New Briggate, [Leeds, agents for the well-known wholesale firm, Lonsdale Bros., who are noted for their brass work and cameras in parts ready for the amateur photographic mechanic. Another novelty is a focussing chamber which shuts up and protects the ground-glass when not in use, and does away with the necessity of the dark-cloth. A special cheap but well-made line is the 3s. half-plate retouching desk with quarter-plate carrier. The Sun print washer is a convenient and well-made piece of apparatus with water supply entering from the bottom, and a lip arrangement to prevent the full flush from tearing the prints. A tap at the top also enables one to obtain a supply of water for developing, etc., without disconnecting the washer. This firm have also a very good lantern in case, with tripod which fits on to the bottom of case,

which is then opened so that there is no trouble in taking the lantern out, all being ready at once for use. A new single lantern carrier and dissolver of very neat design is well worth attention, as well as a new projection and enlarging apparatus with removable bellows front, and rack and pinion. Lanterns in parts is also another feature to which we refer in "Our Lantern Screen."

THE CITY SALE AND EXCHANGE CO., 54, LIME STREET, E.C., face the AMATEUR PHOTOGRAPHER stall, and really we have a surfeit of good things, and it is by no means easy to pick out anything for special mention. The special feature claimed by this firm are, that any buyer is, on visiting their stall or rooms, in a position to choose from every maker's apparatus in the market. "Optimus," Lancaster, Underwood, Talbot and Eamer, Houghton, Clement and Gilmer, Wray, Ross, Dallmeyer, Taylor, etc., etc., all are here, and these goods may not only be purchased outright, but they may be hired by the day, week, or month, and also obtained on the easy purchase system, or in exchange for old apparatus. The firm's own specialities are a one-solution hydroquinone developer, which we report on next week, a new three-fold rule and bayonet joint stand with adjustable legs, very firm, rigid, and light, and also a new crocodile skin camera case, which forms a really handsome case. Stereoscopes and stereo slides are especially *en evidence*.

Following the sun we find—

J. DESIRE ENGLAND, 21—24, CHARLES STREET, ROYAL CRESCENT, W., with some excellent examples on celluloid films; his excellent aluminium-mounted film carriers; Turnbull's neat little pocket camera and film slides; lantern slides both on glass and celluloid, and Scanlan's Practical film and film lantern-slide holder; and last but not least, specimens on his well-known photo-mechanical plates.

A. J. SMITH AND CO., 18A, CLOUDESLEY SQUARE, ISLINGTON, N., have an interesting exhibit, as workmen are busy making cameras and slides. One speciality is a new dark-slide lock, the great feature of which is that the fastening closes over the hasp, so that the lock really holds the slide closer to the body, and thus forms a further prevention to light entering; the folds of this slide are

always rabbetted. The A 1 camera, mounted in aluminium, is very light, and weighs in the half-plate size only  $2\frac{1}{4}$  lb. A new stand has also some good practical improvements. The whole of the cameras on this stand are particularly noticeable for the beauty of the grain of the wood, a special feature to which great attention is paid. This firm are also agents for Hockin, Wilson and Co.'s well-known Desideratum lenses, which combine cheapness with quality.

R. and J. BECK, OF 86, CORNHILL, E.C., make a brave show of the "Frena," and results obtained by the same, both in the shape of prints, lantern slides, and some huge enlargements which speak well for the defining powers of the lens. Of the Frena itself we need hardly speak, as we noticed this some weeks back, and a continual use of the same ever since has only confirmed our good opinion. Dishes, printing frames, and a special drying board for the films back up a complete assortment of albums for prints. A very neat little book for the negatives calls for special attention, as well as a Frena developing cabinet, the neatest thing of its style we have yet seen. For cycling a special camera holder has been devised, and we have no hesitation in saying that it is at once practical, safe, and efficient; formed of stout wire, it is very light, and is adjustable both horizontally and vertically—every photo-cyclist should see this. At the back of the stand is a magnificent 24 by 24 studio camera and stand of colossal and beautiful workmanship. A case of 300 Autograph lenses in brass and aluminium completes an excellent exhibit.

HENRY PARK, OF 1, ORCHARD BUILDINGS, ACTON STREET, KINGS-

LAND, N., so long known for his excellent camera fittings, is showing the same in brass as well as aluminium. He is offering some novelties in bamboo stands, one, a balancing stand, which is extremely useful for hand-camera work, as, no matter how uneven the ground, the head immediately stands perfectly level, and is fixed by a side screw. A new ball-and-socket joint is worth noting as a great improvement. We can also strongly recommend all ladies to make their friends who go in for photography obtain for them one of Park's new camera, music, and easel stands combined, one of the neatest ideas yet brought out. By means of two little adjustable brass clips the stand serves as an easel for ornamenting a drawing-room corner, or as a music-stand as well as a camera-stand. Major Bruno's Universal hand-camera, described in the early part of this year in our columns, is also on view, and at the price of 45s., without a lens, should be a great favourite. We can testify as to the excellence of the workmanship in it, a feature of no mean importance, and which is so apparent too in the beautiful "Victoria" cameras and the huge studio stand with every possible movement and of extreme rigidity.

W. MILLER AND CO., 122, NEWINGTON BUTTS S.E., show a new hand-camera, the "Unique," which is the usual mahogany box form. The plates are placed in sheaths, film upwards, in the top of the camera, which is constructed to hold 12, 18, or 24 plates; when charged, a rod at the back of the camera is drawn out as far as possible, and the plate is drawn through a quarter of a circle and faces the lens, the pushing back of the lever locking the plate in register. The lens is an R.R., working at  $f/8$ ,  $f/11$ , and  $f/16$ . Focussing can be effected by a lever and scale underneath, and either time or instantaneous exposures may be obtained at will. The lens and view-finder are both uncovered by one movement. The camera is well made, simple in movement, and cheap at £5 5s.

W. WRAY AND SON, OF NORTH HILL, HIGHGATE, contribute a good show of lenses in brass and aluminium, and also a new diaphragm shutter of light and elegant design, to which we shall recur again.

MESSRS. MORLEY AND COOPER, 70, UPPER STREET, ISLINGTON, have an excellent assortment of cameras, noticeable amongst which is the Fairy, with aluminium fittings, very light; a new French detective camera, very small and neat, to take six plates; and an enlarging camera, with an adjustable sloping front to correct

drunken architecture; a splendid triennial lantern, which can be made into a biennial or ordinary; and also a flying carrier. A new Fairy stereo camera, with three slides but without lenses, at £7 4s. is cheap.

W. SANDERS, OF 91, MOUNT PLEASANT, LIVERPOOL, shows his "Photoscope" an opera, field, and marine glass, and camera combined, which was also exhibited at Pall Mall. It is just the instrument for a lady.

W. TYLAR, OF HIGH STREET, ASTON, BIRMINGHAM, shows Davenport's new Guinea Dark-room. A neat little metal binding clip will form a series of ladders for prints is a decided novelty, as well as the adjustable washing and draining rack, which takes from lantern size to whole plate. A lantern slide mounting vice, white ink, masks, etc., and the 12s. 6d. Tit Bits camera, with specimens of work, is wedged in with the numerous helpful little odds and ends for which Mr. Tylar has made his name.

SANDS AND HUNTER, 20, CRANBOURNE STREET, W.C., show a neat cyclist's camera and four-fold stand, both extremely light and well made. They also show a new and very light Willesden paper film single holder, the film being slipped under side guides and a brass clip holding it in position at the top. They also show their well-known dry-plate books, about the handiest and safest methods of carrying exposed and unexposed plates yet invented. This firm also make a speciality of second-hand apparatus of all kinds.

PLATT AND WITTE, BIRKBECK ROAD, KINGSLAND, N., exhibit camera fittings and bellows, the former in brass and aluminium; some stands, and also some very good lanterns, and a screen which we notice in "Our Lantern Screen."

A. GRAY, OF 44, SNOW HILL, E.C., shows NAMEIT, the latest improvement in which is the employment of metal-face type, which is inked with a roller, the impression taken on to special transfer paper and then transferred by simple pressure to the negative. The process of titling negatives is by means of this considerably simplified.

ELLIOTT AND SON, OF HIGH BARNET, content themselves with covering acres of wall (this joke isn't original), with their very fine and very well known Wave Study, which gained a medal at Pall Mall, and some first-rate 12 by 10 carbon enlargements from hand-camera shots on Barnet plates, the most noticeable of which are "Welsh Ponies" and "Morning Toilet," the low morning light effect of this being very striking.

THE AUTOTYPE COMPANY, 74, OXFORD STREET, W., show some large and fine specimens of work by the carbon process.

#### THE PICTURES.

Our notes on the apparatus have run to such a length that our notice of the pictures must be brief. The judges, Messrs. Traill Taylor, Andrew Pringle, and Henry Sturmey, made the following awards:—Class A, instantaneous cycling subjects, set of four: Gold and silver medals withheld; bronze medal to three snap-shots at the Harlequin (Cardiff) Grounds, by W. H. Kithen; diploma of merit to Austin C. Edwards. Class B, instantaneous general subjects, set of four: Gold medal for 21—24, to John H. Gear, all 12 by 10 direct platinotype work of good merit; Mr. Austin C. Edwards takes the silver for 8A, four Niagara shots; bronze medal to No. 30, "Filey," by E. M. Stone; diplomas are awarded to A. R. Dresser, No. 8; 7A, A. S. Statham, and 13, E. Hawkins. In Class C, landscape or seascape, with or without figure: The gold and bronze medals for 111, "Fishing Boats," and 110, "Stalham Dyke," by H. Dudley Arnott; the silver medal to 69, "Nelson, Hastings," by A. R. Dresser; diplomas to 78, "Off to the Plough," by J. E. Austin. Class E, pictures in platinotype, any subject: Gold, 267, "Worn Out," by F. Whaley; silver, 268, "Strensham Church," Harold Baker; bronze, 223, "The Wretched Criminal," C. F. Treble; and diplomas to 224, "Who's 'oo?" by C. F. Treble; 197, "Langdale Pikes," by E. Benson, and W. J. Anckorn. In lantern-slides: Gold to J. Carpenter; silver, J. E. Austin and E. G. Lee; bronze to Austin C. Edwards; diplomas to A. R. Dresser, J. H. Gear, J. O. Grant, and W. Taylor.

# OUR LANTERN SCREEN.

*A Monthly Supplement to the "Amateur Photographer."*

No. 2.

NOVEMBER 25, 1892.

## Our Dissolving Views.

"OUR LANTERN SCREEN" has been very heartily welcomed by one and all, and we hope that all our readers will assist us in making it a greater success than it is, by recommending the paper to their friends, by sending us notes and news and suggestions.

In conjunction with "Our Lantern Screen," we have commenced a series of Monthly Lantern Slide Competitions, and the following are the conditions, etc. :—

### PRIZES.

First Prize .. .. .	Silver Medal and Clasp.
Second Prize .. .. .	Bronze " "
Third Prize .. .. .	Certificate.

### SUBJECTS AND LATEST DATES.

Sea Pieces and River Scenery .. ..	Dec. 17th.
Portraiture and Figure Studies .. ..	Jan. 14th.
Instantaneous Work .. .. .	Feb. 11th.
Architecture (exterior and interior) ..	Mar. 18th.

Each competitor must send in two slides. The slides must be mounted and be properly marked, and bear the title of the picture legibly written on the face of mask. Any slide not properly marked will be disqualified. The marking which must be adopted is that most general, viz., two spots (white or coloured) on the face of the mask, which said spots should be placed downwards next the condenser in the lantern, so as to show the slide the correct way on the screen.

Past prize winners of the Gold and Silver Medals in our Annual Lantern Slide Competition, or past winners of the Silver Medal in our Monthly Lantern Slide Competitions, are disqualified. Any competitor winning a Silver Medal will be disqualified for any subsequent competition, but if competing he may be awarded an extra silver bar for the ribbon. Winners of the Bronze Medal or Certificate can only compete for the higher prize or prizes in subsequent competitions.

The slides of competitors which do not gain a prize will be divided into three classes according to merit, and the competitors' names, etc., published in the next number of "Our Lantern Screen."

Winners of the Silver Medal must supply to the Editor on demand an unmounted print from the original negative from which the lantern slide was made.

All slides entered for competition to become the property of the AMATEUR PHOTOGRAPHER.

Entry forms, etc., may be had by forwarding a stamped addressed envelope to the Editor.

THE popularity of lantern shows has been made pretty evident during this last month by the numerous exhibitions at which every evening a lantern entertainment has been the feature.

We have in course of preparation a lantern reading with about 100 to 150 slides illustrating the Peak and Dale country, and we shall be glad to loan this to societies, etc., on application. The lecture is well written, and the slides form a suitable running commentary upon the same.

DISSOLVING effects are not always successful, and we must confess that to us to see a ghostly portrait dissolve into a long-eared quadruped is not happy, though possibly suitable. We were at a local society show last week, when a well-arranged group was meant to dissolve into a landscape, and whether something stuck or somebody was not quick enough, the result was a couple of six-foot lovers enjoying themselves in the midst of a lake. Slightly damp, we should think, for the lovers, and damping for the lecturer, as well as the lanternist.

THE question is, what is the best method of changing pictures on the screen? Some audiences complain that the rapid change from light to darkness, and *vice versa*, as obtained with some carriers, is dazzling and painful to the eyes, whilst others complain that the plain push through is not pleasant, especially as, as will generally happen, some slides stick half way.

THE following is the itinerary of the AMATEUR PHOTOGRAPHER 1892 Lantern Slides:—

1892.	Feb. 11	Haltwhistle
Nov. 28 King's Lynn	" 13	Hexham
" 29 Peterborough	" 14	Sunderland
" 30 Yarmouth (Cam. Club)	" 17	Selby
Dec. 1 Yarmouth (Photo. Club)	" 18	Bootham
" 3 Hull	" 20	York
" 6 Wolverhampton	" 22	Stockport
" 8 Wigan	" 23	Oldham
" 9 Warrington	" 24	Lancaster
" 12 Ashton-under-Lyne	" 27	Sheffield
" 13 Manchester	Mar. 1	Crewe
" 14 Farnworth	" 3	Walton
" 16 Lewisham	" 6	Accrington
" 19 Blackheath	" 7	Keighley
" 20 Faversham	" 8	Wakefield
" 22 Hastings	" 9	Huddersfield

A smart bit of work was done at the Hackney show on 17th inst. A negative of the Hon. Sec., Mr. W. Fenton Jones—who was presented with a handsome clock for past services—was

obtained, and by aid of the Platinotype Company's new oxy-magnesium lamp and a Paget Prize printing-out lantern-slide, a completely finished lantern-slide was thrown on the screen, the whole being done in 120 seconds. This is good business indeed.

A correspondent kindly sends us the following note *re* green lantern-slides:—I was interested in your editorial note on green lantern-slides, because I had just got my fine greens in another way—by intensifying with mercury a uranium-toned (pyro-developed) slide, without discharging the brown colour. Very little intensification is got, nor is the brown discharged by the ammonia following the mercury, but on again toning the intensified slide for a prolonged time in the uranium (and ferridecyanide) bath, the colour ultimately becomes emerald green. I have generally got Prussian blues on slides slightly washed by reducing them with ferridecyanide and hypo.

## Lantern Notes and Novelties.

WE have noticed several lantern novelties since the appearance of our last "Lantern Screen," namely:—

Rice's Screw Carrier Grip; "A. P.," November 4th, p. 324.

The "Optimus" Enlarging and Projection Lantern; "A. P.," November 11th, p. 343.

Butcher's Combination Cover Glass and Reflectoscope; "A. P.," November 11th, p. 344.

Brun's Glossy Colours; "A. P.," November 11th, p. 344.

Tylar's Universal Lantern-slide Printing Frame; "A. P.," November 11th, p. 344.

### THE "LECTURER" CANDLE LAMP.

Benham and Froud, of Chandos Street, Charing Cross, have introduced, as we announced last week, this new lamp for lantern lecturers, and it is constructed on the same principle as their well-known Holiday candle-lamp. The candle is a special hard variety, which is kept at one constant height by a spring, and the light is reflected by a parabolic reflector, which is shown in the diagram, on to the book or manuscript.

For travelling, the candle tube slides up, the foot takes off and reverses, forming a neat little parcel as seen above. A red signal sight hole, actuated by a milled head, is provided at the back; and after trying the lamp at the judging of our Monthly Competition Slides we have no hesitation in saying it is at once a practical and useful adjunct to the lecturer's kit. Absolutely no light escapes into the room. There is no mess, and it is extremely easy to read the smallest print by its aid.

### "APTUS" LANTERN SCREENS.

Sharp and Hitchmough, of 101 and 103, Dale Street, Liverpool, have forwarded us samples of their lantern-screens. One, the Aptus washable cloth, is a great boon. It is supplied in one piece up to 8 ft. square, mounted with rollers, top and bottom, for 15s. All lanternists know how easy it is to soil a screen, and we tried by getting an office-boy to pass his grubby hands over the same, and then tried to eradicate his sign-manual with a little soap and water, and succeeded admirably. The cloth does not mark easily nor crack.

Another screen is the special dead-white opaque material. We have just had our office screen primed and painted, and felt rather proud of it, but on placing the sample of Aptus on it the superiority of the latter was at once apparent. The prices are reasonable, a 9 ft. screen mounted on roller and batten, with cord and pulleys, being only 25s. These screens have found considerable favour in the lantern world, Messrs. Sharp and Hitchmough supplying wholesale, and we can heartily recommend them.

### THE "OPTIMUS" LANTERN.

Messrs. Perken, Son, and Rayment, of 99, Hatton Garden, E.C., have just completed the handsomest lantern it has yet been our lot to see. It is a triennial, with all the latest improvements, manufactured of very dark rich rosewood, with aluminium fittings everywhere, and is a picture that would disgrace no room.

### THE "OPTIMUS" LANTERN OBJECTIVE.

The same firm have also introduced a new lantern objective of the Petzval type with exceptionally flat field, and from the use of the new optical glass, transmitting a very brilliant image. The actinic and visual foci of the lens coincide, so that it may be used for copying, enlarging, and portraiture.

### THE "ENTERPRISE" METAL BINDING STRIPS.

The Photographic Enterprise Co., 41, Erasmus Road, Birmingham, have forwarded us some samples of their metal binding strips. The shape of the binder is already formed, and it is merely necessary to pass the strip round the lantern slide, and push a little tongue of metal through a slit and bend over to lock it.

S. AND J. MITCHELL, 17, Northgate, Blackburn, make a special feature of the hire of lanterns, screens, and slides, and send us a list of charges, which are certainly not exorbitant.

GREGORY AND CO., 51, Strand, W.C., are still adding new slides in their famous military and naval types. We specially commend these sets to all those in or near garrison and naval towns, and the public generally are by no means backward in appreciating our noble defenders.

### PAGET PRIZE LANTERN PLATES.

The Paget Prize Plate Company, of Watford, Herts, have sent us samples of the above plates which are made in two rapidities. The rapid, which are six times more rapid than the slow, give black tones, and are very suitable for reduction in the camera by artificial light. The slow are specially intended for reduction in the camera by daylight, or contact printing by artificial light, and give from black to red tones.

Both samples have given us very good results, clean working, vigorous, and yet full of delicate gradation. But we certainly prefer the slow, because of the warmer tones. These have given us most excellent results, and the brown colour, which is easily obtained, is one which shows well on the screen. The developer and directions for the warm tones are as follows:—

WARM TONES.—Developer:—Solution 1: Hydroquinone,  $\frac{1}{2}$  oz.; sulphurous acid,  $\frac{1}{4}$  oz.; potassium bromide, 60 gr.; water to, 20 oz. Solution 2: Caustic soda,  $\frac{1}{2}$  oz.; sodium sulphite,  $2\frac{1}{2}$  oz.; water, to 20 oz. Solution 3: Bromide of ammonium, 1 oz.; carbonate of ammonium, 1 oz.; water, to 20 oz. Carbonate of ammonium should be in clear lamps; if from exposure to the air it has become coated with the white powdery bicarbonate the latter should be scraped off. Brown: Exposure, 60 seconds 1 foot from gas-flame, or 2 inches of magnesium wire burnt at a distance of 3 feet. Developer, solution 1,  $\frac{1}{2}$  oz.; solution 2,  $\frac{1}{2}$  oz.; solution 3, 100 minims; water to 2 oz. Time required in development, about five minutes. Purple Brown: Exposure, 90 seconds 1 foot from gas-flame, or 3 inches of magnesium wire burnt at a distance of 3 feet. Developer, solution 1,  $\frac{1}{4}$  oz.; solution 2,  $\frac{1}{2}$  oz.; solution 3, 200 minims; water to 2 oz. Time required in development, about 10 minutes. Purple: Exposure, 3 minutes 1 foot from gas-flame, or 3 inches of magnesium wire burnt at a distance of 2 feet. Developer, solution 1,  $\frac{1}{2}$  oz.; solution 2,  $\frac{1}{2}$  oz.; solution 3, 250 minims; water to 2 oz. Time required in development, about 12 minutes. Red: Exposure, 5 minutes 1 foot from gas-flame, or 5 inches of magnesium wire burnt at a distance of 2 feet. Developer, solution 1,  $\frac{1}{2}$  oz.; solution 2,  $\frac{1}{2}$  oz.; solution 3, 300 minims; water to 2 oz. Time required in development, about 15 minutes. Wash the plate in running water for at least three minutes before fixing; otherwise a yellow stain may afterwards appear.

FIXING BATH.—The simplest is the following:—Hyposulphite of soda, 6 oz.; water, 20 oz. After fixing, the transparency is well washed for one hour in several complete changes of water.

### PRINTING-OUT LANTERN PLATE.

The above firm have also introduced a printing-out lantern plate, which is coated with a gelatino-chloride emulsion, which is printed-out like any chloride paper, and toned and fixed in the same way. The variety of tones and the ease with which lantern slides can be made by these plates should lead many to adopt them.

MR. FRED V. A. LLOYD, successor to H. Newton and Co, 5, South John Street, Liverpool, sends us his complete and well illustrated catalogue of lanterns and slides for sale or hire.

MR J. W. McLELLAN, of 36, St. Paul's Road, Canonbury, has just issued a new list of lantern slides, and also some samples of his work, from an examination of which we have no hesitation in saying that our readers might go farther and fare worse. The prices, too, are very reasonable, considerably lower than usual.

THE BLACKFRIARS PHOTOGRAPHIC AND SENSITISING COMPANY, of 1, Surrey Row, Blackfriars, are offering some capital lanterns, both in wood and Russian iron, together with slides and accessories of all kinds. This firm are now the wholesale and retail London agents of Griffiths' well-known lantern-slide cameras.

W. BUTCHER AND SONS, of Blackheath, have issued a new lantern list comprising all sorts of lanterns, from the humble oil at 27s. 6d. to triunials at £20. Their specialities are opaque lantern screens, combined coverglass and spot binder, reflectoscope, and a combined projection and enlarging lantern. Special terms are also offered for entertainments and hire.

J. DORE, of 27, High Street, Sandown, I.W., has sent us one of his patent printing frames for lantern-slides and opals. As will be seen from the diagram, it takes the form of a deep box, the negative being placed in position, the hinged frame being clamped down on to it, and the lantern plate or opal dropped in the opening and the

back closed. It has no loose parts, and negatives of any thickness can be used. Any number of transparencies may be printed from exactly the same part of negative. The frame can be obtained in any size, and the smallest negative used in the largest size. It is neat, practical, and efficient, and will be found specially useful for printing-out lantern-slides as well as ordinary lantern work.

C. C. VEVERS, of 12, Market Street, Briggate, Leeds, sends us some practical useful lantern novelties and his catalogue, which is arranged on a very simple yet easily grasped plan, which is not always the case.

The patent couple regulator is a handy and efficient fitting for any bottle, and the screw working at the top is a good idea, and the gas may be turned full on and the supply regulated by the screw. The registering slide carrier, with automatic slide raiser, is a capital idea, which should be in every lanternist's possession. The lantern slide binding vice is a handy arrangement, which screws down to any block of wood or bench, or stands alone, and at the low price of 1s. should find many friends. VEVERS'

coloured binding strips and masks are well known, and he is now offering gummed sheets of printed numbers for numbering slides.

#### FITCH CELLULOID FILMS AND DISH.

Mr. H. Fitch, of 34, Angell Road, Brixton, has sent us a sample of his celluloid lantern-slides and developing dish. The former is on stout celluloid, and in Moore's patent metal mask and binder is quite as rigid as a glass slide, with about one-quarter of the weight. The developing dish is provided with a well, it is extremely light, and will be a useful dark-room adjunct.

### The Lantern at the Stanley Show.

THERE are several very good lantern novelties at the Stanley Show. Platt and Witte have an excellent portable screen, mounted on spring rollers, which is contained in a case measuring 4 ft. by 3 in. by 3 in. The top of the case, which is cut across diagonally, lifts up, forming side supports for the screen, which hooks on to brass hooks

at each side. This is an extremely ingenious and a useful idea, as when not in use the screen runs back into the box, and is protected from dust and dirt. The same firm have also some very good biunials fitted with a rolling curtain effect and a screw disc adjuster, as seen in the accompanying diagram. Tylar shows his lantern slide vice, masks, binding strips, and white ink, etc.

The City Sale and Exchange offer special facilities for the hire or purchase by easy instalments of lanterns and all lantern requisities. They also have some special thin glass slides, good technically and artistically.

Morley and Cooper have an excellent lantern, which they call the Bi-tri-unial, which it is possible to use as one, two, or three lanterns, and the top one may be used for either oil or limelight. Or the lanterns may be used side by side. The brass fronts are worked upon a central swing, which renders adjustment of the disc very easy, the adjustment being by rack and pinion. This firm have also been appointed special retail agents of Messrs. Levi's flying carrier. As shown in the diagram, the sides are cut away, so that it is very easy to grasp the slides, and by a special arrangement the slides are passed through very quickly and the screen temporarily darkened, thus forming a dissolver.

The Sun Camera are offering a novelty in the shape of lanterns in parts, thus enabling the amateur mechanic to make his own lantern. The woodwork is sufficiently advanced for the amateur to finish with the ordinary hand tools, i.e., the sides and door clamped and

keyed, front and door turned for sight-hole and condenser, and do mouldings finished, the whole complete for 21s. Superior sets with brass stage and Russian iron lining and dome, complete for 42s., whilst biunials in parts of best quality may be had for 95s. This firm also show a new dissolving carrier of neat and practical design

# Monthly Lantern Competition.

LANDSCAPE, WITH OR WITHOUT FIGURES.

## CLASS I.

\* \* Red. = reduction; con. = contact.

1. MARRIOTT, MRS. M. E. (Liverpool).—(1) "Rosscatt, co. Donegal." Red.; Edwards'; hydro. A very fine slide, yet a warmer tone might have been an improvement. (2) "Trees." Red.; Ilford special; hydro. Technically a good slide, but poor artistically.
2. VARDEN, G. E. (London).—(1) "Perivale Church." Con.; Mawson; pyro and amm. Wants at least an inch more mask at the top. (2) "Winter." Ditto. A very beautiful slide.
3. FIRTH, G. F. (Wakefield).—(1) "Summer." Red.; chloride; hydro. Wants clouds, and not pleasing tone. (2) "Winter." Ditto. Another good snow scene.

No. 1.]

ROSSCATT, CO. DONEGAL.

[Mrs. Marriott.

[SILVER MEDAL].

FARMER, H. E. (Loughton).—(1) "Langdale Pikes." Con.; Fry; pyro and amm. carb. A pleasing tone and good sky, but want of sharpness very marked. (2) "Pike o' Stickle." Red.; Alpha; hydro and caust. pot, toned combined bath. A good though little too hard slide spoilt by the tone.

DEAN, S. (Huddersfield).—(1) "Sychnant Pass." Con.; Ilford special; hydro. Well chosen point of view of rather hackneyed spot; slide rather over-exposed, no clean whites. (2) "Above Dwygyfylchi." Ditto. A good slide, pleasing tone, but wants clouds.

SHAW, J. (Manchester).—(1) "Rabagal Mountains." Con.; Mawson; pyro amm. Good slide, a little too heavy. (2) "At Rabagal." Ditto. Not such a pleasing tone as the other, and a little hard.

ELLSWORTH, W. T. (Liverpool).—(1) "Mill, near Barmouth." Con.; England's; hydro. A good slide, but a little too brilliant. (2) "The Old Home." Ditto. Softer and the better of the two.

KENWORTHY, J. W. (Ashton).—(1) "Buar Brae." Con.; Ilford; hydro. A very beautiful slide, but a little too blue. (2) "A Way-side Cottage." Ditto. Very hard and chalky.

GEAR, J. H. (London).—(1) "Eel Bobbing." Red.; Imperial; pyro and amm., uranium toned. A very pleasing tone, though rather hot. (2) "Repose." Ditto. A good slide, but no clear whites.

WALKER, J. (Galashiels).—(1) "Pandy Mill." Con.; Mawson; pyro. By no means the best view of this well known spot, slide a little hard. (2) "Fairy Glen." Ditto. A good slide which shows well on screen.

TIMMINS, C. A. (Runcorn).—(1) "Pleasant Pastimes." Red.; Edwards'; pyro and amm. A little too heavy. (2) "Cottage and figures." Ditto. A well made slide; might have had more sky in it.

PLEWS, F. W. (E. Keswick).—(1) "Bardsey Lane." Con.; Thomas; pyro and amm. A nice little bit, but film stained. (2) "Low Gipton Lane." Ditto. Utterly spoilt by deep yellow staining of film.

DAVIDSON, W. N. L. (London).—(1) "A Kentish Lane." Red.; Ilford special; hydro. soda. (2) "A Kentish Scene." Ditto. Both show careful selection, excellent work, and could be improved by more clouds; those already in are not enough.

STABB, J. (London).—(1) "Windsor." (2) "E. Moulsey Weir." Con.; Mawson; pyro amm. No. 2 a little chalky; 1 a beauty.

## CLASS II.

OWEN, T. W. (Coventry).—(1) "Rushpit." Red.; Paget rapid; hydro and caustic soda. Only wants clouds to make a very good slide. (2) "Coat of Arms Bridge." Con.; Edwards'; pyro and am. Stained and utterly without artistic feeling.

BROWN, J. (Newcastle).—(1) "Gosforth Lake." Con.; Thomas; pyro and amm. A very fine effect, not too clean a slide. (2) "Riverside Musings." Ditto. Very poor.

FARTHING, W. J. (Chirk).—(1) "Shining like Silver through the Shade." (2) "A Welsh Homestead." Red.; Thomas; pyro and am. Two good slides spoilt by over-development.

BENNETT, E. E. (London).—(1) "Bracken and Ferns." (2) "The Rays of Early Morn." Con.; Mawson; pyro and soda. In No. 2 a very fine effect of light. No. 1 is poor.

STEIN, J. (London).—(1) "Two Finger-posts." (2) "Twitch Burning." Red.; Mawson; pyro and am. No. 1 is too black and hard, 2 very fair.

CHILD, C. J. M. (London).—(1) "Sunset." (2) "By the Water-side." Con.; Ilford special; quinol. 1 a good bold effect, but 2 is soot and whitewash.

COULTHURST, S. L. (Manchester).—(1) "Glenoe." (2) "By Stream and Cot." Con.; Paget slow; pyro and am. carb. Two excellent subjects, but so hard and chalky as to spoil their chance completely, and No. 2 wants clouds badly.

HARDING, GEO. (Stourbridge).—(1) "At the Farm Gate." (2) "A Corner of the Meadow." Con.; Ilford ordinary; hydro. Two good subjects spoilt by a hideous "gallery-greenery" tone.

MORGAN, S. DE (Ryde).—(1) "Godshill." (2) "Spring Vale." Con.; Fry's and England's; hydro. Careful work, but both want clouds.

TAYLOR, F. (Grange-over-Sands).—(1) "Odde." (2) "Mundal." Con.; Mawson; quinol. Good slides, but not clean.

WILSON, T. E. C. (Liverpool).—(1) "Harvesting." (2) "The Mill Wheel." Con.; Edwards'; pyro and am. and hydro. Both too hard and chalky.

PEDDIE, A. (Sunderland).—(1) "Drummond Tower." Con.; Thomas; hydro. Too hard and chalky.

ANDREW, W. S. (Bo'ness).—(1) "On the Ellesmere Canal." (2) Ditto. Red.; Ilford special; hydro. No. 1 is decidedly good; 2 very poor and thin.

PITKETHLY, A. (Leith).—(1) "Lamp o' Lothian." (2) "In Kirkton Glen." Red.; Mawson; pyro and am. No. 2 is a good slide a little too hard, and is handicapped by No. 1, which is not good.

Mr. C. D. Taylor, Manchester, sent us two slides insecurely packed, which were received smashed all to pieces.

This, our first Monthly Lantern Competition, has not been so well supported as it should have been, but at the same time there is actually no very bad work.

There is not, we think, any one prevailing fault, if we except that of chalkiness or too much brilliancy. It has, we know, been for long a cry with some that there must be bare glass in a lantern slide. This does not necessarily follow. One or two small bits of bare

glass are allowable, but many operators seem to think that if they can get their slides so that when laid down on white paper nothing but the image can be seen, all's well. This, however, is not so. Too much bare glass, or too many high lights, especially if accompanied by very heavy, dense shadows, such as are obtained by

inequality; that is to say, whereas one slide was perfect both technically and artistically, the companion slide was comparatively a miserable failure. This is especially noticeable with the prize slides, and it is to be regretted that these competitors did not pay a little more attention to this point. Mr. Varden, who takes the Bronze Medal, lost the Silver by this. A little more attention to "Perivale Church," in the shape of a little less chalkiness and a more suitable mask, and he would have come out first.

Monstrosities in tone do not commend themselves to our sober-sided, conservative judges, and bilious, pea-green, grass-green, or claret colour do, we must confess, not look well. On the other hand, black is frequently too heavy, and for our own taste we prefer a warm brown or brown-black, and this is a colour which shows well on a screen; allowing plenty of transparency in the shadows, it is yet rich enough to look well.

With these brief notes we must conclude. We had hoped to have been able to criticise all the slides sent in, but the demands upon our time have been so great that we have found this an impossibility.

## Flashes.

THE last thing out in the lantern—the light.

IT is not wise to take hold of a cracked lime after turning out the light. The lime doesn't mind much, but the operator's fingers do.

NOR is it wise to pack two lantern-slides, with a piece of paper in between, in an envelope or cut down lantern-slide box, and tie a label to the package for the address, and then stick the stamps on the box.

I CALLED on the Editor the other day to help him judge the slides, and he said, "Well, we may as well start; hold that sheet of paper out." I did so, and he just poured out two slides which had been packed like this. I'm no novice at judging or at lantern work, but to judge two slides in about two thousand bits, is beyond me. Besides, the task of fitting the bits together is prejudicial to one's fingers and good temper. Oxygen is apt to explode under such circumstances.

HAVE you been to the Stanley Show? If not, go at once. There are some good things in lanterns, lantern-slides, etc., in the apparatus department, and in shows. Well—didn't I expand and enjoy myself! Hot wasn't it. Whether all cyclists are photographers, or all photographers cyclists, I don't know, but, anyhow, there was a big crush to get in the entertainment hall, which is next door to the photo. section. We've had some good shows too, which reflect great credit on Mr. Herbert Smith, the Secretary of the photo. department.

DOWNSTAIRS, in the body of the hall, my head was in an awful whirl. Everything was round and going on wheels, and the multitude of machines, all exactly like one another to my untutored eyes, and all claiming to be the best in the show, was simply bewildering. Young ladies doing short laps in short skirts, perspiring youths working like the proverbial nigger, and never getting any forwarder, like convicts on a treadmill, and cheered by their pals, whilst all that I could see was a big clock face with funny long hands, with coloured circles at the ends, and then didn't they cheer when one hand got in front of the others, and the man in charge took hold of it and stopped it. Where the fun came in I didn't see, but I suppose the man who took the gate money did though.

I ASKED him how it was worked, and he said, "By gas and wheels sir." Whether he was joking or not I don't know, but there was certainly plenty of gas about, some flaring overhead, some in the tyres, they told me, and my poor ears at least can bear evidence as to the amount of gas expended by the showmen in puffing up their cycles. There should certainly be no lack of gas for inflating the tyres.

I'M no bad hand at passing slides through the lantern. I can show them as quickly as anybody, but at the Hackney Exhibition one lecturer beat the record. Ten slides were passed through in seven seconds, so it is said, and somebody is not satisfied. A lecture which was to have lasted an hour and a quarter, only spun out to three-quarters of an hour.

OXYGEN.

No. 2.]

WINTER.  
[BRONZE MEDAL.]

[G. E. Varden.]

a little under-exposure and a developer strong in bromide, and the subject will look on the screen hard, chalky, and painful.

Another fault is that of blank skies. It is all very well, but no matter how good your slide, if it be a landscape, if it has absolutely a bare glass or a blank sky, it is ruined. Many a comparatively poor

No. 3.]

WINTER.  
[CERTIFICATE.]

[G. F. Firth.]

slide may be quite saved by a suitable sky, particularly with a low horizon, and we strongly recommend our competitors to pay more attention to this part of their slides.

One very noticeable fault with all the slides in the first class was

## Lantern Slides by Reduction.

A SIMPLE APPARATUS FOR MAKING LANTERN SLIDES BY REDUCTION IN THE CAMERA BY ARTIFICIAL LIGHT OR DAYLIGHT.

By E. B. WAIN.

THE apparatus consists of a baseboard, B, 3 ft. 9 in. long, on which is placed the camera, and a box, A, of sufficient dimensions to take the negative which it is desired to reduce.

The baseboard is made of deal, or any suitable timber, 1 in. thick, and is clamped at the ends N N to prevent warping. Two pieces, F F,  $\frac{3}{4}$  in. by 1 in., are fixed by screws on each side, to act as guides

ELEVATION (Scale  $1\frac{1}{2}$  in. to the foot).

for the box A, and so keep it in line when sliding backwards and forwards. A cross-bar, G,  $\frac{3}{4}$  in. square, serves to keep the camera in position.

The box A is made of  $\frac{1}{2}$  in. timber, with two grooves, C and D, the former to take a sheet of ground-glass to diffuse the light, and the latter to take the negative.

Instead of a carrier for smaller sized negative, a second box, A', is used, which is screwed to a block, H, which serves to keep it true in the slides and to raise the plate to the centre line of the lens at the point K.

joiner for a few shillings. The only care required is to keep the slide FF true and parallel, and the centre line K of the lens and the negative in their correct position.

The rising and cross fronts of the camera allow for the necessary adjustment, if only part of the negative is required to be copied. Where, however, the camera is not fitted with a cross front, a little liberty should be left in the width, and so as to allow for side movement.

To use the apparatus the negative and ground glass are placed in their grooves D and C, and the box brought to the proper distance from the lens according to the size of the positive image required on the lantern plate. The fine focussing is then done with the rack screw of the camera, the focussing screen having been carefully marked to show the position of the sensitive plate in the dark slide. The lens is then capped, the focussing cloth loosely thrown over the

box A and the camera, to prevent any rays of light finding their way directly into the lens, except through the negative, the dark slide is fixed in position, cap, etc., withdrawn, and exposure made.

For artificial light, from 6 to 9 in. of magnesium ribbon burned at a distance of 2 in. to 3 in. from the ground-glass gives ample illumination when reducing a full-plate negative to lantern size, using a Thomas's plate. Care must be taken to illuminate the whole surface evenly by burning the two pieces of magnesium on opposite sides of the negative, say, 1 in. from the edge. The exposure given is for a negative of good printing density, and can easily be varied

PLAN OF BASEBOARD.

Any camera or lens may be used, provided the baseboard, B, is made to fit. In the case of the apparatus as illustrated, the camera used is a 5 by 4 studio camera, with portrait lens about 6 in. focus. A carrier to receive the lantern plate is fixed in the dark-slide, J.

As the centre line of the lens exactly coincides with the centre of the negative, D, with a whole-plate negative, both camera and box

for thinner or denser negatives by either using more magnesium, or, in the case of the former, increasing the distance from the ground-glass. The spirit lamp E will be found useful for lighting the illuminant. Focussing can be easily done by means of a paraffin lamp, or gas burner fixed at the back of the negative, and by using a lamp with an opal or ground-glass globe the exposure may be made, but the time of exposure will be increased, and it will hardly be possible to ensure so equal illumination as with the magnesium.

When the focus is once fixed it will be seen that it is quite possible to make any number of slides from any number of negatives without alteration or risk of scratching the negatives, as in contact printing, and it will be found that where the camera allows for sufficient extension, it will be easier to print slides from small negatives in the camera than in the printing frame.

For daylight exposures all that is necessary is to place the apparatus on a suitable support facing a window, but it is not possible to give any exposure time, owing to the variation of the light. As a rule the magnesium exposures will be found most satisfactory. By using the spirit lamp to light the ribbon and a small pair of pliers to hold it, there will be no trouble in working and as magnesium is now so cheap the cost of working will be trifling, an ounce of ribbon being sufficient for some scores of exposures.

Frame for 1/1 Negative.

Frame for  $\frac{1}{2}$  Negative.

are placed in the same line, but where this was not the case, as where a large camera was used, it would be necessary to block up the box, as shown in A'. Of course, with a smaller camera, the block would have to be placed under the camera.

The apparatus can easily be made by any amateur with the most elementary knowledge of carpentry, or would be supplied by any

"The Photographic Record" for November, Elliott & Son's free monthly, comes to hand. Bright and lively as the previous numbers.

## Single Oil Lanterns for Lecture Purposes.

By D. W. NOAKES, GREEN WICH.

THE production of photographs on glass, improvements in the means of illumination, and the production at a really cheap rate of the optical parts, have combined to achieve for the lantern a position as an educational instrument, rather than the toy it was once regarded.

The production of a portable lantern with 4-inch compound condensers and double combination achromatic front for the low sum of from 30s. to 40s., has done much to make the magic lantern more popular than ever.

The "improvement" in cost is not the only one; its portability, its radiant and its optical system combined, make it far and away the superior of the old type phantasmagoria lantern costing treble.

The eighteen-penny toy lantern possesses all the necessary parts, of the most powerful instrument, viz., a radiant, an optical system, and a body to carry them—the difference being in intensity and degree. It will be better, perhaps, to dissect the lantern, and speak of each part separately. In these few remarks to our readers it is impossible to go into the optical problems involved in the construction of lanterns; those wishing (and all should do so) to gain an optical knowledge of the instrument they are working cannot do better than consult Lewis Wright's "Optical Projection" or some other standard work on optics. Space limits our remarks to the use rather than the construction of the instrument here mentioned.

(1) *The Body.*—This, as a rule, in all the cheap forms is made of japanned tin, the only objection being that the heat makes the upper part of the instrument inconveniently warm. This also applies in a stronger degree to "Russian iron" lanterns, the greater body of metal retaining more heat, less being lost by radiation to the surrounding atmosphere. The best body for an instrument, especially where the radiant used is a mineral oil light, is a mahogany body lined with tin, having air spaces between the outer and inner body. The tin body is sometimes described as too weak, but this is not so if the body is properly constructed. With the exception of certain rubbish now in the market, all the cheap form japanned tin lanterns have a stereotyped pattern which is both strong and portable. Attention should be given to the case in which it is contained, as this has to bear all the brunt of ill-usage during transit. In some cases the body part of metal lanterns has been improved by constructing in such a way that the lamp can be lit and adjusted outside the instrument, and then placed in working position without removing the tall chimney. To sum up, then, a japanned tin body is both strong and portable, and we think preferable to Russian iron, but the most comfortable working body, apart from its better appearance, is a mahogany body—tin lined—especially as the cost of the latter does not exceed Russian iron.

(2) *The Optical System.*—The body just described has no work to do in an optical sense, and might be constructed out of an egg box or a biscuit tin; but the optical system has genuine work to do, and upon the quality and construction of the lenses used depends to a large extent the quality of the image projected, although it must also be taken into consideration that the radiant strongly affects both the definition, flatness of the field, and covering power of the lenses used. It would be well to make this point absolutely clear, as we feel it is not generally understood. Take, for instance, a lantern fitted with oil light—we will project a photograph five or six feet in diameter—this being an easy diameter to test—now remove the lamp and use a blow-through jet with the same optical system and the same slide, the improvement in intensity of brilliance is, of course, most marked, and on careful examination a remarkable gain can also be detected in the defining power of the lenses. Substitute the blow-through jet for a mixed gas jet, and still greater improvement follows, showing, without doubt, that the optical system is strongly affected by the radiant used; but this does not destroy the fact that if the optical system is bad no good results can be got; in fact, we have known some optical systems which when limelight instead of oil light is used, their faults have become more flagrant and noticeable. Good optical parts, therefore, are necessary, no matter what radiant is used, and it can be laid down as a pretty general rule that an optical system, giving good results with oil light, would give much better results with limelight, the improvement not being solely greater brilliance in illumination, but also in increased sharpness, flatter field, and greater covering power.

The deduction to be drawn from this is that the optical system can only be judged by the result projected on the screen, and we advise all intending purchasers to see their instruments tested in this way before finally deciding. Another note of warning is also necessary at this point, and that is, no matter how good the optical

system of your instrument may be, do not attempt too large a picture when oil-light is used as the radiant—to a large extent puffy advertisements have led inexperienced lanternists to attempt what others of larger experience would shrink from. It is well to remember a comparatively small but brilliant picture can be seen farther, and by more people, and certainly is much more pleasing than a larger and weaker picture. Light is like butter; if you cover a large area you must put it on thin, like bread and scrape; it is much better to study economy, and make the same piece of bread do for our butter as we have for our cheese, we shall then have something we can enjoy, but enjoyment is out of the question when one is viewing dense photographs projected on a 12 ft. or 14 ft. disc with an oil-light lantern. No matter how many "thousand candle power" the maker may describe it, it is too often forgotten that a 9 ft. disc requires two and a quarter times the light of a 6 ft. disc, and a 12 ft. requires four times as much.

This leads us to the consideration of the radiant, and in single lanterns that most generally used is the mineral-oil lamp. These are known under many names; but as the principles on which all must be constructed to give good results are the same, our remarks will be found to generally apply.

If the lamp is a new one and never had oil in it, take out the wicks and thoroughly dry them—use only the very best oil—and good wicks. Do not slop the oil over the lamp in filling, neither fill it too full, or it will stink in use. Never carry the lamp filled to an exhibition, and always empty it after the exhibition is over. Do not get your oil chilled, cold oil flows slowly. In lighting do not drop charred pieces of match between the wick holders, or you will stop a proper supply of oxygen from reaching the flames. Keep the inside of the chimney clean and free from sooty deposit. Wipe the lamp thoroughly dry before again using; the oil "sweats" out all over it, and when in use the heat evaporates this oil, creating an offensive smell. In a 3-wick lamp the flame of centre wick should be the highest; in a 4-wick lamp the two centre flames should be higher than the two outer flames. If the front glass cracks across, bind it round the edge with paper in the same way as a slide; it will not crack again.

A new lamp has been recently introduced which is apparently giving great satisfaction, and, personally, we have seen some excellent results. The lamp can be obtained from nearly all the dealers, and in purchasing, the extra cost of this lamp is about 12s. or 14s. above the usual pattern, but the extra outlay is economy of the highest grade, as every picture shown by the instrument profits by it.

*General Remarks.*—Having carefully wiped the lenses with a soft chamois leather, light the lamp and allow it to remain for five or ten minutes with the wicks only partially turned up, then turn the wicks up still more, but not to the fullest possible extent; and whilst lamp and lenses are thus being gradually warmed, their respective positions can be adjusted in the following way:—Put a slide in the lantern and focus same on the screen; if racking out, the objective does not focus the picture sharply, pull out the front sliding tube a little way. Having focussed the picture, you now know that the objective is somewhere near its working position. Next take out the slide, and leave only the plain lighted disc on the screen, and then try a few experiments with the lamp. By placing it nearer to, or by drawing it farther from, the condenser, or by turning up one or more, or perhaps all, the wicks, the disc may be much improved. Whilst trying these experiments the wicks will be turned up to their highest limit, without smoking. Having, by experiment, got the most evenly and best lighted disc, the slide can again be introduced and accurately focussed, and the exhibition begun in real earnest. Probably, as the lamp gets hotter, the wicks will need turning down a little; or, in the case of the new pattern lamp, the chimney slightly lengthened by means of the chimney rack, and this remark applies more to a 4 than a 3-wick lamp. Note that no part of the lamp touches the condenser, or perhaps it will crack it; and care must be taken not to tilt up the lantern, or oil may run out of the filling hole. When the show is over, do not take off the chimney with your fingers, or you will get them burnt, nor expose the hot condenser to a cool draught, or it will crack through sudden contraction. Empty the lamp and drain out all the oil possible, and turn the wicks down below the top of the wick-holder; even then the oil will sweat out, and lamp will require wiping next time of using. Do not pack the chamois leather in the lantern case; it will probably get greasy and smear the lenses.

It is better to have a separate box for slides, screen, leather, and other little sundries. The best screen is a nice white wall—or an opaque screen; and best results are got by projecting on to a screen, and not through it. If it is compulsory to show through the screen, make it as transparent as possible by wetting it.

In conclusion, it is well to remember that a high sounding name adds nothing to the practical power of a lantern, and that the true test of efficiency is the result projected on the screen.

## Skies in Lantern-Slides.

By JOHN A. HODGES.

A PHOTOGRAPH showing blank white paper in the place of a sky is now universally and justly condemned, and, indeed, is seldom seen except in the productions of the veriest novice. But if the fault be a glaring one in a print, which is of comparatively small dimensions, how much more so is it likely to be in the case of a lantern-slide when magnified many diameters and projected upon the screen. Yet many amateurs who would hesitate to show a cloudless photograph as a print seem to have no compunction in exhibiting it as a lantern-slide. This is the more surprising because it is in reality an easier matter to put a sky into a lantern-slide than it is to do the same good office for a print. There are several ways in which the work may be carried out, the easiest of which I will first describe. Briefly, it consists in printing a sky on a second plate, which is ultimately bound up with the view, and used instead of an ordinary cover glass. When so working, it is necessary in developing the landscape slide to avoid the slightest veiling or discolouration of the sky portion of the view, therefore the sky portion of the negative should be sufficiently dense to prevent any light passing through it and affecting the plate; if it is thin, the sky must be blocked out with a paint-brush and some opaque pigment. The landscape slide being finished, a suitable sky negative is selected and placed in the reducing camera, and a sky slide obtained. Care must be taken, however, if the lighting of the sky negative is from the same direction as the lighting in the landscape, to place the negative in the carrier *film side out*, otherwise when the slide is bound the lighting of the landscape and the clouds would be different. The method is equally applicable to contact printing, but as a reversed image cannot then be so easily obtained, it becomes necessary to print the sky from a negative lighted from the opposite direction to the view, so that when the two are bound face to face the light may appear to be from the same direction. The landscape portion, as it were, of the sky negative should be shielded with a mask roughly cut to the outline of the trees, buildings, etc., in the view, and kept gently moving during the exposure of the lantern plate. The exposure and development of the sky slide should be adjusted to produce a light delicate slide; photographic skies are very frequently far too heavy and dense, and the same plate or process must be used for both view and sky, so that there may be no appreciable difference between the colour of the sky and that of the view. It will often be found that, notwithstanding all precautions, the cloud-forms come down too low and encroach upon the horizon, or obtrude themselves into objects standing out against the sky. This difficulty, however, is easily overcome by cautiously painting the parts which it is desired to remove with a fine sable brush charged with Howard Farmer's reducing solution, the formula for which is so well known that it is unnecessary to repeat it here. This operation must, of course, be done carefully, and the solution should not be used at full strength. It is well to have a glass of clean water at hand, into which the brush can be dipped and immediately applied to the plate if the solution is found to attack the image too vigorously. After this treatment the plate will require to be thoroughly washed before being dried and bound up.

There is another and extremely simple method of masking which was recently suggested to me by the Editor, and which I find answers well. I do not know with whom it originated, though I recollect having seen it described some time ago. A slide is first made from the landscape negative, and developed, fixed, washed, and dried in the ordinary manner, except that development is pushed until the slide is very dense. This will constitute the mask. A second plate is then to be exposed, but great care must be taken to keep it in exactly the same position in the dark slide as was the first; this is all-important, as by this method it is imperative that the plates should accurately register. In order to ensure correct registration, one side of the rebated recess of the dark slide into which the plate drops should be marked, and if each plate be kept pressed tightly against the marked side, no difficulty from want of registration will occur. After the second plate has been exposed it is removed from the dark slide, but not developed. At the same time the landscape negative is removed from the reducing camera, and replaced by a suitable sky negative. The dark slide is opened, the over-developed slide, now to be used as a mask, carefully placed in position, and upon it the previously exposed plate is superimposed, care being taken to keep both plates in accurate register against the mark previously made on the dark slide. To avoid any chance of mistake, a pencil mark should be made on the plate, after exposing for the view, in order to distinguish the top from the bottom. A second exposure should then be given for the sky. Development is then proceeded with in the ordinary way, view and sky making their appearance together. The method is far more simple than it would appear to be from the description, and certainly infinitely

easier than attempting to block out a sky negative with a cardboard mask, which mode of working, however skilfully done, generally betrays itself. I should have said that it will be necessary to block out any lights, or half tones, on the mask slide with some opaque pigment, otherwise the finished slide would present a curious combination of "negative" and "positive," not, of course, desirable.

It will also be apparent that the method is susceptible of variation and modification in several ways. For instance, a second plate may be exposed for the landscape and developed, and the sky printed on a separate plate with the mask in front, the two being afterwards bound together, the second plate with the sky on it forming the cover glass. It will be noticed that when the mask is used the image is to a certain extent thrown out of focus, but with the extremely thin lantern plates now in use the loss of definition is practically inappreciable, and if the sky negative happens to be very sharp is an advantage rather than otherwise, a softer and more natural appearance in the clouds being produced.

Although in describing this method of working I have referred only to the reduction process, the plan is equally applicable to contact printing.

## A New Idea.

THE "Photographer's Record," Messrs. Elliott and Son's monthly leaflet, makes the following good suggestions for lantern work:—

"The most important point that strikes us in connection with lantern pictures is their shape; the accepted dome and mat shapes are, in our opinion, simply hideous when used for anything but purely scientific subjects, and circles are not very much better. An oblong shape is invariably more pleasing, whether it be rectangular or elliptical. An exception will, of course, occasionally occur, but it will only go to prove the general rule.

"A further source of fatigue to the eyes is the sharp contrast between the brightness of the picture and its black surroundings. A much more harmonious result would be obtained if, instead of using a black mask for the slide, a semi-transparent one were employed; thus we could produce on the screen somewhat the effect of a print mounted on a grey mount. This will, of course, require a little more care and trouble than ordinary lantern-slide making, but, thanks to commercial gelatine lantern plates, the operation of making lantern-slides has become so simple that few will grudge the little further trouble involved in improving on the present crude form that so universally obtains.

"The method we propose is, in printing the lantern-slide, to use an opaque mask exactly the same size as the aperture of the mask that is intended to be mounted with it, so as to prevent any part of the picture showing through the semi-transparent mask when the picture is projected on the screen. Care must be taken, in mounting the slide, to ensure the cut-out part of the mask registering *exactly* with the edges of the picture. An opaque mask with an opening somewhat larger than the opening of a semi-transparent mask should also be used, so as to give a suitable shape to what may be called the mount of the picture.

"As an illustration, suppose it is intended to make a lantern picture measuring 2½ in. by 1½ in. Take an opaque mask with an aperture exactly this size, and place it between the sensitive lantern plate and the negative in the printing frame (if it is intended to make the slide by contact); the mask and the lantern plate should be adjusted so that the picture will be in the middle of the lantern plate. When the slide is developed there will be a clear margin all round the picture. Now if we take a semi-transparent mask with an opening exactly the same size and shape as the opening of mask that was used in printing, it can be easily fixed so that the margins of picture exactly coincide with the cut-out mask. The next operation is to adjust an opaque (black) mask with a larger opening than the transparent mask, say 3 in. by 2 in.; we then have a picture 2½ by 1½, with a semi-transparent margin all round it of a quarter of an inch, and when the picture is projected on the screen the grey margin produces a much more pleasing effect than if the bright picture is in sharp contrast with intense black."

**West Surrey Society.**—The first public lantern evening of the season was held at headquarters on 16th inst. There being no charge for admission, a large muster of friends was recorded, notwithstanding the wet weather. A very fine collection of transparencies was passed through the lantern, explanations being given by Mr. Davison. The slides were contributed by Commander Gladstone, R.N., Messrs. T. W. Bright, H. L. Andrew, Martin, Graham, A. R. Berry, F. W. Berry, J. S. Bond, and others. As was expected, this proved to be the most successful public evening that the society has ever held, and the committee feel so much encouraged that they intend to continue the series of free public evenings at intervals during the winter months. The lantern was kindly lent and worked by Mr. F. W. Berry.

# THE LANTERN

THE essential parts of an optical or projecting lantern consist in a luminant, a condenser, a slide stage, and an objective.

The English method of adapting these to each other has undergone very little modification or improvement for the past twenty or thirty years or more—in fact, the stereotyped design of English magic-lantern is just about what it always was, only there is a little more show about it now. In the best lanterns—that is to say, the most expensive instruments—there is usually an elaborately-polished brass slide-stage with a spring plate, which is always clicking and making a noise when used, and a crowd of brass studs and milled heads, etc. To the inside of this polished brass slide-stage is attached a socket for the condenser, and on the outside are a series of telescopic brass tubes, all beautifully polished and lacquered, for supporting the objective. Now, these telescopic brass tubes ought to be sufficiently rigid at their greatest extension to support the objective in the optic axis of the condenser but the fact that they are very rarely so and that, on the contrary, they are nearly always rickety or dropping, is well known to all lanternists of experience, and this, too, is admitted by the various more or less elaborate mechanical contrivances that have from time to time been introduced to secure the desideratum.

Polished brass fronts are defective or expensive—very often both—and contribute no more light to the screen than an equally well polished brass bedstead would.

That we have adopted a simpler and more efficient slide-stage and objective holder every lanternist will admit, sooner or later. By dispensing with expensive absurdities we have not only increased the efficiency and reduced the weight and bulk, but are able to provide the more perfect optical system, viz.,  $4\frac{1}{2}$  in. triple condenser, interchangeable objectives of various foci, specially constructed for projection, a properly constructed jet holder and jet with mechanical adjustments in every direction (not the unmechanical tin tray and pin which was never known to fit), and all this we can supply for less than half the price of other instruments intended for the same class of work.

Lantern Catalogues, 3 stamps.

101 & 103, Dale Street, Liverpool.

## STOCKS' COMPACTUS LANTERN,

Fitted with his Patent Powerful Oil Lamp, which Mr. J. A. Hodges referred to in an article in THE AMATEUR PHOTOGRAPHER, 28th Oct., 1892.

WONDERFULLY  
COMPACT.

Send for Full  
Particulars.

W. STOCKS, RYE.

## NO MORE TORN PRINTS BY USING FIRTH'S Double Syphon Print Washer.

Only a small stream of water required.

Wholesale: MARION & CO., LONDON; and  
all Dealers.

## JOHN DONE & CO.,

Photographic Printers,

Have the most complete Works for Silver Printing in the Country, and give special attention to Amateurs.

ENLARGEMENTS ON PAPER AND OPAL.

LEWISHAM HOUSE WORKS,  
WOODVILLE RD., NEW BARNET (nr. LONDON).  
Price Lists free on application.

PHOTOGRAPHIC, SCIENTIFIC, AND  
MISCELLANEOUS PROPERTY.—Mr.  
J. C. STEVENS SALKS BY AUCTION of Miscellaneous  
Property of every description take place nearly every  
FRIDAY. Lists for Catalogues should be sent at least  
a week before the sale.—86, King Street, Covent  
Garden, London, W.C.

## Gelatino-Chloride Paper.

BY "ENTERPRISE."

My experience with gelatino-chloride printing paper has been somewhat varied, having worked with various brands and numerous formulae.

I started some two years since with "Celerotype," using the ordinary toning (borax) bath, did fairly well with it, but found much difficulty in mounting them. For some time I abandoned its use, but when the Ilford P.O.P. came into the market, and hearing such good reports on it, I was induced again to try it. I worked this very successfully for some time, toning with the sulpho-cyanide bath, until the supply was stopped for the laying of new machinery.

Whilst anxiously waiting the re-issue of my then favourite paper, I tried a few packets of Jacoby's, got fair tones, but generally impure whites, and it has apparently too much gelatine on its surface, which renders it more difficult to mount. When P.O.P. was again on the market I had a supply, but found it not identical in working to that I had previously—two faults, viz. :—(1) The purple colour to which it prints does not redden enough in the preliminary washing, which is detrimental in watching the tone; you think you have a grand tone, but when putting into the fixing bath you are grieved to see this turn to a sickly yellow colour. While I admire the colour for first proofs, yet it is a drawback for toning. (2) The film of gelatine partially and wholly leaving its support during washing manipulations. I took all the usual care with waters of nearly even temperature—alum bath, salt and water after toning, etc.—but in spite of all precaution I could not avoid blisters. At this stage I felt almost defeated in the use of gelatino-chloride paper. Now the Eastman paper was the last I resolved to try, though my first experience with this was not altogether satisfactory, viz., for want of a suitable toning bath, the sulpho-cyanide bath resulted in patchy toning, the borax too blue and flat, the combined bath impure whites and unstable action, and doubt as to its permanency. About this time Mr. Welford's carbonate bath formula appeared in your journal, which I thought would be a rather expensive one, especially when I read it "won't keep," nevertheless I resolved to try it, but made up the formula with double the amount of water given. This I found toned plenty fast enough. Having only a small batch, I ventured to try the experiment of "keeping." I have toned ten or twelve batches of prints with same bath since, only replenishing by adding a small quantity of gold about five minutes before use, and this is the last tone it yielded (print enclosed; Editor, please note), which is of a rich purple blue which is very pleasing.

This is not the only tone that can be obtained; warmer tones, and even the blue-black tones can be obtained. I do not know how long this bath will work; its only objection now is the colour of its bulk, which is of a deep claret, and is a little detrimental in watching the stage of toning. I intend now of using the old bath as a part bulk for a new one.

With regard to gelatino-chloride paper, I think the photographer has in his hand an article which suits his every requirement for general work. He can finish with ease as with ordinary albumen paper, or with a glass-like surface, or with a beautiful matt surface, almost resembling platinotypes; he can suit the finish as his subject requires.

A word or two as to my method of working, and I have done, viz. Having the batch I intend to tone in my left hand, and my porcelain dish filled with water in front of me. I proceed. Taking the prints separately by the corner, I place them in the dish (face down), holding each one under water for about one second until I have all in. By this time it will be time to throw away the first washing water; then give five or six more changes of about four or five minutes each, then tone, return to the same water again, then use alum bath, rinse well again in water, then fix in hypo three ounces to one pint of water for twelve or fifteen minutes, then frequently change the water from fifteen to twenty times for four or five hours. As a mountant I like a gelatine mountant in preference to starch. All prints should be quite dry before proceeding to trim and mount. For backing the glaze-surface ones, I prefer a heavier paper than the waterproof paper usually sold for the purpose; say ordinary note or cartridge paper. I squeegee the print on to "enamel plate" or "matt opal," as the finish is required in their rough sizes. When partially dry put on the backing papers about one-eighth of an inch smaller than the prints, allow to dry, when they will fall off, or strip easily; trim and mount. If prints are for frames, "cut-out" mount with picture pasted behind looks well. I find the Eastman "Solio" paper the hardest surface I have as yet tried.

To mount, place the print face down on a clean piece of paper (newspaper, or old journals will do, providing they are some months old and the printing is well dry), place the thumb and two fingers firmly on the centre of the print to avoid any slipping, first paste the edges well, then remove the fingers to one end a little in order

for the centre to be pasted; avoid using too much mountant, and that same is free from grit of any sort; take gently by the edges, place in position on mount, place a sheet of non-fluff blotting paper on the face of it, well rub on mount with the hand. If you find any part of the edge of print not in contact, moisten a pad of cotton wool and rub down. I think if any of my brethren wishes to try gelatino-chloride paper, and follow above directions, he will be pretty successful with it.

## A New Process for Photo-Dyeing.

BY A. VILLAIN.

At one of the last meetings of La Société d'Etude, while experiments in photo-dyeing were being made under the eyes of the members, M. Villain passed in review all the known different processes which give coloured photographic prints by the medium of dyes. He spoke of the process by imbibition, and of the processes of Kopp, Philippe, Willis, Green, Feer, etc., and called attention to the little stability to light of certain prints obtained by these processes. He mentioned M. Philippe, who in his patent admitted "that the only perils to be feared were the emanations and the acid contacts, as under this action the sub-chromates of chrome and copper tend to deoxidation and to the forming of greenish salts; aniline black and the subsalt of violaniline in slowly absorbing the acid also become green, and the general appearance of the prints becomes disagreeably darker." As to the processes using dye-woods, and the derivations of aniline, such as fuchsine, eosine, violet-methyl, etc., their want of stability is well known. The great objection to the primuline process of Mr. Green is that it always gives yellow backgrounds and false tints. Mr. Feer has avoided these tinted backgrounds and has obtained shades more solid to the light and not running in the washing. After having spoken of the processes with the salts of iron, or uranium, etc., M. Villain gave the following description of his process:—

I took for a basis the experiments of Kopp, but this process may be nevertheless recognised as new, as certain products date only from a few years, some even from a few months. I use as the sensitive salt bichromate of ammonia, to which I add some metavanadate of ammonia, a salt which gives me a more energetic mordant. I steep a sheet of paper or a piece of tissue in a solution composed as follows:—

Water	...	...	...	...	1,000 c.c.
Bichromate of ammonia...	...	...	...	...	50 gram.
Metavanadate of ammonia	...	...	...	...	5 "

I allow to dry at a low temperature and away from all white light. I afterwards expose under a negative, and after an exposure which varies according to the nature of the negative and the condition of the light, I withdraw my print, when all the details appear clearly defined. I then thoroughly rinse so as to completely eliminate all traces of the non-fixed chrome salt. In this state the print may be dried and preserved, and it will suffice to steep it in warm water when dyeing is to be performed. I place the well-rinsed print in the dyeing bath, which I bring to a boil, which temperature it is necessary to maintain from ten to fifteen minutes. I thoroughly rinse, and if the whites are not entirely pure I pass my print in a warm bath of carbonate of soda or in a cold bath of chloride of lime, to which a few drops of chlorhydric acid have been added. I again thoroughly rinse and the print is finished. The colouring products used are for the most part derived from anthracene, and you will pardon me if I only designate them by their common names, as most of them consist, in chemical terms, of at least from twenty-four to twenty-seven letters, as, for example: the dioxyanthraquinone-quinoline, or alizarine blue S.

These products are, therefore: artificial alizarine; propurpurine; alizarine blue S.; alizarine black S.; alizarine black R.; galloflavine; purpurine; anthracene blue; alizarine orange; ceruleine S.; galatine; alizarine green; alizarine yellow; alizarine maroon, etc.

All these products may be mixed and thus give a very varied scale of shades. All the tints thus obtained offer very great resistance to the action of the light, of the alkalis and of the acids. These different products only becoming fixed in the parts in which is found some fixed mordant, and according to its concentration, it follows that the portions not impressed by the action of the light will yield whites unless impure products have been used, or some errors committed, either of having neglected to fill the frames in red light, or of not having waited for the complete elimination of the non-fixed chrome salt. But these prints offering great resistance to the chemical actions, we may, by steeping them when finished in a solution of chloride of lime, succeed in obtaining perfect whites. The quality of the tissues, and especially of the papers, has a great influence as these products are also fixed by the action of the mordant of aluminum of iron, of copper, and other metallic pro-

ducts, and give different tints. It was in this matter that I was enabled to obtain with paper loaded with aluminum and chrome, two different tints with alizarine black. In the places where the light had converted the chrome salt into a mordant I obtained black, and in the places not so affected a pinkish-grey. I advise also not to dry the paper or the tissue impregnated with the chrome salt at a temperature higher than 25 deg. Centigrade, as at 30 deg. transformation already begins and shows itself by colouring the whites and fogging, so to speak, the image.

The applications of this process may prove to be very numerous, and I hope to arrive at a rapidly fixing enough mordant to obtain prints by enlargement, and not only screens but veritable hangings. The cost is not very great, as for three or four francs it is possible to dye from ten to twelve kilos of tissue or paper, which represents about from 1,500 to 2,000 prints, 13 by 18 centimetres. The experiment made with photo-dyeing has demonstrated the simplicity of this process and the correctness of the above.—*L'Amateur Photographe*.

## Apparatus.

### THE BLACKFRIARS ALBUM.

The Blackfriars Photographic and Sensitising Company are placing a capital album on the market. The one sent us has places for four quarter-plate prints on each sheet, and the prints

are slipped into their places, not stuck in, thus obviating any chance of spoiling the surface of the prints from the mountant, or of soiling the mounts. Another advantage too is that prints may be easily removed and fresh ones put in their place.

## Catalogues.

MESSRS. WILLIAMS AND NORGATE, 14, HENRIETTA STREET, COVENT GARDEN, have sent us a very complete and useful catalogue of foreign works on mathematics, astronomy, photography, physics, optics, technology, etc., which will be found extremely useful to all book buyers and librarians.

## Review.

*A Scamper through the States.* Published by the Polytechnic, 14, Langham Place, W. Price 1s.

The Poly, as it is usually called, has organised a trip to Chicago, and this work forms a handbook to the World's Fair, 1893. It is well compiled and will be found very useful, and being illustrated with over 120 illustrations, is well worth getting. The Poly trips to Chicago and back are worth looking after too; twenty-five guineas inclusive is not dear.

## Holiday Resorts and Photographic Haunts.

### TO ARCADIA WITH A CAMERA.—V.

BY LIEUT. G. HARVEY.

SINGLETON is a picturesque village in a valley of the South Downs. It has its railway station (London, Brighton, and South Coast Railway), and boasts six trains per diem. I would advise the camera man to make his head-quarters at this place, unless he be prepared to make his bed in a haystack with his camera for his pillow, as once outside this parish nothing short of a miracle will find you safely housed when night casts his mantle over the earth. There are many pretty cottages and views to tempt the photographer, and if studies of farm life be in request, then these can be had *ad lib*. Notice the tower of the church, which is very old. The reredos of alabaster is certainly worthy of a plate, for simple though it be it is extremely effective as a work of art. Also give the interior (as a whole) a plate. The pulpit is in a most singular position, approached through a rood-loft gallery, and will be an interesting souvenir. Levin Down (558 ft.,  $\frac{3}{4}$  m. N.E.) is a hill worth climbing; and if the photographer cares to mount the opposite hill (1 m. E.), he will obtain a fine view of this very striking eminence. Seen from that, Levin Down exhibits a most effective profile, and makes a bold picture. I do not advise a visit to West Dean unless one is in quest of a symphony in stucco, but if he be so desirous, a walk of three-quarters of a mile will take him to West Dean church, where he will be able to satisfy his hunger. One of the bells is dated 1901—rather a stretch of imagination on the part of the caster! I photographed it for the sake of curiosity. I thought if I died before that date it would be a sore puzzle to the next generation. At Cocking descend into the valley of the Rother. The scenery along the top of the Downs for seven miles E. and W. of Cocking is very grand—unequalled in the South of England, the inhabitants tell me, and I do not doubt them. It is a thousand pities that accommodation is so very difficult to obtain here. Personally, I should have been in a sorry plight had I not remembered a military man who had a house here. Do not then come here with the idea of finding rooms, because you won't get them. Conveyances are also at a discount, and the roads execrable. On the hill above Treyford are five large barrows which deserve a visit, not only for their own sakes, but for the views obtainable therefrom. A walk or ride on horseback (if the latter, be sure and carry films) from Beacon Hill, near Treyford on the west to Duncton Beacon on the east, a good nine miles, affords a glorious panorama, changing at every mile. The road is barely passable, but do not let that detain you. Boots are not scarce, and such a series of beautiful landscapes are not to be found everywhere. At Verdley Coppice there once existed (1 m. E. of road) a hunting tower, mentioned here by the name of Verdley Castle. The pathway to the site is a good one, but, unfortunately, very difficult to find—much less to describe. It lies 150 yards south-west of the letter S, in the word "Survey," on the new Ordnance map, amid woodland scenery of great beauty. The local Goths utilised the remains of the tower for mending the roads of the neighbourhood. Fine view from Henley Hill adjoining Verdley. Two miles west of Henley Hill, near a place called Pigeon Hill, there is one of the most magnificent views in England. Fernhurst ("the wood abounding with ferns") is a charming place. Shulbrede Priory lies 2 m. north-west. It was an Augustinian Priory, founded early in the thirteenth century by Sir Ralph de Arderne, but is now the property of the Earl of Egmont, and is used as a dairy and cottage. The Priors' room is still an interesting feature, and on the walls are various rude paintings and legends of more than one date. Notice the royal arms. They are more modern, seemingly temp. James I. The women adjoining are in Elizabethan costume. You can gain access if you apply. Two miles east of Sussex Bells, from the top of Black Down, a most magnificent expanse of country is visible. The late Lord Tennyson had a house here. The view to the east includes Beachey Head.

### BRIXTON AND CLAPHAM CAMERA CLUB.

THE work exhibited by the members of this club, which is only about three years old, is certainly of high standard. The exhibition was opened by Dr. Reynolds (the President) in a few well-chosen words. In No. 5, "A King's Pyon," Mr. C. F. Palmer has a pretty bit, but printed far too heavily; 18, "Stormy Weather," by W. Thomas, is a fine effect, but still a little too black to be true; 31, "Old Mill, Cassiobury," by C. F. Palmer, is again a pleasing little bit, and 37, "In Cool Waters," by J. H. Edwards, is simply spoilt by the absence of clouds; 40, 41, and 42, Exeter Cathedral interiors, by H. H. Willoughby, are really good work. C. F. Archer, in 53 to 57, shows that it is not necessary to travel far afield to find artistic bits, the Crays supplying him with good material. 65, "Ely," by T. Buck, is noticeable from its drunken architecture; 70, "Grindewald," by F. Goldby, is a fine bit of work. We really had to wonder why 83 was hung; it is neither artistic nor curious, being merely a common bath-room. In 92 Mr. F. Goldby deservedly takes the bronze medal with another of his Swiss scenes. In 96, "Clouds," J. H. Edwards makes a bold attempt, and 152, by the same worker, is worth noting. Nos. 149 to 154, Zulu scenes, by J. H. Edwards, again have special ethnological interest. In 160, F. W. Grant has two good studies, though a little black. 174, by W. Thomas, is almost Robinsonian in style, and the frames 183, 184, and 185, by the same worker, are excellent little shots, beautifully printed. 193, "While the City Sleeps," by R. G. F. Kidson, is a bold attempt, but not quite true in tone; 196, T. J. Bartrop's study of Sty Barrow Crag, is good; 232, "Eynesford," by C. F. Palmer, merely wants clouds to be a good thing. In Enlargements, C. F. Archer takes silver medal with a very nice soft result, 257, "Interested;" and F. Goldby runs him hard with a bronze medal for 271, "Via Mala." There was a small exhibition of apparatus by Marion and Co., Soho Square, including the Radial hand-camera, the Perfection camera, and specimens of work done on their well-known plates. Messrs. Hill Bros. show Cresco-Fylma, and Mr. Butler, a member, shows some capital stereo slides.

### THE HACKNEY PHOTOGRAPHIC SOCIETY.

In our last issue we noticed the novelties exhibited in the apparatus division, and we shall now deal with the pictures.

The appearance of the exhibition as a whole was exceedingly attractive, and the executive certainly deserved great praise for the admirable manner in which they had done their work. The bright colours of the flags and banners above the pictures was, however, a little distracting to people of quiet tastes, and rather tended to divert attention from the pictures themselves.

Dealing first with the work of members of the Society, we found in Class A, "For pictures taken since the last exhibition," no less than seventy-five pictures entered. Mr. Houghton's prize went to J. Carpenter for two very pretty flower studies, "Cornflowers" and "Cypripediums;" W. L. Barker taking Mr. Potter's prize with No. 65, "Returning;" the silver medal going to S. J. Beckett for No. 16, "Sunrise on the Fjords," a heavy-looking print of an unpleasant

brick-red colour. W. Fenton Jones (Hon. Secretary) showed several pleasing views of Manxland. W. L. Barker had a very delicately treated landscape, called "Iford Bridge," which surely must have escaped the judge's attention. In Class B, S. H. Barton took the silver medal with what we consider the best picture exhibited, No. 97, "Loch Long," but his companion picture, "Evening," was rather heavy. The bronze medal went to W. Wesson for "Yachting on the Bure." J. O. Grant is to be complimented for No. 96, "Winter;" the leafless trees and the foggy atmospheric effect, at this season so familiar, have been well rendered. W. Hensler took the silver medal in Class C, "Pictures taken at club outings," for 113, "Eynesford," a delicate silver print; but we liked No. 112, by the same exhibitor, even better. The bronze medal went to J. O. Grant for No. 136, "At the Zoo." In Class D, "Portraiture and genre," there were some good portraits, notably one of Captain Abney, by Robert Beckett. G. Hankins took the silver medal for 193, "Wood Nymphs," a charming little quarter-plate study in platinum. The bronze went to S. J. Beckett for an enlargement, "A Group of Laplanders." The lantern slides at the time of our visit were in the hands of the judges, so that we cannot offer any criticism upon them. The awards were as follows:—Class E, medals presented by the *Hand-Camera and Lantern Review*, silver, W. P. Dando; bronze, S. J. Beckett. In the next class, "Hand-camera work," medals presented by *Photography*, we had some difficulty in inspecting the exhibits, owing to their being squeezed up into the corner of an alcove. There was, however, some very good work shown. W. P. Dando took the silver, and G. Hankins the bronze. In Class G, "Animal life," J. O. Grant took the silver, and S. H. Barton the bronze, the former for an effective sheep study on rough bromide, and the latter for 239, "A Collie's Head." We are glad to note that there are some stereoscopic workers in the Hackney Society, and some clever ones too. T. Horne Redwood took the silver, and W. L. Barker the bronze. F. Houghton's slides were too red in tone.

Turning to the open classes, we found in Class K some well-known exhibitors represented. There were, as usual, several pictures entered which had previously received distinction, although the rules distinctly barred such work. The gold medal was withheld, presumably on account of the paucity of the exhibits, there being only fifteen competitors. The silver was awarded to F. Seyton Scott for 296, "Kew Gardens," a beautiful picture with a subtle effect of atmosphere not often seen in a photograph. A landscape, No. 335, by C. B. Lewis, was bracketed equal with 296, but from an artistic point of view was far inferior. J. E. Austin took a bronze medal for "Harvest-time." Mr. Horsley Hinton has, we consider, been rather badly treated. We cannot understand why such pictures as "Lowland Solitude" and "In April" should have been overlooked. "Winter's Requiem" we liked less; the sky appeared to overpower the landscape, and the water should, we think, have been more in sympathy with the heavy laden atmosphere. In Class L the silver was withheld, and equal bronze awarded to 311, "Dat's my Gal." L. Sawyer; 361, "A Hindoo Merchant," S. N. Bhedwar; and 311 "News of Battle," R. Terras. J. W. Evans, we noticed, showed a picture which has been previously medalled in one of our own competitions. The awards in the lantern-slide class were as follows:—Silver, J. E. Austin; bronze, J. Carpenter and A. Brooker; J. H. Spencer also took a bronze for stereo slides.

The Hackney Society is to be congratulated on possessing so many working members, who have so well supported the efforts of the Committee to make the show a success by sending in their work for competition. Notwithstanding the inclemency of the weather, the attendance has been large, and the exhibition will probably prove as great a success financially as it has been in other respects.

**Gosport.**—A well-attended meeting was held on the 15th inst., when the President (Rev. L. J. Matthews, O.F.) delivered the opening address. In the course of his remarks, which were illustrated by the lantern, he ably portrayed the advantages offered by the society to its members in the many branches of the art, and hoped that it would long continue to serve so good a purpose. At the close of the address there was an exhibition of members' slides by the aid of the limelight. Among the exhibitors were the Rev. L. J. Matthews, Messrs. A. Fisher, H. Fisher, S. W. F. Morrish, W. Missebrook, and C. R. Wright (Hon. Sec.). The rules, as drafted by the council, were unanimously adopted. The next meeting will be held on December 6th, when Mr. T. E. Williams will give a demonstration in flash-light photography. Five new members were ballotted for at a subsequent council meeting, and duly elected.

**Greenock (Camera Club).**—On the 17th inst. Mr. H. M. Smith, of the Eastman Co., gave a most interesting and instructive lecture on "Solio Paper" to members, professionals, and friends. He also toned several prints in the sulphocyanide bath with first-class results, showing that this bath could be used equally as well as the combined bath.

## Societies' Notes.

**BRISTOL CAMERA SOCIETY** have elected the following officers for the ensuing twelve months: President, Mr. C. Bryant; Council, Messrs. J. H. Brock, W. T. Crank, H. J. B. Davies, M. E. Dunscombe, G. A. Evans, E. Jakeways; Hon. Secretary, M. W. Dunscombe; Hon. Treasurer, G. L. Wood. Meetings held the second and fourth Thursdays in each month at 10, St. Augustine's Parade.

A SOCIETY has been formed at Woolwich, known as the Woolwich Photographic Society, with its headquarters at the St. John's School. The President is the Rev. S. E. Chettoe, M.A.; and the members of the council include Dr. T. Maxwell, B.A., Rev. J. A. Drummond, B.A., Messrs. W. H. Dawson, P. Hobson, J. B. Panting, and E. G. Kimber. The Hon. Secretary is Mr. H. H. Barker, 244, Burrage Road, Plumstead. Meetings are held the second and fourth Thursdays in each month.

As regards its membership, the Glasgow and West of Scotland Amateur Photographic Association is increasing by "leaps and bounds." At the opening meeting of the present session no fewer than five-and-twenty new members were added to the roll, and other thirty candidates are entered for election at next meeting. There are already about 250 members in the association, and if the same rate of increase continues during the session, Mr. President Taylor will have abundant excuse for being a "prood, prood man."

MR. A. F. PENRAVEN, of 10, St. Matthew's Street, has been elected Hon. Secretary of the Ipswich Photographic Society, vice Mr. Hill, resigned.

**OXFORD UNIVERSITY PHOTOGRAPHIC CLUB.**—The next and last meeting of the term will be held in Merton College on Monday, November 28th, at 8 p.m. Mr. J. L. Myres, B.A., Magdalen College, will exhibit slides from photographs taken in Greece. All communications should be addressed, A. Eglington, Hon. Secretary, Oxford University Club, Lincoln College, Oxford.

THE Amateurs of Walsall have decided to form a photographic society. Mr. E. A. Day, of St. Paul's Terrace, Hon. Secretary *pro tem.*, will be glad to receive the names of any ladies or gentlemen desirous of becoming members.

A PHOTOGRAPHIC CLUB has been formed called the Tyneside Geographical Camera Club, with the headquarters at the Geographical Institute, Barras Bridge, Newcastle, and Mr. Alfred Harding as Hon. Secretary.

THE Hackney Photographic Society are to be congratulated, as at the Stanley Show they carry off no less than one gold, one silver, and one bronze medal, besides three diplomas. Well done, Hackney! Hackneyed work will soon become a synonym for the best.

## Societies' Meetings.

**Aberdeenshire.**—The exhibits of the first competitive exhibition were arranged in the Society's rooms at 35a, Union Street, and the display of amateur work was decidedly good. The "Hanging Committee" have done their work exceedingly well, and the public—to whom the exhibition was open—did not fail to be most favourably impressed with the excellent collection which had been got together. A few of the workers have been unable (from various circumstances) to contribute to the exhibition, but those who have done so have certainly put their best foot foremost; and a number of the figure studies and scenes and portraits are of exceptional interest, both as regards artistic treatment and technical execution. The prints have been judged by Messrs. Ewing and Morgan, the well-known city photographers, whose awards are as follows:—Class 1 (half-plate landscapes), silver medal, L. M. Gibb, Victoria Street; bronze medal, E. L. Brown, 2, Esslemont Avenue; highly commended, E. L. Brown, 2, Esslemont Avenue; commended, L. M. Gibb, Victoria Street. Class 2 (whole-plate landscapes), silver medal, J. Milne, Devanha Terrace; bronze medal, W. Gibson, London; highly commended, W. Gibson, London; commended, J. Milne, Devanha Terrace. Class 3 (portraiture and figure study), silver medal, J. Milne; bronze medal, W. Gibson, London; highly commended, J. Milne; commended, E. L. Brown, 2, Esslemont Avenue. Class 4 (seascape and river scenery), silver medal, J. Milne; bronze medal, W. A. Hawse, Gilcomston Park; highly commended, W. A. Hawse, Gilcomston

Park; commended, W. T. Moffatt, Beaconsfield Place. Class 6 (enlargements), silver medal, W. Moffatt, 7, Queen's Gardens; bronze medal, W. Ramsay, Dyce; highly commended, J. Milne, Devanha Terrace; commended, J. Anderson, Culter. Class 7 (hand-camera work), bronze medal, E. T. Smith. The magic-lantern slides, of which there is a very creditable collection, have been submitted to Mr. Charles Wilson photographer, whose awards will speedily be forthcoming.

**Aston (Nat. Hist.)**—On the 17th inst. a most entertaining lantern exhibition was given. A large hall was used, and its seating capacity of 300 was well tested, and but for the foggy weather would have been crowded. The subject was dealt with by Mr. Townsend, of the society, who gave his experiences of a photographic trip in the Channel Isles. The slides were exceedingly good, and well merit the rounds of applause that greeted many of them. Mr. Tylar also put through the lantern some of his now famous Swiss views, while other exhibitors were the President, Mr. J. W. Neville, who showed some magnificent hand-painted natural history slides of his own production; Mr. Casson, jun., and Mr. Priddin. Eight new members were enrolled, principally for the photographic branch, and the next meeting of the photographic section will take place on Thursday, December 1st, 1892.

**Birmingham (Photographers' Union).**—At a meeting held on 11th inst. Mr. S. Delicate gave a most interesting demonstration on "Lantern Slide Making," which was greatly appreciated by a large audience. Next Friday there will be an exhibition of members' slides, and those who are interested in photography are invited to attend. The society is rapidly increasing in numbers.

**Blackheath (Camera Club).**—An ordinary meeting was held on the 15th inst., Mr. G. S. Criswick being in the chair. A demonstration on "Lantern Slide Development" was given by Mr. J. T. Field (Vice-President). The demonstrator commenced by remarking that in order to make a good lantern slide you must first obtain a good negative, as it is useless expecting to get good slides from bad negatives. He printed and developed a few slides, using various brands of plates and the following developer:—(a) Hydroquinone, 160 gr.; metabisulphite soda, 90 gr.; potassium bromide, 20 gr.; water, 20 oz. (b) Soda hydrate, 160 gr.; water, 20 oz. (c) Soda carb., 2 oz.; potassium carb., 2 oz.; water, 20 oz. Equal parts of a and b to produce slides with black tones, and equal parts of a and c for warm tones, with prolonged exposure, the proportions being modified according to time of exposure of slide, density or colour of negative, etc. He used an Autocrat printing frame, and exposed by opening door of dark-lamp, and holding frame at a distance of one foot from gas-flame. He pointed out that by exposing in this manner you can dispense with the back of printing frame, as no light can fall on back of slide, and this is a great advantage when it is necessary to screen the light from any portion of the negative, as by looking through the back of the slide you can see exactly where the shadow of the screen falls. The fixing bath used contained 4 oz. of hypo and 1 oz. of soda bisulphate to 25 oz. of water, and was perfectly clear though it had been in use for some weeks. He recommended the use of a clearing bath for lantern slides, especially when hard water had to be used for the other operations, the one he used himself being Edwards'. At a previous meeting of the club, Mr. Field had said that he was in the habit of developing isochromatic plates by yellow light, and to prove this he brought an exposed instantaneous isochromatic plate to the meeting, and developed it by the light of the club dark-lantern. This is a large gas-lantern with front and two sides, formed with two thicknesses of yellow medium, the front having a light area of about 2 feet by 18 inches, and sloping forwards so as to throw the light down on to the developing dish, which was placed directly in front of the lamp and within a distance of three feet, thus forming a very severe test. The plate was developed, and proved to be a perfect negative without a trace of fog, though it had been once or twice held close up to the lamp for examination. This seems to prove that a deep ruby light, which is very unpleasant to work by, is not necessary for these plates; but, of course, care must be taken to prevent an undue amount of light from falling upon the plate before it is covered with the developer. There is much more danger of fogging the plate while transferring it from the slide to the dish and pouring on the developer, than there is afterwards when the image has made its appearance. In this case the developer used was hydroquinone, which when fresh has only a very slightly non-actinic tint. With pyro and ammonia the plate would naturally be much more effectually protected.

**Brixton.**—Exhibition opened by Dr. J. Reynolds, F.R.P.S., who gave a short address. Lecture by C. W. Hastings. Friday: slides by F. Goldby, a member, on "A Tour in Switzerland." Slides specially made for occasion. Interesting demonstration of Cresco-Fylma, Saturday: competition and other slides. Lantern operated by B. E. Pinder, Lanternist of Club. Large attendances each evening. Silver medal for direct prints awarded to W. Thomas (1838 and 84).

**Cardiff.**—At the weekly meeting on the 18th inst., before a full

attendance, a number of hand-cameras were on exhibition, including the Surprise, Allen's, Kitchin's, Loman's Reflex, Anschutz, Itakit, Swinden and Earp, Ross, Key, and Pollack's patent. A large number of prints taken by some of these cameras were passed round, including a collection of instantaneous athletic photographs by Mr. Kitchin. This gentleman's home-made camera is a marvel of ingenuity, every movement being provided for, horizontal and vertical swing from exact plane of the plate, and provision is also made for a focussing reflector. The size of plate,  $6\frac{1}{2}$  by  $4\frac{1}{2}$ , makes the instrument rather bulky, but the results obtained, considering the difficulties to be encountered, were really marvellous. At the close of the meeting a few slides illustrating the British navy, ancient and modern, were passed through the lantern.

**Carlisle.**—The AMATEUR PHOTOGRAPHER Prize Slides were exhibited here on the 11th inst., and were much admired by a very large audience. The landscape series and the figure studies of Mrs. Clarke received the most applause, but the Silver Medal pictures in the architectural section were also admired. Altogether they are a very fine lot, and are much appreciated by the amateurs of this district.

**Croydon (Camera Club).**—Lantern night 21st inst. There was a good attendance. The members present who showed slides were Messrs. B. Gay Wilkinson, C. Bray, H. Griffiths, H. E. Neeves, H. Maclean, A. Hirst, G. Corden, and A. E. Isaac (the last named being in charge of the lantern).

**Croydon (Micro. and Nat. Hist. Phot. Soc.).**—On 18th inst. a large and appreciative audience assembled to hear Mr. John Weir-Brown give an account of the Photographic Convention of last July, which he attended as a delegate. A large collection of views taken by himself and other members of the Convention during the various excursions were shown on the screen. Particularly noticeable were some fine architectural slides of Melrose Abbey, Abbotsford, and St. Andrew's, and a series of hand-camera shots of fisher life in the little village of Newhaven.

**Derby.**—The second meeting of the winter session was held on 18th inst., Mr. G. Walker in the chair. Mr. S. S. Watkinson read a paper, entitled "Photography and the Amateur Photographer." The author, in his opening remarks, disclaimed any intention to stand before the meeting as an authority on photography. The awkwardness of his position that evening was intensified by the fact that he had to speak before gentlemen who were recognised masters of the art, and if photographic stature were taken into account he was afraid they would require a powerful lens to discover him. The claims of photography, from an artistic point of view, were then considered. Some artists considered the death knell of fine art was sounded when the first photograph was produced, and that it was impossible to get true artistic results by means of such a mechanical science. In answer to this the lecturer said that an ounce of proof was worth a ton of assertion, for the holders of palette and brush who practised the art of photography acknowledged their indebtedness to it, also that artists were often to be seen buying photographs of farm-yard studies and broken pieces of foreground which are to be seen in shop windows. It was hardly fair to compare photography with painting; the latter was thousands of years old, while photography was still in knickerbockers, and photographers have every reason to believe—for there were many indications of it—that photography was on the eve of a greater development in the solving of the problem photography in natural colours. The lecture, which was much appreciated, led to a considerable amount of discussion at its close. Mr. Watkinson also passed round a number of pictures printed by various processes, those in platinotype being admired as giving the most artistic results.

**Eastbourne.**—An ordinary meeting was held on 16th inst.; the Rev. H. G. Jameson (the President) occupied the chair. In an interesting paper on "Enlargements," Mr. Hollway said that not every photograph was improved by enlargement. This remark applied to very many of the things they took in their hand-cameras. Charming little bits of woodland, many foreground things, very attractive when taken in as a whole and looked at as direct prints, looked somewhat clumsy and distorted if enlarged two or three diameters. He did not altogether profess to understand the reason for this, but he suspected that it was just one of those things where the operator's individuality came into play, and he was led to accept or reject a certain effect according to his impression of what might be satisfying to his aesthetic sense. Be that as it may, it was certain that to make a thoroughly good enlargement of some small picture which they had seen in nature in its natural size was a source of great enjoyment, and to his mind was likely to give more real pleasure than the long-looked-for photograph in colours—when they got it. In a really good enlargement it was possible to get all the important qualities of a direct picture, minus, of course, the extreme definition. Whether the slight loss of this quality militated seriously against the general effect was one of those questions which everyone must decide for himself or herself. For his part he thought it did not. It

seemed to him that what one lost in that respect was more than compensated for by a breadth and harmony of effect which a small picture might show, but which was more likely to be wanting. Mr. Hollway, by way of demonstrating the process he subsequently described, made two enlargements from quarter-plate negatives to 12 by 10, using magnesium ribbon and a lantern made by himself, with the result that he produced two remarkably good pictures.

**Elizabethan (Photographic Society).**—A lantern-slide exhibition was given on the 17th inst. The hall was well filled. A small charge was made for admission, and the amount thus realised will be devoted to the liquidation of the cost of a lantern which the society has purchased. The lantern was manipulated admirably by Mr. Lambert Matthews. The photographs of the views shown were the work of members of the society, and in the majority of cases the slides were also made by members. The gentlemen whose work was exhibited were the Rev. D. W. Barrett (Rector), Messrs. Medland, Lambert Matthews, Baddeley, Imray, Birt Acres, A. Kemp, Herbert Milne, T. Samuels, and W. Ottaway, and excellent work it was. Arrangements have been made for members of the society to meet during the coming winter for practical illustrations of and experiments in photography.

**Hereford.**—An ordinary meeting was held on the 15th inst. Mr. Leo Richards, Aylestone Hill, was elected a member. Mr. Alfred Watkins gave a practical demonstration on "Platinum and other matt-surface printing." He explained the method of obtaining a matt surface on gelatine-chloride prints, and then demonstrated the method of salting and sensitising drawing paper, and of toning the image when printed with platinum. Some large prints, the negatives of which were taken with a pinhole aperture, no lens being used, were shown. The Platinotype printing process was demonstrated, and prints developed by both the hot and cold bath process. Mr. Watkins also exhibited Dallmeyer's new Tele-photographic lens. The Hon. Sec. read a letter from Mr. Davies saying that, owing to an appointment he had received, he was compelled to resign his office of assistant hon. sec. The resignation was received with great regret. It was agreed to hold an extraordinary meeting on December 13th for the purpose of testing lantern slides made by the members.

**Holborn (Camera).**—On November 18th, Mr. H. Thompson in the chair, Mr. J. H. Avery gave a lecture and demonstration on "Development." The subject of development was one which the photographic worker must thoroughly master. How many amateurs knew how to develop a plate properly. It was the stumbling block. What he wanted to prove that night was that in development, treated in a rational manner, they had at their disposal the means of producing in the negative something like the image they had seen on the focussing screen. Mr. Avery gave a few hints on the developing agents and on the different classes of subjects, and in conclusion said he could give no definite method of development. Every plate required its separate development according to the different conditions under which the plate was exposed and what they required in the resulting negative. Mr. Avery developed a number of negatives and a large transparency.

**Kensington and Bayswater.**—A meeting was held on the 21st inst. The President (the Hon. L. M. St. Clair) presided. A most interesting lantern lecture was given by Mr. C. Dixon on "Holland House." The slides were taken from negatives made by the lecturer nineteen years ago by the wet-plate process. Their brilliancy compared very favourably with the more modern gelatine negatives. Mr. Dixon gave a most complete description and history not only of the place itself, but also of its generations of inhabitants.

**Oxford.**—The prize slides of a contemporary for 1892 were shown on the 17th inst. As this Society was very early on the list this year, the slides were consequently in excellent condition. A few slides might have been omitted with advantage, but they were chiefly very good, there being some charming bits among them. The American sets were well to the front in every respect. It should be mentioned for the guidance of secretaries that there are about two dozen of the best slides on quarter-plate size, so that a carrier should be ready for these.

**Lewisham.**—On November 18th, Mr. B. Davidson, in his paper on "Hand Camera Work," said that photographers who would not think of using with their ordinary cameras a lens that did not cost less than £5, would often buy a hand-camera in which the value of the lens was about 2s. 6d. at the most, and yet they used it for the most difficult work, and expected good results. For some kinds of work, such as land and sea scapes, nothing could beat the single combination, but the doublet was by far the best to have, being a thorough all-round tool, and could be used at a much larger aperture, which was absolutely necessary for some subjects and light. For some time he had been using a Zeiss, made by Ross, with the best results, as proof of which, numerous lantern slides were shown of the Zoo, Scilly, and the Channel Islands, etc., the detail in the rock scenery being well defined. When first taking up the hand-

camera, he had one with fixed focus, but found it of very little use. To develop, it was advisable in some cases, with very short exposures, to commence with a small amount of pyro and ammonia, with gradual additions. He generally did about four plates at a time, as they very often took upwards of an hour, and if a rocker is used they could be left to themselves for a time. When Amidol is better understood, he thought it would be found the best developer for snap shops. A hand-camera should not be used on a stand unless absolutely necessary—some workers even giving exposures up to three seconds by placing the camera on the knee—but he thought it was always advisable to carry a light tripod ready for those occasions.

**Newcastle.**—On the 14th inst. the occupation of the new home in the Central Exchange Art Gallery, Newcastle, was inaugurated by giving an exhibition of lantern slides by limelight. This took place in the new concert hall, where a large number of people had gathered. The exhibition was extremely interesting. There was a constant succession of pictures for more than an hour, and all of them were very beautiful. There were many local views, the river scenes and the scenes taken in the slums being particularly good. There were several sea views, among them being some very beautiful sunrise, sunset, and moonlight effects. The views of local country places were all delightful, and the photographs of flowers were exquisitely pretty. The hall proved admirable for the purpose, and the exhibition was one of the most successful which the association has held.

**Phot. Soc. of Ireland.**—The ordinary meeting was held on the 11th inst., Mr. Geo. Mansfield, J.P., President, in the chair. The President delivered his annual address, in the course of which he reviewed the various improvements which had taken place in the different branches of the photographic art during the last twelve months. After the address a discussion on matters of photographic interest was introduced by Mr. Ruthven, who advocated the setting apart of certain evenings during the session for similar discussions, with the object of encouraging beginners in the art to bring their difficulties before the members for elucidation and advice. Mr. Ruthven's remarks led to a very animated discussion, in which most of those present took part, and so interesting did the debate prove that it was adjourned till next meeting.

**Preston.**—The AMATEUR PHOTOGRAPHER Prize Slides were exhibited on the 18th inst. before a large audience, and gave general satisfaction. Instrumental and vocal music was given at intervals.

**Richmond.**—At the meeting on the 7th inst. the first lantern show of the season took place, when a very large number of slides were projected on the screen, among them an interesting series of Ceylon scenery and customs by Mr. S. D. Gibson. Messrs. Alabaster, Ardaseer, Harris, Hunter, Davis, Perry, Ramsay, Baron, and others also showed some of their latest productions. On the 14th inst. Mr. F. P. Cembrano, jun., in the chair, the paper announced for the evening had to be postponed, as Mr. Ennis was unable to be present. Mr. Faulkner showed two prints on platinum new paper, which had been exposed to damp. One had been developed with glycerine in the developer; it turned partly red on development, but this redness, as well as some parts of the image, had disappeared on fixation. The other print, in the development of which the glycerine had been omitted, was of good quality, the deepest shadows being of a good rich black. Both pieces of paper, before exposure and development, had had the same opportunity of

getting spoilt by moisture, and he could therefore not account for the great difference in the results. Mr. Ardaseer suggested that the piece that had become bad must have been outside the roll, and had therefore protected the second piece inside. Mr. Green wanted to know the simplest way of reducing whole-plate to lantern size. Mr. Williams said he attached his camera to a baseboard, at the end of which he placed a box with an aperture in it to carry the negative to be reduced. The space between the negative and the camera he covered with a black cloth. To obtain the best results reducing should be done by daylight. Mr. Davis had tried Mr. E. G. Richardson's system of using various strands of magnesium, and although he had burnt as much as eight pieces, each one eight inches long, the transparencies were much under-exposed. The amount of smoke produced was so great that he had to clear out of his dark-room after each exposure. Mr. Cembrano said that with all its uncertainty daylight was the best, as with artificial light it was difficult to obtain evenness in the lighting. For those that had no time during the day, he would recommend using smaller plates and making slides therefrom by contact.

**Wakefield.**—On 16th inst. the members of the above Society had a decided treat in listening to a most interesting lecture on the cold-bath platinotype process, which was delivered before a well-attended meeting by Mr. Buchanan Wollaston, of the Platinotype Company, London. The lecturer gave full details of the process, from ordering the paper to producing the finished prints, introducing valuable hints of his own for overcoming the various difficulties which beset the path of not only the printer in platinotype but in all other processes. His remarks were in most cases illustrated by practical demonstration, and during the course of the evening he developed prints of unequal density by the various means at the command of every operator, dodging under and over exposure and other defects caused by the negatives, and in every case producing well-balanced and beautiful prints in the most masterly manner. A number of beautifully-finished specimens of the process were then handed round for the inspection of the members, which were greatly admired.

#### SOCIETIES' FIXTURES.

- Nov. 24.—LIVERPOOL (A.P.A.).—"A Glimpse of Rome in 1892," Mr. J. S. Brown.  
 " 24.—OLDHAM.—"The History of a Lantern Slide." Demonstrator: Mr. J. W. Wade.  
 " 28.—RICHMOND.—Annual Dinner at the "Grehound" Hotel, 7 p.m.  
 " 28.—NEWCASTLE-ON-TYNE.—H. P. Robinson's "Picture-Making by Photography," Mr. C. W. Hastings.  
 " 28.—GLOUCESTERSHIRE.—"Theory of Isochromatic Photography," Mr. G. Embrey.  
 " 28.—SOUTH MANCHESTER.—"Norway and its Fjords," Mr. J. W. Kenworthy.  
 " 28.—CAMERA CLUB.—"Lenses," continued of lectures on "Elementary Photography," Mr. Lyonel Clark.  
 " 29.—HACKNEY.—Open Night.  
 " 29.—BLACKHEATH.—"Enlarging," Mr. A. R. Dresser.  
 " 30.—WAKEFIELD.—Development.  
 " 30.—DERBY.—"Hand-Cameras and Shutters," Captain Abney.

#### To Correspondents.

All communications for these columns are to be addressed to **The Editor, "Amateur Photographer," 1, Creed Lane, Ludgate Hill, London, E.C.**

##### RULES.

1. Write clearly and distinctly on one side of the paper only.
2. Write each Query or Answer on a separate sheet of paper.
3. Write the name and address legibly on the back of each communication, and sign all Queries and Answers with name or *nom de plume*.
4. All matters for these columns MUST be received by TUESDAY MORNING'S POST.
5. The Editor does not undertake to answer questions by post.
6. In answering Queries, correspondents are requested to mention, in every instance the number and full title of the query referred to.

#### QUERIES.

5870. **Lantern Slides by Reduction.**—Wanted, the distance between half-plate negative and lens, and lens and lantern plate. Focus of lens,  $\frac{3}{4}$  inches.—FEN DOCTOR.

5871. **Multum in Parvo Camera.**—Will someone who has used this up to 15 by 12 state with what results?—FEN DOCTOR.

5872. **Diameter and Focal Length of Lens.**—Will anyone please tell me what diameter and focal length of lens must be for a camera which takes a 12 by 10 plate and has an extension of 80 inches? I should also be glad to know the rule which governs the diameter and focal length of lens for plates of any size.—H. B. S.

5873. **Composition for Graph.**—Can anyone tell me how to make the composition which is used in the various copying graphs?—QUERIST.

5874. **Printing in Clouds.**—How can I print in clouds when enlarging with Lancaster's enlarging apparatus?—QUERIST.

5875. **Acid Alum Fixing Bath.**—What harm can come of using the acid alum fixing bath given in AMATEUR PHOTOGRAPHER for negatives and bromide paper? It has the great advantage of hardening the film and so preventing it from injury in after processes, but I fear it might affect bromide paper so as to cause fading. Would it? I can never make it without getting sulphur deposited. Could it be modified to prevent this?—QUERIST.

5876. **Convex Glasses for Crystoleum Painting.**—Will someone kindly give me one or two addresses of good wholesale firms where these can be procured?—R. T. W.

5877. **Photo Prints Suitable for Crystoleum Painting.**—Where can these be bought? Are there any houses in London where good German photo prints can be got?—R. T. W.

5878. **Plate Numbers.**—Would any of your readers

kindly inform me whether the sensitometer number placed by manufacturers on their plate boxes is only approximate, or can be relied on in estimating exposures? For instance, according to Bothamley's book, Iford ordinary marked 18 require exactly twice the exposure of special rapid marked 24, while according to the Cadett tables in Abney's instruction, the exposure should be four times.—R. C. LONG.

5879. **Enlarging Lantern.**—Have just commenced lantern-slide making, and am anxious for information as to whether a good enlarging lantern, such as the Optimus, is equally useful as the ordinary lantern for exhibiting slides, both in large and small rooms (of course, the bulk considered apart), as, if there were no serious drawback, I should prefer the enlarging apparatus, so as to be able to enlarge from my quarter and half plate negatives.—R. C. L.

5880. **Speed of Shutter.**—Should be glad of information as to the speed of my Kodak shutter, No. 3 Kodak Junior, just the ordinary as bought from the makers, and then the other three catches by which one cannot increase the tension. I have also a half-plate lens, called the iris shutter, of foreign and unnamed make, of which I should like to know the speed.—R. C. L.

5881. **Dark-Slides.**—Does anyone know if the double dark-slides used with Lancaster's "Merveilleux" camera are capable of being used without any alteration with Le Meritoire camera?—IN STATU PUPILLARI.

5882. **Shutter.**—Will some kind reader kindly tell me of a good shutter for a hand-camera I am making, say about 10s. or 12s., for time and instantaneous not the pneumatic ball arrangement?—X.

5883. **Enlarging.**—(1) Will anyone tell me where I can procure tables for enlarging with Lancaster's Multum-in-Parvo and my own camera? (2) Can I use this with artificial light, and if so, which is the best to use, gas or paraffin, and is there any way of using them without a lantern? I do not possess one, and they seem very expensive.—MANFIELD.

5884. **Film Slide.**—Can any reader inform me of a suitable dark-slide for a Major Bruno hand-camera for cut films only?—B.

5885. **Flash-Light, etc.**—Can anyone tell me of a small book giving instructions how to photograph by flash-light and magnesium lamps?—IN STATU PUPILLARI.

Correspondents not seeing their queries inserted are requested to look for the same under "Editorial."

### QUERIES UNANSWERED

Oct. 28th.—No. 5849.

Nov. 14th.—Nos. 5850, 5851, 5852, 5854, 5856, 5857.

" 11th.—Nos. 5859, 5860, 5862, 5863, 5865.

" 18th.—Nos. 5866, 5867, 5868, 5869.

### ANSWERS.

5861. **Loan of Negatives.**—The writer will be pleased to loan "Trefoil" say half a dozen whole-plate negatives of Irish scenery, if the gentleman or lady will forward stamps to cover parcel post.—JNO MCMURDO, Bessielee Cottage, Bellshill.

### EDITORIAL.

**SPECIAL NOTICE.**—We are very pleased to find that replies in this column are so much appreciated, but we should be very grateful if those requiring advice would send their letters to us before TUESDAY MORNING'S post if possible. The time occupied in replying in this column is very considerable, and owing to the often late receipt of letters, many matters have to be left over each week. This we much regret.—ED. AM. PHOT.

R. T. W.—Many thanks, but it has almost gone entirely out of fashion.

L. F. R.—Your queries are inadmissible. Wood's washer is a good one, and you will find Edward's, England's, Fitch's, or Obermeyer films easily managed, just as glass plates, and all are to be had in 7½ by 5 size.

M. HAFEN.—We do not see that you want a better lens than your 3½ in., but if so we should choose No. 6 of 4 in. focus. Thanks for note, reprinting out.

F. H. JOSELYNE.—As soon as your print which is with the others on loan, comes back, we will try and find and criticise. Try with the rocking-horse, but do not print so deep. It often occurs that clouds opposite the sun are obtained, especially in the afternoon.

MORA.—T. Haddon, 2, Maitland Street, Edinburgh, sells Vitreographine, a special ink for diagram slides. Baird also sells ground glass which can be written on and then varnished for same purpose. We will try and get article written.

B. PUCKLE.—Your slide was accidentally put in the competition. We should say that the negative was one with harsh contrasts, the slides over-exposed, and as a picture very poor.

ASHTON.—We will communicate with makers, and write you.

G. B. W.—We do not know the lenses named, and the statement that the other lenses you name are as good as you could buy anywhere is not one that receives our support, because it is impossible to speak generally in that fashion of any lens-makers, particularly those in question.

J. THOMAS.—Yes, we shall always be pleased to develop some plates for you if you send full particulars as to make, subject, time of day, light, and exposure. Mark on the outside of packet "Unexposed plates."

FEN DOCTOR.—Yes, we shall be pleased to lend you 150 to 200 slides, free of charge, provided you pay carriage both ways.

T. A. SUMMERS SCOTT.—Print will be retained for next Figure Study.

TEPIDUS.—Many thanks for letter and sample.

J. ROBSON.—Many thanks for the trouble you took in binding slides.

T. BLIXRUDE (Christiana).—Barnard's varnish colours most decidedly.

M. AUGUSTUS.—We fail to see how you can use your flash lamps without getting false and cross lights—because you must burn your wire or flash your flash behind the camera, and opposite therefore to the lighting from the E. window. Our method would be to use one of Edwards's medium isochromatic films, backed and exposed on a dull day when the light was behind the camera, that is in the afternoon. The ghost is a troublesome thing to overcome, but could be got over by trying different lenses, no doubt.

D. W. F. M.—(1) Printed too black; surely the streaks are admissible, does it not suggest a ghost in a very suitable place. (2) Good. (3) Better. (4) Printed too deep. (5) Ditto. (6) Ditto. Shade the top of this while printing. (7) Printed too deep. (8) Over-toned, you have a good model; try a scene from "Faust" or the "Fair Penitent." The accessories in your print are poor, and out of keeping with so graceful a pose, and why should the model look at that curious bit of wood on the wall? The tone is good, but nearly all are printed too deep. Do not burnish. Pack a negative safely and send us, and

we will print one for you to show to what depth to print. Can you call and see us by appointment?

HYDROKINONE.—The fault is not in the lens, but is due to over-exposure for the distance, at least this is what we understand from your letter, or do you mean that you cannot get clear lantern slides from negatives of distant views?

H. HOLT.—Nobody has won a clasp yet. Try again; go in for rough-surface printings, and try for the lantern slides.

J. W. WESTERN.—(1) Too much pyro and bromide in developer. You will find in our issues of Sept. 9th and 30th, a paper on harmonising harsh negatives which process should be applied to this. (2) Ditto. (3) Would stand reducing slightly, and then intensifying. Have you not been using hydrokinone, if so, this accounts for the harsh contrasts at once. (4) Intensify. (5) See note to 1. (6) Ditto. (7) Intensify with mercury and ammonia. (8) Intensify with Monckhoven's silver cyanide. (9) Intensify mercury and ammonia. (10) Intensify mercury and sulphite. (11) Treat as suggested for No. 1. (12) Good. Negatives ready for you on Saturday morning.

LIMELIGHT.—Yes, we should recommend the Scott saturator, and as a rule the slides never stop in the lantern long enough to get damaged. We should have a 40 ft. bottle. You would not really require more than 24 ft., but it is just as well to be on the safe side.

CALDER.—Shall be pleased to criticise prints, and return same to you.

ALPHA.—(1) The fault is in the paper, not in your manipulations. (2) To make the gold solution neutral, add about ten grains of bicarbonate of soda to every grain of gold immediately before mixing your bath. Add the same to the sulphocyanide bath. (3) Your query is inadmissible, but we believe the apparatus to be well made and capable of turning out good work.

A. M.—We do not know anything about the paper, but have written for some.

H. H.—The "Optimus" will do all the work and more besides. Get rid of the other lens.

R. H. M.—Many thanks for letter and enclosures duly to hand. We have not got the number you ask for, but will see if we can get it.

W. N. WHITTARD.—The usual way is for competitors to write on entry form, "Winner of bronze or silver medal."

J. C. M. (Germany).—Always glad to help you. (1) The peculiar positive appearance of the image when viewed at a certain angle is merely due to the total reflection of the light from the silver particles forming the image, and may be totally disregarded. (2) We should and do prefer to use 25 c.c. of C, and 35 c.c. of D, without any water this is quite weak enough, your developer is too weak to suit our taste. We have not found any difficulty in getting density in a reasonable time, in fact the general cry is that the fault is that the films are prone to give too much density. (3) Aqueous solution of shellac is considered the best varnish. Try adding strong ammonia to white hard varnish till it becomes clear. (4) There is no work on platinum printing, except "Die Platinotypie," by Hubl, and for the carbon process "Der Kohleindruck," by Liesegang. The Autotype Company also issue the A B C to Carbon Printing, price 2s. 6d. The platinotype paper will keep in its calcium tube, but the carbon tissue will only keep fourteen days when sensitised. You could buy it and sensitize it yourself by floating on solution of bichromate of potash. (5) Pleased to see your prints. No, they need not be mounted. Never mind the number of questions, we will always answer as many and as often as you like to ask.

B. B. B.—Rapid plates are better, but the exposure will depend solely upon the light, etc., which we cannot gauge. The extra rapid plates are, we believe, three times as rapid as the ordinary. We will try and find your print, and criticise.

EMERALD NO. 2.—(1) Dip your slide into ferrous sulphate solution 2. There is no chance of the image fading. (8) Prussian blue is formed with the ferrid-cyanide. We hope to publish paper on Mezzotype next week, but, alas! we have not green tones yet. These could be got by the carbon process.

L. D. A.—(1) Good, slightly over-printed, and wants trimming down. Some bipeds are not above following the example of your cat and dog. We notice both have rather a tendency to cast suspicious sheep's eyes. (2) Very fair, though you were a little too far off, and there is a suspicion of flare in the centre of this. (3) Very poor, over-printed, absolutely without any interest beyond the white blouse which immediately catches the eye. (4) As a likeness this is good, as we are not unacquainted with the sitter by sight. The accessories are not happy, but it is worth retouching if you think it wants it—we don't. (5) Good again, might be printed a little deeper. (6) Fair; it would be as well to spot out the white flowers by the sitter's face, so as to throw the latter more into relief. (7) You were a great deal too far off. Wants intensifying, we should say, and print is over-toned. (8) Ditto.

H.—Your print wants clouds, and is, we are afraid, hardly artistic enough to score. Nitric acid, with an equal quantity of water, is the best thing to clean dishes, and should be used with a brush.

ERA.—We place direct into the fixing-bath. We are not quite sure that the change of tone is tonin as it occurs even on drying. We are looking into the question, however. We hope to publish a paper next week on it. The print you send is very good though we should have liked just a trifle deeper printing.

PUNJABI.—You might send us up some negatives if you like. (A) Flat and wanting in distance. (B) Negative wants intensifying, over-toned. (C) Over-toned. Can you not call on us?

HIDE.—(1) There is only one fault, and that is your horizon is at an angle of about 25 deg. In England it is usual for water to find its own level, and not rise up. (2) Very fair, slightly over-printed. (3) You might have slewed your camera round a little more, and not arranged your tree so as to grow out of the top of the fountain. (4) Over-exposed and spoilt by halation. (5) Flat and over-exposed. This looks far better when taken a little way up, with an afternoon light.

## Sale and Exchange.

### RULES.

**CHARGE.**—Twelve words or less for Fourpence. Every additional three words, one penny. The name and address of the sender must be paid for. (A single figure, or group of figures undivided by letter, space, stop, or words, counts as one word; compound words count as two words.)

**DEPOSITS.**—The money for goods forwarded on approval may be deposited with the Publishers of the AMATEUR PHOTOGRAPHER, who will hold the amounts deposited until they are satisfied that the transaction has been completed to the satisfaction of buyer and seller.

**ADVERTISEMENTS** can be inserted under a number, the name and address being registered, and letters forwarded for a fee of 8d. to cover postage.

**PAYMENTS** should be made in Postal Orders or Postage Stamps.

**ADDRESS.**—All advertisements (which can be received up to Tuesday mid-day) and other communications having reference to the "Sale and Exchange" column, must be addressed "Sale and Exchange, AMATEUR PHOTOGRAPHER, 1, Creed Lane, London, E.C."

**COMMISSION.**—A charge of 2½ per cent. will be deducted from all deposits whether a sale is effected or not. Minimum charge 1s.

**PAYMENT.**—All payments are to be by cheques or Postal Orders, made payable to Hazell, Watson, and Viney, Ltd., 1, Creed Lane, London, E.C.

**CARRIAGE** must be paid on all apparatus sent for report, and they will be returned carriage forward.

**REPORTING.**—Apparatus may be sent to the EDITOR, AMATEUR PHOTOGRAPHER, 1, Creed Lane, London, E.C., who will report upon the apparatus to the buyer for a minimum fee of 2s. 6d., or a commission of 2½ per cent., upon the sale price of the apparatus.

**Cameras, Lenses, etc.**—Will exchange Rayment's patent whole-plate camera and three double slides, good as new, for microscope by good maker, stereoscopic camera, or will sell; can submit to Editor's inspection; also Swift's whole-plate rapid Paragon lens with iris diaphragm.—No. 354, office of this paper, 1, Creed Lane, E.C.

10 by 8 double extension portable bellows camera, all movements, one double brass-bound book slide, take £4; R.R. lens for same, £2 10s., or £6 lot. Half-plate square leather bellows camera, all movements, three best double book slides, folding stand, very best make, take £4. Quarter hand-camera for use on stand, fitted with 5 by 4 eyepiece lens and three double book slides, finder, and shutter, and stand complete, £2 5s.—G. A. Knight, Claremont Road, Seaford, SUSSEX.

**Hand-Cameras, etc.**—Optimus hand-camera, rectilinear lens, two finders, three double dark slides, 3 guineas, cost 6; open to exchange.—Clemence, 80, Bath Road, Bedford Park, Chiswick.

Stirn's waistcoat detective camera, in good condition, 12s. 6d.—Mitchell, 99, Commercial Road, Ipswich.

Griffiths' camera, detective, excellent single lens, three slides, pneumatic instantaneous shutter, perfect order, cost 27s., sell for 16s.—Owen, Croesor, near Penrhynendrach.

**Lanterns, etc.**—Splendid single limelight lantern, £18, complete for £8; pair best mixed gas jets, 34s.—Waldron, Chemist, Hanley.

**Lantern Slides.**—Lantern slides of views, seascapes, portraits, etc.; 6d. each.—Tickery, 5, Vrinceas Buildings, Bath.

**Lenses, etc.**—Lancaster's Instantograph lens

quarter-plate, and shutter for sale, £1.—Culmer, 75, Lichfield Road, Bow, E.

Lancaster's half Instantograph lens and shutter, 14s.—Kean, 14, Queen Street, Darlington.

Cabinet portrait lens by Ross, rack and pinion adjustment (no stops or flange), 40s.—H. M., 111, Shakespear Road, Herne Hill, S.E.

**Negatives.**—First-class negatives, specially selected as guides for amateurs, showing retouching, etc., result of 40 years' professional experience, 6 for 1s. 3d., free.—Richford, Wells, Norfolk.

**Sets.**—Extraordinary bargain. Watson's latest pattern whole-plate Acme camera, turntable top, with Watson's three-fold tripod, fitted with Ross's rapid symmetrical lens with iris diaphragm, the lot cost over £23 net, sacrifice for £5.—Address, G. Brunner, 12, Stanley Street, Southsea.

For sale, quarter-plate Lancaster's Instantograph, good lens, three double dark slides, instantaneous shutter, folding legs, 30s.—Tuckfield, Halstead, Essex.

Half-plate Optimus camera, 7 by 5 R.R. lens, tripod, and one slide, £5 5s.—Arthur, 10, Dunsford Villas, Merton Road, Wandsworth.

Lancaster's quarter-plate Instantograph, including camera, lens, iris stops, two double slides, tripod in leather case, bag for camera, perfect, 40s.; also quarter-plate set by Watson, camera, lens, one double slide, strong tripod, complete with box for camera, in good condition except slide, price 20s.—S. Williams, Secretary L.E.C.C.C., 38, Silver Street, Leicester.

Marion's Student's 5 by 4 camera, lens, stand, two double slides, two printing frames, set of dishes, including special made leather case, all for 40s.—Sergt.-Major Jones, Army Service Corps, Devonport.

**Stereoscopic Apparatus.**—Stereo hand-camera, very compact, splendid lenses by Underwood, iris stops, four double backs, price 40s.—T. H. Bishop, Lake Street, Leighton, Beds.

**Sundries.**—Mitre cutting machine, scarcely used, 10s. 6d.—St. Lucy's Cottage, Kingsholm, Gloucester.

For sale, first 13 vols. of AMATEUR PHOTOGRAPHER, ten bound, also first ten holiday numbers, the lot £3.—C. P., 24, Hazlett Road, West Kensington.

Solid leather tripod case, waterproof canvas case for quarter kit, new, half price.—Edwards, 8, Mapesbury Road, N.W.

Eastman's half-plate rollholder, 21s.; Tyler-Pickard exposure meter, 4s.; tripod, three-fold, 6 in., 13s. 6d.; ditto, two-fold, 8s.—Waldron, Chemist, Hanley.

Dark-room lamp by Bishop, as new, also 11 in. burnisher by Adams, exchange for short-focus lens, or sell 25s.—White, Poplars, Sutton-on-Trent, Newark.

## WANTED.

**Hand-Cameras, etc.**—Wanted, Talmer or Underwood's Sphinx quarter-plate hand-camera; exchange microscope by Swift, cost 70s., and little cash.—Turnall, King Street, Stroud, Glos.

**Lantern Slides.**—Wanted, slides of Yorkshire, North Wales, Derbyshire, Isle of Man; will give slides in exchange.—Allen, 2, Pymont, Barber Road, Shafton.

**Loan of Negatives.**—Wanted, loan of negatives suitable for making lantern slides by contact, interesting subjects. Description and terms, Thomson, Lang Street, Tetbury.

**Prints.**—Wanted, a few prints to illustrate the geology of the chalk district, cliffs, ravines, quarries, etc.—Newburn, Beach-terrace, Widnes.

**Sets.**—Wanted, half-plate outfit in exchange for good violinist's outfit.—Goddard, 9, Trafalgar Street, Ashton-under-Lyne.

Wanted, half-plate outfit, good maker, will exchange 1-3rd h.p. steam engine, no boiler, small dynamo and frictional electric machine, 4 cels, Bunsen, and some sundries.—E. H., 44, Wandle Road, Upper Tooting.

**Sundries.**—Wanted, AMATEUR PHOTOGRAPHER, vol. 7.—W. Thacker and Co., 87, Newgate Street, E.C.

**Lanterns! Lanterns!! Lanterns!!!** Slides!! Slides!!! The largest and most varied selection in the whole kingdom. Before selecting elsewhere, call and inspect the stock of the City Sale and Exchange, 54, Lime Street, Leadenhall Street, City, where we have no hesitation in saying you will find all that you require in this way. Lanterns for sale, lanterns lent on hire, lanterns sold on commission, or taken in exchange for other apparatus. Write for special supplemental lists, Manager, City Sale and Exchange, as above.

**Magic Lanterns and Slides.**—Walter Tyler's Helioscopic is perfection of all lanterns, supplied to Indian Government, School Boards, science

classes, clergy, and exhibitors throughout the world. Impossible to have lanterns give better definition or more satisfactory results; specially constructed lenses, which no other lantern possesses.—Walter Tyler, 48, Waterloo Road, London.

**Walter Tyler's Best Triples and Bi-unials** are unsurpassed, and perfect in every detail. Good bi-unials, mahogany bodied, brass fronts, and all improvements, £7 10s.; single lantern, with 4 in. condensers, portrait front lens, 4-wick lamp, complete, in case, 27s. 6d.—Walter Tyler, 48, Waterloo Road, London.

**Lantern Lenses.**—Specially constructed. Walter Tyler's new Helioscopic portrait combination lantern lens gives the most perfect definition and brilliancy, can be fitted to any lantern, and for excellence cannot be surpassed. No other maker has this lens, which is manufactured expressly for Walter Tyler, 48, Waterloo Road, London.

**Regulators and Gauges.**—Great reduction, in price. Either can now be had of Walter Tyler for 14s. each. The largest stock of gas cylinders in England. Best seamless steel, tested and valved, and all sizes at very low prices.

**Slides from Negatives and Pictures.**—Walter Tyler manufactures and colours slides on the premises, thus ensuring speedy delivery, and prices are most moderate.—Walter Tyler, 48, Waterloo Road, London.

**Bi-unial Lanterns.**—If you are in want of a really good bi-unial lantern, perfect in every respect, call and see Walter Tyler's entire brass fronted, mahogany-bodied, lined with Russian iron, and fitted with new best quality lenses, and sold at a most moderate price. The top lantern will take a 4-wick lamp. These are great bargains.—Walter Tyler, 48, Waterloo Road, London.

**Hire Department** is now perfect. Largest and best collection of slides in the world; over 200,000 always in stock. Temperance, travels, Scripture, educational, comic, tales, etc. Cheaper than any other house, no extra charge for coloured slides or effects. Special terms for large quantities.—Walter Tyler, 48, Waterloo Road, London.

**Lanterns and Slides.**—If you wish to hire, purchase, or exchange, you cannot possibly do better than go to Walter Tyler, who makes this business a speciality, and you will thus save dealer's and all intermediate profits.—Walter Tyler, 48, Waterloo Road, London.

**Second-hand Lanterns and Slides** at very moderate prices, also all kinds of apparatus. Send for large catalogue, 420 pages, with instructions for working lanterns of all kinds, and costing an immense sum to produce, sent free for 6 stamps. Small catalogue and second-hand list, post free.—Walter Tyler, 48, Waterloo Road, London.

**Bijou Enlarging Lanterns.**—Finest results with Hughes's patent rectangular condensers, half the size of ordinary make, superior definition, proper diffusion of light; scientifically constructed, not commercial; several whole and half-plate for sale, cheap.

**The Marvellous Pamphengos.**—Finest oil-lighted lantern, equals limelight, stood the test of over fourteen years against all imitations, elegant solid brass fronts, best lenses, from £2 10s. each.

**Magic Lanterns, Magic Lanterns.**—Largest assortment in the world, cheapest and best, nicely japanned lantern body, 4 in. double condensers, portrait front lenses, rack and pinion, four-wick lamp, in case, £1 7s. 6d.

**The Docwra Triple Prize Medal**, highest award, supplied to Dr. H. Grattan Guinness, Capt. C. Selwyn, Madame Adelina Patti, and the Royal Polytechnic, etc.

**The Malden Triple**, supplied to B. J. Malden, Esq.; unparalleled results; Capt. Chas. Reade, R.N.

**Fine Triple Lantern**; four set of large diameter lenses, £32, cost £20.

**Special Triple**; mahogany, brass fronts, £12 12s.

**Elegant Mahogany Bi-unial**; brass fronts, £7 10s.; blow-through safety jets, 11s.; mix gas jet, 15s. 6d.; Malden double dissolving tank, 15s. 6d.; a number of grand effects; particulars free, before purchasing. Send for Mr. Hughes's grandly illustrated catalogue, over 180 fine wood engravings, price 6d.; postage 3d.; separate list of 60,000 slides, price 6d.; postage 3d.; pamphlets free; second-hand lists of bargains.—W. C. HUGHES, Brewster House, Mortimer Road, Kingsland, London, N. 50 coloured slides on loan for 3s.

**CHRISTMAS CARD MOUNTS**, gold blocked mottoes, fancy bevelled edges, various samples; 1s. and 2s., post free.—Hooper and Co., mount manufacturers, 5, Hand Court, Holborn, London. Price list of all kinds of mounts post free.

**ENLARGING APPARATUS.**—Hume's enlarging apparatus, 5 in. condenser, without objective, 61s. 6d.; with 8 in. condenser, 122s. 6d., carriage paid.—Hume, 1, West College Street, Edinburgh.

**IMPORTANT TO AMATEURS.**—Negatives skillfully retouched. Printed in silver, gelatin-chloride, etc., and Enlarged. Also Developing, Copying, etc.—Terms strictly moderate.—Address, Wifley Emery, 24, South Street, Baker Street, W.

**PUBLISHING DEPARTMENT.**—All letters containing Subscriptions, Orders, Remittances, SALE and EXCHANGE Advertisements, or other business matters for the AMATEUR PHOTOGRAPHER are to be addressed to the Publishers, HAZELL, WATSON, and VINEY, LD., 1, CREED LANE, LUDGATE HILL, LONDON, E.C. SALE and EXCHANGE Advertisements (at the charge of Three Words for One Penny) must be received by Tuesday evening's post to ensure insertion in the same week's issue.

"Amateur Photographer" Monthly Competition, No. 43.—"PORTRAITURE and FIGURE STUDY." Latest day, December 19th.—Prizes: Silver and Bronze Medal, with ribbon and clasp. One mounted print only to be sent in. Entry forms, etc., on receipt of stamped envelope. Address: Editor, AMATEUR PHOTOGRAPHER, 1, Creed Lane, E.C. (Prizes will be announced and photographs reproduced and criticised in the AMATEUR PHOTOGRAPHER Supplement, January 13th, 1893.)

AN explanation is due to Mrs. S. Francis Clarke, with regard to the disqualification of her picture at Leytonstone. This occurred from the fact that the print there exhibited was somewhat similar to one which had been previously awarded a prize. Mrs. Clarke is so well known as a successful worker in figure studies, and is, as we are aware from personal knowledge, a most enthusiastic worker, that we regret having for one moment led anyone to believe that she was guilty of wilful or accidental negligence of one of the conditions of exhibition.

UNDOUBTEDLY the time is ripe for a clear understanding as to the awarding of medals and previously medalled pictures. The subject is one which will be very prominently brought before the photographic world in a short time. Cannot the Camera Club or the P.S.G.B. do good service by forming a committee to consider the question?

AN important question was put to us last week which we were and still are unable to answer. We will state the case as plainly as we can, and ask our readers for their opinion. A negative is obtained and prints from the same medalled at one or more exhibitions. Is it permissible to make lantern-slides from the same negative for competition or exhibition purposes, and would the same be eligible for entry in an exhibition, one of the conditions of which debarred previously medalled pictures?

THE point seems to us to be this. If a print receives a medal as a picture, then a lantern-slide from the same negative is debarred if a lantern-slide is a picture. Is a lantern-slide but another method of photographic printing? If so, why should it again be medalled?

THE action of the judges at Tunbridge Wells is one that has and will cause no small amount of comment, and whilst they have no doubt acted in all honesty of purpose, it is said that it will have a disastrous effect on the society, and that the question of disbanding the same has been discussed and is still under consideration.

WE never, beyond expressing a slight surprise at a judge's award, feel it incumbent on us to question the same; but we certainly do think that in this case Messrs. Gale, Davison, and Mayland have overstepped the bounds, and it was not only hard but unfair to local talent to set so high a standard.

We publish a letter upon the subject, and, judging from extracts also sent us from the local paper, the feeling is strong in the town itself. It is true that this action enhances the value of the awards made, but was it wise?

THE question of medals, exhibitions, and previously medalled pictures is a burning one, and even the stones cry out for settlement and some authoritative action.

WE referred a week or so back to a nebulous idea of a central photographic club, and we are glad to hear that the scheme is well on its way. The goodly ship, laden with the hopes of the leading men of photography, both in art and science, we trust will meet with fair yet vigorous winds from all, and come safely to port.

ENGLISH artists have studied and painted in Japan, and collections of modern Japanese art have been seen in London, yet probably our British public hardly realise the degree of cultivation at which the artistic mind in the far East has arrived. By those who are in the best position to judge it is admitted that the standard of taste is there higher and more refined than in Europe, and hence it is with no little curiosity that the promised exhibition of photographic pictures in Tokio next year will be awaited.

WE understand that through Prof. N. K. Burton Japan invites a limited number of European photographers to send representative works to be judged by a jury composed exclusively of leading Japanese artists, who, it is pointed out, will know nothing of the names or previous records of the exhibitors and whose opinion will, therefore, be unbiassed.

Chicago on the one hand, Tokio on the other! Artist photographers are determined to be heard. True merit is the first thing, but persistent appeal is also a contributory towards recognition, and if the enemies of the art—how dwindling their numbers—deny the one they must at least admit the latter.

THE township of Louth—the very name suggests a low-lying marshy locality—is situated, as everyone knows, amidst the flattest of flat country. The names of one or two very well known photographers (and one a lady, whose successful work admits no equal amongst her own sex, and not too many amongst the opposite) are associated with Louth, and once a year the good folks organise a free exhibition of photography for the benefit of their uninitiated townsfolk.

IN sorrow be it said, the members of the photographic society in Louth are heard to rail against the level country which environs their town, and complain that there are “nothing but flats in and about Louth.” Strange that some of our prominent landscape workers, whose works are well known enough in London and elsewhere, seem particularly addicted to picture-making in the lowlands, and hence some of these gentlemen have been asked to lend a few examples of marsh and fenland pictures in order to stimulate our Lincolnshire friends, and suggest the possibilities of an unpromising country. We are promised also a short article on “Photography in a Flat Country,” which may also serve as instructive in the same direction.

“WHAT is Art? Science at least is definite,” dropped from the lips of a well-known figure in photographic London and provincial circles. The prudent man nowadays is cautious of his answers, lest the scientific expert analyse and

dissect them until their authors would not recognise them. So we answered nothing, and stepped not into the breach, where even angels might fear to tread. Truly science is definite, and perhaps the very difficulty of defining art is in some measure an essential characteristic of that which is born of imagination, and aims at the intangible ideal. But the man of measures and equations will find more delight in Euclid's diagrams than the precious suggestions of the artist's sketch. For him is the definite and real, he should beware how he sully by his touch the robe of the ideal.

SPEAKING of “Scientific Experts”—one of the many recent creations of the restless photographic mind—“Cosmos,” in a leading contemporary, rushes into the breach as the champion of this peculiar species of photographer. Because Colonel Ga'e's own work exemplifies high technical excellence, he attempts to identify *him* as a scientific expert, and Captain Abney is an expert of a kind which most artists could tolerate. Has he not, and that recently, expressed high commendation of the very unphotographic photograph of an advanced Impressionistic worker? But for the matter of that a good many of these same experts appear to be yielding to the opposition, in proof of which statement we invite notice of recent medallings. How comes it that Seyton Scott's broadly treated fuzzy picture comes out “first” at Hackney if, as “Cosmos” would have us believe, both Mr. Ralph Robinson's colleagues were scientifically inclined, and how comes it that a print of this kind once styled a gravel-path photograph is medalled by a jury which includes Mr. Andrew Pringle, an award, by the way, the justice of which we cannot quite approve? Good, “Cosmos,” leave these things to others who without subtle argument and nice deductions can reconcile them with their reasons and good consciences. Your “Jottings” will be more welcome without such criticisms as we refer to, and your friends the more numerous.

IT has often been suggested to us that in the interests of the general reader, and because the reports of Societies' Meetings appeal to a limited number only, we should cut down and abridge as far as possible these reports of proceedings in our columns. This we are striving to do, as will have, no doubt, been noticed. Now we are met with another difficulty, and that is the reporting of the very numerous exhibitions, which at all times, but particularly just now, are as plentiful as the troubles of a beginner in photography. We propose curtailing as far as possible the notices of these numerous exhibitions, believing that our readers will rather find our over-taxed space occupied with more permanent matter, and less of the typical newspaper reviews. We shall be glad to hear what some of our readers think of this.

THE peripatetic photographer is a well-known figure wherever cheap-trippers and holiday-makers foregather, yet it is rarely he figures in literature as a character study of our times. The *Morning Leader* of November 18th, however, selects this character for its eleventh type of “London Life.” The writer finds his subject on the banks of the River Lea, appealing to passers by with:—

“An' the price only sixpence. Here I am, ole Joe, what has 'anded 'alf London down to posterity. Young man, it'll be rough on that Roman nose of yours if future generations don't admire it. Don't cheat yer nose, I say. Let it 'ave fair play. Come on! Come on! What? Ain't that bonnet of yours, miss, worth sixpence to be 'anded down? Ah! that's the style. You'll be himmortal in a jiffy, miss. Now for posterity!

“With that final tribute to the recording powers of his art he disappeared beneath his dark cloth.”

What a suggestion for the artist who has immortalised “coster life,” Mr. Albert Chevalier!

THERE is trouble in the air, and rumours even of litigation, anent the subject of sending prize pictures to unmedalled classes. Our contemporary, who rarely errs on the side of over-discretion and gentleness when he commences an attack, has safely styled it "Bluffing the Judges." There will be more, and a good deal more, to be said here and elsewhere on this subject, but of this anon.

Two suburban societies, the notices of whose exhibitions recently occupied attention, both aspire to the luxury and dignity of being their own landlords and having their own premises. These are strides indeed for young societies. Meanwhile the parent society languishes in a garret—we beg pardon—in an upper storey where but few venture to intrude.

THUS far the weather, though uninviting indeed to the outdoor photographer, has been anything but wintry; still, snow is probably not very far off, and in these times of rapid changes of temperature it is unwise indeed to wait until the snow is covering the ground before one looks up what has been written and said on the subject of exposure and development of snow pictures. Read up beforehand and so be prepared, for the white fields of one day may become converted into brown mud within twenty-four hours, and snow time is a limited period at best, and one has little time for practice and experiment.

We hope to give some lengthy notes on snow pictures, chiefly from the artistic aspect, in an early issue.

## Letters to the Editor.

### WOOLWICH SOCIETIES.

SIR,—Woolwich is evidently flourishing in the photographic society line, as witness the new society formed six months after the birth of the Polytechnic Photographic Society. Man, surely, hath great faith in himself to even contemplate the formation of two societies in Woolwich, after the miserable existence and ignominious death of one, which ran its short career some eighteen months ago. Are the Poly members such juvenile workers that no benefit can result from swelling their numbers? Or does any one wish to handle the reins?

Man, also, is ambitious as well as confident. I may say the "Poly Society" is in a very prosperous condition, and with Mr. A. R. Dresser as President, ought to commend itself. I, therefore, ask, "Is another society needed?"—I am, yours, etc.,

UNITY.

\* \* \* \*

### WHAT TO DO WITH YOUR SPOILT NEGATIVES.

SIR,—Can you find space for a few words on the above subject in your paper, as I think they may be of use to some amateur photographers? Most amateurs, I think, have a few failures among their negatives, though some say they don't, but I have never seen inside their dark-rooms. I have many such, and what use to turn them to puzzled me for some time. I clean them well with hot water, so as to remove all chemical impurities, and then in the ordinary way with a solution of gelatine, squeegee a silver print (smaller than the glass, say a quarter print for a half negative) in the centre and leave to dry. Then squeegee some tinfoil round the bare parts of the glass, so as to make a sort of frame for the print. Then take a piece of cardboard the size of the glass (that which Eastman's bromide paper is packed in answers capably), and bind it to the back of the glass with strips of gummed paper, in the same way as lantern slides are bound. This, with a support of some kind, makes a pretty little ornament, and is in my mind very effective for a snow scene or the like.

Hoping this may be of use to some brother amateurs, I am, yours, etc.,

J. R. COOKE.

\* \* \* \*

### THE TUNBRIDGE WELLS "SHOW UP."

SIR,—“Obtaining pictures under false pretences”! Rather strong remark to make, but such and kindred expressions have

been heard reiterated since the awards of the Tunbridge Wells Photographic Exhibition have been made known. The Tunbridge Wells Photographic Association published particulars of their sixth annual exhibition, and offered in all forty-one silver and bronze medals for competition, which had the effect of bringing together nearly 800 pictures, amongst whom were the best workers of the present day. But, to the astonishment of everyone, ten awards only were made, the remainder being withheld on the grounds of insufficient merit.

I do not for a minute believe the Association are in any way responsible for, or desired, such a mode of awarding. Are the Tunbridge people themselves satisfied with the result? I should say, not exactly. And the success of the exhibition has not been what they would wish for, judging from the remarks of an artist in the *Tunbridge Free Press*, who expresses himself in the following terms:—"The inhabitants of Tunbridge Wells are indebted to the amateur photographic society for a very excellent and interesting exhibition this week . . . . Another thing noticed in the town is the want of sympathy and the way in which local efforts are nipped in the bud. In this exhibition, the members of the Society seemed to have secured no prizes, and surely the judges do not think the exhibition is for the exclusive benefit of outsiders. Without questioning their judgment in the awards given, I maintain such work as Nos. 44, 45, and 46 are deserving of reward. These are most exquisite specimens of photography, full of tender and artistic treatment. Some work of H. Yeo could not possibly be better, so full of sweet harmony that it is a pity they are hand works instead of camera works; yet these lovely productions that have exercised the patience, skill, time, and energy of members have not received the slightest encouragement. As a non-exhibiting member, and one acquainted with art, I say it is a great mistake, and I fear will help to damp and check an institution that should be encouraged in every possible respect."

I did not pay a visit to the exhibition, therefore I do not question the meagre number of the awards made, but I certainly question the wisdom of placing the high standard that appears to have been set, for in looking through the catalogue we notice many pictures that have heretofore received recognition from hands equally as capable—aye, and even more so—of judging, as the judges in the present instance; and I cannot help thinking that the three photographers who have adjudicated have not all reached the high standard they themselves have set up. Admitting that one of them has attained that proficiency, is it wisdom to judge a local exhibition on that standard, and withhold the awards offered because the exhibitors have not reached the same degree of artistic merit. What do they want? In the class for interiors there are several men capable of managing this branch of the art with skill, and, in fact, I notice one or two entered in this class which we know to be well selected and technically perfect specimens, yet they do not reach the standard these "authorities" set up. Further, suppose we accept the plan adopted and agree that they are capable of judging at this very high standard, and that with regard to the pictures they adopted the proper course, the question will be immediately asked, are they also as capable of judging apparatus at the same standard? A silver medal was offered for the best show of apparatus, and I see that Taylor, Taylor, and Hobson exhibited a case of their lenses and standard fittings, for which they were awarded a gold medal at the P.S.G.B. Exhibition, yet even the magnificent work of this firm fails to reach the standard fixed by these critical judges.

Altogether I cannot but come to the conclusion that the result is one not likely to bring about the best result in the future for the Tunbridge Wells Photographic Society, for if the services of the same judges are retained for the next annual show, I feel sure the pictures will be considerably diminished in numbers.

—Yours, etc.,

DISGUSTED.

### A SUGGESTION.

SIR,—It was with great pleasure that I read Mr. Wilkinson's suggestion for an inter-society competition and exhibition in your last issue.

It is a scheme which would undoubtedly further the good fellowship already existing between photographic societies.

It appears, from the remarks as to limiting the size of plates, and these being marked, that Mr. Wilkinson's idea is to place the artisan or clerk with a limited amount of time and cash at

his disposal on the same level as the gentleman with an unlimited supply of both commodities. It is certainly a fair test for the capabilities of the competitor, as the man who could turn out the largest number of finished pictures from a given number of plates should by all means be classed as the best photographer.

This sounds all very well in theory, but I am afraid it would scarcely answer in practice. What is there to prevent a man exposing a plate or two of the same brand on a subject before he exposes the one marked?

With the idea as to marking the plates left out, I see no reason why the suggestion should not be carried to a successful issue, especially as it is proposed to place the profits of such an exhibition to the credit of the Photographers' Benevolent Association.

Wishing the movement every success, and thanking you in anticipation for inserting this, I remain, yours, etc., QUINOL.

\* \* \* \*

#### LANTERN SLIDES.

SIR,—Messrs. Elliott and Son's suggestion as to the reduction of the harsh contrast in a lantern slide between the bright picture and the surrounding darkness seems to me a most feasible and sensible idea. But I am not sure that the use of a semi-transparent paper mask would give a very pleasing effect, since, unless specially made, the texture of the paper would show up; and again, one would have to keep to the sizes supplied by the manufacturer, for few amateurs can cut a satisfactory dome or circular shape. Of course, it is quite different in the case of opaque masks, for then one can modify the size of the opening in numberless ways by lengthening or shortening the sides of a dome, etc.; but with a semi-transparent mask this would be impossible, as every joint would be shown up.

Would it not be a better plan to *paint* the border of the slide or cover-glass with varnish painting colours? One could then vary the tint of the border to suit the tone of the slide; a matter just as important in lantern pictures as in ordinary prints.—

Yours, etc., W. PITCAIRN CRAIG.

\* \* \* \*

#### ENAMELLING PRINTS.

SIR,—I have just seen a letter in your admirable periodical, signed "Thermo," complaining of failure in the process of enamelling silver prints.

As "Thermo" invites suggestions from his brother amateurs, I beg respectfully to submit the following for his adoption.

I have confidence in so doing as I have found the process to be absolutely successful. I use pieces of ordinary plate glass, slightly larger both in length and breadth than my prints, which are half-plate. I prepare a hot saturated solution of sodium carbonate, and into this I place the piece of glass, which is allowed to remain immersed therein for, say, two minutes.

I then remove it, and rub it well with the fingers on the side which is to be utilised. Next it is held under a tap of clean water (rain water the best), and the rubbing is continued until all traces of the soda disappear, and it is then reared on edge to drain. It is important to have some mark on the glass which will indicate the side to be treated in the various processes.

When the glass is drained, should it be found inconvenient to allow it to dry naturally, it can be dried over a paraffin lamp or before a fire. When perfectly dry I rub the prepared side softly with an old silk handkerchief kept specially for this purpose, in order to remove any trace of the soda or other impurity which may remain on the surface of the glass. The glass is then sprinkled lightly with fine powdered talc, which is immediately spread about on it with a soft camel-hair brush, and then rubbed off with same.

I then take another old silk handkerchief, kept also for this special purpose, and rub the glass with gentle pressure in order to remove any of the talc left behind by the brush. The talc must be completely removed, otherwise I find the prints will stick.

When the talc is thus thoroughly removed, the piece of glass is taken up with the pneumatic holder, and coated with collodion in the ordinary way, and placed on end to set.

After this preparation I leave the glasses twelve hours or so to rest, and so divide the enamelling process into two distinct stages.

I do this not only as a matter of convenience and as a division

of labour when I have a number of prints to enamel, but moreover I found by experience that a continuation of the process soon after the coating of the glasses with collodion is very much liable to cause a sticking of the prints.

2nd. The essentials for the next stage are some Nelson's No. 2 gelatine, and some very thin cardboard—so thin as to be more like drawing paper than cardboard. The gelatine is put in a large jam-pot, two ounces to ten ounces of water, and left there for an hour or so until it has completely swelled. The cardboard is cut into pieces of *exactly* the same size as the prints.

When the gelatine has swelled fully in its pot, I place the pot in a vessel of boiling water until the gelatine melts in the water in which it has been steeped. I have a clean porcelain dish ready, and thoroughly warmed, and into this I strain my gelatine solution through a piece of muslin.

To ensure that the gelatine will not thicken or cool during the process, I place the dish of strained gelatine into a galvanised bucket, or some similar vessel, in which there is a little water, and this bucket I place on a little tripod over a spirit lamp.

The prints, if dried and curled or rolled, are of course immersed in the meantime in a vessel of clean water and made to expand and become limp.

We are now quite ready for the next stage, with which I proceed thus:—

I take a collodionized glass and gently drop it prepared side upwards into the dish of gelatine in the bucket. Immediately I take a limp print and put it face downwards into the same dish. After two or three seconds I lift the glass with the print resting on it out of the dish, draining for a few seconds one corner downwards. It is then placed on a table or other flat surface, and the roller squeegee is carefully and *quickly* passed over the print, which should now rigidly adhere to the glass. A cloth is then used to remove superfluous gelatine from the unprepared side of the glass, as also from its edges, and it is set aside while others are treated in a similar manner. When all are thus treated, the cardboard pieces are immersed *one by one* in the dish of gelatine, and when it is seen that all are saturated with the gelatine solution a glass with print attached is placed on a flat surface—a piece of cardboard is *very quickly* removed from the dish and fitted evenly on the back of the print. The roller squeegee is used as before, and the process so far is complete.

To assure that the prints will invariably come off the glass when dry, a very precise mode of procedure in the drying process is essential. What I find to be a principle is this:—*Slow drying at first until the excessive moisture has left the gelatinized print and cardboard, and after that very fast drying.*

My system of carrying this out is as follows:—

I place the glasses either in warm sunshine or before a fire at such a distance that the heat will be about equal to ordinary summer heat. I leave them there for about half-an-hour, when I dry them very fast by means of paraffin lamps after this fashion. Two simple square boxes are procured. The dimensions of these square boxes are such that the side of the square will be a little more than the breadth of two half-plate enamelling glasses standing on end. Conceive these boxes to have no bottom, to have the sides projecting 3 inches over the lid, to have the lid as high as the centre of the flame of your paraffin lamp, and finally to have a square aperture in the centre of the lid large enough to admit the funnel of the lamp. This box is placed down over the lamp, the glasses are arranged around the flame and standing against the projecting sides. The lamp flame is feeble at first, but is gradually increased as the drying goes on. Thus each paraffin lamp will dry at a time eight half-plate prints, and this drying will not take more than three-quarters of an hour.

With prints treated as I have indicated there is an invariable forewarning of the separation of the prints from the glass, and it is this:—An occasional *tick* is heard, becoming more frequent after a time, and when it ceases, by cutting about an eighth of an inch from off the print all round with a small sharp knife, it will be found to come off with its beautiful gloss.

I am an amateur of short standing, and I have been told by an experienced professional that he never enamelled prints better than some done by me, following with scrupulous exactness the details I have here given.

I send by this post one of the first prints I have done in accordance with above.—Yours, etc.,

PATRICK KENNEDY.

[The print sent has a very good surface.—EDITOR.]

## The Speed of Plates.

WE have received the following correspondence for publication:—

[COPY.]

Appleton, Widnes, Nov. 15th, 1892.

DEAR SIRs,—Our attention has been called to your advertisement in last week's photographic journals, in which you state that your plates have a speed of 100 upon our scale.

We must ask you to kindly inform us upon what ground this statement is based.—Yours truly,

(Signed) F. HURTER AND V. C. DRIFFIELD.

To Messrs. The Imperial Dry Plate Co., Ltd.

Cricklewood, London, Nov. 17th, 1892.

DEAR SIRs,—Referring to your letter of the 15th inst., we shall esteem it a favour if you will kindly let us know if we are wrong in estimating the ratio between the "Watkins" scale and yours, as 3 is to 2, a ratio, we believe, to be generally accepted as correct. —We are, dear sirs, yours faithfully,

THE IMPERIAL DRY PLATE CO., LTD.

(Signed) T. E. H. BULLEN, Secretary.

To Messrs. Hurter and Driffield.

Appleton, Widnes, Nov. 18th, 1892.

DEAR SIRs,—We are obliged for yours of the 17th inst., which confirms the conclusion to which we had arrived, that the speed 100 you quoted as the speed of your plates upon our scale was a pure inference, based upon Mr. Watkins' estimation. Whatever connection Mr. Watkins may have stated to exist between his speed and our own has never in any way been acknowledged by us; nor have we ever given a thought to the subject, for the simple reason that Mr. Watkins has no system of speed determination, beyond that open to every photographer, namely, camera test. We cannot, therefore, for one moment admit his speed as a basis upon which to estimate ours. Our own method of speed determination is the outcome of years of laborious investigation, specially undertaken with a view of superseding camera tests. It is based upon actual measurements of the work done by the light, and is provided with a scientific nomenclature and system of units. From what we have said, we think you will allow that we are justified in objecting to platemakers using our names at all, unless they actually adopt our system. Such a course is clearly calculated to mislead the public, who naturally infer, when the speed quoted is associated with our names, that it has been ascertained by our method.

Should you at any time care to adopt our method yourselves, you may count upon our cordial assistance, and we trust you will regard what we have said in the friendly spirit in which it is offered. We do not, for a moment, imply that your plates may not reach a speed of 100 upon our scale, but it is in the highest degree improbable that this figure accurately represents their speed. We should like, with your permission, to publish this correspondence, including any reply to this letter you may care to favour us with, as we think it may prevent misunderstanding in the future, and that it is only fair to those plate-makers who have adopted our system to take this course. —Yours truly, (Signed) F. HURTER AND V. C. DRIFFIELD.

To Messrs. The Imperial Dry Plate Co. Ltd.

Cricklewood, London, Nov. 21st, 1892.

DEAR SIRs,—In reply to your letter of the 18th inst. we have somewhat anticipated your reply, having withdrawn your names from our advertisements, it being far from our desire to have a controversy with you or prejudices you in any way.

You are, however, doubtless aware that plates are now in the market branded with a certain number on your scale, and "equal to . . . on Watkins'." Statements to the same effect may be found in photographic literature every week, comparisons being made, as one would between Fahrenheit and Réaumur or Celsius. We cannot therefore see that the publication of the correspondence that has passed between us, would help to solve the question whether 150 Watkins' is equal to 100 Hurter and Driffield.

Should you decide to publish our letters, we should probably let the manufacturers who are pledged to one or both systems discuss the matter.—We are, dear sirs, yours faithfully,

THE IMPERIAL DRY PLATE CO., LTD.

(Signed) T. E. H. BULLEN, Secretary.

To Messrs. Hurter and Driffield.

Appleton, Widnes, Nov. 24th, 1892.

DEAR SIRs,—From your letter of the 21st inst. we gather that you have failed to understand the position we have taken up. We have no objection whatever to plate manufacturers who have adopted our system deducing the Watkins' speed from ours, but we do object to our speed being inferred from Mr. Watkins'. Our

object in publishing this correspondence has nothing whatever to do with deciding what relationship exists between Mr. Watkins' plate number and our speed, but simply arises from a desire to do justice to those plate-makers who have taken up our method and who are earnestly striving to carry it out impartially and thoroughly. Furthermore, in the interests of the photographic public, we consider that any quotation of our speed should be based upon an actual determination, and not upon an inference.

In conclusion we again ask you to accept the assurance of our good will, and we remain.—Yours truly,

(Signed) F. HURTER AND V. C. DRIFFIELD.

To Messrs. The Imperial Dry Plate Co. Ltd.

## Apparatus.

### DOLLOND'S "MONOCLE."

UNDER this name Messrs. Dollond and Co., of Ludgate Hill and Old Broad Street, have introduced a set of periscopic lenses with mount, as shown in the diagram. Four lenses, which vary in foci according to the size of the plate for which they are intended all fit into the back of the mount and are kept in position by a spring ring. As will be seen from our article on p. 327 (AMATEUR PHOTOGRAPHER, November 4th, 1892), it is necessary to make a correction after focussing for the non-coincidence of the

actinic and visual foci, and on the mount is a scale divided into sixteenths of an inch for this purpose, the correction being effected by the rack and pinion. Waterhouse stops are also provided.

We have actually tried these lenses for portraiture, and they give exquisite softness, which, in the hands of an artist, will be of great value. In landscape work they give that softness of outline which is noticeable in some of the best work shown, and at the price of 27s. 6d. they should find many friends.

### CHRISTMAS AND NEW YEAR MOUNTS.

Christmas is again close at hand, and many of our readers will desire to send out their own prints as Christmas and New Year Cards. Messrs. Hannam and Co., 25, Soho Square, have sent us samples of cards for this purpose neatly put up in boxes, or they may be obtained loose. The mounts are extremely artistic and neat, and are well worth the attention of all our readers. The prices vary according to size, averaging about 2d. per mount.

### MOUNTS FOR CHLORIDE PRINTS.

The same firm have also sent us samples of mounts which they are placing upon the market specially for chloride prints. They are made with cut-outs, and so that the print is slipped into place as in albums, thus avoiding all trouble with mountants, and the surface, either glazed or matt, is thoroughly preserved. They may be obtained either with plain or fancy cut gold bevelled edges, and, like all this firm's work, are of the best quality of finish.

### MARION'S ART SLIDES.

Marion and Co., of 22 and 23, Soho Square, have sent us half a dozen fine art studies by Downey, which are reproduced in collotype and which are all strong proofs that if photography is not art in the hands of a master it can come as near to art as possible. The prints measure about 10 by 8, and are printed in collotype on large boards, and every study is well worth framing. The price is only 1s. 6d. each.

## General and Photographic Chemistry. — XII.

By E. C. CONRAD, F.C.S.

### THE NON-METALLIC ELEMENTS AND THEIR COMPOUNDS.

(Continued from page 302.)

COMPOUNDS OF CARBON AND OXYGEN.—Carbon combines with oxygen in two proportions, forming carbon-monoxide, CO, and carbon-dioxide, CO<sub>2</sub>.

*Carbon-Monoxide*, CO=28. This gas is always produced when carbon is burnt in a limited supply of oxygen. M.: (1) by heating formic acid with strong sulphuric acid. Eq.:  $\text{CH}_2\text{O}_2 + \text{H}_2\text{SO}_4 = \text{H}_2\text{SO}_4 + \text{H}_2\text{O} + \text{CO}$ . The sulphuric acid decomposes the formic acid, and combines with the water produced. (2) By heating oxalic acid with sulphuric acid. The oxalic acid is decomposed, producing water and a mixture of carbon-monoxide and dioxide; the carbon-dioxide can be absorbed by passing the mixed gases through a solution of caustic soda or potash. (3) By heating powdered crystallised potassium ferrocyanide with about ten times its weight of strong sulphuric acid. Eq.:  $\text{K}_4\text{FeC}_6\text{N}_6 + 6\text{H}_2\text{O} + 6\text{H}_2\text{SO}_4 = 3(\text{NH}_4)_2\text{SO}_4 + \text{FeSO}_4 + 2\text{K}_2\text{SO}_4 + 6\text{CO}$ . P.: Carbon-monoxide is a colourless gas almost insoluble in water, 100 volumes of which dissolve at 15°C about 2.5 volumes of the gas. It burns with an exceedingly hot blue-coloured flame to form the dioxide. Carbon-monoxide is a very poisonous gas, but its action is peculiar; it forms with the hæmoglobin of the blood a bright red-coloured body called carboxy-hæmoglobin, which is decomposed with difficulty; whereas the body formed by the union of oxygen and hæmoglobin (oxy-hæmoglobin) is easily decomposed. Charcoal and coke always produce carbon-monoxide when burnt, and in badly ventilated rooms their combustion quickly produces death.

*Carbon Dioxide*, CO<sub>2</sub>=44.—Oc.: In the atmosphere in relatively small but actually enormous quantities; it is evolved from subterranean sources, and is a product of respiration. M.: (1) By the combustion of carbon monoxide or any substance containing carbon in an excess of oxygen; (2) by fermentation, as the action of yeast on solutions of sugar in brewing, etc.; (3) by decomposing any carbonate with any acid; thus calcium carbonate (chalk or marble) acted on by hydrochloric acid produces free carbon dioxide. Eq.:  $\text{CaCO}_3 + 2\text{HCl} = \text{CaCl}_2 + \text{H}_2\text{O} + \text{CO}_2$ . P.: Carbon dioxide is a colourless, invisible, incombustible, irrespirable gas 1.5 times as heavy as air. Under a pressure of thirty-six atmospheres at 0°C. this gas is condensed to a liquid and can also be obtained as a solid, having in this condition a temperature of -78°C. On mixing this solidified gas with ether it evaporates, producing such intense cold that many gases are frozen by the resulting temperature. Water dissolves the gas (100 volumes at Stp. absorbs 180 volumes of the gas), and the solution forms carbonic acid H<sub>2</sub>CO<sub>3</sub>, which feebly reddens litmus and is decomposed on boiling, CO<sub>2</sub> being given off. Carbon dioxide is often called carbonic acid, but this term is incorrect and should only be applied to its solution. On an increase of pressure water can be made to take up larger quantities of the gas, but the excess is expelled on the pressure being released. This is the cause of the effervescence of many natural mineral waters and also of champagne, soda-water, lemonade, etc. The dioxide is produced in wines by fermentation, and is forced into the aerated water under a pressure of from four to six atmospheres (say about 75 lb. to the square inch). The

*Carbonates*. Carbonic acid having two atoms of replaceable hydrogen is said to be diatonic or dibasic, and forms two series of salts; thus with sodium there is (1) acid carbonate of soda or bicarbonate, NaHCO<sub>3</sub>, (2) sodium carbonate, Na<sub>2</sub>CO<sub>3</sub>. (The bicarbonate is always met with commercially as a white, impalpable powder, the carbonate generally in crystals containing 10H<sub>2</sub>O as ordinary washing soda. *Test*.—A solution of perchloride of mercury gives a red precipitate with a solution of the carbonate, and a white precipitate, which turns red on boiling, with a solution of the bicarbonate). The carbonates of the alkaline metals are formed by passing carbon dioxide into a solution of caustic soda or potash, or into ammonia. Eq.:  $2\text{NaHO} + \text{CO}_2 = \text{Na}_2\text{CO}_3 + \text{H}_2\text{O}$ , and the carbonates of all the other metals are produced by heating their salts with the alkaline carbonates or by boiling the salts in solution; thus, barium chloride heated with sodium carbonate produces barium carbonate and sodium chloride. Eq.:  $\text{BaCl}_2 + \text{Na}_2\text{CO}_3 = \text{BaCO}_3 + 2\text{NaCl}$ . The carbonates of the alkalies are soluble in water. All other carbonates are insoluble in water, but some dissolve in carbonic acid; thus, if carbon dioxide is passed into lime-water (calcium oxide or caustic lime dissolved in water) a white precipitate of carbonate of lime (CaCO<sub>3</sub>) will be thrown down, but if the gas is still passed through this precipitate will be again dissolved, owing to the formation of the bicarbonate of lime (CaCO<sub>3</sub>CO<sub>2</sub>) (see hardness of water). Barium, magnesium, and iron are the principal other metals that act in this way. The uses of the carbonates in photography, etc., will be described under the headings of the respective metals. *Tests*.—All carbonates are decomposed by acids with evolution of carbon dioxide, which can be recognised by reaction with lime-water. All carbonates, with the exception of the potassium, sodium, and ammonium carbonates, are decomposed by heat, forming an oxide or leaving the metal, and giving off carbon dioxide and sometimes oxygen. Barium, strontium, and calcium carbonates require a high temperature.

COMPOUNDS OF CARBON AND NITROGEN.—Carbon and nitrogen do not combine directly, but by indirect means their combination can be effected.

*CYANOGEN*, C<sub>2</sub>N<sub>2</sub> (=52).—M.: By heating mercuric cyanide. Eq.:  $\text{Hg}(\text{CN})_2 = \text{Hg} + 2\text{CN}$ . P.: Cyanogen is a colourless gas, of a peculiar odour, soluble in water, one volume of which dissolves about 4.5 volumes of the gas. The aqueous solution soon decomposes. It does not attack mercury, and can be collected over that metal. Under a pressure of 4.5 atmospheres, or at a temperature of -20°C. the gas is condensed to a liquid of S.G. 0.86; at lower temperatures it freezes to a crystalline mass. Cyanogen burns with a purple flame, forming carbon dioxide and liberating nitrogen. Eq.:  $\text{C}_2\text{N}_2 + \text{O}_4 = 2\text{CO}_2 + \text{N}_2$ . Many metals unite with the radical CN (usually written Cy) to form cyanides, many of which have a blue colour, hence the name cyanogen (blue producer).

*PARACYANOGEN*, C<sub>2</sub>N<sub>2</sub>.—This compound, the exact composition of which is unknown, appears to be condensed cyanogen. It is a brown substance, and can be produced by heating silver cyanide in a sealed tube. On heating in an atmosphere that has no chemical action on it, paracyanogen is converted into cyanogen without separation of carbon.

**Stockport.**—A meeting of the above society was held on Wednesday 23rd ult., at which Mr. G. Hilderley, showed about 100 lantern slides of Switzerland from negatives taken during a holiday there in the summer. The whole of them were taken within five days, and their uniform excellence caused great admiration.

## "Mezzotype" and other Rough-Surface Silver Papers.

WE had purposed this week giving some fuller particulars as to the use and manipulation of Mezzotype and other rough-surface papers. Pressure upon our space at present, and the fact that fresh information is so constantly coming in from the very many photographers who have now taken up this paper, will prevent our present notes from being as complete as we would have wished, so that we may return to the subject at a later date.

The increased use and inquiry for a rough-surface printing paper has been generally remarked, and its popularity must have struck any one who has carefully considered recent exhibitions.

It is between two and three years ago that the present writer pointed out to Dr. Hezekiel, of Berlin, the desirability of placing upon the market a rough drawing paper, salted and sensitised for silver printing, and for this purpose samples of Whatman's, and Arnold's unbleached drawing papers were supplied as specimens to Dr. Hezekiel or his agent in London. The sensitised paper which resulted from these proposals was eminently satisfactory in every respect, except, perhaps, in its keeping quality. It yielded a very vigorous image, often very bright and transparent, but the paper suffered by being kept, and a calcium box, together with the greatest care, was necessary to preserve the stock of paper. It may here be remarked that two large prints, which we made in 1890 and which have been to several exhibitions, and have otherwise been hanging on a well-lighted wall, show not the least indication of fading or yellowing; the one is gold-toned, and the other toned with platinum.

Subsequently we proposed the manufacture of this rough-surfaced printing paper to two London makers—Mr. Otto Scholzig, whose extensive manufacture of ordinary sensitised papers prevented his going further with the matter than the preparation of the first few sheets; and secondly, to Mr. Blackie, of the Blackfriars Company, from whom we received a quantity of sensitised Whatman's paper, some of which was nearly very successful.

Again, the Fry Manufacturing Company brought out their "Soltype," which, although not precisely a rough surface, was a movement in the right direction. The Imperial Photographic Company have, we believe, also undertaken to sensitise rough paper, but, so far as we are aware, nothing much has been done by them. The probability is that papers of this class require such excessive care and watchfulness that in the ordinary course of commercial manufacture it would not pay to prepare, and at present, large as the demand is becoming, it is probably not sufficiently to warrant any very especial arrangements on the part of the paper sensitizer who has plant and work-people already employed in regular goods.

With Mezzotype, however, the circumstances are somewhat peculiar, and seem to give the paper a prestige and probability of continued success which its predecessors have hardly possessed. Mr. C. F. Robinson, who is the prime mover of the Carlotype Company, is an artist by profession, and a successful exhibitor at the Painter-Etchers' Exhibition, of which society he is a Fellow. Finding that Mr. Robinson was interested in the coating of photographic papers, we at once saw that his artistic sympathies might be drawn upon to attempt the preparation of certain papers especially suited for artistic purposes, and we think that

thus far, at least, Mr. C. F. Robinson's Mezzotype paper is the most uniform and altogether successful paper of its kind which has yet been produced. To this Mr. Robinson's practical knowledge and his personal direction and superintendence of its preparation is probably the chief contributory.

In the first place we should like to point out to our readers that with regard to rough surfaces generally it is a fallacy to suppose that they are only suitable for prints of large size. We unhesitatingly assert that there are many quarter-plates, pictures which are admirably rendered on very rough paper, but as it is a matter which cannot well be proved by argument, we can only ask that it be put to a practical test and tried.

Then as regards colour. Fashion just at present decides that sepia brown is the *sine qua non* of a good picture, and whilst we readily admit the pictorial charm of this colour we are by no means ready to let every other give place entirely to it.

Now in producing pictures on this Mezzotype paper—and we take it for granted that it will only be employed for pictorial, that is, artistic purposes—the crux appears to be in the toning, so as to secure a pleasing and desirable colour and in this direction alone a very large field for experiment lies open. At present, so far as we are aware, only gold "toning" and platinum "toning" have been attempted, and it is merely some notes of these two methods which we propose at present to give.

To commence with, such serious doubts have been cast upon the reliability and permanency of the hyposulphite of soda and gold toning and fixing bath that we shall abandon it entirely, but, for the use of those who may care to try it, the formula given by the Mezzotype manufacturers is as follows:—

Hypsulphite of soda	..	..	..	1 oz.
Water	..	..	..	10 "
Chloride of gold sol. (15 gr. to 1 oz. water)				10 minims

Toning and fixing is here performed in one operation. The print is placed in the above bath without previous washing, and kept moving for twenty minutes. On removal, wash thoroughly for about two hours in running water.

There seems to be nothing in the constitution of Mezzotype paper which should demand any different toning formula to those ordinarily used for albumenised silver paper, except that the bath must be very much weaker. The Mezzotype paper is extraordinarily rich in silver, and it will be best to dilute usual toning baths with their own bulk of water. Toning will perhaps be slower, but the alteration in colour will be more uniform and regular.

The combined toning and fixing bath as used for the gelatino-chloride papers, composed of sulphocyanide of ammonia and chloride of gold, may be successfully employed, but the reduction which takes place in the image is often so great that it will hardly recommend itself.

We have submitted a large number of prints on the Mezzotype paper to the above combined bath, to the acetate of soda and gold bath, and also to the borax bath, and are of opinion that if it be desired to tone with gold, then it is with the latter bath that the most satisfactory results are to be obtained.

The point for consideration in deciding upon the bath to be used is probably chiefly one of colour. There is at the present time a very wide-spread desire to secure a pure sepia brown colour, and it must be confessed that it is this colour which we have found it most difficult to get. The brown colour obtainable in silver papers is almost invariably suffused with a peculiar pink hue, and one which is to our

taste as undesirable as it is difficult to get rid of. We recommend, however, the following proportions:—

Chloride of gold .. .. .	1 gr.
Borax .. .. .	20 "
Distilled water .. .. .	20 to 30 oz.

The print should be about as deep as ordinarily, and must be well washed in running or frequently changed water, the thick soft paper being very absorbent, and a great deal of free silver will leave it, making its presence seen by the milkiness imparted to the water. It will be noted from the above formula that our toning bath is about *half the usual strength*, and consequently the process of toning will be a very slow one. In like manner it is very important that the "fixing" bath of hyposulphite of soda should be similarly diluted, 1 oz. hypo to 8 or 10 oz. water being about the best.

In this way we have succeeded in getting a fairly wide range of colours, from a sienna brown to a cool purplish-grey, these two representing the extremes of the gamut, and are the colours most readily obtained. The various shades of browns and blacks which come between appear to be involved in some degree of uncertainty—that is to say, it is almost impossible to foretell the exact colour any given print will be when finished, and, moreover, having secured the precise colour desired, it seems that to repeat it is more dependent upon chance than intention.

Such an element of uncertainty is obviously a drawback when producing prints with a definite intention and aim. Still, we think it is fair to conclude that the fault is more attributable to an imperfect knowledge of the paper than to any integral character thereof, and that a little further experiment should remove the fault, if there be one, and place the colour of the print directly within the operator's control.

Quite recently we have come rather nearer to this position by stopping the toning when the print is something short of the desired colour, and allowing for a certain alteration during fixation. Thus we made up three separate borax and gold toning solutions of different strengths, and three prints of various depths were placed one in each respectively. The print in the strongest bath was somewhat over-printed. This, however, was removed first, the colour then being a decidedly ruddy brown. After fixation this was changed to a much cooler and not unpleasant shade. The other prints were treated in the same manner, one of them being more lightly printed, but in a weaker bath took about the same time to tone to the same ruddy brown at which the first was stopped, and the third print being in a very weak bath, took a very long time to reach the same colour. Both these latter when fixed were *within a very little* of giving the same tint as the first print finished.

The prints have a very different appearance when dry as compared with wet, and the hypo bath also, as shown above, will usually take some of the warmth out of the colour, and the desired control to which we have referred may perhaps be ours if a little closer acquaintance be made with some of the specific characteristics of this paper.

In toning with platinum we have tried two well-known formulæ, one of which succeeded admirably with the rough silver paper supplied to us by Dr. Hezekiel in 1890, but as yet we have not secured such pleasing results as with the gold. The formula just referred to is that given by Mr. Lionel Clark in his little book, "Platinum Toning,"\* but that, as when toning with gold, it is better to dilute very considerably with water, thus:—

Potassium chloroplatinite solution,	
60 gr.; water; 2 fluid oz....	... 1 drm.

Nitric acid ... ..	3 or 4 drops.
Water ... ..	16 to 20 oz.

We have lately seen some excellent prints of a deep brown colour, with which the above bath was used at a temperature of about 70 or 80 deg. Fahr.

In these cases the prints were in the first place a good deal over-printed, then toned a good deal longer than appeared necessary; that is to say, the prints were not removed from the bath when the desired colour was arrived at, but allowed to continue some time longer, the deep brown tint returning in the hyposulphite fixing bath. For our own part, however, we have obtained better colour when using the bath cold and of greatly reduced strength. Another platinum formula which works well with the gelatine-chloride papers and has been successful with Mezzotype, is the following:—

(1)	
Neutral oxalate of potash .. ..	3½ oz.
Potassium phosphate .. ..	1¼ "
Distilled water .. ..	32 "
(2)	
Potassium chloroplatinite .. ..	60 gr.
Distilled water .. ..	3 oz.

Six volumes of No. 1 to be taken with one volume of No. 2.

With this a pleasant warm grey can be pretty well relied upon by pushing toning as far as it will go, this provided that the print is fairly strong.

With regard to the application of rough surfaces for pictorial work, we should like to point out that whereas those who in our own time first adopted rough-surface papers for landscape pictures, did so with a definite intention, and, employing it intelligently, illustrated thereby some of its advantages. The great republic of photographers always ready to take up a new thing heard these rough surfaces admired and commended by those whose opinions carried weight, and forthwith set about using rough surfaces, apparently under the impression that one had but to print any reasonably good negative on rough paper to ensure an artistic picture, and hence now that in this Mezzotype such a paper is obtainable at a moderate cost, there seems some danger that we shall shortly have rough paper prints *ad nauseam*, and already we fear the faults and misapplication of it are quite as, if not more, often exemplified than the advantages. The subject, the character of the scene, and similar considerations should be duly weighed, and the printing process selected and decided upon accordingly.

A rough surface and an adaptability to warm "tones" is by no means the only characteristics of Mezzotype paper. A print upon it compared with a print by some other process—say, platinotype—will at once illustrate this. For instance, a high light in the landscape which is somewhat over-dense will often print through on Mezzotype or an ordinary silver paper when it fails to affect the platinotype or bromide; this means that the resulting print is *flatter* with a preponderance of half-tone, a quality well worth bearing in mind when the negative is a little hard or under-exposed, also when double printing is resorted to, as, for instance, when introducing clouds from a second negative, or in combination printing the advantage of a "print-out," a process in which we are able to watch the progress, will be obvious enough.

We believe, in intelligent hands and with increased knowledge of its capabilities, a great deal may be done with the Mezzotype paper, which will go to advance the artistic status of photography generally.

\* "Platinum Toning," Lionel Clark. Hazell, Watson, and Viney, Ltd., Creed Lane, Ludgate Hill.

## Rational Development.\*

By J. SIMKINS.

OUR worthy and esteemed Secretary, to whose kindness I am indebted for the invitation to read this paper before you, has, as I think, very judiciously limited me to half an hour. He does not suppose—you do not suppose—that I can tell you everything about development in thirty minutes, but I shall hope, by touching lightly upon certain essential points, to make clear to you my own idea of what may be considered a rational method of development.

And, first, I must say a word about exposure, for exposure and development are so intimately connected one with the other that it is almost impossible to leave out of your consideration the one while treating of the other. I am aware, gentlemen, that this question of exposure is the point of divergence between myself and those photographic friends who take the trouble to think anything about me or my work, and I am conscious of some self sacrifice in coming here to-night—I will not say to be laughed at, but to be smiled upon for my eccentricities. But, in spite of all that, I have absolute faith in my method, and I shall not ask my friends to perjure themselves by saying the same thing about theirs. Please understand that I have not the slightest desire to under-rate the methods employed by those who differ from me—methods that may be described generally as the endeavour to give each subject a correct exposure (so-called), and to obtain perfect negatives by the use of a so-called normal developer.

I have seen—indeed, I am constantly seeing—very excellent results obtained in this way—results, however, in no way superior to those gained—not by me—by a competent manipulation of the processes I am about to describe.

Well, to return to this question of exposure. The orthodox way of exposing a plate is first of all to focus the view, then to insert a sufficient stop, and next, with the value of the rapidity of the plate clearly fixed in the mind as a numeral, to calculate the correct exposure.

What is a correct exposure? The text-books tell us that when the darkest shadows of a subject have received the critical exposure, that is, when the deepest shadows have received the least possible intensity of light the action of which a given developer can make visible, then that subject has had a correct exposure, and I believe that to be true. But if, as too frequently happens, the critical exposure of the shadows is not reached, or is exceeded, what happens? Why, in the first instance we have a hopelessly under-exposed negative, which no skill, save that of retouching or dodging, can make perfect, while in the second instance we have an over-exposed plate, which will be ruined (in cases where the correct exposure has been very much exceeded) unless we very quickly modify the developer.

It was this glorious uncertainty in exposure that prompted me some time ago to adopt the method I now employ, and which renders me practically independent of any but the simplest calculation before exposing a plate.

Well, gentlemen, we have seen what correct exposure is said to be, let us now see what correct or normal development is supposed to mean.

With every box of plates that you buy you will get a printed formula for the composition of your developer, and you cannot do better than adhere to it. For a correctly-exposed plate the developer mixed in the proportions recommended is called the normal developer.

We will not now take into consideration the merits of this or that developer, but will assume that the alkaline-pyro developer—the alkali being ammonia—will serve our purpose.

In a pyro-ammonia developer the pyro is the real reducing agent; sulphite of soda does not influence the production of the image in any way, but is used to prevent the discolouration and rapid deterioration of the developer by oxidation; citric acid and nitric acid serve the same purpose; and bromide of potassium acts as a restrainer; while ammonia is simply the accelerator, rendering the pyro active and enabling it to do its work.

Given then a plate accurately timed for a particular developer, we need have no hesitation in at once pouring on the normal developer in the proportions recommended by the plate-makers; always provided that the subject does not require special treatment, as the softening down of the high lights in a too brilliantly lighted picture, say the windows in an interior; in such case we must modify the developer, and it is in this process of modification, requiring at once, in many instances, judgment, precision, and promptitude, that we find the rock on which so many amateurs split. A skilled photographer (and I do not think that any society can claim as members a larger number of skilled amateurs than the Birmingham Photographic Society) takes a negative in his mind's eye as well as on his plate, and works for a certain result, so modi-

fying his processes as to gain it in the majority of instances; but the inexperienced are too prone to treat all plates and all subjects alike, and the only results in nine cases out of ten are discomfiture and disgust.

We have seen that a correct exposure is one in which the darkest shadows of a subject receive the smallest intensity of light that a given developer can make visible, and that if this exposure is very much prolonged, say for three times the duration, the plate is to be considered over-exposed. But is it really over-exposed? Why should an exposure which with a normal developer gives a perfect result, be considered a correct exposure, while an exposure greatly exceeding it in duration, *but giving equally perfect results* under different treatment in development, be considered an over-exposure?

I do not believe in over-exposure until it is manifest in the developed negative. It has been laid down that there is an absolutely correct exposure for every subject. Granted, but which is really the most rational way of gaining the results of that absolute correctness—to stand with the cap in your hand, and to endeavour in a moment or two to give the exact value to the concomitants of light, stop, plate, distance, shadows, and several other things, or to say, "I cannot with certainty gauge these values; I think 4 sec. would do it, but I will make sure and give 20 sec., feeling confident that the EQUIVALENT of correct exposure will appear during development and may then easily be secured as such?"

You are all, I think, aware of the difficulty of giving any particular subject an absolutely correct exposure, and are prepared to admit that many failures are the outcome of errors of judgment in this respect. I would ask you then if it would not be an advantage to be practically independent of exposure, provided that we have a method of development which will give us the same results, in a simpler manner, as a correct exposure and a normal developer would do? I am of opinion that that would be a very great advantage, and I will now lay before you the way in which you may make the most of this advantage.

We will suppose, if you please, that we have focussed our picture and inserted the necessary stops. We look at the subject; any subject will do, and we will suppose it to contain deep shadows in the foreground, and a brightly lighted distance, mountains, for instance. We can ignore the distance and consider only the shadows in our estimate, committing to memory, however, the general lighting of the scene. We think 4 sec. will be enough, but are we sure? No, we are not—if we could give 8, 16, or 20, we should be sure that we had given the critical exposure to the shadows; any exposure in excess of that need not trouble us at all.

But you will say that would be excessive over-exposure! Well, I beg to dissent; no one at this stage is justified in saying the plate has been over-exposed. If the completed negative shows any trace of the so-called excessive exposure, then your criticism will be just, but if a perfect negative is the result, how can you say the plate has been over-exposed? So much for the exposure. We will now mix our developer which is practically a standard pyro-ammonia developer: To 3 oz. of water for a whole-plate, we add 15 gr. of sulphite of soda,  $\frac{3}{4}$  gr. of citric acid, and 6 gr. of dry pyro. In another glass we will put 2 dram. of ammonia solution, made up as follows:—Ammonia '880,  $\frac{1}{2}$  oz.; potassium bromide, 40 gr.; water, 10 oz. Such a developer contains 2 gr. of pyro, 2 mims. of ammonia,  $\frac{3}{4}$  gr. of bromide, 5 gr. of sulphite of soda, and  $\frac{1}{4}$  gr. of citric acid to the ounce, when used in normal proportions, and is really the formula of the maker for the plates I always use, viz., the Paget Prize Plates.

Removing now the backing from the plate (you see I back my plates, and I advise you always to do so under all circumstances. I am sorry time will not permit me to explain to you fully now the great importance of doing so), I place it in the dish, and pour on the 3 oz. of pyro solution, *without the alkali*, and move it about until the developer lies evenly on the film, no air bubbles showing; then we can leave it with a cover over the dish while we make other preparations. We will pour about  $\frac{1}{4}$  dram. (or one-fourth the normal quantity) of the ammonia solution into the 4 oz. measure, and returning the solution now on the plate to the glass, once more pour it over the plate. The developer is now slightly alkaline. Do not be anxious if the picture does not show quickly, it rarely does so with so weak a developer; it is all there, and by and bye, say in a minute or so, the picture will show, and if you have not overdone the ammonia for the particular exposure, will grow in if correctly exposed, *only more slowly*.

The plates I am developing received the one 30 sec. exposure with stop f/64, the other 150 sec. at the same time, and with the same plate and light, and I shall hope to show you that the one which had 30 sec. is correctly exposed for the normal developer, and that the plate which had five times as much will produce an equally good, if not better, negative.

We are now developing the one which received 150 sec. There need be no hurry; indeed, the less the better—you will have time to coax forward more quickly the detail in a very deep shadow, or you

\* Read before the Birmingham Photographic Society.

can subdue a very brilliant high light with weak bromide solution; indeed, the facilities for making up for some of the shortcomings of the commercial dry plate, in giving correct values of light and shade, are unlimited.

Watch your picture closely, and when your shadows indicate that you have obtained the equivalent of a correct exposure as regards detail, add a drachm of citrate of ammonia solution to the developer and pour it back on the negative. Any detail that at this stage may still lie latent, so to speak, in the film, at once ceases to exist. At the moment of the addition of the ammonia citrate, the deepest shadows should show little or no change under the action of the developer.

We have now the same result as regards detail, gradation, etc., as we should have if the plate had received only the critical exposure. But the plate lacks density. Well that is easy enough to get.

In this dropping bottle I have a solution made up as follows:—Potassium bromide, 200 gr.; ammonia '880, 1 oz.; glycerine, 1 oz.; water, 6 oz. We will add 20 drops of this solution to the developer and see what happens. The image gradually darkens (if not quickly enough, then add more, but slow intensification gives the best results. You cannot very well fog the plate with it, strong as it is), and in a few minutes we have gained the density we require, and the plate is ready for the hypo bath. Under this process of intensification only the image which was actually formed when we stopped the development of more detail is strengthened. Excessive exposure, as such, ceased to exist upon the application of the citrate, and if we have not erred in our judgment of the necessary amount of detail in the shadows, we shall have produced a negative equal in every respect to a plate said to be correctly exposed and developed by the orthodox method. We have been able to do this with certainty, because development has from the beginning been entirely under our control, and because we have been able to see on the plate what is so difficult to see mentally, the equivalent of correct exposure.

There are one or two points I should like to reiterate. Always back your plates. To my mind to do so is essential in all photography, and especially under the system I have explained to you. A good backing will enable you to obtain results which would be impossible without it. Give plenty of exposure, and make sure of all detail even if in excess of what is really required. Begin development very gently and tentatively. Do not add more ammonia unless necessary, one-fourth of the normal quantity will usually be sufficient. Stop development before the deepest shadows veil over; you will soon learn how much you must make allowance for detail that the after-process of intensification will make visible. And do not consider a plate over-exposed—within reasonable limits—unless through error of judgment in development you have made it so.

If you ask me what are the advantages of this method over the old one, I will say that in my opinion they are these:—

- (1) It is much easier to over-expose a plate than to give it a correct exposure.
- (2) Development is gradual and perfectly under control.
- (3) If we wish a soft negative very full of detail we can have it. If we require the negative to show marked contrasts, or if we wish to brighten a view taken in a bad light, we can have that too, both with the same exposure.
- (4) The planes of a picture are more correctly rendered, because these planes are built up slowly in due sequence, and are really controlled by that portion in the shadows which we decide shall show the critical exposure.
- (5) The negative does not stain even under prolonged development.
- (6) No hasty modification of the developer is even necessary, provided that the plates have been sufficiently, we will say over, exposed. The proportions of the developer I have given you will do for all subjects, from interiors to seascapes; that is to say, you may always commence with 2 gr. of pyro to the ounce, and with one-fourth the normal quantity of ammonia. You will admit that such a formula is simplicity itself. These are a few of the advantages I claim for this method, there are others which will appear in the working.

And now, gentlemen, it is my duty to tell you that not even the merest detail of this method of development can I lay claim to as my own. It was first brought to my notice in a paper by Mr. George Bankart, of Leicester—an amateur almost without peer in the landscape department of photography. If you had seen his pictures you would admit them to be perfect both in composition and technique—indeed, when I tell you that he was associated with Dr. Emerson in the illustration of the most beautiful edition of Walton's "Complete Angler" that has ever been published, you will not doubt what I say. Mr. Bankart's contributions are superb. Well, Mr. Bankart always works in the way I have endeavoured to describe, and it is knowing that, and not—believe me—any consciousness of merit in myself that has given me the courage to address you upon the subject to-night.

#### CITRATE OF AMMONIA SOLUTION.

Dissolve 1 oz. of citric acid in 3 or 4 oz. of water, then add liquid ammonia '880, until when tested with neutral test paper it is neither acid nor alkaline—that is neutral. Then make up to 10 oz. with water.

In connection with this paper Mr. Simkins developed the two negatives mentioned, and produced both of them equally perfect, and so much alike that you could not recognise which had received the long exposure.

## Skies in Photographs,

AND SOME

PRACTICAL SUGGESTIONS UPON COMBINATION PRINTING.

BY JOHN A. HODGES.

#### NO. I.

THE "printing-in" of a sky from a separate negative by double or combination printing, as it is called, is a method of improving the artistic qualities of the photograph seldom resorted to by the average amateur. It is unnecessary, however, to seek very far for a reason, as combination printing, even in its simplest form, is generally regarded by the uninitiated as a desperately difficult affair, and one quite beyond the skill of any but the most experienced. It is to remove this impression, which is largely an erroneous one, from the minds of the less experienced readers of the AMATEUR PHOTOGRAPHER, that I have undertaken to write this article.

It may be explained at once that it is not intended to give much consideration at the moment to the purely artistic or æsthetic aspect of the subject, and it will also be assumed that the desirability of introducing suitable clouds into the composition when they are absent is conceded. The following suggestions, therefore, will be essentially of a practical nature.

Let me say at the outset, that I prefer, whenever possible, to secure the sky and landscape together upon the same plate, and, unless the reader be wedded to the use of very small diaphragms, this is generally by no means a difficult matter. In work of this kind one's aim should be to represent nature as truthfully as possible; therefore, if it be not practicable to secure the sky upon the landscape negative a second plate should, with as little delay as possible, and without moving the camera, be exposed upon the sky. But in so working, great care must be exercised, for it by no means follows that the particular cloud forms existing at the moment when the landscape was taken will necessarily be those best suited to harmonise with the general lines and balance of the composition.

If an attempt be made to secure the sky and landscape upon the same negative with an ordinary cap, in nine cases out of ten the result will be a failure. Resort must therefore be had to some more perfect means of effecting the exposure. An expensive or very quick-acting shutter is by no means necessary. Indeed, many such are quite useless for this particular purpose, the object being to use an instrument capable of giving a relatively longer exposure to the foreground than to the sky. The particular type of shutter which best fulfils these conditions is that known as the "Blind" or "Window" shutter, by which names the shutters of Piacé and Tylar are respectively known. In each the principle is the same, the exposure being effected by drawing a blind or curtain up and down in front of the lens, and commencing and ending with the foreground. An additional advantage in this form of shutter lies in the fact that being effected by hand the exposure is absolutely under control, and can, moreover, be graduated so as to cause the foreground to receive, if necessary, many times the amount given to the sky. In practice, after focussing the view, I cautiously draw down the blind until the horizon is just shut off; I then note its position, and when making the actual exposure arrest the descent of the blind when that particular point is reached, and allow the requisite additional time for the foreground before drawing it completely down. When so working, stops smaller than  $f/16$  should not be used. This, as I have said, is my favourite method of obtaining skies, and as I have now given it a six or seven years' trial, I have no hesitation in recommending it. Previously I had used for the same purpose an ordinary flap shutter affixed to the lens; the former method is, however, preferable. Conversing recently with Mr. Hepworth upon the subject, he informed me

that thirty years ago the late Mr. J. H. Dallmeyer placed a similar shutter upon the market, thus proving that in photography no less than in other matters, "history repeats itself." I have for some time past entirely given up the use of the cap, and now make all my exposures with an ordinary blind shutter, for, besides the special advantage of being enabled to give a graduated exposure, the possibility of accidentally shaking the camera is entirely removed.

The method is simplicity itself, but a little care may be needed at first to avoid over-exposing the foreground, although by careful development an error in this direction can to some extent be compensated for. If the sky and the landscape portion of the negative develop up together, a good result may be expected; but if, on the other hand, the foreground comes up quickly and in advance of the sky, the dish should be tilted so as to keep the developer over the sky portion of the plate and away from the foreground. If, on the contrary, the sky should make its appearance well in advance of the rest of the picture, the converse treatment should be adopted, but in either case the developer must be kept in gentle motion, and the dish occasionally tilted, so as to cause the whole of the film to be wetted with the solution; this must be done, or the negative will probably be of unequal density when finished.

Skies always afford a target for the critics' darts, and I have on more than one occasion had my own pictures pointed to as examples of unsuitable combination printing, but the critics had themselves fallen into error, for in each instance it so happened that sky and view were secured upon the same plate. But it is right to point out that unnatural and untruthful results may be produced even when this method is resorted to. For instance, if the sky be either under-exposed or under-developed, it will easily be seen that a very false rendering may result. Some judgment, therefore, must be exercised, both in exposing and in developing the plate. In the event of the sky printing too heavily, the negative may be improved by intensifying with uranium, and subsequently discharging the colour from the landscape portion with a brush dipped in a weak solution of ammonia, by the method which I have recently described in detail in the *Photographic Quarterly*.

Before proceeding to describe the actual process of printing-in clouds from a separate negative it may be well to briefly refer to the cloud negatives themselves, and to the taking of them. A collection of cloud negatives should, of course, be as extensive and varied as possible, so that the necessity may not arise of having to combine the same sky with several different landscapes, a practice by no means uncommon with some exhibitors even at the present day. I do not intend to enter into a dissertation upon cloud forms, because any work upon meteorology will give the reader more information upon the subject than would be possible in the short space open to me in these columns.

I now prefer to take my cloud negatives upon celluloid films, because, by being able to print them from either the back or the front, they may be easily adapted to suit the lighting of any particular view, which in practice will be found a great convenience. I have long noticed a great advantage in using isochromatic plates for this work, particularly when sunset effects are attempted, or when the cloud forms themselves are very light and delicate. I have tested isochromatic plates, both of Edwards' and Ilford make, against ordinary plates of otherwise irreproachable quality, upon cloud effects, and have satisfied myself of the undoubted superiority of the isochromatised plates over the ordinary. Indeed, I have been able to secure good, printable negatives of delicate fleecy clouds upon isochromatic plates, to have attempted which on ordinary plates would have been to court failure. It is a mistake to suppose that only heavy, well-defined clouds with strong contrasts of light and shade are necessary; the use of such for all purposes by the unthinking has done much to bring combination printing into contempt. To combine, for instance, a heavily-printed, stormy sky taken late in the day with a bright, sunshiny landscape taken with the sun high in the zenith can but lead to a glaringly untruthful result, and yet the practice is not an uncommon one. In order to guard against possible errors of this kind, a note of the time of day and the direction of the light, whether from the left, on the right, or in front of the camera, should be made at the time the negative is taken, and these details should be written upon a slip of paper and pasted on the negative itself. The actual exposure necessary will, of course, vary considerably, and will depend upon the nature of

the clouds, the time of year, and the time of day when the negative is taken. An elaborate or very quick-acting shutter, however, is not necessary, for if the light be very bright the lens may be stopped down. I find the "blind" shutter to which I have previously referred quite efficient and sufficiently quick for the purpose. In taking bright feathery clouds in good summer light, the exposure, of course, must be short. For such, with the lens stopped down to  $f/32$ , I find by drawing the blind down as quickly as possible I get a correctly exposed plate. On the other hand, when taking a late sunset effect, with heavy massive looking clouds partially obscuring the sun itself, it is sometimes necessary to give two or even three seconds' exposure. When taking cloud negatives a point of view should be chosen which will give an unbroken and low horizon; trees or other objects obtruding on the sky line would render the negative useless for the purposes of combination printing.

In regard to development, little need be said. Any good formula to which the worker is accustomed may be used. Personally I prefer pyro and ammonia. A rather weak developer will be found most suitable, and development should not be pushed too far, the object being to produce a delicate and not over-dense negative. A very dense and vigorous negative will render the operation of double printing a more difficult one to perform.

#### RICHMOND CAMERA CLUB.

At the meeting held on the 21st inst. Mr. F. P. Cembrano, jun., in the chair, Mr. Andrew Pringle delivered his address on "Different Lantern-slide Processes." He said he would neither particularise nor demonstrate any of the known processes, but he would simply discuss the theory and the salient points of each one. At the outset he protested against the idea held in certain circles that no artistic result could be obtained in a lantern-slide. We all know that some people, principally the followers, not disciples, of a defunct worker, despised and condemned this mode of pictorial representation. He maintained that a slide properly made and properly shown was capable of as much artistic feeling as any print. We should not lose sight of the different conditions under which each is seen; one is viewed directly in our hands by reflected light, the other is indirectly transmitted to the eyes by the light of the lantern on the screen. The gradation must be the same in one case as in the other; in other words, it must be equally long in the prints as in the slide *as seen on the screen*. This meant that the scale must actually be higher in the slide itself, because it was viewed by transmitted light, and because the image was enlarged very considerably when projected on the screen. The loss of light being extremely great the scale of tones must therefore be considerably higher.

Judging from his own experience, he had no doubt that most photographers had missed the principal point in this branch of photography. They were under the wrong impression that absolutely clear high lights were an important factor, but such was not the case. The highest lights on the slide should be absolutely clear glass, but they would not show as absolutely white on the screen. The very highest light, such as represented in the slide by clear glass, should be very sparingly used. It was the enormous expanses of clear sky and superabundance of high lights that had brought discredit on lantern-slides.

Next in importance were what he would call secondary lights, which are the highest, though *not the very highest*, lights in a slide; for instance, a whitewashed building, which should not be represented by bare glass, but should show detail.

The half-tones were extremely essential in all pictures, whether slides or prints; the detail should be plentiful and the light moderate, neither too high nor too low. If there was too much light the "tout ensemble" would be hard, while if the half-tones were too low the picture would be flat.

Special attention should be paid to the shadows, as they formed a most important part of the slide. They should be so transparent that all the detail in them should be visible on the screen to a very considerable extent. If an absolutely clear light on the screen was dangerous, great opacity in the shadows was much more so.

It was a fact that not sufficient attention was generally given to the general tone of a lantern-slide. For his own part he believed that warm tones were the most desirable; in fact, a perfect slide should, besides the points above referred to, be of a warm, a decidedly warm colour. The tone obtained on a wet collodion slide toned with platinum was pleasing, but it became wearisome. Cold tones, such as those produced by the ferrous-oxalate developer, were good for scientific subjects, but for artistic work they were very undesirable. He really believed that a large number of cold-toned slides in a lecture produced a cold and fatigued effect on the spectators.

Barring toning processes, there was a great danger of over-exposure and fog when attempting to obtain warm tones by development and increased exposure. This was especially the case with gelatine.

Mr. Pringle said that there were two kinds of slides which he would qualify as intolerable; one of them was of the black and white sort, such as a snow scene in midsummer, a variety often met with; and the other, which was quite as painful to see, was the result of over-exposure. The lecturer then mentioned the leading characteristics of the various processes most in vogue for lantern-slide work.

Beginning with the wet collodion process, he said that the high lights and the half-tones were very good, and the shadows fairly transparent, though liable to too much opacity. If developed rapidly and thin, the results could be modified to a great extent by subsequent intensification. It also possessed the advantage of toning. Some Scotch photographers toned their wet collodion slides with gold, and though it was said that slides so toned would not be permanent, he knew that permanency was quite possible if the toning was properly carried out.

With regard to the dry collodion or collodio-bromide process, he was of opinion that it would almost equal wet collodion in the matter of producing transparent shadows and clear high lights. Warm tones could be produced with great ease, and, the exposure being a short one for contact work and not too long for reduction, he considered this the second best process.

The very finest results were obtained by the albumen process, but being exceedingly slow it was only suitable for contact work. He thought a brief outline might prove interesting to the members. The glass plate was cleaned thoroughly well and carefully coated with iodised collodion. It was then coated with albumen. The albumen should not be whipped up, and it must be iodised. When in a limpid condition it should be poured over the collodion film for about a minute or so. It was then allowed to dry, and here was one of the difficulties of the process, for it was absolutely essential to avoid dust while the plates were drying. The plate is then sensitised in a strongly acid silver bath. The average exposure would be, by contact, about 30 sec. to diffused daylight. The acid pyro developer was the best, and it was preferable to use and to keep it hot during development. The plate was toned and fixed simultaneously in the sel d'or bath. Toning was a great advantage, as any desired colour could be obtained.

The gelatino-chloride process, although it had produced some remarkably fine slides in the hands of Mr. Cowan, he believed was not the best process for lantern-slides. He referred principally to rapid chloride emulsions, in which his own experience was that there was a danger of introducing serious defects in the results.

For all-round work, and provided the proper brand of plate was chosen, the gelatino-bromide process was the best of all processes. The results were almost, if not quite, equal to those obtained by the other processes; warm tones could be easily got without necessity of fogging, and there was no difficulty in getting good half-tones. He recommended a slow emulsion, and he deprecated one containing a mixture of bromide and chloride, or an organic salt of silver. Workers of gelatine plates seldom used a clearing bath, but he thought this a great mistake; in fact, he strongly advocated its use, not only on account of the plate itself, but also of the water used in development, which generally left a deposit on the plate. A saturated solution of alum acidified with hydrochloric acid was the bath he would recommend. Although varnishing the slide was not an absolute necessity, still he thought it was an advantage not to be overlooked. The shadows were rendered more transparent, as by altering the molecular surface of the gelatine the varnish allowed the light to go through better. The more nearly the image approaches the appearance of a stain, the nearer will the slide be getting to perfection. Mr. Henderson's argentic stain, which was an emulsion containing an organic salt of silver, had this quality. It printed right out, it could be toned to any desired colour, but sometimes it was difficult to obtain density by this process.

As to light for contact work, Mr. Pringle said that magnesium was better than daylight, especially for chloride plates.

The lecturer then handed round some specimen slides on albumen and collodion, showing some of the points he had alluded to.

A member asked for the formula for the acid clearing bath.

Mr. Pringle replied that he used the following:—

Saturated solution of alum	...	...	...	...	20 oz.
Hydrochloric acid	...	...	...	...	2 drms.

The Chairman said that Mr. Pringle had so thoroughly discussed the matter that he had left him little to say. He agreed with all of Mr. Pringle's remarks, but he thought that to an experienced eye a collodio-bromide possessed a quality and a sparkle that were seldom met with in a gelatine plate. Taking it all round, he inclined to think that collodio-bromide was the easiest and the best process

for lantern work. Gelatine plates had the great drawback that the colour of the slide very often changed on drying, and he had even noticed a change take place some months after the slide had been made.

With regard to the clearing bath, he warned the members that though very useful it was liable to spoil a good slide if it was not used with great care. An acid bath containing iron was very good for some slides, as it not only cleared the plate but would improve the colour of the image. If the plate were left in it for too long, the image would be too much reduced and the tone too cold.

## TUNBRIDGE WELLS AMATEUR PHOTOGRAPHIC ASSOCIATION.

THE sixth annual exhibition is over, and it is more than likely that it will long be remembered in Tunbridge photographic circles, and it may bring the subject of exhibitions and awards prominently to the front. The judges were Col. Gale, and Messrs. Geo. Davison and Wm. Mayland, who, in making the awards, say that, having given careful consideration to the exhibits in the exhibition, their decisions are as follows:—

In the following classes, whilst withholding all awards of medals on the ground of insufficient merit, they are pleased to mention the following as the best, in their opinion, in each class:—Class I.: (No. 13) "Entrance, Great Mosque," E. R. Ashton. Class II.: No award or mention. Class III.: (44) "Breakers," Geo. Lewis. Class IV.: No award or mention. Class V.: Lantern slides: No award or mention. Class VI.: Transparencies: No award or mention. Class VII.: Scientific: No award or mention. Class VIII.: No award or mention. Class IX.: Nos. 224 to 227, four slides, A. Cornell. Class X.: (358) "Waiting for the Boats," F. G. Smart. Class XI.: (314) "Shade," W. B. Cassingham. Class XV.: No award or mention. Class XVI.: (578) "Washing Day, Normandy," R. W. Robinson. In the remaining classes the awards are as follows:—Class XII.: (345) "The Grey Dawn," silver medal, B. Alfieri; (399) "Fenland," silver medal, A. Horsley Hinton; (372) "The Peasmarsh after Sunset," honourable mention, T. M. Brownrigg. Class XIII., Genre: (418) "Aha!" silver medal, Mr. S. F. Clarke; (412) "All's Fair in Love or War," bronze medal, A. G. Tagliaferro; (414) "Worn Out," honourable mention, J. E. Austin. Class XIV., Lantern slides: Nos. 499-504, silver medal, T. M. Brownrigg; 463-468, silver medal, E. G. Lee. Class XVII. Genre: (607) "A New Pet," silver medal, R. W. Robinson; (591-595) "The Naver Ceremony," honourable mention, S. N. Bhedwar. Class XVIII.: Nos. 664a-669a, bronze medal, Geo. A. Thompson. Class XIX. Portraits: (690) "Sir F. Leighton," silver medal, R. W. Robinson. Class XX., Enlargements: (735) "Kew Gardens," silver medal, F. Seyton Scott. Apparatus: No award.

The judges wish it to be understood that they have fixed a high standard of excellence, and have applied it throughout all the classes and awards.

The judges have been very chary in making their awards, a course of proceedings by no means to be deprecated when not carried too far.

In Class I. (architecture, exterior or interior) Mr. A. W. Pierson's "Portcullis, Bodiam Castle" (5) strikes one as being very good, and Mr. E. R. Ashton, who sends a most interesting collection of Algerian views (10-15), gains honorary mention for "Entrance to Great Mosque" (13), in each case the native figures being most artis-

tically grouped. Passing to Class II. (for interiors), some interesting views of the drawing-room at Broom Hill (35) and Sir David Salomon's workshop come from Mr. J. D. Morgan, whilst Messrs. H. T. Wood, E. R. Ashton, and W. B. Cassingham again figure creditably. By far the largest class is No. III. (landscape and seascape), for it is here where the talent of the amateur is always most visible; 44-48 are excellent seascapes, and Mr. G. Lewis secures honorary mention for the first. Mr. H. T. Wood's dozen (49-62) are all of them very pretty little scenes. Mr. Horace Booty's exhibits (80-85) prove him to be a welcome addition to the Association, and his contributions include some very effective views. In 112 and 113 Mr. J. Chamberlain, the energetic secretary, has two good specimens of pictures taken with a pinhole instead of a lens. Class IV.: Messrs. J. Chamberlain, W. E. Brampton, and E. R. Ashton send specimens of genre. In the case of the latter, No. 128, "An Arab Household," is really one of the best pictures in the room. It has been awarded one of our Bronze Medals, and the figures are posed with great skill, and the scene is exceedingly natural. "A Consultation" (No. 126) is a capital example of artistic work. The lantern-slides and transparencies, and stereoscopic (132-183) make very fair classes, for which Messrs. Pierson, Cornell, Morgan, and Cassingham are responsible. Coming to Class VII. (scientific or any subject not included in the above), it is perhaps well that this class does include any subject other than scientific, for we cannot find anything that especially calls our attention in a scientific sense. It contains, however, some good flower studies by Mr. Morgan, but the other entries are of no great importance; and Class VIII. includes some admirable specimens of the work from the President, Mr. F. G. Smart, Messrs. Wood, Cornell, Morgan, and Cassingham, the latter two of whom, together with Messrs. Cornell and G. Brittain, being the contributors in Class IX. for lantern-slides from negatives taken with the hand-camera.

Classes X. and XI. were open to members of any photographic society in Kent or Sussex, and were very fair. In the former (figure studies) the President forwarded some very good pictures taken at Hastings (256-258). Messrs. P. Darm, W. S. Putland, and A. R. Dresser are the fresh names to be found in Class XI. Mr. C. A. Timmins, in Class XII., landscape or seascape, has two good cloud effects (336 and 338), but they are printed so dark as to look like moonlight. Mr. B. Alfieri secures a silver medal with "The Grey Dawn" (345), and his "Against the Sky" (346), like 345 and 347, is an example of the new school, in which definition subordinates pictorial effect; whilst the grouping is very good. Mr. Brownrigg has some fine atmospheric effects in 372-6, but one sadly feels the want of figures in some of these pictures. Mr. A. Horsley Hinton contributes four exhibits, gaining with "Fenland," 399, a silver medal. "Winter's Requiem" (396) is very good, but surely, Mr. Hinton, the sky is too dark, and ought to reflect in the water. "Lowland Solitudes" is a large specimen of Mr. Hinton's excellent work. Passing on to the Genre class, a silver medal is awarded in this class to Mrs. F. Clarke for a capital little item, suggestively entitled "Aha!" (418), and Mr. A. G. Tagliaferro, for his "All's Fair in Love or War" (412), carries off the bronze medal. "Pastorale" (428), from the silver medallist, appears to be a good example of combination printing, and is very poetic in treatment. A good specimen of the pun-title is afforded by Mr. C. Court Cole in 429, "The Cobbler with his First and Last." Silver medals go to Messrs. E. G. Lee and T. M. Brownrigg, in Class XIV., for lantern slides. In the Landscape or Seascape Class, "A Stiff Breeze" (571), by H. W. Bennett, is exceedingly good. Mr. R. W. Robinson comes again to the front with some very fine work. Very interesting and very original are some of the studies, in which the grouping is very effective, particularly "A Mussel Gatherer" (579).

The open class of Genre is certainly the most interesting and important, thanks to Mr. S. M. Bhedwar, of Bombay, who secures "honorary mention." It contains his now famous "Naver" pictures. R. W. Robinson, who is awarded a silver medal for "A New Pet" (607), and whose series of pictures (607 to 617), many of them dealing with life in Brittany, have been famous in many of the recent exhibitions. Mr. G. E. Thompson is the recipient of a bronze medal in Class 18 for lantern slides, and in the next section Mr. W. J. Byrne, Mr. S. Bhedwar, and H. Yeo have some good studies, and a silver medal for a fine portrait of Sir Frederick Leighton goes to Mr. R. W. Robinson, who is here again very successful. In the enlargements (Class 20), Mr. F. S. Scott, with a platinotype, "Kew Gardens" (735), wins the silver medal. To deal with the not for competition exhibits, we fancy we recognise in 772, "The Weir Pool," by Mr. H. P. Robinson, the artist himself sitting at the side of the waterfall, and in looking at the picture just note the excellent effect of the smoke in the distance. The Rev. W. F. Scott, Messrs. Elliott and Sons, H. Sandland, and A. Cornell also exhibit in this class; an interesting series of views are lent by Colonel Dawes.

Apparatus was exhibited by Messrs. Watson and Son, Smith and Son, James Doré, the Blackfriars Photographic and Sensitising Company, Taylor, Taylor, and Hobson, T. H. Powell, J. R. Gotz,

Dunkley and Rogers, the Paget Prize Plate Company, Henry Park, Whitrow, Cassingham, Morgan and Penn.

#### EXETER AMATEUR PHOTOGRAPHIC SOCIETY.

At the Art Gallery of the Exeter Museum the annual exhibition was opened on 24th ult. It was on a much more pretentious scale than last year—which was practically a private exhibition.

The Exeter society are to be commended for having divided their competitions into two parts, namely, for members only and open classes. In the latter division contestants may be amateurs or professionals. To an outsider it might seem unfair to pitting amateurs against professionals, but experience has proved the reverse. This was now again made manifest on Thursday by the amateurs carrying off the majority of the awards. There were 455 pictures hung on the walls, and of these 362 were for competition. Contributions were sent in from all parts of the United Kingdom, whilst Italy and Philadelphia were also represented. Members' classes comprised general photos, portraits, lantern slides, and enlargements, the several processes including platinotype, bromide, carbon, and others. The rest of the sections are open, beautiful examples being exhibited. Two large carbon enlargements of Hawarden Castle and Chester Cathedral attract a good deal of attention, and among the exhibits not for competition are an enlargement of the Alhambra Palace, the interior of St. Puolo, Rome, a bird's-eye view of Oxford, and a splendid photograph of Exeter Guildhall by Mr. Long.

The officials of the society are as follows:—President, Dr. J. Cheese; Vice-President, Mr. W. P. Wall; Hon. Secretary, the Rev. J. Sparshatt; Hon. Treasurer, Mr. J. Hinton Lake. Committee—Messrs. Holden, Dudley, Berrie, Cole, Lloyd-Jones, Batt, Huggins, Melhuish, Colonel Hutchinson, and Colonel Dowdall. Following are the awards:—

General (members only)—Silver medal, E. Dudley, subject, "The Chapel at Haddon Hall;" bronze medal, "A Somersetshire Peep," by A. Norman. Portraits and figures (members only)—Silver medal, "Family Cares," the Rev. J. Sparshatt; bronze medal, "Moorish Male Figure Study," Colonel Hutchinson; honourable mention, "Playing with our Dolls," the Rev. J. Sparshatt. Enlargements (members only)—Bronze medal, "Looking Down the Exe from the Bonhay," Miss K. E. Truscott. Lantern-slides (open)—Equal for bronze medal, C. Cole and F. W. Huggins (various subjects); honourable mention, F. W. Huggins, "Microscopic." General (open)—Silver medal, A. Horsley Hinton, "Salt Marshes, Essex," "October," "The Evening Ebb;" bronze medal, C. C. Cole, architectural studies; honourable mention, W. C. Hemmons, "Boats in Harbour," "Old Hulk." Portraits and figures—Open—Silver medal and honourable mention, F. E. Austin, "Chaff" and "Worn Out;" bronze medal, R. H. Lord, "How's That?" Enlargements (open)—Bronze medals, A. Drysdale, "On the Couquet;" and Woodbury Company, "Punchinello." Lantern-slide—Open—Silver medal, J. E. Austin, various subjects; bronze medal, E. G. Lee, ditto; honourable mention, A. Pringle and Mrs. Traverner. Other prizes were given by the President, the Hon. Secretary (the Rev. J. Sparshatt), Colonel Hutchinson, and Colonel Dowdall. In a competition for a photograph illustrative of the poem "Dora," Miss Sherley Surridge was successful; for survey prints Miss Truscott and Mr. E. Dudley took first and second respectively, and Mr. Cole won the honours for pictures illustrative of holiday rambles.

Mr. Walter D. Welford was the judge.

#### SOUTH LONDON PHOTOGRAPHIC SOCIETY.

This exhibition was opened on 24th ult., and closed on 26th ult., and we regret that we cannot congratulate the Society either on the exhibition or the hanging of the frames. The judges, Messrs. Cembrano, Horsley Hinton, and Andrew Pringle, made the following awards:—

Class A, silver medal for the best general exhibit: Nos. 482 to 513, and A 52 to 54, Mr. C. H. Oakden. Class B, silver medal for the best picture exhibited, irrespective of size: No. 242, Mr. Thos. H. Powell. Class C, silver medal for the best set of six lantern slides: No. A 41, Mr. W. Rice—bronze medal for the second best set of six lantern slides: No. A 2, Mr. H. Esler. Class D, silver medal for the best series of six views taken within a radius of five miles from Hanover Hall, south of Thames: Withheld. Class E, silver medal, portraiture, best set of six: Withheld. Class F, bronze medal for the best picture taken on any of the Society's excursions, irrespective of size: No. 179, Mr. Wm. Howell.

Classes open for the members of the South Metropolitan photographic societies:—Class G, silver medal for the best picture shown, irrespective of size: No. 486, Mr. C. H. Oakden; bronze medal for second best ditto: No. 110, Mr. H. Kirby. Class H, silver medal for best set of six lantern slides: No. A 62, Mr. F. Goldby, of Brixton and Clapham Camera Club; bronze medal for the second best ditto: No. A 51, Mr. C. H. Oakden.

On Friday evening, at the time of our visit, the room was fairly

full, and it was utterly impossible without going on one's hands and knees to see many of the frames, as they were actually some of them touching the ground. The silver medal in Class B was awarded to 242, "A Rising Chemist," by Mr. T. H. Powell—we presume for the somewhat punning title, otherwise we cannot understand it, for it is certainly not a perfect print or perfect picture.

The first we notice are some small landscapes by W. Dishman, several of which if printed in more suitable process and with greater care might be really nice subjects. Of these, "Morning," "A Frog's Paradise," and a "Windy Corner" are the best, the last-named being spoilt by a careless joining of clouds and landscape. J. W. Slater shows some good plain silver printing of the usual commercial type. Amongst a number of works by Howard Esler, we should select the two Canterbury subjects as very good. The remainder of this exhibitor's contributions are no doubt technically good, but are wanting in taste and feeling. Very well worth notice are the landscapes by N. Harman, "The Rookery, Dorking," and "Mill at Beddgelert," being amongst quite the best landscapes in the room. Wm. Howell shows a number of things of very unequal merit; thus his landscapes, such as "On the Ravensbourne," which is very hard and appears to have been under-exposed. His Canterbury architectural studies are very fine, and must run the best very close.

We notice a frame of carefully produced snap-shots, but the ill-advised style of mounting seriously injures the effect. Thos. H. Powell sends a great variety of work. To "A Rising Chemist" is awarded a bronze medal. It is a small child portrait in very red colour. "Gee-up, mine Horsie" is another nice little piece of work of the same character, albeit many of Mr. Powell's photographs are very inferior to these, and it is difficult to understand an exhibitor lowering his average merit by contributing some that are seen here adjacent. H. E. Farmer has some very satisfactory work to show. "With the Tide" is a nicely rendered seascape with sailing vessel. "Winter," too, narrowly misses being a complete success. The opportunity and material are there, but have not been fully utilised. "A Coming Storm" might have been a picture but for the three children in the immediate foreground. Some half a dozen little landscapes by G. Richardson are worthy of notice. They give evidence of nice appreciation of quiet river scenery nicely treated, but this is marred in one case at least by a frivolous arrangement of figures. Chas. H. Oakden has a great number of exhibits, and carries off silver medals for the best general exhibit and also for the best picture. His work is by no means of equal merit throughout, his architectural studies being by far the best, and it is for an interior of Ely Cathedral that he takes the first award. Other exhibitors whose work should be noticed are H. Sandland, J. T. French, E. A. Whitby, W. Rice, etc.

The apparatus section, or, as it is called in the catalogue, "the apparatus erection," included exhibits by Messrs. Adams, H. Crouch, Ltd., Dollond and Co., Gill and Son, J. R. Gotz, Howell and Son, Percy Lund and Co., Mody and Cattens, D. Noakes, H. Park, George Philip and Sons, T. H. Powell, W. F. Slater, W. H. Whittingham and Co., and A. N. Wormald and Co. During our stay in the hall a series of lantern slides were thrown on a screen, and we cannot congratulate the South London Society on the quality of the slides, some being actually bad.

#### NORTH MIDDLESEX PHOTOGRAPHIC SOCIETY.

THIS exhibition was opened on the 28th ult., and deserves special mention in that the society have been courageous enough to rely upon its members only for the pictures, and right well have they responded. The exhibition is certainly the best we have yet seen as representing purely members' work. Thirty-three members contribute over 180 pictures and twenty sets of lantern-slides. The judges, Messrs. J. Gale and Ralph Robinson, have awarded five certificates, although nine were placed at their disposal, and the others were withheld because they felt that they would have had to award at least a dozen extra.

Mr. Mummery is well to the front with some charming studies in low tones, particularly noticeable being No. 4, "A Light from his Pipe," and 19, "Low Tide in an Essex River," for which he gains a certificate. No. 7, by the Hon. Secretary, J. McIntosh, is good but a little too dark, a fault which is carried to the extreme in No. 7, by Mr. Mummery. No. 14, "The Long Day Closes," by J. McIntosh, is a true evening lighting, though even this is heavy in the shadows; another of Mr. McIntosh's prints, No. 21, is soft and pleasing. No. 23, "A Professional Beauty," a series of successive dog attitudes, by R. H. Wynne, is worth looking into. In 29, by J. McIntosh, we have soft, low tones decidedly pleasing, and Mr. Marchant scores in 31, "Still Waters." No. 45 is hot in tone, and thus a good thing spoilt. No. 56, "Trout Inn, West Drayton," by E. Cherry, is a pleasant study, but has too many figures, and 62, by the same worker, is a capital interior. No. 66, "A Creek on the Thames," by C. Beadle, may well be noticed for its clever foreground. No. 80, "Towards Evening on the Yare," by A. J. Golding, is one of this

worker's well-known shipping bits with far too much foreground, and 83, by the same, is a good figure study. No. 92, "Oulton Broad," by H. Smith, is clever and breezy. In 96 Mr. Golding misses a picture for want of a sky. No. 116, "The Lynher, North Hill," by W. Taylor, justly deserves the judges' award, it being a simple little study, but very soft and harmonious. No. 119 is a frame of four lake scenes by H. Walker, of rather hackneyed subjects but showing good technical work. No. 122, by A. J. Johnson, the two centre shots have fine skies, but the right-hand one is absolutely spoilt by the black masses of trees and over-printing. No. 132, "Footsore and Weary," by A. J. Hewson, is certainly expressive of the title, and in 133 Mr. F. Gaudon scores with a good enlargement by the energetic Hon. Secretary. No. 144, "A Much-Prized Picture," by H. Walker, is quite like Col. Gale's work in style, and takes 'a certificate. No. 145, "Marbles," by S. E. Wall, is spoilt by a curious blue stain over the whole picture, and 148, by the same worker, is a little heavy, especially in the sky, a fault again noticeable in 149. No. 153, "Going an Errand," by the same worker, takes a certificate, but is, we think, rather too black with a heavy sky. No. 174, "Ouchan Valley," is a clever treatment of low country, and 175, by A. J. Johnson, a clever portrait of "Sir Fred. Leighton." No. 177 is a series of five prints by J. W. Marchant and J. McIntosh, especially valuable as a lesson of the value of re-halogenisation. No. 180, an enlargement by J. Hand, is also good and is free from those too prevailing faults, soot and white-wash. The lantern-slides, 193, by A. D. Golding, take a certificate, but are, we think, beaten by 203, by S. E. Wall. Too many of the slides are far too brilliant and black and white, and many spoilt by the want of suitable skies.

### Societies' Notes.

THE amateurs of Oban, N.B., have banded together and formed a photographic society. Mr. Sam Lawrence, chemist, has been appointed interim Secretary.

A PHOTOGRAPHIC society has been formed at Marlborough. Mr. H. H. Copnall, of 5, Barn Street, has been appointed Hon. Secretary.

### Societies' Meetings.

**Aldenharn Institute.**—The usual fortnightly meeting was held on the 22nd ult., when the Chairman of the Club, Mr. W. Vere Mingard, gave "A Chat on Light," which proved very interesting. Having shown how difficult it is to properly define light, the lecturer showed the fallacies of Newton's "emission" theory, and then briefly pointed out the essentials of Huygen's "undulatory" theory. He showed the impossibility of light travelling in any but straight lines, and explained the principle of the "pinhole" camera. Having made it plain that light is a *sensation* and is itself invisible, Mr. Mingard dealt with the subject of refraction, afterwards combining it with dispersion. Newton's famous prism experiment, with the resultant spectrum, was described, and the solar spectrum analysed. Naturally special interest was evinced in the ultra-violet rays. A careful explanation of the theory of colour, and a comparison of colour in light to pitch in sound, brought a very enjoyable demonstration to a conclusion. In the conversation which followed, Mr. Allan Hair specially congratulated the lecturer on his fertility of illustration, by means of which he was enabled to simplify many parts of the subject ordinarily fraught with much difficulty. During the evening the Secretary distributed some sample lantern plates kindly presented by the Paget Prize Plate Company.

**Bournemouth.**—A meeting was held on the 22nd ult., when a demonstration of photography by flash light was given by Messrs. Miell & Ridley. A very interesting paper was read, dealing with the subject in a practical manner. After describing the source of light, and some of the various means employed to utilise it, pointing out the defects and drawbacks of the earlier methods, an improved lamp recently introduced for the purpose of photography by flash light was fully described, the mechanism being explained by means of a drawing. The contrivances used to diffuse and reflect the light were shown and explained. After the reading of the paper, four photographs were taken, including an instantaneous one of the President of the section (Rev. J. R. Husband, M.A.) and Dr. Roberts Thomson, also a group of seven of the members, all of which were very successful. Two of the negatives were developed in the presence of a number of the members in the large developing room of the establishment. At the conclusion a hearty vote of thanks was passed to Messrs. Miell & Ridley for their demonstration, which had clearly proved to those present that daylight is not

essential to the successful practice of the art of photography, and that the application of such artificial light will enable the photographer to ply his art under conditions and in circumstances never dreamt of fifty years ago.

**Cardiff.**—The seventh annual meeting was held on the 25th ult., the President, C. F. Gooch, Esq., J.P., in the chair. The report and statement of accounts were adopted as presented, and the officers for the ensuing year were elected. The retiring President was re-elected, and offered to repeat the prizes given during the past year. The Shuttle Hand Camera, sent by Messrs. Houghton and Sons for the inspection of the members, and the unique method of changing the plates, were much admired.

**East London.**—On the 22nd ult., ordinary meeting, Mr. G. S. Pasco (Pres.) in the chair. Mr. S. G. Buchanan Wollaston, of the Platinotype Company, demonstrated the new cold-bath platinotype process, in a very able and explicit manner, before a crowded meeting. As a previous demonstration by Mr. Wollaston has already been fully reported, it is unnecessary to publish a repetition. The members were particularly struck by the ease in which a passable print could be obtained from an indifferent negative, by the judicious use, of glycerine alone, and when mixed with the developer. A dozen prints from negatives of various contrasts were developed, showing how soft prints could be obtained from comparatively harsh negatives, the half tones in each case being beautifully rendered. A large number of mounted specimens were handed round for inspection, and were greatly admired.

**Glasgow.**—The society met on the 18th ult. at 4 o'clock. The subject for the evening was a lantern exhibition by the secretary, Mr. William Weir. The subject the exhibitor chose was "Uses of the Hand Camera." He showed slides of the Clyde, steamers, animal studies, etc. The views were mostly taken with Shew's Hand Camera. The slides, which were much appreciated, showed that Mr. Weir knew how to make good use of his camera. The lantern was successfully worked by the chairman, Mr. McCall.

**Fairfield Camera Club.**—The fortnightly meeting was held on 22nd ult., the Vice-President, Mr. H. J. Mallabar, in the chair. After the usual business, he gave a most interesting and instructive demonstration in the new cold-bath platinotype, treating the subject in his usual able manner. His magnificent specimens called forth universal commendation, and were ample proof of the capabilities of the process. The mode adopted of development locally by the aid of a brush and glycerine, was watched with much interest. The result was, as in the other cases, a fine print, and it almost seemed as if it were impossible to spoil a print.

**Fillebrook.**—November 21st, preliminary arrangements were made for the exhibition on March 1st and 2nd, 1893. Discussions followed on the subjects of (1) "Transparent markings on gelatine lantern plates after development" (which it was suggested might arise from imperfect mixing of the emulsion), and (2) "The new developer, Amidol." Mr. H. W. Bennett showed six negatives taken by him with a view of testing the relative capabilities of amidol and pyro. The subject was a light vase, and the plates and exposures were as follows: Nos. 1, 2, and 3, Ilford ordinary, exposure four minutes each; No. 4, a Mawson; No. 5, an Ilford special rapid; No. 6, an Ilford ordinary, the exposure for the last three being two minutes each. Nos. 1, 4, and 5, were developed with pyro and ammonia, proving, as was expected, somewhat under-exposed; No. 5, especially so, being very poor and stained from forced development. No. 2 was developed with pyro, potash, and soda, the result being similar to those preceding, but the development prolonged. No. 3, developed with amidol, mixed according to maker's directions, but diluted with three times its volume of water, and restrained with half a grain of brom. potassium to the ounce, was completely developed in two and a half minutes, and appeared as if considerably over-exposed. No. 6, with amidol developer, as per No. 3, was a negative full of detail and good gradation, though rather too thin; no stain or fog of any kind. In this case an Ilford ordinary developed with amidol proved decidedly faster than a special rapid developed with pyro. Mr. Bennett promised to make further experiments, particularly with the object of obtaining greater density with amidol; meanwhile it was his opinion that this developer was of great value for shutter work.

**Hackney.**—Ordinary meeting held on 22nd ult., Mr. J. Carpenter in the chair. The Hon. Secretary presented the society with several books, and a number of books were also added. Mr. Hudson also presented the society with a new arrangement for using gas from any tap with the lantern. Mr. Poulson showed some new kind of ordinary silver paper, which was glossy without having been burnished. It was not on the market at present. A demonstration was then given by the Autotype Company's representative. The lecturer proceeded to say that in 1839 it was discovered that paper with bichromate potash darkened by exposure to light, which discovery subsequently led to finding that sized paper darkened more rapidly, and that the darkened gelatine is insoluble. Mr. Swan patented a

process with pigmented gelatine. The lecturer then gave a description of single and double process of transfer. The advantages, he said, were permanency and variety of colours. Ready-sensitised paper would keep from a fortnight to a month if kept dry. To save the trouble of double transfer a mirror at an angle of 45 degs. was used. Several exposure meters were handed round, enabling people to see how the exposure was determined upon. Demonstration was then given, showing the action, single and double transfer being shown. Various questions were asked incidentally by Messrs. Avent, Gosling, Barker, Beckett, and others, and the lecture was one full of interest. The ease of manipulating the paper was surprising, and its cheapness when compared with ordinary silver paper.

**Leigh.**—The ordinary fortnightly meeting was held on the 24th ult.; Mr. T. L. Syms presided. Mr. T. Haddock gave a paper on "Plate-Making," recommending all amateurs to make their own plates. A discussion followed, in which Messrs. Burrows, Leigh, Syms, and Battersby took part. Mr. R. Leigh exhibited some beautiful bromide enlargements which were much admired.

**Liverpool (A. P. A.).**—The monthly meeting was held on 24th ult., the President, Mr. Wm. Tomkinson, being in the chair. He referred in feeling terms to the loss the society had sustained in the death of Mr. J. Noakes, one of the well-known workers of large-sized pictures. The President next complimented the lady members upon the fact that one of their number, Mrs. Marriott, had just succeeded in gaining one of the AMATEUR PHOTOGRAPHER Silver Medals. The Secretary read a short paper kindly contributed by Mr. Whitefield, of Manchester, upon his experiments with compressed gases for lantern purposes. The paper contained most useful information, which was highly appreciated by those present. Mr. J. Sirett Brown then gave a most interesting lecture entitled "A Glimpse of Rome in 1892," illustrated by upwards of 120 slides made from negatives taken by him in the spring of this year. The following is a synopsis of the lecture, which was certainly equal to any of the traditions of the society, and was followed with close attention, interrupted only by the bursts of applause which were frequently evoked by the excellent pictures.

**Louth.**—The AMATEUR PHOTOGRAPHER 1892 Prize Slides were exhibited in the Town Hall on the 24th ult., by Mr. E. J. Wall, to an audience of between 300 and 400. It is needless to state that they were much admired, and the work of the two local celebrities, Mr. and Mrs. S. Francis Clarke, was very warmly received. An interval with vocal and instrumental music gave a brief rest to lecturer, lanternist, and audience.

**North Surrey.**—On 15th ult. Mr. Lewis Wolff read a paper on development (one of a series of lectures for beginners), in which he dealt only with the pyro-ammonia developer, as being the one mostly in use, and which he believes to be still unrivalled. After giving a description of the use of the developer, and explaining how, by varying their proportions, developers may be compounded to meet the requirements of varying exposures and subjects, he developed two plates, the first being a properly exposed one which yielded a good negative with a normal developer, the second a plate which had received exactly four times the exposure of the other, but by greatly increasing the pyro and developing very slowly, using no alkali at the start, an equally good result was obtained, and it showed no trace of its having received so liberal an exposure. To give the beginners present a distinct idea of the functions of the chemicals used, he compared pyro to a horse, bromide to the reins, and ammonia to the whip.

**P.S.G.B.**—Technical meeting on 22nd ult.,—"Preparing Photographs for Exhibition." Mr. A. Cowan in the chair. Mr. W. Bedford deprecated the employment of peculiar frames which ruined the effect of adjacent photographs, but that photographers who adopted eccentric styles of framing should not feel hurt if their work was set apart or placed in less conspicuous situations. It might be advisable even to let it be understood at exhibitions that pictures in frames which might not harmonise with others would very possibly have to be hung in undesirable positions. The Chairman was in favour of the screen system, as at the Crystal Palace, but this could only be adopted in a properly lighted gallery. Mr. W. E. Debenham thought exhibitors should be left to the exercise of their own tastes; the only way he saw out of the difficulty being to draw a hard and fast line, saying within certain limits how the picture should be framed. The Chairman thought such a rule would be unfair. It might shut out a good work, as a particular picture might be the best sent in, and the plea raised by its producer that the other pictures did not harmonise with them. Mr. Debenham did not think that so much in judging depended on the mount as was often thought. Any of the members present were quite capable of judging a photograph on its own merits whatever the mounts might happen to be. They might think the mount was unsuitable, but their judgment of the print would not be materially affected. The Hon. Secretary asked whether the time had not arrived when all prints not actually permanent should be excluded from exhibition altogether. When one

saw prints fading even during the six weeks of an exhibition, he thought it was necessary to take some such course. Mr. Debenham would not exclude fleeting photographs from such exhibitions, but of course permanent collections were another thing. He thought the objections to stating methods and process were most unreasonable. Mr. A. Mackie thought that the exhibitor himself was the greatest sufferer when the pictures faded during a few weeks of exhibition. Mr. Bedford would not impose any unnecessary restrictions upon exhibitors, but thought that when a photograph was judged as a work of art, it was not well to inquire too closely as to the method by which it was produced, at least it should not be stated as a merit of the photograph that it had been produced by any special method; he would not exclude pictures if the details were not given. He thought the Society had done well hitherto in limiting information as to the process; that was certainly interesting, and he saw no objection to it, though others might. If there was any strong objection, he should say it would be well to relax even that condition. It had been said that there was a large increase in carbon prints at the recent exhibition, but from an analysis which he had made of the catalogue, that did not appear to be the case. Mr. Nievsky then demonstrated his apparatus for flash-light portraiture on ferrotype dry plates. The camera held forty plates, and could be charged and recharged in daylight. After exposure a movement of the camera dropped the plate into a developing tank. The developer, fixing bath, and water were contained in india-rubber bulbs, pressure upon which forced the contents into the tank. He proceeded to photograph some of the members present. Mr. Clifton always made a point of having as much light as possible from supplementary lamps, so that the flash when it came was comparatively unnoticed. Mr. J. A. Harrison exhibited a camera-stand attachment for enabling the camera to be tilted. It consisted of a double frame, the lower fixed to the tripod, and the upper carrying the camera, and was capable of being placed at any angle by means of a system of levers.

**Pudsey.**—AMATEUR PHOTOGRAPHER Slides were shown to a good and highly appreciative audience on the 22nd ult., and were very much admired indeed, being a distinct advance on previous year's slides.

**Putney.**—Ordinary meeting was held on 21st ult. Dr. W. J. Sheppard in the chair, when Mr. Kidd (of Messrs. Morgan and Kidd, of Richmond), gave a demonstration on "Bromide Enlargements." In a short preface Mr. Kidd said that bromide printing possessed advantages which practically made it indispensable to amateurs, especially during the winter, when every one engaged during the day must have found the extreme difficulty of obtaining prints by any process requiring our often absent friend, the sun. Here then was an easy way out of the trouble, for bromides could be worked comfortably at our own fire sides at night, with light and exposure entirely under control. As regards results, he passed round some prints, which certainly would have held their own with the best of any other process. Proceeding with the subject of the evening, he stated that the most suitable negative from which to enlarge was one that was soft and full of detail, but that he had purposely brought one which was a trifle hard, so that members might see how best to get over that difficulty. Having thrown from a  $3\frac{1}{4}$  in. portrait negative to 23 by 17 enlargement on the screen, he explained the best method of obtaining a good vignette. In this case he made a pear-shaped hole, about 2 by  $1\frac{1}{2}$  in., in the centre of a piece of thin cardboard, remarking that the mistake was often made of using a vignetting aperture far too large. Moving this backwards and forwards between the lens and the easel, he obtained a remarkably even and delicate vignette. When pinning up the paper the great advantage of using a yellow glass cap for the lens was clearly shown, as the image was plainly visible, and the operator could, therefore, see at the very last moment that it was properly thrown on to the paper. He strongly recommended the ferrous-oxalate developer, the stock solutions for which were made up in accordance with the following formulae:—(1) Oxalate solution: Potash (neutral oxalate), 16 oz.; acid (citric), 1 d m.; hot water 50 oz. (2) Iron solution: Iron sulphate (pure), 15 oz.; acid (citric), 1 d m.; hot water, 30 oz.; (3) Bromide solution: Bromide of potassium, 1 oz.; water, 20 oz. For use, take 6 oz. of No. 1. and add 1 oz. of No. 2, and a few drops of No. 3, mix in the order given immediately before development. In his opinion this developer gave the purest blacks and whites, and consequently brilliant results. Only such a quantity of bromide of potassium should be used as might be absolutely necessary to bring the developer under control, as an excess would tend to produce greenish tones. The solutions must not be alkaline, and when mixing it is necessary to add the iron to the potash, otherwise a deposit will form and make the developer muddy. With an oxy-hydrogen light he gave an exposure of four seconds, and having prepared a developer of one iron to six of potash, he proceeded to develop, having first soaked the paper in clean water, and taken care that no air bubbles were on it. A glass bottomed dish was used, as density can better be judged by transmitted than by reflected light. The result was a print that was

slightly chalked, and in order to show how this could be improved, he exposed the same negative for eight seconds, and made up a developer of one part of iron to twelve of oxalate, with bromide as before. The development was now, of course, slower, but the print was decidedly superior to the first, being more harmonious and pleasing. The prints without being washed were transferred from the developer direct into a dilute acid bath, made up of 1 oz. of acetic acid to 6 pints of water, where they were allowed to remain five minutes, and being then thoroughly washed in clean water, were placed in a ten per cent. hypo fixing bath for at least fifteen minutes. To obtain the best results all operations should be carried through as expeditiously as possible, with clean hands, and in dishes which should be specially reserved for the process; development being completed before the hypo bath is even mixed. To get rid of the hypo, Mr. Kidd recommended that the prints should be taken out from the washing bath and occasionally squeezed on the back; if this is done, two hours' immersion in running, and about five hours in several changes of still water will be sufficient. Mr. Kidd now proceeded to make an enlargement of a landscape, with a view to showing how to print in clouds. Throwing the image on the paper he screened the sky during exposure, taking care to avoid a hard line, by moving the shade gently up and down. After soaking, the paper was developed to about two-thirds of the desired density, he then washed the developer well out in clean water, replaced the print on the easel, and printed in the sky from a second negative, now screening the partially developed landscape. The paper being wet it was less sensitive, and the exposure was, therefore, proportionately lengthened. The development was then proceeded with until full density was obtained, local treatment being resorted to where necessary. The usual acid bath, washing, and fixing, of course, following. Mr. Kidd advised using the lens with as large a stop as was consistent with covering power, as small stops tend to produce flatness. If properly exposed, the image should be seen in about thirty seconds; the development should be proceeded with until the required density is nearly reached, when the developer should be poured off. It will be found that the print can then be better seen, and development stopped immediately by pouring on the acid solution. After making a few contact prints from negatives brought by members, Mr. Kidd exhibited some fine examples of collotype printing, showing results obtained by the firm's improved collotype method of producing machine-printed ink photographs. He gave an outline of the process, and explained its suitability for producing large numbers of photo-prints at a small cost for all kinds of artistic and commercial purposes. He stated that his firm had one of the largest and best equipped works in this country for carrying on this interesting process.

**Sutton.**—A meeting took place on the 1st inst., Mr. De Clifford being in the chair. There was a good attendance of members and visitors. Several sets of prints were forwarded for the summer competition, Mr. McCame and the Rev. J. Gale being requested to inspect and judge them at an early date, the result to be announced at the next meeting. A number of lantern slides lent by the Camera Club were afterwards exhibited. The next meeting takes place on Tuesday, December 6th.

**West Kent.**—Ordinary meeting on the 25th ult., the Vice-President, Mr. A. R. Dresser, in the chair. It was proposed and carried that the fortnightly meetings be held on Thursday instead of Friday. Mr. Hastings kindly placed a silver and bronze medal at the disposal of the judges for competition at annual exhibition January 12th, 1893. Mr. Gregor Grant read a paper on "Multiple-coated Plates, their history, use, and treatment" in which he followed the various experiments which led up to the invention of the Sandell Plate, and those which have been made to test it, showing specimens of the results of various exposures, and the action of the double film in rendering heavy contrasts of light and shade and preventing halation, also some showing the plate's great capacity for standing abnormal over-exposure. Mr. Grant held that for ordinary work where the correct exposure is known, and in cases of great contrast and for interior work where halation is to be feared, the Sandell plate shows great and invaluable superiority over all others, and carries out all that is claimed for it by its makers, viz., abolition of halation, capability of rendering great contrasts, and capacity for standing an almost indefinite exposure. Mr. Grant concluded his paper by touching on a modification of the Sandell plate for spectrum photography. The slides sent into a contemporary's monthly competition were shown, some being exceedingly good, especially those by Mr. Edgar Lee.

**West London.**—On 22nd ult., the President in the chair, a very pleasant evening was spent listening to Mr. J. C. Dollman's lecture on "Art and Photography."

**The Photographic Society of Japan.**—A regular meeting was held on the 7th ult., Mr. Edmond R. Holmes in the chair. The minutes of the last meeting were taken as read. The following gentlemen were proposed, seconded, and unanimously elected:—

Messrs. H. Baehr, F. Grosser, J. Schedel, and R. Mitomo. A set of pamphlets entitled:—"The Principles of a Photographic Lens simply Explained," by Messrs. R. and A. Beck, was distributed amongst the members, and a printing frame, of ingenious construction, by the same firm, was shown. This frame was of metal, except the back, and was of such construction that the whole of the print could be examined at once. A cordial letter was read from the Secretary of the Photo-Club, Orahais. The new "Concentric lens" of Messrs. Ross and Co. was shown by Mr. W. K. Burton, along with work done by it and by other wide-angle lenses of the same focal length. The new lens did not give absolute definition with the maximum aperture of  $f/16$ , but it gave exactly the same definition at the edge as at the centre of a fairly large sized plate. With an aperture of  $f/22$  it gave absolute sharpness very nearly to the edge of a plate 22 by 12, the lens being twelve inches focus and a flat object at right angles to the axis of the lens being focussed. In fact, the field was truly flat, and this was the first lens of which such a statement could be made. A "Universal" lens by the same firm was also shown. This type was of the type of the "Rapid Symmetrical," but was twice as rapid. It was an outcome of the new Jena optical glass. Mr. K. Ogawa, as well as Mr. Burton, spoke of its high qualities as a portrait lens. The Foreign Secretary had been asked to report on a sample of Mr. J. B. Obernetter's plates. He had found them very rapid, although not quite up to the rapidity of the most sensitive plates in the market in Japan, and of exceptionally good quality. A very ingenious portable metal tripod stand, each leg going into a small tin box less than three inches long, was presented to the Society by Mr. R. Mitomo. A set of small prints on bromide paper were shown by Mr. K. Arito, and were much admired.

### SOCIETIES' FIXTURES.

- Dec. 1.—LONDON AND PROVINCIAL.—"Scenes from Ireland," Mr. F. W. Hindley.  
 " 1.—LEEDS.—"Wanderings with a Hand-Camera in 1892," Mr. Godfrey Bingley.  
 " 1.—WIGAN.—"The Carbon Process," Mr. J. H. Atherton.  
 " 1.—CAMERA CLUB.—"Odds and Ends," Mr. T. C. Hepworth.  
 " 1.—NORTHAMPTONSHIRE NAT. HIST. SOC. (Photo. Sec.)—Comparison of Work.

### Reviews.

*Virages et Fixages* (Part II.) By P. Mercier. Published by Gauthier-Villars et Fils, 55, Quai des Grands-Augustins, Paris. Price 2fr. 75c.

This is the second part of M. Mercier's excellent treatise on toning and fixing is fully up to the standard of the first. Platinum toning is treated of very completely and thoroughly, and new facts are brought to light. The other metals of the platinum group are also treated of, and the little-known papers which require no toning. A final theoretical and practical chapter on fixing concludes the book, which with Part I. forms the most reliable and complete treatise yet written on the subject.

*La Photographie la Nuit. Traite Pratique des Operations Photographiques que l'on peut faire a la lumiere artificielle.* By Marco Mendoza. Published by Gauthier-Villars et Fils, 55 Quai des Grands-Augustins, Paris.

Especially useful in the winter months, this little work treats of portraits and groups obtained by artificial light. Copying, reducing and enlarging, both with camera and lantern, are clearly and succinctly treated, and as the author has been careful to avoid loading his work with theoretical and unnecessary matter, it is practical and useful.

*Les Tableaux de Projections Mouvements. Etudes des Tableaux Mouvements, leur confection par les Methodes Photographiques, Montage des Mecanismes.* By N. Fourtier. Published by Gauthier-Villars et Fils, 55, Quai des Grands-Augustins, Paris. Price 2fr. 25c.

This book forms a suitable context to the same author's work "La Pratique des Projections." It treats of the preparation of mechanical and lever slides of all kinds, chromatropes, etc., and to those of our readers desirous of making such slides we can heartily recommend the book.

*Around the Roman Campagna.* By G. E. Thompson. Published by E. Howell, Church Street, Liverpool, and Simpkin, Marshall and Co., Stationers' Hall Court, London. Price 4s.

Mr. Thompson has earned a well-deserved reputation as a lantern lecturer, nor is he a novice at literature; his previous work "Spring at the Italian Lakes," is well known. In the book before us the author leads us by easy stages round the Roman Campagna. Guide-books as a rule are very dry reading, yet Mr. Thompson has given what is essentially a guide-book which is not only extremely interesting but which is full of quaint quips and fancies. He was accompanied in his travels by his brother "the scientist," and the following note as to the meeting with the Curator of the marine aquarium at Naples is a fair sample of what the book bristles with:—

"The scientist had been to the marine station and aquarium situated in the public gardens of Naples. I believe that he and the Curator had rubbed noses together; at any rate, they had had much enjoyment in each other's society, for though they had never before met they had long known of each other by hearing of the ear; and, I believe, that the Curator had called some horrid beast after the scientist. I am not in it myself, and therefore I speak as a fool; but it does savour of drivelling idiocy when intellectual scientific men get wildly excited and nearly lose their mental balance if one of them finds in his tow-net a beast, half the size of nothing which has a tail, say eight-tenths in size—shorter than another beast about its own fighting weight. I know not if I have made myself clear, for I lack the scientific method of expression."

The book is well printed and bound, and is illustrated with six collotypes from the author's negatives. There is not a dull page from start to finish, and to the photographer or tourist about to visit Rome will be at once amusing and instructive.

**Cassell's Family Magazine** appears this month of the same high standard of literature as previously but much enlarged. We note that they are offering prizes of £5, £4, and £3 for the best single figure study, prints for which must be sent in not later than February 1st.

**The Benevolent.**—A meeting of the Committee of the Photographers' Benevolent Association was held on November 24th. Mr. A. Mackie in the chair. Four applications for relief were on the agenda. In the first case the applicant appeared. The Secretary had made him an advance of 8s. to meet immediate necessities, which was confirmed, and a further loan was made. Temporary work was found for the applicant until such time as he should find a situation. The second case was an application for a loan to buy furniture, and a loan of £5 was granted. The third case was adjourned through the applicant's failure to attend the meeting. The fourth case was an application for a loan of a camera and lens to enable applicant to do work for which he had received orders. The application was granted. The thanks of the Association were unanimously accorded to the Photographic Society of Great Britain and Fredk. Hollyer, Esq., for their generous contributions to the funds. The Secretary reported that an application for advice and legal assistance had been received in a case of illegal discharge. He had put the matter in the hands of Mr. Tabrum, who had promised to advise and to take such other steps as should seem necessary. Dr. Lindsay Johnson and Fredk. Hollyer, Esq., were elected Life Governors of the Benevolent Association, as some small acknowledgment of the assistance they had recently rendered to it.

**Ely Cathedral.**—Those who are interested in architectural photography will be well pleased at a few hours or even days spent at Ely, where one of our grandest cathedrals is. For the amateurs who do not know Ely these few lines are intended. The cathedral, which dates from 1083, has many historical interests and every style of architecture. There are many pretty bits to be obtained of the exterior; one or two I would mention. One taken from the college—if the reader is coming from the station, comes up Back Hill, and turns in the first arch on the right, and again immediately turns to

the left; a hundred yards will bring you to the "Quiet Nook," which includes a portion of the Western Towers, and also some old gables, which makes a very pretty picture, and has been painted by an artist and termed "A Quiet Nook," which well deserves its name. Good views can also be had from the Park, River Ouse, Dean's garden, Bishop's garden, and the market place. Before entering the cathedral by the west door, I would ask you to pause and observe the Galilee Porch, which is a beautiful and exquisite specimen of Early English work. Entering this porch you will at once appreciate the grand view which meets the eye, the length of the nave (203 ft.), the noble appearance of the lofty arches, and the sublime grandeur of the whole. The ceiling, which is 200 ft. long and 200 ft. from floor, was partly painted by Mr. Henry Styleman le Strange, of Hunstanton, in 1858, but, owing to his illness, finished by his friend, Mr. T. Gambier Parry, in 1861. The central subjects are arranged in chronological order from the west, each being surrounded by a border and containing a legend. Walking down the nave and turning into the south aisle, when half way down you come to the Priors' Doorway, which is well worth a plate; it was formerly the Priors' entrance from the cloisters, but now opens into the Dean's private garden. You pass on to the elegant and magnificent octagon, which is one of the special glories of the cathedral; it would take too long for me to describe the grandeur here; and then again when we enter the choir there the visitor can expose any number of plates. The carving of the stalls is exquisite, illustrating sculptured groups in oak of the Old and New Testament; they were most of them executed by M. Abeloois, of Louvain. The reredos, though modern, is very beautiful, and was erected in 1858. There are also the north and south choir aisles, and the Lady Chapel, which is most interesting. In concluding, I would advise the visitor to look at photographs and purchase guide before going to cathedral, which can be seen and obtained at Morris's bazaar and luncheon rooms (established over forty years), where every information can be obtained about cathedral and surroundings, and permission to photograph can readily be obtained from the Canon in residence.—T. K. (a lover of the grand old cathedral).

## To Correspondents.

All communications for these columns are to be addressed to **The Editor, "Amateur Photographer," 4, Creed Lane, Ludgate Hill, London, E.C.**

### RULES.

1. Write clearly and distinctly on one side of the paper only.
2. Write each Query or Answer on a separate sheet of paper.
3. Write the name and address legibly on the back of each communication, and sign all Queries and Answers with name or *nom de plume*.
4. All matters for these columns **MUST** be received by **TUESDAY MORNING'S POST**.
5. The Editor does not undertake to answer questions by post.
6. In answering Queries, correspondents are requested to mention, in every instance the number and full title of the query referred to.

### QUERIES.

5883. **Burnham Beeches.**—Can any reader tell me how to get to Burnham Beeches, and how to spend a half-day there to the best purpose, photographically speaking?—**GOBANG.**

5887. **Ferrous Oxalate.**—I bought ferrous oxalate in two solutions (Eastman's)—No. 1, 20 oz.; No. 2, 6 oz. I wish to replace No. 2. Can anyone give me formula?—**GOBANG.**

5883. **Sink.**—Can any reader tell me how to make a cheap sink about 2 ft. by 1 ft.?—**GOBANG.**

5889. **Negatives into Positives.**—Should be glad of any information as to the best method to adopt for converting old negatives into positives.—**R. S. V. P.**

5890. **Retouched Negatives.**—Will any reader kindly inform me where I can buy some negatives that have been retouched, as a guide to amateur?—**W. K. B.**

5891. **Removing Stains.**—Can anyone tell me how to remove pyro and ammonia developer stains out of a light coat sleeve, which I soaked in the developer accidentally, and did not discover till dry.—**HON. SEC.**

5892. **Lantern Slides by Reduction.**—I want to reduce some half-plates. I have a home-made apparatus very similar to that described in last week's **AMATEUR PHOTOGRAPHER** at p. 388. I therefore was

glad to see this article, and resolved to get some ribbon; but looking on a little further, p. 396, I see Mr. Davis and Mr. Cembrano virtually say ribbon is useless, leaving out the chance of being smothered. Which version is correct? My objection to daylight is that I can't get any at this season of the year. I tried the other day with Thomas's plates, and with /16 gave 7 minutes, but it was not enough, although the winter sun was shining that day, but since there has not been a chance. What should exposure have been? Personally I prefer the Alpha plates, and have in summer time got good results with a 25 or 30 minutes' exposure; now they would take a day per slide, and are useless for reduction.—**H. P.**

*Correspondents not seeing their queries inserted are requested to look for the same under "Editorial."*

### QUERIES UNANSWERED.

Oct. 28th.—No. 5349.

Nov. 4th.—Nos. 5832, 5854.

" 18th.—No. 5866.

" 25th.—Nos. 5873, 5878, 5880, 5881, 5834.

### ANSWERS.

5850. **Altering a Group.**—This can only be done by carefully measuring on the negative the size of the head to be removed, then focus on the person it is desired to introduce, having a perfectly white background. Care must be exercised that this sitter is lighted in the same way as the original, and is of exactly the same size. Having exposed, developed, and fixed the negative, the original sitter should be carefully painted out with opaque or black varnish, and after the group has been printed in, the second negative adjusted so as to print in the second figure. It is an operation requiring considerable care, but is not impossible to do successfully.—**EDITOR.**

5851. **Neutralising Clearing Bath.**—It certainly is extremely easy and simple to neutralise the acid clearing bath. It may be effected by placing the print in a weak solution of ammonia, caustic soda, or potash, but whether it is wise is another question altogether, as, should all traces of iron not be removed, the same would immediately be precipitated.—**EDITOR.**

5856. **Toning Slides.**—There is no difficulty in toning slides with platinum. Any of the formulae used for paper may be used, but unless the slide is very warm in tone no change will be apparent. Any intensifier applied to negatives may be used for lantern slides. Hodges' "Lantern Slide Manual" would give you every information on this subject.—**EDITOR.**

5857. **Toning Bath.**—Every bath used for toning may be kept. The precautions to prevent the deposi-

tion of gold are—(a) Use distilled water to make the bath; (b) Preserve from light before and after use; (c) Filter after using. But so much depends upon the constituents of the bath that no definite statements can be made.—**EDITOR.**

5859. **Platinotypes.**—Freshly-made chlorine water or a mixture of nitric and hydrochloric acids might do, but that the paper would suffer as well is almost certain. We have some experiments in progress, which we hope to publish shortly.—**EDITOR.**

5860. **Galatine Lantern Slides.**—The best substitutes for glass is undoubtedly celluloid, and England, of Charles Street, Notting Hill (see advertisement), and Fitch, Angell Road, Brixton, will supply both lantern and stereo celluloid films.—**EDITOR.**

5862. **Metal Plates.**—Probably these plates are lacquered; if so, the best thing to do would be to clean off all the old lacquer with strong hot soda solution, wash well, dry, and relacquer.—**EDITOR.**

5863. **Toning Trouble.**—The "disgusting" smell is due to carelessness on the operator's part, and points to acidity of the individual prints or toning bath. This may be avoided by washing the prints thoroughly before toning, by dipping into carbonate of soda, 1 to 20, before and after toning, neutralising both gold and fixing bath.—**EDITOR.**

5865. **Lead Toning.**—What advantages are expected from using lead and gold? In alkaline gold baths the addition of lead causes a precipitate of lead, and the tones are exactly the same as in a plain gold bath. In the neutral, or faint alkaline or acid baths, yellow oxide of lead is precipitated, which carries down some of the gold and weakens the bath. The action of lead in the combined bath was explained by Lainer in the **AMATEUR PHOTOGRAPHER**, July 8th, p. 12.—**EDITOR.**

5867. **Enlarging Apparatus.**—"Notes on Enlarging," which ran through the early issues of this year, will be of assistance, or Hodges' "Practical Enlarging"—**EDITOR.**

5868. **Alpha Paper.**—This paper requires from 30 to 120 seconds at 2 ft. from a Bray No. 5 burner. It is developed with the ordinary ferrous oxalate developer. After development, and without washing, immerses in the following for two or three minutes:—

Alum .. .. .	4 oz.
Citric acid .. .. .	1 "
Warm water .. .. .	80 "
Then well wash and tone in the combined bath or—	
Warm water .. .. .	20 oz.
Acetate of soda .. .. .	60 gr.
Chloride of lime .. .. .	4 "
Chloride of gold .. .. .	2 "

Use as soon as cold. Try and obtain red prints first, as these tone best. Give rather long exposures, and use weak developer and plenty of bromide.—**EDITOR.**

5869. **Springs, etc.**—Try Percy Lund, Memorial Hall, Farringdon Street, or Fallowfield, 146, Charing Cross Road, W.C.—**EDITOR.**

5870. **Lantern Slides by Reduction.**—Distance between negative and lens,  $2\frac{1}{2}$  in.; between lens and lantern plate,  $12\frac{1}{2}$  in.—PEN.

5872. **Diameter and Focal Length of Lens.**—There is no hard and fast rule for these, but unless it is required to include a wide angle, the focal length of the lens should not be less than the longest side of the plate used, i.e., for 12 by 10 plate 12 in. focus. The diameter is purely a matter of what rapidity the lens is required, the most useful being one, the full working aperture of which is  $\frac{1}{2}$  the focal length.—PEN.

5873. **Composition for Graph.**—The following receipt is a very good one (the measurements are taken by weight):—Glycerine (pure), 6 parts; water, 4 parts; sugar, 1 part; barium sulphate, 2 parts. After mixing, let them soak for 24 hours, and then melt gently and pour into a pan.—HIRCUS.

5873. **Composition for Graph.**—A good chromograph mixture is the following:—

Water	..	..	..	4 oz.
Sulphate of baryta	..	..	..	2 1/2 "
Sugar	..	..	..	1 "
Gelatine	..	..	..	1 "
Glycerine	..	..	..	6 "

Pour the above when warm into a zinc or other tray. When dry, prints may be taken in the usual way by writing with the aniline colour known as violet of methylaniline.—J. R. COOKE.

5874. **Printing in Clouds.**—If enlarging by artificial light, make a print of the view and cut out as mask, expose the bromide paper for the view, cover with the mask, place a cloud negative in lantern, and expose again for the sky, moving a piece of cardboard to and fro over the edge of the mask to graduate the darkening. If daylight and dark-slides are used, I should print clouds in on a transparency by contact, and from that make an enlarged negative of the combined picture.—PEN.

5876. **Convex Glasses for Crystoleum Painting.**—S. and G. de Saulles and Co., Spencer Street, Birmingham; J. Griffin, Floodgate Street, Birmingham.—PEN.

5876. **Convex Glasses for Crystoleum Painting.** These glasses may be bought at 9d. a pair from Messrs. Lorraine and Forrester, 6, Middle Street, Hastings, but 7d. should be enclosed extra for box and postage, etc.—J. R. COOKE.

5877. **Photo Prints Suitable for Crystoleum Painting.**—These may be had from the same place as the glasses in answer No. 5876, but any ordinary photograph will do.—J. R. COOKE.

5879. **Enlarging Lantern.**—This will not give such good results when used for exhibition purposes, owing to the loss of light occasioned by using large condensers.—PEN.

5882. **Shutter.**—I should say Lancaster's "Sea-Saw" shutter, patent, price 10s. 6d. for quarter plate, or 12s. 6d. for half-plate, would suit your purpose, as it gives time and instantaneous without the use of a pneumatic arrangement.—J. R. COOKE.

5883. **Enlarging.**—(1) From any text-book, such as "Dictionary of Photography" (Wall). (2) You could use two paraffin lamps, placing a sheet of ground-glass between them and the negative, and using reflectors; or focus with these and expose by magnesium ribbon.—PEN.

5885. **Flash-Light, etc.**—The best book is "Flash-Light Photography" (R. Slingsby), 4s.—PEN.

## EDITORIAL.

**SPECIAL NOTICE.**—We are very pleased to find that replies in this column are so much appreciated, but we should be very grateful if those requiring advice would send their letters to us BEFORE TUESDAY MORNING'S post if possible. The time occupied in replying in this column is very considerable, and owing to the often late receipt of letters, many matters have to be left over each week. This we much regret.—ED. AM. PHOT.

D. W. F. M.—Letter by post.

FERRUS OXALATE.—We had a very complete article on warm tones on bromide paper in the AMATEUR PHOTOGRAPHER.

NOVICE.—(1) An under-exposed plate is usually a long time in the developer before any trace of the image is apparent, and when development is complete, the high lights are rather dense, but the shadows represented by almost bare glass. With over-exposure the image appears very quickly, and the whole plate is thin, and yet full of detail. (2) This query we do not understand. (3) Development by Lionel Clark, price 1s. from our publishers.

H. HOLT.—Yes. Mezzotype not too hot in tone. No restrictions as to when negatives taken. We forget what your slides were now, so can give you no idea of how you stood.

GEO. T. USHER.—We may be able to find print, but we make a change this month, which will suit you.

W. A. R.—(1) You cannot do better than try Solio paper, with Mason's bath, by using which if the prints are properly washed permanent prints would be obtained.

S. S. WILTON.—We regret that your letter is inadmissible except as an advertisement.

C. V.—One part of washing soda, and two parts water will make a saturated solution.

TRIX.—Many thanks for notes on Ely. The last volume commenced with our issue for January 1st, and finished with that for June 24th. The present volume began July 1st and finishes December 30th.

CONSTANT READER.—(1) The rapidity of the plates you ask for is Ilford white label 25, medium isochromatic 30; Marion's ordinary, 35; isochromatics are the most suitable for snow and clouds. (2) Sepiatype from Sharp and Hitchmough, Dale Street, Liverpool. Sepia, platino type and the carbon process are the only ones which can be absolutely relied on.

H. HEYWOOD.—All your prints are very badly over-toned, and certainly do not possess artistic merit, they are merely poor hand-camera shots. No. 5 is not straight. 2 has shifted in printing.

H. F. LINGING.—We will write to author, and then write you.

HON. SEC.—(1) There is no formula which can be absolutely relied on for sepia tones either with gold or platinum. (2) We are afraid the case is hopeless, but we insert as a query. (3) The loss of tone can hardly be avoided; try toning very deeply, but we are afraid you will not get over it.

EQUIRER.—(1) Is there anything else you want? We give this up; you are almost as bad as the man who wanted his camera to do everything under the sun and a little more besides. Still, joking apart, Archer's ideal is the only one which comes anything near your requirements. (2) We will let you know about slides. (3) Your idea of prices is good, the lamp you mention is 15s. Many thanks for good wishes, always pleased to help you.

ALPHA.—We answer your query this week; if not full enough drop a post card, and we will write by letter.

J. H. GODDING.—Many thanks for print, which however has hardly enough general interest to warrant us reproducing.

HIRCUS.—(1) Isochromatic, either Edwards' or Ilford. (2) The present volume began July 1st, and closes December 31st—all back numbers in print. (3) The cause of your stain is due to not washing plate enough, the stain will not matter, but try rubbing gently with handkerchief or soft linen dipped in spirit.

W. D.—The formula you want is—

Uranium nitrate	..	..	..	20 gr.
Potash ferricyanide	..	..	..	20 "
Water	..	..	..	20 oz.
Glacial acetic acid	..	..	..	1 "

It is not proved yet that the prints are permanent. Probably they are.

H. J. WATTS.—All chloride papers contain free nitrate of silver, which soaks through on to the paper, hence the image on the back.

L. M. WALL.—Pleased to loan you slides, will book some to you, if you let us know the date you want them.

OKO.—The white deposit is due to some insoluble silver salt, probably sulphate, caused by your not using distilled water; filter it out as it is no good. Yes; good black tones may be obtained by the Kallit-type process, and it is not a difficult process either.

J. N.—(1) Ten per cent. sol. of ferricyanide. (2) The ordinary fixing-bath. (3) Soak your negative in water, then in hypo solution, add a few drops of ferricyanide solution, adding more if not strong enough for local reduction add the ferrid solution in the proportion of 1 to 10 of hypo. (4) Yes; wash thoroughly after reducing. (5) The carbon process is not expensive and not difficult, and we hope to have a note on it shortly.

F. N. F.—You cannot use the ordinary printing frame. Get one of Cowan's opal printing frames from Marion's, or any dealer.

J. LINGARD.—(1) Use isochromatic plates, and the yellowness will not matter, and in a fair midday light the exposure should be about three minutes. (2) Yes, it would be possible to copy, using practically the same as for your print. (3) Probably a whole-plate W. A. lens would be of too long a focus for a half-plate, we should say that an ordinary M. A. half plate of 5 in. focus would suit you. We will try and get article on copying this month.

S. ALLPRESS.—The articles you want appeared in August 5th, 12th, 19th, and 26th issues, price 2d. each, and 2d. postage.

W. B. P.—(1) No. Wood's, Cheapside, or Noakes', Greenwich, are the most likely people. (2) Your lens sounds like a French make, probably an early Chevalier or Darlot. We might tell more if we saw it. (3) It is a French lens no doubt. (4) The frilling is due to some peculiarity in the manufacture. (5) We always use cotton wool to polish with, the smear was probably damp. (6) The 12 by 10, if your camera will rack out enough. (7) No, we think not. (8) Tylar's or Upson's backs are both good. (9) We prefer artificial light entirely for lantern work. It is an advantage sometimes to take negatives the same size, but we much prefer to reduce from large negatives as it gives you a much better chance of artistic trimming down. (10) No, your solution would probably act all right. (11) When copying, use photomechanical or lantern plates with pyro developer. (12) There would be no difficulty in obtaining leave from the publishers of *Art Journal*, Warwick Lane, E.C. Many thanks for good wishes.

J. H. W.—Merely pin your photograph up on a flat surface, and set the camera up opposite it and then

focus as large as required, and expose, using an ordinary dry plate.

M. WHITESIDE.—Yes, we shall be glad to lend you slides. We have three or four sets to loan. Will write you as to date.

J. F. M.—Your fault lies in allowing the prints to dry and the use of blotting paper. The prints after an alum bath must not be dried, and use writing paper, while squeegeeing—you cannot get pressure with blotting.

QUIZ.—(1) Silver printing is the usual thing, even in winter. (2) Alpha paper, see answer to query, No. 5868, in this issue. To tone this paper the prints must be of a red tone. (3) The toning by the bath you name is sulphuration, and is not likely to be permanent.

W. R. M.—We must see the prints before answering your question.

HY. E. SMITH.—The correct position of the stop is a matter for the optician to determine. Your best way is to cut a stop of about f/8 aperture, and slide it into the lens tube, and then find the correct position by pushing it backwards or forwards till you get the flattest field with the least distortion. If you like to send us the data as to focus and diameter of front lens, the distances between lenses, we may be able to tell you more.

BEGINNER.—Very pleased to see you any Monday between 2 and 5, or if this will not suit you, we will make a day appointment.

J. H. WESTERN.—You will find the formula for the intensifiers in Wall's "Dictionary of Photography," pp. 128 and 129—and almost any text-book if you cannot find them, we will repeat in full.

DOUBLE DROP.—Many thanks for letter which goes in.

BLUE GREEN.—About ten minutes' stay in the uranium bath, and then on applying the ferric chloride the green blue tones are obtained.

## Sale and Exchange.

### RULES.

**CHARGE.**—Twelve words or less for Fourpence. Every additional three words, one penny. The name and address of the sender must be paid for. (A single figure, or group of figures undivided by letter, space, stop, or words, counts as one word compound words count as two words.)

**DEPOSITS.**—The money for goods forwarded on approval may be deposited with the Publishers of the AMATEUR PHOTOGRAPHER, who will hold the amounts deposited until they are satisfied that the transaction has been completed to the satisfaction of buyer and seller.

**ADVERTISEMENTS** can be inserted under a number, the name and address being registered, and letters forwarded for a fee of 8d. to cover postage.

**PAYMENTS** should be made in Postal Orders or Postage Stamps.

**ADDRESS.**—All advertisements (which can be received up to Tuesday mid-day) and other communications having reference to the "Sale and Exchange" column, must be addressed "Sale and Exchange, AMATEUR PHOTOGRAPHER, 1, Creed Lane, London, E.C."

**COMMISSION.**—A charge of 2½ per cent. will be deducted from all deposits whether a sale is effected or not. Minimum charge 1s.

**PAYMENT.**—All payments are to be by cheques of Postal Orders, made payable to Hazell, Watson, and Viney, Ltd., 1, Creed Lane, London, E.C.

**CARRIAGE** must be paid on all apparatus sent for report, and they will be returned carriage forward.

**REPORTING.**—Apparatus may be sent to the Editor, AMATEUR PHOTOGRAPHER, 1, Creed Lane, London, E.C., who will report upon the apparatus to the buyer for a minimum fee of 2s. 6d., or a commission of 2½ per cent., upon the sale price of the apparatus.

**Background.**—8 ft. by 7 ft. cloth background with roller, cost 25s., take 12s. (subject, book shelf, etc.)—Fredk. Sharpe, Church Street, Oakham.

Two backgrounds, interior and scenic, flatted oils, 8 ft. by 8 ft. in., new condition, price 12s. and 10s. 6d.; photographs, one stamp.—William Hare, Photographer, Sutton, Surrey.

Pair of backgrounds in flatted oils, good condition, 8 by 7, on linen and rollers, exterior and interior, 10s. each.—Drury, Wellington Street, Lincoln.

**Cameras, etc.**—Lancaster's 1892 special brass-bound Instantograph, See Saw shutter, three double slides, and tripod, cost 125s., price 84s.—Lyth, Westbourne Avenue, Hull.

Lancaster's quarter-plate Le Meretore, three slides, complete, also Lancaster's Omnigraph, 27s. the two.—Quinton, High Street, Wimbeldon.

**Cameras, Lenses, etc.**—5 by 4 portable camera, six double slides, 5 by 4 rapid landscape half-plate R.R. and canvas case, all by Perken, Son, and Raymond, in perfect condition, £7 the lot.—W. Street, Chase Road, Southgate, N.

Ohadwick's hand-camera, six dark slides, Wray's 5 in. detective lens, bamboo stand, cost £7 7s., £3 10s. taken.—E. Ravenswood, Bromley Road, Beckenham.

Splendid 7 by 5 rapid rectilinear lens, good definition, f/8, only 1/4s. 6d.; camera and few other things, list for stamp.—Cheltenham House, Stroud.

Will exchange Rayment's patent whole-plate camera and three double slides, good as new, for microscope by good maker, stereoscopic camera, or will sell; can submit to Editor's inspection; also Swift's whole-plate rapid Paragon lens with iris diaphragm.—No. 354, office of this paper, 1, Creed Lane, E.C.

Meagher's 9 by 7 portable camera, one single two double backs in leather case, and doublet lens by Ross, £5 10s.—E. Owen, Broad Street, Newtown.

**Hand-Cameras, etc.**—Griffith's magazine detective, holds 12 quarter-plates, pneumatic time and instantaneous shutter, single lens, finder, stops, etc., cost 31s., will sell for 21s.—E. Greenleaves, Priory Mansions, Bournemouth.

**Lantern Apparatus.**—Scott's warm air saturator for limelight, scarcely used, perfect order, £1.—Rev. F. Stow, Aygarth, Yorks.

**Lenses, etc.**—Ross' medium-angle doublet lens, new condition, iris, for plates 10 by 8, splendid definition, £3 10s.—E. Owen, Broad Street, Newtown.

Pair accurately matched 5 in. focus single lenses, work f/8, by Sharp and Hitchmough, cost 33s., price 15s. 6d.—Faversham, 303, Wightman Road, Hornsey, London.

Half-plate R.R. lens, new, will take 21s., or exchange for landscape lens or 8 in. barnisher; approval.—Thomson, 25, Merchant Street, Peterhead.

**Negatives.**—For sale, 20 half-plate negatives—Manx, Wales, Grange, Ingelton, Buxton, etc.—1s. each; also 70 numbers "Photography."—13, Nelson Street, Broughton, Manchester.

First-class negatives, specially selected as guides for amateurs, showing retouching, etc., result of 40 years' professional experience, 6 for 1s. 3d.—Richford, Wells, Norfolk.

**Sets.**—1892 quarter Instantograph, finest order, camera, lens, shutter, two slides, stand, and case, 50s.—J. Corbett, Knowle, Warwickshire.

Quarter-plate Lancaster's Instantograph, square pattern, four double slides, lens, and shutter, tripod, cloth, and case, complete price £2 2s.—E. S., 318, Old Street, E.C.

Good half and quarter plate camera for sale, with Wray's double extra 5 by 4 lens, covers both, two tripod stands, nine dishes, printing frames, and every accessory, £4, or separate; approval on deposit with Publisher of AMATEUR PHOTOGRAPHER.—Photo, 62, Castlegate, Grantham.

**Sundries.**—AMATEUR PHOTOGRAPHER, first 13 vols., 8 vols. bound half calf with extra numbers; "Quarterly," vol. 1, and numbers 6, 7, 9, 10; "Societies' Reporter," vols. 1 and 2; "Photographic News," 1884, bound; "Magazine of Art," 1889, unbound. Offers to John Stabb, 154, Queen's Road, Bayswater.

Valuable bargain. Violin, beautiful harmonious tone, in fine preservation, suit lady or professional, very handsome model, excellent silver mounted bow, and first-class baize-lined case, accept 16s. 6d. the lot, also about 20s. worth of good music given in free; absolutely certain to give satisfaction; approval willingly; references given.—Mrs. Graham, College Buildings, Ipswich.

E. P. half-plate camera stand, 5s. 6d.; Godstone print washer, whole-plate, 4s. 6d.; ruby developing lamp, never used, burns colza oil, 2s.—Miss Godley, Killegar, Killeshandra, Ireland.

## WANTED.

**Cameras, etc.**—Wanted, Lancaster's quarter-plate superior Omnigraph.—M., 7, Victoria Street, Barnsley.

Wanted, quarter-plate square camera, Underwood's Instanto or similar long-focus pattern, lowest price.—18, Braybrooke Road, Hastings.

**Hand-Cameras, etc.**—Wanted, hand-camera, must be good and cheap.—Goller, Woodside, Crookham, Newbury.

**Lantern Slides.**—Wanted, sets of lantern slides in exchange for photographic sundries.—H. Bamford, Augusta Street, Rochdale.

**Lenses, etc.**—Wanted, whole-plate rapid rectilinear, all wide-angle, no rubbish, lowest price; on approval; deposit.—James Bandles, New Mills.

Wanted, 5 by 4 rapid rectilinear lens, iris diaphragm, by good maker, cheap.—Pickthall, 15, Clarence Street, Runcorn.

**Sets.**—Wanted, good hand-camera or quarter-plate camera, lens, and tripod, exchange large 4-tune self-acting musical box, or sell 45s.—Frederick Sharpe, Church Street, Oakham.

Wanted, quarter-plate set, also hand-camera.—D., Woodside, Crookham, Newbury, Berks.

It is unnecessary to send an advertisement for the "Sale and Exchange" column for more than one insertion, as the goods are usually disposed of when the first advertisement has appeared.

**Lanterns! Lanterns! Lanterns!!!** Slides! Slides!!! Slides!!!! The largest and most varied selection in the whole kingdom. Before selecting elsewhere, call and inspect the stock of the City Sale and Exchange, 54, Lime Street, Leadenhall

Street, City, where we have no hesitation in saying you will find all that you require in this way. Lanterns for sale, lanterns lent on hire, lanterns sold on commission, or taken in exchange for other apparatus. Write for special supplemental lists, Manager, City Sale and Exchange, as above.

**Bargains in Lenses.**—Dallmeyer No. 2 B portrait lens, Waterhouse stops, rack focussing, grand definition, as new, £7 7s.; whole-plate rapid rectilinear lenses, by Parker, Holborn, covers well to edges, Waterhouse stops, moveable hood, as new, 45s.; 9 by 7 Optimus rapid euryscope lens, grand definition, Waterhouse stops, as new, £5 5s.; whole-plate rapid rectilinear by Charterhouse Stores, Waterhouse stops, best condition, 35s.; 7 by 5 Laverne wide-angle rectilinear, grand definition, rotating stops, as new, take 24s. 6d.; Dallmeyer's 6 by 5 rapid rectilinear, grand definition, Waterhouse stops, moveable hood, as new, take £3 7s. 6d.; half-plate Lancaster's rectilinear, thorough order, covers well, Waterhouse stops, take 32s. 6d.; half-plate Lancaster Instantograph lenses, iris stops, and instantaneous shutter, 15s.; half-plate Ross' rapid symmetrical lens, as new, fine definition, Waterhouse stops, £3 17s. 6d.; pair very fine Argus 5 by 4 rapid rectilinear lenses, accurately paired for stereoscopic work, fitted Waterhouse stops, moveable hood on front, and with camera division, take 42s.; Optimus quarter-plate portrait lens, rack focussing, Waterhouse stops, quite new, 21s.; 5 by 4 Optimus rapid rectilinear, by Perken, Son, and Rayment, Waterhouse stops, 27s. 6d.; Swift 5 by 4 wide-angle rectilinear, 5 in. focus, rotating stops, 32s. 6d.; Dallmeyer portrait lens, c.d.v., grand definition, Waterhouse stops, finest order, 63s.; Quarter-plate hand-camera lens, by Laverne, rapid rectilinear, adjustable focus, 15s., quite new. All above lenses are warranted as described.—On view, City Sale and Exchange Rooms, 54, Lime Street, corner Leadenhall Street, City (late Goy's Medium). Every description of apparatus bought, sold, or taken in exchange.

**Bargains in Hand Cameras.**—No. 4 Kodak, as new, size 5 by 4, carries 100 films, fine rapid rectilinear lens, instantaneous shutter, in solid leather case, £7 7s.; No. 3 Kodak, as new, size quarter-plate, carries 60 films, rapid rectilinear lens, instantaneous shutter, take £5 7s. 6d.; Optimus Magazine, very finest order, Optimus rapid rectilinear lens, carries twelve quarter-plates, roller blind, shutter, focussing adjustment, £5 5s.; Marion's Radial hand-camera, carries twelve quarter-plates, fitted rapid rectilinear, instantaneous shutter, two sunk finders, covered morocco, in case, £5 5s.; 5 by 4 Swinden and Earp hand-camera, fitted Laverne rectilinear lenses, adjustable focus, carries twelve 5 by 4 plates, finder, roller shutter, etc., as new, £5 12s. 6d.; Fallowfield's special Facile, covered morocco leather, special rectilinear lens, iris stops, two finders, instantaneous shutter, carries twelve quarter-plates, as new, take £5 10s.; cost £8 9s. 6d.; Rouch hand-camera, quarter-plate rapid rectilinear lens, roller behind shutter, bag changing, as new, £3 17s. 6d.; Blair's 5 by 4 hand-camera, good lens, time and instantaneous shutter, two finders, rack focussing, three double dark-slides, as new, £3 3s.; Kodak No. 1, best R.R. lens, carries 100 films, best order, in leather case, 40s.; Fallowfield's Facile, fitted rapid rectilinear lens, carries twelve quarter-plates, as new, £3 17s. 6d. All above are warranted as described. On view, City Sale and Exchange Rooms, 54, Lime Street, corner Leadenhall Street, City (late Goy's Medium). Second hand apparatus bought, sold, or taken in exchange. Inspection invited.

**Bargains in Cameras and Sets.**—10 by 8 camera fitted all latest improvements, back and front extension, for wide-angle pictures, leather bellows, reversing back, rising and falling front, two double slides, grand condition, take £6 10s. 10; Whole-plate camera, by Middlemiss, wide-angle movement, double extension, leather bellows, all latest improvements, three double dark-slides, book form, rapid rectilinear lens, Waterhouse stops, Taylor and Hobson finder, three-fold stand with turn-table top, and solid leather case, grand lot, £8 15s.; whole-plate camera, by Walker, back and front extension, rising and falling front, double extension, leather bellows, three double slides, rapid rectilinear lens, Thornton-Pickard shutter, three-fold stand and case, finest condition, £8 8s.; half-plate camera, by Percy Lund, back extension, conical leather bellows, three double slides, rapid rectilinear lens, shutter, folding stand, and case, as new, take £4 10s.; 5 by 4 best quality camera, by Robinson, Regent Street, leather bellows, rising, falling, and cross front, wide-angle movement, three double slides, fine rapid rectilinear lens, by Robinson; Newman's shutter and Eastman's quarter-plate roll holder. All above guaranteed finest order. On view, City Sale and Exchange Rooms, 54, Lime Street, corner Leadenhall Street, City (late Goy's Medium). Second hand apparatus bought, sold, or taken in exchange. Inspection invited.

**Magic Lanterns and Slides.**—Walter Tyler's Helioscopic is perfection of all lanterns, supplied to Indian Government, School Boards, science classes, clergy, and exhibitors throughout the world. Impossible to have lanterns give better definition or

more satisfactory results; specially constructed lens, which no other lantern possesses.—Walter Tyler, 48, Waterloo Road, London.

**Walter Tyler's Best Triples and Bi-unials** are unsurpassed, and perfect in every detail. Good bi-unials, mahogany bodied, brass fronts, and all improvements, £7 10s.; single lantern, with 4 in. condensers, portrait front lens, 4-wick lamp, complete, in case, 27s. 6d.—Walter Tyler, 48, Waterloo Road, London.

**Lantern Lenses.**—Specially constructed. Walter Tyler's new Helioscopic portrait combination lantern lens gives the most perfect definition and brilliancy, can be fitted to any lantern, and for excellence cannot be surpassed. No other maker has this lens, which is manufactured expressly for Walter Tyler, 48, Waterloo Road, London.

**Regulators and Gauges.**—Great reduction, in price. Either can now be had of Walter Tyler for 14s. each. The largest stock of gas cylinders in England. Best seamless steel, tested and valved, and all sizes at very low prices.

**Slides from Negatives and Pictures.**—Walter Tyler manufactures and colours slides on the premises, thus ensuring speedy delivery, and prices are most moderate.—Walter Tyler, 48, Waterloo Road, London.

**Bi-unial Lanterns.**—If you are in want of a really good bi-unial lantern, perfect in every respect, call and see Walter Tyler's entire brass fronted, mahogany-bodied, lined with Russian iron, and fitted with new best quality lenses, and sold at a most moderate price. The top lantern will take a 4-wick lamp. These are great bargains.—Walter Tyler, 48, Waterloo Road, London.

**Hire Department** is now perfect. Largest and best collection of slides in the world; over 200,000 always in stock. Temperance, travels, Scripture, educational, comic, tales, etc. Cheaper than any other house, no extra charge for coloured slides or effects. Special terms for large quantities.—Walter Tyler, 48, Waterloo Road, London.

**Lanterns and Slides.**—If you wish to hire, purchase, or exchange, you cannot possibly do better than go to Walter Tyler, who makes this business a speciality, and you will thus save dealer's and all intermediate profits.—Walter Tyler, 48, Waterloo Road, London.

**Second-hand Lanterns and Slides** at very moderate prices, also all kinds of apparatus. Send for large catalogue, 420 pages, with instructions for working lanterns of all kinds, and costing an immense sum to produce, sent free for 6 stamps. Small catalogue and second-hand list, post free.—Walter Tyler, 48, Waterloo Road, London.

**Bijou Enlarging Lanterns.**—Finest results with Hughes' patent rectangular condensers, half the size of ordinary make, superior definition, proper diffusion of light; scientifically constructed, not commercial; several whole and half-plate for sale, cheap.

**The Marvellous Pamphengos.**—Finest oil-lighted lantern, equals limelight, stood the test of over fourteen years against all imitations, elegant solid brass fronts, best lenses, from £2 10s. each.

**Magic Lanterns, Magic Lanterns.**—Largest assortment in the world, cheapest and best, nicely japanned lantern body, 4 in. double condensers, portrait front lenses, rack and pinion, four-wick lamp, in case, £1 7s. 6d.

**The Docwra Triple Prize Medal**, highest award, supplied to Dr. H. Grattan Guinness, Capt. C. Selwyn, Madame Adelina Patti, and the Royal Polytechnic, etc.

**The Malden Triple**, supplied to B. J. Malden, Esq.; unparalleled results; Capt. Chas. Reade, R.N. **Fine Triple Lantern**; four set of large diameter lenses, £32, cost £60.

**Special Triple**; mahogany, brass fronts, £12 12s.

**Elegant Mahogany Bi-unial**; brass fronts, £7 10s.; blow-through safety jets, 11s.; mix gas jet, 15s. 6d.; Malden double dissolving tap, 15s. 6d.; a number of grand effects; particulars free, before purchasing. Send for Mr. Hughes' grandly illustrated catalogue, over 180 fine wood engravings, price 6d.; postage 3d.; separate list of 60,000 slides, price 6d.; postage 3d.; pamphlets free; second-hand lists of bargains.—W. C. HUGHES, Brewster House, Mortimer Road, Kingsland, London, N. 50 coloured slides on loan for 3s.

**CHRISTMAS CARD MOUNTS**, gold blocked mottoes, fancy bevelled edges, various samples; 1s. and 2s., post free.—Hooper and Co., mount manufacturers, 5, Hand Court, Holborn, London. Price list of all kinds of mounts post free.

**ENLARGING APPARATUS.**—Hume's enlarging apparatus, 5 in. condenser, without objective, 61s. 6d.; with 8 in. condenser, 122s. 6d., carriage paid.—Hume, 1, West College Street, Edinburgh.

**IMPORTANT TO AMATEURS.**—Negatives skillfully retouched. Printed in silver, gelatin-chloride, etc., and Enlarged. Also Developing, Copying, etc.—Terms strictly moderate.—Address, Wilfred Emery, 24, South Street, Baker Street, W.

SALE and EXCHANGE Advertisements (at the charge of Three Words for One Penny) must be received by Tuesday evening's post to ensure insertion in the same week's issue.

"Amateur Photographer" Monthly Competition, No. 43.—"PORTRAITURE AND FIGURE STUDY." Latest day, December 19th.—Prizes: Silver and Bronze Medal, with ribbon and clasp. One mounted print only to be sent in. Entry forms, etc., on receipt of stamped envelope. Address: Editor, AMATEUR PHOTOGRAPHER, 1, Creed Lane, E.C. (Prizes will be announced and photographs reproduced and criticised in the AMATEUR PHOTOGRAPHER Supplement, January 13th, 1893.)

REFERRING to our notice of the 24 by 18 carbon enlargements forming part of Elliott and Son's exhibit at the recent Stanley Show, we should like to draw attention to the fact that they were made from negatives taken in Houghton and Son's Shuttle Hand-camera by Mr. Birt Acres.

WE have to again caution all our readers to strenuously adopt the "deposit system" in all dealings through our Sale and Exchange column. To all honest advertisers, whether buyer or seller, it is nothing but beneficial, whilst it is a great protection against unscrupulous advertisers.

WE are now rapidly approaching the completion of our present volume and the commencement of Volume XVII. Our increased efforts to provide sufficiently varied reading for a very diversified *clientèle* seem to have been generally recognised, and our steadily increasing list of subscribers is evidence enough that our endeavours are appreciated. With success grows strength, and we are going one better. Some time ago our provincial contemporary announced its advent by saying that there is always room at the top. Still, it must be remembered that the topmost may always be out-topped, and there is no telling who in the end will be at the truck of the mast, and modesty prevents our suggesting.

RUMOUR has it that the case of one friend is hopeless, and its demise is inevitable, but its obsequies are likely to be attended by a newborn journal, which will come into existence under a very favourable horoscope. So some come and others go, but we, with your leave, good reader, go on for ever.

THE annual dinner of the Holborn Camera Club, which took place last Saturday at Anderton's Hotel, on which occasion the President of the club took the chair, was pronounced a decided success, and proved a very enjoyable and festive evening. Capital after-dinner speeches were made by Mr. Fred Brocas, who proposed the health of the "Visitors," and Mr. Lowe, who evoked a great deal of merriment by his toast of "The Ladies." Mr. John Raphael rose to the occasion of responding to the latter toast in good style, and Mr. F. Cobb, the Hon. Sec., answered on behalf of the "Holborn Camera Club."

THE familiar figure of Mr. Chang was seen busy in the earlier part of the evening with the flash-light. Altogether the annual dinner of this active club was quite in keeping

with the sociable character which has always been a feature of all its gatherings.

JUDGING from a perusal of last week's journals, one is irresistibly brought to the conclusion that the photographic press were not in attendance at Tunbridge Wells during the exhibition, but depended solely upon the Secretary's official report and the local papers. This is hardly to be wondered at when exhibitions are as numerous as they have been just of late, and almost suggests the possibility of a Photographic Central News Agency being formed, by which competent reports of provincial exhibitions might be provided for the various papers.

WE intimated last week that societies' meetings and exhibitions are always troublesome to deal with, and must be introduced at the expense of matter of more permanent and wide-spread interest. Probably all the photographic press will ere long recognise the necessity of reducing such items to a mere synoptical report. We are ourselves working in that direction, and believe our readers will not, in the end at least, disapprove.

IN addition to lantern-slide making the present season is essentially one for other branches of artificial light work, including enlarging. The recognition of the necessity for filling the upper half of a landscape print with something representative of nature's clouds or sky tones has been quicker in winning its way to recognition than it has when enlargements from landscape negatives are undertaken. This is partly, perhaps, because of the supposed difficulty of combining two negatives, and projecting them consecutively on the paper so as to join correctly and develop up in proper relative value.

WE would point out that the difficulty is not as great as might be imagined, and is certainly not insurmountable, and this being the case clouds in the landscape enlargement *must* be attempted unless we are satisfied with the most mediocre results. On this particular subject and many others equally important, Mr. George Wheeler, in his little book "Photographic Enlargements, and How to Make Them," gives some very useful hints, told in a clear, concise manner. It is a first-rate shillingsworth.

THE scheme for a new Central Photographic Club seems prospering, and appears likely to become an accomplished fact somewhere about the birth of the new year. The idea, by the way, has nothing whatever to do with the Photographic Institute or "Photographies," proposed a long time back by Major Nott. This gentleman appears to have completely dropped out of the photographic world, and on his leaving this country his scheme seems to have died.

PHOTOGRAPHIC EXHIBITIONS are singularly unhappy in that they are too often followed by dissensions and disputes of a peculiarly unhappy nature. As will be seen from our correspondence column this week, the outlook is particularly stormy just now, and points to the urgent need for some effective and authoritative body of arbitrators or some universally recognised code of regulations, by the standard of which disagreements might be settled. It is greatly to be feared, however, that such an arrangement is not likely to be brought about, and a remedy in some other direction will have to be sought.

THE probability is we are gradually drifting towards the abolition of classes, and also the suppression of many disqualifying conditions. How soon the disappearance of

medals altogether will follow, it were rash indeed to forecast, but to a considerable reduction in their number we may confidently look, in which case their value will be enhanced, and they will be the better worth trying for.

IT is not, perhaps, generally made clear as to whether a medal is awarded to the best in a given class, or for intrinsic and particular merit; the latter is surely the most rational course, only it involves the fixing a standard of excellence which may not meet with general approval. Whilst we cannot but heartily sympathise in the disappointment which our Tunbridge Wells friends are naturally feeling just now, and regret, though not necessarily wholly disapprove, the action of Messrs. Gale, Mayland, and Davison, their behaviour, after all, only differs in degree from what most other judges have done elsewhere. A similar trouble arose at Bedford last time, when the judges found it necessary to withhold several of the medals, to the great vexation of the society.

Societies are prone to be too generous in providing prizes—perhaps the chief blame lies there.

THE powers forbid that the disappointment felt should have a disastrous effect upon the future of the society at Tunbridge Wells. This society we have always looked upon as one of the most flourishing and deserving of encouragement. But surely its members live for some better aim than medal winning!

REPORTS of heavy snowfalls in various parts of the country reach us, and the presence of winter needs no demonstrating; one turns up the coat collar and thinks twice before taking up the camera-bag and sallying forth. Yet let us again remind our readers that the cold winds are worth braving for the pictures which winter landscapes will furnish, and probably early winter is a better time than the transition period between winter and spring.

LAST week we noticed Dollond and Co.'s "Monocle" lens, and since then have had excellent reports from the one or two workers who have had the instrument for trial. An absence of sharpness without actual fuzziness appears to be the first characteristic which will command the approval of artistic workers. We shall very shortly make further and more careful experiments with the "Monocle," and give our readers particulars of the result. It appears likely that this lens will satisfy the taste of many who cannot as yet reconcile themselves to the suppression of the lens altogether in favour of the "pin-hole," but to whom the rendering of the usual doublet lens has become distasteful.

ON the reading of Mr. Pringle's paper on "Multiple-Coated Plates," at the Camera Club last month, a highly interesting discussion ensued on the subject of halation, and the characteristics and uses of the "Sandell" plates referred to. Mr. Pringle somewhat qualifies his approval of the plates, and wishes it understood that it was not his intention to exploit these plates, but merely to open a discussion by giving the results of his experiments with them. Mr. Pringle said:—"I want you to understand that I do not think they are of any real value unless you give them enormous over-exposure. If you take them out and expose them sufficiently, you will get a result on the lower film, but I would not think of taking these plates into the field for any purpose unless I were sure to be faced with great halation, and even then I should think twice about taking them and giving such an exposure as would make life a misery. I am not an apologist for the plates."

CAN we not have a National Photographic Union, which shall include all societies, and which shall, like the N. C. U. in cycling, settle some of these vexed questions, and also give some sort of recognition to those societies which will abide by their rules?

WE publish two appeals for help this week. Cannot some of our readers open their hearts at this festive season of the year, and help some of the poor children? We do all we can by loaning slides for charitable purposes free, and out of their abundance cannot our readers spare a little? We shall be very pleased to receive anything on account of the children.

WE would remind our readers that on the 31st inst. our annual "Holidays with the Camera" competition closes. The following are the

#### Rules and Conditions.

**PRIZES.**—Gold, Silver, and Bronze Medals, and Certificates, with special prizes of "Niepce" or progressive medals for past prize-winners.

**SUBJECTS.**—All photographs are eligible that have been taken during the "holidays," but must be landscape or sea pieces, with or without figures, views of towns, photographs of cathedrals, churches, public buildings, etc., but *not* portraiture, figure study, or pictures which could be classed as "Photography at Home." The prize pictures will become the property of the proprietors of THE AMATEUR PHOTOGRAPHER; other photographs will be returned if stamps be enclosed to cover postage.

**NUMBER.**—Not more than twelve or less than six prints are to be sent in. They must all be mounted and numbered to correspond with the numbers in the MS. They will be judged upon their merits as a whole.

**DESCRIPTIVE NOTES.**—Each competitor must contribute a short account of his holiday, to be not less than 500 or more than 1,000 words.

**DATE.**—All photographs must be received on or before the 31st December, 1892.

The photographs must be endorsed "Holidays with the Camera," and addressed to the Editor, AMATEUR PHOTOGRAPHER, 1, Creed Lane, Ludgate Hill, E.C.

## NOTES ON COLOUR.

### VI.—THE MIXTURE OF COLOURS.

(Continued from p. 379.)

WE must first of all distinguish between coloured light and coloured pigments, not only because the results are so different, but also because it has some considerable bearing on the results obtained in practical colour photography. And it is want of appreciation or recognition of this fact which will account for many of the conflicting statements made by various experimenters in this department of photography.

If we mix coloured light, we may state beforehand what the result will be. This is clearly shown in our last chapter, when treating of the three primary colour sensations. But this statement applies solely to pure-coloured lights, or lights obtained from the spectrum; in a less degree to stained glass, which is white glass stained with a pigmentary matter of some kind, and not at all to the admixture of solid pigments, whether dry or mixed with water or oil. A striking example of this kind is shown by the two following diagrams, fig. 6, *a* and *b*; *a* represents the light transmitted by a cobalt blue glass, and *b* represents the light

reflected by the same glass ground to powder and mixed with water and spread on paper.

FIG. 6 *b*.

Let us first examine the result of mixing spectrum colours: we will take the spectrum colours from red to yellowish green.

Red and yellowish green  
give .. .. Orange or yellow.\*  
Red and yellow give .. Orange.  
Orange and yellowish  
green give .. .. Yellow.

Then taking our next primary colour, we come to rather a curious situation, viz., that green, when mixed with other colours, produces whitish shades. For instance—

Green and red, in varying  
proportions, give .. Orange .. Whitish.  
Yellow .. " ..  
Yellowish green .. " ..  
Green and yellow give .. Whitish yellowish green.  
" cyan blue give .. " blueish green.  
Green and violet give .. Whitish ultramarine blue.  
" .. " cyan blue.  
" .. " blueish green.  
Yellowish green and  
blueish green give .. Very whitish green.

Treating the violet end of the spectrum in the same way, we find—

Blueish green and ultra-  
marine blue give .. Cyan blue.  
Blueish green and violet  
give .. .. Cyan blue.  
Violet and cyan blue give Ultramarine blue.

We have now only to consider the results of mixing the two extremes of the spectrum, and here we find:

Red and ultramarine blue  
give .. .. Whitish violet.  
Red and cyan blue give .. ultramarine.  
Orange and violet give .. red.  
Red and violet give .. purple.  
Orange and ultramarine  
give .. .. purple.

We have thus exhausted all but four combinations of spectral colours, and these do not give coloured but white light:

Red and green blue give .. .. White.  
Orange and cyan blue give .. ..  
Yellow and ultramarine give .. ..  
Greenish yellow and violet give .. ..

These are so far all the principal mixtures of coloured lights with which we need concern ourselves, save one, and this exception is curious because it actually mixes lights though pigments are used, and also because in photographing such a subject we obtain a result totally different to that obtained visually. An artifice often adopted by artists who have a complete command over, and knowledge of, the power of colours, is that of alternating lines or dots of

FIG. 6 *a*.

\* According to the proportion of separate constituents.

coloured pigments, the result being not the result of the mixture of these two pigments, but that obtained by mixing coloured lights as above described, when viewed at the proper distance. The author has lately come across a striking example of this, and the result to be obtained on an ordinary bromide dry plate. For purposes of testing certain dyed plates a coloured lithograph was used, in which a sky, illumined by a setting sun, was tinted a pale yellow, and in the foreground was a mass of yellowish-green foliage. To the eye these shades were even and perfectly graduated, the whole of the sky showing as one blended wave of deepening yellow; to the sensitive salt of silver, as shown by the resulting negative, this deepening tint looked like an innumerable number of minute black dots on a white background, and it was only when closely examined with a pocket microscope that it was seen that this yellow was formed of minute dots of cobalt blue and chrome yellow, regularly and evenly distributed over the whole surface of the paper. Ruskin, in his "Elements of Drawing," says: "Breaking one colour in small points through or over another is the most important of all processes in good modern oil and water-colour painting. . . . In distant effects of a rich subject, wood or rippled water or broken clouds, much may be done by touches or crumbling dashes of rather dry colour, with other colours afterwards put cunningly into the interstices. . . . And note, in filling up minute interstices of this kind, that, if you want the colour you fill them with to show brightly, it is better to put a rather positive point of it, with a little white left beside or around it, in the interstice, than to put a pale tint of the colour over the whole interstice. Yellow or orange will hardly show, if pale, in small spaces; but they show brightly in fine touches, however small, with white beside them."

This method—if we may so call it, this mosaic method—of mixing colours, often occurs in nature. The hue of a landscape is so modified in this way as to be charming to the eye, and it presents one harmonious uniform tint; whereas if this is photographed, the uniform tint is broken up into patchiness by the greater and different sensitiveness of the sensitive salt. Another method of mixing light adopted by nature is that of illuminating an object by two coloured lights. This is well seen in the case of a sunset, where objects are illuminated by the light from the sky and by the light of the setting sun. In a less degree we find this the case where coloured objects reflect their light on surrounding objects. When the object thus doubly lighted is white or grey, the above law holds good, but where the body itself is coloured a more complex problem is presented to us.

To enter fully into the different results obtained by mixing lights and pigments is almost beyond our scope, although an important subject. We shall, therefore, content ourselves with considering the fundamental difference between the two. Thus suppose we mix blue with yellow light, we obtain white, and we do so by sufficiently exciting the whole of the nerve fibrils by adding the effect of yellow to the effect of blue. Now let us consider the effect of adding a blue pigment, such as ultramarine, to a yellow pigment, such as chrome yellow. On intimately mixing these colours in the state of powder, the resultant colour will be a dull green, because this colour is composed of light reflected from the surface of the pigments and the light reflected from the interior of the pigments. Now, the light reflected from the surface is a dull yellowish grey, as it really is a mixture of impure blue and impure yellow, which mixture is, as it were, combined in our nerve fibrils; but, as we have already seen, the light entering the particles suffers

absorption, and this light is also returned to the eye. Now, ultramarine absorbs the red orange and yellow rays, and the chrome yellow absorbs the blue and violet, therefore green is the only colour which is not absorbed, and this returned to the eye mixes with the surface colour, which we have seen to be a dull yellowish grey, and the resultant tint is dull green.

One very important point on the admixture of colours, which we must not omit to consider, is that of the effect of gas or lamplight on colours, because this is suggested as the most satisfactory method of copying oil paintings. Artificial light, such as gas or lamp light, is deficient in the blue and violet rays, and it has been proposed to increase this deficiency by using yellow glass or a deep yellow reflector.\* The following are some results, given by Rood,† of experiments carried out on this subject.

Table of results obtained by illuminating colours by gaslight:—

ORIGINAL COLOUR (by Daylight).	RESULTS (by Gaslight).
Carmine ..	gave intense red.
Vermilion ..	fiery red.
Orange ..	brilliant orange.
Yellow ..	brilliant yellow tending to orange.
Yellow green ..	pure yellow.
Greenish yellow ..	pure yellow.
Full green ..	strong yellowish green.
Blue green ..	pale yellowish green.
Green blue ..	pale yellowish green.
Cyan blue ..	greenish yellow.
Blue ..	grey.
Ultramarine ..	violet.
Violet ..	strong red purple.
Purple ..	intense purple red.

This is an instructive table, which will well repay a little further notice, as we shall by this method obtain a somewhat clearer idea of what we require when carrying out practically our colour theories, and from a comparison with this table of any pigment in an oil or water colour we may arrive at a somewhat definite idea of the necessary rays of the spectrum for which we must work.

## Letters to the Editor.

### [ SIMPLE CHANGING SYSTEM FOR HAND-CAMERAS.

SIR,—Notwithstanding all the various methods adopted by the different makers of hand-cameras to effect the above object, a compact yet reliable and simple method, and one by which either plates or films or both, could be used, and that without the weight of metal sheaths or carriers, seems not yet to have been attained.

It occurs to me that by adopting the following modification of the systems in both the "Repeater" and "Frena" cameras the above objects could be effected in a very simple manner, and without the necessity of cutting the films, as required in the "Frena," viz:—

That between each plate or film a thin, stiff card, about one-eighth of an inch higher than the plate, should be placed, with a notch cut out of each side about one-eighth of an inch from the top, so that top of notch or gap comes on a level with top of plate or film, a small catch at either side sliding up and down holds the film in position by its two top corners, and two small fixed catches hold it at the bottom. To change plate or film it would only be necessary to cause the two sliding catches to rise about one-eighth of an inch until the plate or film is released and falls forward into well at bottom; by again sliding the catches down to their original position the card at back would be released by reason of the gaps in it, and

# IMPORTANT ANNOUNCEMENT

In consequence of the enormous demand for the

## “CADETT” LIGHTNING PLATE

(RED LABEL),

We very much regret having to discontinue the manufacture of our **ORDINARY** Plate (Yellow Label) for a short period, in order to allow us to cope with the daily increasing orders for the **Lightning** and Lantern Plates.

The recent additions and alterations to our present Factory being insufficient to meet the demand for our goods, we are compelled to at once commence the erection of additional works. These new works will be fitted with Steam and Electric Machinery, embodying the latest improvements.

The Hurter and Driffeld Speed Numbers of our latest deliveries are:

also fall forward into well over the plate; the catches at same time holding the next plate firmly in position. The usual spiral spring at back forces the plates forward as released.

A hand-camera could be made very cheaply on this principle, would be extremely compact, and if fitted with a good lens and shutter, and charged with films, would be all that could be required.

As regards cut films there can be little doubt that in a short time, when their advantages become better known, they will supersede glass altogether; the results being in every way equal, the manipulation as simple, and then there is added to this their lightness, freedom from breakage, and advantages of storage.—Yours, etc.,

DOUBLE DROP.

\* \* \* \*

#### THE BENEVOLENT.

SIR,—At the present time we have on the books of the Employment Bureau connected with the Benevolent, the names of many assistants for whom we see little probability of finding work this winter. We have one or two wet plate men who do well in the summer time, who are hard-working and economical, but who cannot tide over the whole of the winter. These, and some other men who are printers, would be glad to accept almost any situation in which they could earn a living. Some of them would take places as packers, light porters, etc. At present there seem to be very few vacancies for assistants, though we could find a first-class position for a thoroughly good wet-plate lantern slide maker. On the books we have a considerable variety of almost all classes of general assistants. In one or two cases of men for whom we have found outdoor employment, where we could not obtain them indoor work at their proper branches, the poor fellows are in need of good boots and weather-proof overcoats, which their reduced circumstances and small salaries in their temporary positions hardly enable them to purchase. If any of your readers have "cast offs" in these two lines, I should be glad to have a postcard offering them. I would rather not have the things sent on at once because, in some such cases, the contributions come to hand in greater quantities than the need requires; and it would be a pity for us to accumulate clothing which is needed for other charities.—Yours, etc.,

H. SNOWDEN WARD (Hon. Sec.).

Memorial Hall, E.C.

#### EXHIBITIONS AND MEDALS.

SIR,—The letter from "Disgusted," in your issue of the 2nd inst., fully expresses the views of many who, like myself, have for years been sending work to various exhibitions.

There is no doubt that the time has arrived when some radical change will have to be made both in judging and classification of exhibits if the bulk of amateurs are to be expected to compete.

There can be no doubt that certain judges have their own fixed ideas of what should be the correct style, colour, and mounting of a photograph, and unless all these are complied with an exhibit stands no chance of recognition, no matter how good it may be from another judge's point of view.

The question of standard is another important one, and I think that the only solution is to have a champion class, in which the standard of excellence should be very high, and to which none but medallists should be admitted.

The ordinary class should be open only to those who have never taken a medal, and the classes might be further subdivided into "bronze medallists," "silver medallists," and "gold medallists." Imagine what a stimulus this would be to beginners, and how they would work for the honour of competing in a superior class. Each class would then show better work, and the "gold medallists" would naturally be those only who had attained the highest standard.

With regard to the judging, in my humble opinion it will never be satisfactory until the present system is entirely done away with, for I maintain that the best picture is the one which pleases the greatest number of people, and therefore the public who visit the exhibition should be the judges.

This arrangement could easily be carried out much in the same way that pictures are criticised and judged in circulating portfolios, where each member records his vote for the best, second best, and third picture in each class.

The picture obtaining the largest number of votes takes the prize, and in the event of a tie the matter could be got over by the casting vote of an expert appointed for that purpose. If

each visitor to an exhibition be given a printed paper on which he can record his votes for first, second, and third in each class, and he deposit this paper as he leaves in a sealed box, I see no fear but that a perfectly fair and impartial judgment would be arrived at, and I greatly wish that some society would start an exhibition on these lines, as I feel sure it would be a great success.—Yours, etc.,

H. HARVEY-GEORGE.

The Tower, Gt. Yarmouth, Gorleston.

#### LANTERN-SLIDE CARRIER.

SIR,—In your issue of 23rd November last I notice you illustrate and give a short description of a lantern-slide carrier with an automatic slide raiser, manufactured by C. C. Vevers, of 12, Market Street, Briggate, Leeds. I have since carefully examined a sample of this carrier, and find that it is exactly the same in principle as those shown, described, and claimed in Patents No. 20,972, dated 23rd December, 1890, and No. 1,635, dated 27th January, 1892, of which I am part owner. In fact, it is identical with that shown in 1,635, 1892. I send you herewith the copies of the specifications, a sample lantern-slide carrier, and a block for your inspection. I find Mr. Vevers' application for letters patent was filed on October 13th, 1892, some time after the application of 1635, 1892, was completed, so there is no question as to priority of invention. The well-known firm of Messrs. Perken, Son, and Rayment have the sole right of manufacture of these carriers, and I feel sure, knowing your keen sense of right and justice, that you will do me the favour to publish this in your valuable and interesting paper, and thus correct any wrong impression that the article referred to may convey to any unwary members of the public who might be ignorant of the existence of the patents referred to in the commencement of this letter.

Thanking you in anticipation, I am, yours, etc.,

R. W. JAMES.

We have examined the patent specifications and carrier, which is shown in the accompanying block:—

Mr. James has the prior claim, we think.—EDITOR.

\* \* \* \*

#### A SUGGESTION.

SIR,—Your correspondent, Mr. W. Pictairn Craig, has evidently misread your extract from the article which appeared in the November number of our paper, the *Photographer's Record*. If he will refer either to your extracts or the full account in our paper he will see that no mention whatever is made of *paper* semi-transparent masks; we simply mentioned a semi-transparent mask. The reason we did not indicate material is that we were making some experiments with stained gelatine and celluloid, and we hope in our next issue, which will be ready in about ten days, to give further particulars.—Yours faithfully,

ELLIOTT AND SON.

\* \* \* \*

#### SOCIETIES' REPORTS.

SIR,—As you invite your readers in this week's issue to express opinions as to your curtailing your reports of societies, etc., I beg to put in my word and say that I have observed with satisfaction what seems to me an improvement in this line. Your journal is a valuable hand-book on photography, and the more it is used as an educator in the art, and a record of its progress, the better.

When matters of general interest and instruction are brought forward at societies' meetings, by all means let us have them, but it annoys the general reader to even have to skip over the fact that Mr. So-and-so made a complimentary speech, or that such a society spent a social evening. Photography has advanced to the forefront in science and art throughout the world, and I am glad to see its useful helpmeet, THE AMATEUR PHOTOGRAPHER, keeping pace with progress.—I am, Sir, yours,

A SUBSCRIBER.

## SOUTH LONDON PHOTOGRAPHIC SOCIETY.

SIR,—As a reader of your valuable paper, I have noticed your general remarks tend to help on photography, whether practised by individuals—amateur or professional, or societies and clubs—and, in the same spirit, as a comparatively recent recruit in the ranks of amateur photographers, I have been somewhat crushed by the thought that possibly merit is not the only requirement for success, and such being the case, I am afraid to prepare work for the exhibition of next year, having no hope of success. I have been led to this conclusion by the result of the exhibition of the South London Photographic Society, held just recently. I was not an exhibitor, therefore my opinion is perfectly unbiassed, and I do not give it altogether as an opinion, but am rather seeking information by asking the following questions:—Was it right to expect the judges (gentlemen of good stature and fine physique) to grope about on the floor to find work—pronounced “good” by many members, but which they could not possibly judge well under such peculiar arrangements as these? Is it usual for the judges to have in their hands catalogues which give the number and name of exhibitor clearly set forth, when the conditions distinctly stated: “Names of competitors will be covered during judging”? (By the way, many of us are sorry that the printer did not reap financial benefit from his arduous labours on the well prepared and printed catalogue, which must have taken up a deal of time, and to him—and to the Secretary for his complete list of the exhibits, and to the producer of the woodcut portraits on the front page—all our thanks are obviously attributable; but honour is surely their reward, although unaccompanied by medals). The lantern-slides were splendidly shown; but why, Mr. Editor, were some of them hurried through, and others kept on for a few moments to wait for the applause, and why were some omitted altogether without a reason being given? As an amateur of about two years’ experience, my pictures were not anywhere near good enough to be classed with numbers of those which had no opportunity of being appreciated by reason of their separation from each other—some on the ground, some hung where they could not be seen, here, there, on the “find them who can” principle; and my contention, expressed by many others also, is that tactics like these tend to keep such as myself from attempting to join the army of conscientious artists, who desire to make their profession an art, and who look to the expression of the honest judgment of the many (rather than the opinion of acquaintances) as a means to their attaining that end, and this cannot be done, nor our societies make real progress, unless all have the opportunity to receive either compliments or criticism, and surely, sir, this was not the case in the exhibition under notice. I have purposely avoided writing anything that might have caused pain to individuals, but I believe a little wholesome criticism from abler pens than mine may conduce to true “progressiveness” in the Society, which I hope will strive to encourage others who like myself could sign themselves as a persevering and ambitious, in its highest sense,

YOUNG MEMBER.

## MEDALS AND LANTERN SLIDES.

SIR,—In response to your suggestion that readers of the AMATEUR PHOTOGRAPHER should give their opinion on the subject of lantern slides from medalled pictures, it has occurred to me that you might consider the following proposal of some slight value. Let slides from previously honoured negatives be admissible by all means, for the very reason that they are probably as good or better than those competing with them, and why should so many be debarred from seeing a picture on the screen who have had no chance of admiring the original print? I take it that more enjoyment is provided for the greater number by means of lantern shows than by exhibitions, *i.e.*, more for the photographer and his immediate friends, not the general public perhaps. But whom should we first consider?

The plan I propose is as follows: Let the silver medal of the class be given irrespective of the medallist, and honour the latter, *if his work is superior only*, with a clasp. He has fought two battles in one campaign. Treat him accordingly.—Yours, etc.,

H. SALWEY.

## MEDALS AT THE HACKNEY PHOTOGRAPHIC EXHIBITION.

SIR,—I herewith send you copies of correspondence between the Hackney Photographic Society and Mr. J. E. Austin on the question of the medal awarded him for a set of six lantern slides.

Should you consider this question of sufficient public interest, you will greatly oblige me by finding a corner in your paper for these letters.—Yours, etc.,

J. O. GRANT.

“Dear Sir,—I have been absent from home, and no communication on matters photographic were forwarded to me. In reply to yours, I have not been guilty of any violation of your regulations, which I have again carefully perused. I must request that you furnish me with the names and addresses of those who have made the statement you mention, so that I may take legal proceedings against them.

“In your telegram you say, bronze medal for ‘Harvest-time.’ Has any protest been lodged against this also? Kindly forward to me a catalogue with awards.

“The price of ‘Election Time’ (including frame) is 30s.—Yours, etc.,

“West Court, Datling, Maidstone,  
“November 22nd, 1892.”

“J. E. Austin, Esq.—Dear Sir,—In reply to your favour of the 22nd ult., I have to inform you that I have sold the picture ‘Election Time,’ and have pleasure in enclosing you P. O. value 27s., being the amount named by you, less 10 per cent., as per our regulation.

“The other picture I have given instructions to be forwarded you, and trust you have received it. I also send you by this post bronze medal awarded you for same.

“Now to come to the more important part of your letter, *re* lantern slides. It was undoubtedly remarked during the exhibition that some of your slides had already been awarded a medal. I should not think of supplying you with the names of the gentlemen making the remarks, but thought it only right to give you an opportunity of at once saying if such were the case or not—hence my telegram to you the morning after the judging.

“As I considered the information as to your slides having been medalled before to be from good authority, I have taken the trouble of going to Peterborough and comparing them myself with the set for which you were awarded the AMATEUR PHOTOGRAPHER Silver Medal, and I found that two of the slides, namely, ‘Out from School’ and ‘Off to the Plough,’ sent into competition at our exhibition, were the same as two in that set.

“Under the circumstances, the Committee have decided to withhold the medal, and to draw your attention to the following extract from the regulations:—‘No prize-picture can compete.’

“As there was considerable talk at the exhibition about this matter, which is of public interest, the Committee feel it their duty to send this correspondence to the photographic Press for publication.—Yours, etc.,

J. O. GRANT.

“December 3rd, 1892.”

\* \* \* \*

## TUNBRIDGE WELLS ASSOCIATION.

SIR,—I was very much surprised to see in your last issue a leaderette stating that the question of disbanding our association had been discussed, and was still under consideration. I most emphatically deny that such has been the case, or has been contemplated; on the contrary, there are five candidates for election at our next meeting on the 8th inst. I feel it is necessary to take this course as communications from exhibitors express a hope that there is no foundation for the rumour.

I would wish your correspondent “Disgusted” to know that the medals were offered for competition by our association in the same good faith that they have in previous years, and therefore the sentence with which he opens his letter is entirely uncalled for. By inserting this you will greatly oblige, yours, etc.,

JOSEPH CHAMBERLAIN (Hon. Sec.).

[We are glad to hear that the above Society are not so disheartened as we were led to believe, on what seemed good authority.—Ed.]

\* \* \* \*

## AN APPEAL.

SIR,—Can you kindly give me a small place in your most valuable paper to make an appeal to my brother amateurs or others on behalf of 200 poor children, for some lantern slides to interest them during the long winter evenings. If you can you will be doing a very great favour indeed. I do not mind of what the slides consist. I have given them a good lantern. I would willingly pay carriage on slides.—Yours, etc.,

J. F. GRAY.

Essex Villa, Stevenage, Herts.

(Letters to the Editor, continued on page 433.)

## ILLUSTRATED SUPPLEMENT,

## Monthly Competition, No. 42, "Sea Pieces and River Scenery."

MOSS, C. (London).—"The Evening Hour." R. R., *f*/16; half sec., July; Edwards' Medium Iso.; mezzotype, platinum toned. A very effective massing of light and shade, and full of luminosity in the shadows.

SMALLPEICE, M. (Windermere).—"On the Wey." Watson's R. R. *f*/32; 2 sec., August, 4 p.m.; Ilford ordinary P.O.P. Rather too warm in tone.

CHEYNE, TULLOCH (Ashton-under-Lyne).—"Sunset at Menai." Wray's R.R., *f*/16; 1-30 sec., August; grey light, 6 p.m. Ilford Iso.; ordinary P.O.P., squeezed on zinc. Although printed a little too deep, this is another effective study of light and shade.

ALLEN, W. A. (Reading).—"Boat too central, and print flat."

ALLEN, J. E. (Sheffield).—"Too much foreground, not sharp, and curious blaze of light on right; over-printed."

ANDERSON, W. S. (Edinburgh).—"Flat print; the tree-boughs too offensive on right; print wants trimming down."

ANNEXTY, Mrs. J. (Kempston).—"Flat, poor print, and too much foreground."

ARROW, C. G. (London, N.W.).—"Flat, grey print, with curiously marked and unnatural sky."

## CLASS II.

BANKS, J. F. (Norwich).—"West Beach."

BASSANO, C. W.—"On the Severn."

BIBBY, W. H. (Blackburn).—"After the Thunderstorm."

ASKEW, J. R. (Rochdale).—Fearfully over-printed, and the figure not artistic.  
 BAILIN, R. (London, N.E.).—A flat and dirty print.  
 BARKER, E. (W. Hartlepool).—A little too flat, and wants clouds.  
 BATTY, A. C. (Liverpool).—Too flat; would look better on a rough surface in warmer tone.  
 BAXTER, G. H. (Jersey).—A flat, foggy print in the foreground, and sky too black and heavy.  
 BINKS, W. (Harrow).—Probably meant for midnight; most fearfully over-printed; a good thing spoilt.  
 BLOMLEY, C. (Rochdale).—Boat too central, and horizon cuts the plate in two.  
 BOOTH, J. A. (Reading).—Wanting in brilliancy, and too many straight lines in it.  
 BOLTON, C. P. (Waterford).—Flat and over-printed; a difficult subject to make a picture of.  
 BRIERLEY, J. T. (Chorley).—Over-printed, unevenly toned, and too much foreground.  
 BRIGGS, W. C. (Burton-on-Trent).—Over-toned, with patchy lights.  
 BROWN, F. H. (Cardiff).—Boat too central; wants clouds and less foreground.  
 BUCK, T. (London, S.W.).—Flat, poor print, too much foreground.  
 BURRELL, B. A. (Leeds).—A little too patchy at top to be pleasing.  
 CAIN, J. J. (Millom).—Over-printed and over-toned.

No. 2.]

"ON THE WEY."

BRONZE MEDAL.

[M. Smallpeice.

CHAPPELL, W. F. (Flinchley).—Too much foreground and too little sky.  
 CHEW, E., jun. (Biggleswade).—Too much foreground, and printed too deep.  
 CLEMENCE, H. (London, W.).—No matter how artistic this print might be, it would at once be put down low on account of the unequal tones. It is an imperfectly washed bromide, toned with uranium, and is greeny-blue and brown in irregular patches.  
 COLLIER, R., MISS (Liverpool).—Too much foreground and a little too black and white; boat too central.  
 COLLINS, A. MISS (Fulford).—Over-printed, and a little too much foreground.  
 CORNWALL, G. (Derby).—Over-printed and sky too white.  
 CROOM, J. E. (London, N.).—Sky far too heavy, too deeply printed.  
 CURRIE, J. E. (London, S.W.).—Spoilt by cutting off top of sail, no pure whites, boat too central.  
 D'ACTON, C. C. H. (Wincanton).—Printed too deep, and wants more clouds in sky.  
 DAN, F. (Faversham).—Too black, and wants clouds.  
 DAVIES, C. V., MISS (Mumbles).—Over-printed and too foggy.  
 DEAN, S. (Quarby).—Over-printed, and boat too central.  
 DOE, C. E. (Leeds).—A little too flat; a rough paper would improve it.  
 DUNCAN, A. H. (Glasgow).—A good bit of work, but not artistic.  
 ELLIOTT, W. (Coldstream).—Far too much foreground; the boat is in the centre, and horizon cuts print in two exactly.

EMMETT, W. (South Shields).—Over-printed and wants clouds.  
 FIDOOGE, A. (London, N. W.).—Horizon runs up-hill, too much foreground.  
 FIELD, A. M. C. (Cambridge).—Over-printed and over-toned.  
 FORSDYKE, E. (Woolwich).—Wants a sky, and a little too much printed.  
 FULLS, H. E. L. (London, S.E.).—Flat, poor print.  
 GETHEN, C. (Hereford).—Foreground too black, vignetting does not improve it.  
 GILL, R. (Chorley).—Badly stained, dirty print.  
 GOULD, R. C. (London, S.W.).—Over-printed, and wants some more sky.  
 GRANT, F. W. (London, S.E.).—Too much foreground.  
 GRAY, J. (Glasgow).—Good technical work, but not very artistic.  
 GROUNDELL, W. D. (Shanklin).—The straight lines of weir not pleasing, and a bad tone.  
 HALL, H. H. (Eccles).—Over-printed, and too pinky.  
 HARDING, G. (Stourbridge).—Flat and poor, wants sky.  
 HARGREAVES, G. R., JUN. (Kendal).—Fair technical work, but print would be improved by trimming.  
 HARRIS, H. (Hayward's Heath).—Fearfully over-printed, and sky too heavy; a good thing spoilt.  
 HARROP, A. E. (Gravelly Hill).—Wanting in artistic feeling, and not a pleasant tone.  
 HARROP, J. A. (Birmingham).—Too black and white; negative harsh.  
 LANGTON, C. R., MISS (Liverpool).—A little under-printed.  
 LEGG, F. (Edgbaston).—Over-printed, flat, and poor.  
 LEWIS, B. A. (Carmarthen).—Over-printed, and fearfully over-toned.  
 LIGHT, R., CAPT. (Torquay).—Too patchy, and wants a principal object.  
 LLOYD, J. A. (Mere).—A little too flat, and wants clouds.  
 LONG, A. H. (Portsmouth).—A good photograph of an old boat, but not artistic.  
 LYON, E. J. (Wimbledon).—Under-printed, and not artistic.  
 MACGREGOR, A. M. (Huddersfield).—Over-printed, and wants clouds.  
 MACMILLAN, M. (Rothsay).—Corners of view cut off by something; not artistic.  
 MALLINSON, A. W. (Clifton).—Over-printed, and wants sky.  
 MARRIOTT, E. L. (Liverpool).—Over-printed, and too flat.  
 MASON, E. (Askrigg).—Over-printed, over-toned, wants clouds.  
 MASON, J. W., DR. (London).—Utterly spoilt by the hideous yellow tinge all over.  
 MICKLEM, E., MRS. (London).—Over-printed, over-toned, and wants clouds.  
 MORTIMER, F. J. (Portsmouth).—Wanting purity in whites, and not artistic.  
 MOSS, G. (London).—Too much foreground and sky, and water too white.  
 MURRAY, W. (New Swindon).—Too much foreground, over-printed and over-toned.  
 HARWOOD, A. C. (Forest Gate).—A little too flat and grey, and the straight tree trunks by no means too pleasing.  
 HAWKINS, S. (Belper).—Too dark and too patchy.  
 HENNING, C. (Leeds).—Too dark and spoilt by pink tinge.  
 HERTSLET, E. C. (London).—Too grey, and the repetition of one set form in the bridge is not pleasant to the eye.  
 HAWKSWORTH, J. (Leek).—Good technical work, soft and delicate, but too many straight lines.  
 HEATH, F. P. (Kendal).—Over-printed and too flat.  
 HEATON, H. J. (Southport).—Over-printed and not artistic.  
 HOLLAND, B. (Spaldwick).—Ditto.  
 HOOPER, H. A. (Gateshead).—A very good thing spoilt by want of toning.  
 HUMAN, E. (New Swindon).—Over-printed, and print shows considerable number of spots, etc.  
 JAMES, T. (Worcester).—Too grey and flat; wants sky.  
 JONES, G. J. (Malton).—Too much foreground, wants clouds, and over-toned.  
 KIRKPATRICK, J. (Omagh).—We object to an horizon which runs up-hill, and over which clouds have been printed.  
 KITTON, F. (Preston).—Over-toned, and not artistic.  
 LAIDLER, T. S. (Fellingington-on-Tyne).—Another horizon which runs up.  
 LAMBE, D. W. (Edinburgh).—Flat, over-toned, and foggy.  
 NIEL, R. (Edinburgh).—Over-printed and not artistic.  
 NUGENT, J. (Dalkey).—Wants clouds.

- PARKER, J. E. D. (Liverpool).—Flat, poor, and much stained.
- PASCO, G. S. (London, N.E.).—Wants clouds and no vignetting.
- PATTERSON, T. (Preston).—Wants clouds and no figure.
- PEARCE, R. J. (Durham).—Over-printed and over-toned.
- PEARCE, W. B. (Wednesbury).—A very poor, flat print, and not free from stains.
- PERKINS, E. A., MRS. (Shaftesbury).—Utterly spoilt by want of clouds.
- PETTY, D. (London).—Over-printed, flat, and poor.
- PLAYFAIR, J. M. (Belfast).—Good technical work, but not artistic.
- PRESTON, G. (Cornwall).—Water and sky too white.
- PRUCE, J. C. (London).—Flat and poor.
- RAMSDEN, L. G. (London).—Over-printed and wanting in brilliancy.
- REMFRY, F. E. (Exmouth).—Too black and white; a very poor and not clear print.
- REYNOLDS, B. (London).—Wants clouds, and a bad tone.
- RHODES, R. (Kendal).—Over-printed, and wants clouds.
- RICHARDSON, J. T., MRS. (Nottingham).—Utterly spoilt by want of clouds.
- ROBERTS, C. A. (Liverpool).—Too much foreground, and wants clouds.
- ROBERTS, D. O. (Kensington).—Wants clouds.
- ROBERTSHAW, J. (Hebden Bridge).—Over-toned, and a hideous pink tinge over all.
- ROWELL, T. B. (Newcastle-on-Tyne).—Too harsh, and unequal in tone.
- SANDERSON, T. H. (Cambridge).—Over-printed, and wants clouds.
- SAVAGE, G. A. (Folkestone).—The cloud is unfortunately lit from the opposite side to the lower part.
- SCOTT, T. B. (Belfast).—Fearfully over-printed and untrue.
- SCOTT, E. (Cork).—Over-toned, and not artistic.
- SCOTT, M. A. (Oban, N.B.).—Badly mounted and all sorts of colours.
- SEABROOKE, H. C. (Grays).—Too much foreground, wants clouds.
- SELBY, H. (London).—Unequal toning, and it contains two pictures.
- SHAW, R. (Coniston Lake).—Too black and white, and spoilt by the shading at top.
- SIMPSON, J. (Dublin).—Wants clouds, and another horizon running up.
- SLATER, J. Y. (Winterset).—A very poor, muddy, foggy, dirty print.
- SMITH, H. (London).—Clouds, instead of a tinted sky, would have looked better, and sail too black.
- SPALDING, F. W. (Norwich).—Printed on rough paper, with suitable clouds this might make a picture.
- SPEIRS, J. W. R. (Haltwhistle).—Flat, poor print; boat too central.
- STIMSON, T. (Southampton).—Fearfully over-printed, horizon running down, nothing artistic in it.
- SLIT, J. C. (Liverpool).—Utterly spoilt by the want of clouds.
- SMELT, C. S. (Wisbech).—Too much foreground and sky, and clouds too heavy.
- STACEY, F. H. (Sheffield).—Wants clouds badly, printed a little too dark.
- STONE, G. F. (Bristol).—Too dark, and the two straight tree trunks offensive.
- TAYLOR, N. W., Miss (Barnet).—Wants  $1\frac{1}{2}$  in. less foreground, and church too central.
- TERRY, W. (Bristol).—Degraded whites, and not artistic.
- TERSON, T. A. (Dover).—Too black and white, contrasts too great, and a warmer tone would suit it better.
- THIRKETTLE, W. L. (London, N.).—A very poor print indeed, the boat is intensely black, and there is just a faint indication of water and nothing else.
- THOMAS, W. J. (London, W.C.).—Wants clouds badly, and print flat.
- THOMPSON, H. (Harrogate).—Printed on rough paper this might be an effective bit, but the negative wants dodging considerably.
- TIPPING, E. P. (Richmond, Surrey).—Utterly inartistic and poor print.
- USHER, G. T. (London, N.W.).—The straight line of bridge is a little too offensive, and should have been broken on left.
- VULLIAMY (Radnorshire).—Over-printed and too harsh.
- WAGNER, W. G. (London, W.).—A nasty yellow print without any artistic qualities.
- WAKEMAN-NEWPORT L., MRS. (Bewdley).—Too flat and wants more decided clouds.
- WELCH, J. H. (Liverpool).—Wants clouds, and a lighter, warmer tone would improve it.
- WHITE, M. (Wimbledon).—An awful yellow monstrosity due to sulphur toning.
- WILDING, P. P. (Preston).—Point of view too low, wants sky to relieve it a little.
- WILKINSON, A. (Manchester).—An awful colour, not terra-cotta, and no pure whites.
- WILLIAMS, J. (Festiniog).—Over-printed, over-toned, and not artistic.
- WILLIAMSON, L. W. (Darlington).—Too much cotton-wool foreground, wants some sky, a little too dark.
- WILSON, F. E. C. (Liverpool).—Boat too central; wants clouds.
- WINN, E. (Birmingham).—Printed too deep, does not want the figure of child, and a little too much foreground.
- WOOD, J. G. (Glasgow).—Not artistic, and taken wrong way of plate.
- WOOD, P. E. (Edgbaston).—Too dark altogether, wants sky, and should, we think, have been taken the other way of plate.
- WOODWARD, F. G. (Bath).—Utterly without interest of any kind.

The tail of this competition receives this month a brief note on its prints, the first and second class being ignored.

The quality of the work of the two first classes is decidedly high, but there is a tendency to overdo the rough surfaces and hot tones which is not wise.

The prevailing faults in the third class are blank skies, horizons which will run up and down at all sorts of angles, printing too

No. 3.]

SUNSET AT MENAI

[Tulloch Cheyne.

CERTIFICATE.

deeply, and the principal object too much in the centre. Some competitors seem to think that as long as the camera is put down somewhere, the result must be a picture. No idea of selection or artistic arrangement of the masses of light and shade by shifting the point of view seems to enter their head. On the other hand, many prints are excellent in technique but purely topographical studies. Photogrammetry, like photogrammetry, may be a good and useful science, but unfortunately in our monthly competitions the judges are unkind enough to look for a little artistic work. The winner of the Silver Medal is to be congratulated upon the result he has obtained. It is purely an effect of light and shade, true in tone, with all obtrusive detail subordinated, and as we have seen the gradual progress made by him during the last twelve months, and we do not think he is much older in photography, his career will serve as a good lesson to some of our younger workers. That a competitor may by a happy fluke take first or second place is unfortunately too true, but we can almost point out certain competitors who will, ere long, take our medal, as each month sees an improvement in their work.

Technique and artistic merit both score, the latter more especially, and every competitor should remember this, and try by dodging negatives, trying different printing processes, trimming his prints down, to take yet a higher place in our monthly trials.

A notice is appearing every week in the *Fishing Gazette*, giving particulars of money prizes offered for piscatorial photographs taken by anglers.

## Notes on the Exposures for Moving Objects.

By LT.-COL. E. T. D. COTTON-JODRELL, M.P.

IN connection with instantaneous photography the following problem offers itself for solution.

If an object be at a distance,  $D$ , from the lens of a camera, moving at a speed,  $S$ , what is the maximum limit of an *adequate* exposure,  $X$ , in order to obtain a "sharp" picture with a lens whose focal distance is  $F$ ; (1) where the object is moving in a direction at right angles to the axis of the lens; and (2) where the object is moving in an inclined direction to the axis?

*Case 1.*—Object moving at right angles to the prolongation of the axis of the lens.

We will first illustrate the method of solution by assuming a particular instance, and subsequently endeavour to show, by algebra that the same reasoning is true for all cases.

Suppose the object we wish to photograph to be moving at the rate of 20 miles per hour (which = 10 yards in one second nearly), and to be distant 100 yards from the lens, which is of 8 in. focal length.

Now, it is known that the motion of the image of such object on the plate should not at most exceed  $\frac{1}{16}$  of an inch, in order that a practically "sharp" picture may be obtained.

FIG. 1.

Let  $O O' =$  space moved through by the object during exposure.

$L =$  lens.

$F'F'' =$  maximum movement on the plate =  $\frac{1}{16}$  inch.

$O L =$  100 yards.

$L F =$  focal distance = 8 inches.

Then by similar triangles we have—

$$\begin{aligned} O O' &= \frac{F'F'' \times O L}{L F} \\ &= \frac{\frac{1}{16} \times 100 \times 3 \times 12 \times \frac{1}{16}}{8} \\ &= \frac{36}{8} = 4\frac{1}{2} \text{ inches.} \end{aligned} \quad (1.)$$

Thus, under the given conditions, the object in motion can be exposed only for such an interval of time as will restrict its movement during exposure to  $4\frac{1}{2}$  inches, so that the picture may be sharp. This interval is easily calculated: as the object is known to be moving at the rate of 10 yards per second, how long will it take to move  $4\frac{1}{2}$  inches? Let  $x =$  the time—

Then 10 yards :  $4\frac{1}{2}$  inches :: 1 second :  $x$ ,  
or  $x = \frac{1}{20}$  of a second, which indicates the speed of the shutter or limit of exposure required. By a similar process, it will be seen that at the same distance from the camera, but with the object only moving at half the speed, the exposure may be doubled, at a quarter the speed quadrupled, and so on. On the other hand, if the distance be reduced, the exposure must be proportionately quickened. In stating the problem, the words "adequate exposure" were used, and we assume, of course, that the conditions of light, plate, etc., are such that the exposures are sufficient for the picture.

Optics teach us that with lenses of other focal distances, the times of exposure must be inversely in the proportion of the squares

of those distances, assuming the apertures of the lenses to remain the same, and we shall show hereafter that the size of the aperture of the lens does not enter into the present problem, and may be disregarded.

Suppose that we now substitute a lens of 4 inches focus for the 8-inch one. Assuming the aperture to be unity, we may for shortness call these two lenses  $F 4$  and  $F 8$  respectively, in accordance with the ordinary nomenclature.

The speed of these lenses varies inversely as the squares of their focal lengths; therefore

$$\begin{aligned} \text{Speed of } F 8 : \text{speed of } F 4 &:: (4)^2 : (8)^2 \\ &:: 16 : 64 \\ &:: 1 : 4 \end{aligned}$$

Therefore if, as we have seen, a certain object can be properly exposed by the  $F 8$  lens in  $\frac{1}{20}$  second, a similar result will be obtained by the  $F 4$  lens in  $\frac{1}{80}$  of a second.

But now comes in the question of the moving object. Going back to the standard equations (1) and (2), we see that during  $\frac{1}{20}$  second the object moves  $4\frac{1}{2}$  inches; in  $\frac{1}{80}$  of a second it will therefore move 18 inches; but this amount of movement will cause corresponding motion on the plate sufficient to enlarge the diameter of the proper "circle of confusion" from  $\frac{1}{16}$  of an inch, which will not produce a satisfactory picture. This, however, is with 8 inches focus; the question is, how will the alteration of the focus to 4 inches affect the picture?

FIG. 2.

Refer to the figure of similar triangles once more. Make  $L V = 4$  inches. Through  $V$  draw  $V M$  parallel to  $F F'$ , and mark off  $V V' = \frac{1}{16}$  inch. Join  $V' L$ , and produce it to  $R$ . Now it is obvious that with the shorter focal distance  $L V$ , the movement of the object during exposure can extend to  $R$ , and yet be sharp on the plate so long as  $V V'$  does not exceed  $\frac{1}{16}$  inch.

To find  $O R$  by similar triangles:

$$\begin{aligned} O R : O L &:: V V' : V L \\ &:: 100 \text{ yards} : \frac{1}{16} \text{ inch} : 4 \text{ inches} \\ \therefore O R &= \frac{100 \times 3 \times 12 \times \frac{1}{16}}{4} \\ &= \frac{36}{4} = 9 \text{ inches.} \end{aligned} \quad (3.)$$

Therefore; with the shorter focal distance sharpness can be obtained if the object moves 9 inches during the exposure of the plate. And we see that although an exposure which permits a movement of the object of 18 inches will not produce sharpness, yet a good picture will result when the motion is 9 inches. How long an exposure must be given? We have seen that for correct exposure our  $F 4$  lens requires a period of  $\frac{1}{80}$  of a second to produce the same result, which can only be obtained by  $F 8$  in a quarter of the time. But during  $\frac{1}{80}$  of a second the object moves 18 inches; how long is the interval in which it will only move 9 inches? Let  $x' =$  the time.

$$\begin{aligned} 18 : 9 &:: \frac{1}{80} : x' \\ \therefore x' &= \frac{9 \times \frac{1}{80}}{18} = \frac{1}{160} \text{ of a second.} \end{aligned}$$

Thus by increasing the speed of our shutter from  $\frac{1}{20}$  to  $\frac{1}{160}$  of a second we can produce the same result with a 4-inch focus lens, as our original  $F 8$  lens with a shutter obliged to work at a speed of  $\frac{1}{80}$ .

$$\text{Or—} \quad 100f \times \text{OO}' \sin \theta = D - \text{OO}' \cos \theta.$$

$$\text{Or—} \quad \text{OO}' (100f \sin \theta + \cos \theta) = D.$$

$$\therefore \text{OO}' \text{ or } S = \frac{D}{(100f \sin \theta + \cos \theta)} \quad (13.)$$

Now OO' is, as we stated, the space through which the object moves during exposure,  $x$ .

And as in Case I., where R is rate at which the object moves in one second—

$$R : 1 :: S : x, \text{ or } S = Rx.$$

$$\therefore \text{ from (13) } D$$

$$x = \frac{D}{R(100f \sin \theta + \cos \theta)} \quad (14.)$$

Now, as  $\cos \theta$  by itself can never exceed unity, it may practically for the purposes of photography be disregarded, as producing a valueless effect on the whole fraction, even when R be taken into account, as it is neutralized by the product of R and  $\sin \theta$ .

Therefore we may write the equation as—

$$x = \frac{D}{R 100f \sin \theta} \quad (15.)$$

Thus we get two standard equations—

$$\text{from Case I. } x = \frac{D}{100f R}, \text{ and}$$

$$\text{from Case II. } x = \frac{D}{100f R \sin \theta}.$$

Suppose  $\theta = 90^\circ$ , so that  $\sin \theta = 1$ , then  $x = \frac{D}{100f R}$ , which is the same as in Case I.

This completes the investigation into the maximum exposure for varying distances and focal lengths of lenses, for it is plain that if the case be taken of the object moving obliquely away from the lens, the conditions attached to finding the value of OO' are unaltered, and therefore the formulæ are true in all cases.

It may be asked, "*Cui bono?*" For it is certain that no photographer could look at a moving object and spare the time under ordinary circumstances, to calculate the value of  $\sin \theta$  before taking his shot. No, but work may be done beforehand; a very broad approximation to the actual movement will suffice; some of the best known angles may be taken, distances and rates of speed worked out which are sufficient for all the practical purposes of a sharp picture; at any rate people may be prevented from attempting absurdities such as the writer did when he once tried to photograph a house fifty yards from a train going 60 miles an hour with a shutter which gave an exposure of about  $\frac{1}{50}$  of a second.

It may be, too, that these calculations will be possibly of some service in the problems of astronomy, to which photography is now giving such valuable aid, but this is soaring into those boundless realms of space with which the writer is unacquainted.

Two tables are appended, the first giving an approximate movement per second for objects at so many miles per hour, and the second giving sundry values of  $\sin \theta$ .

TABLE A.

Object moving, miles per hour.	Yards per second.	Remarks.
100	50	} Trains.
60	30	
40	20	
20	10	
12	6	} Steamers.
10	5	
8	4	} Horse trotting.
6	3	
4	2	} Carriages.
3	1½	
1	½	

TABLE B.

$$\text{When } \theta = 90^\circ, \sin \theta = 1.$$

$$\text{" } 75^\circ = \frac{\sqrt{3} + 1}{2\sqrt{2}}$$

$$\text{" } 60^\circ = \frac{\sqrt{3}}{2}$$

$$\text{" } 53^\circ = \frac{4}{5} \text{ nearly.}$$

$$\text{" } 45^\circ = \frac{1}{\sqrt{2}}$$

$$\text{When } \theta = 37^\circ = \frac{3}{5} \text{ nearly,}$$

$$\text{" } 30^\circ = \frac{1}{2}$$

$$\text{" } 15^\circ = \frac{\sqrt{3}}{2\sqrt{2}}$$

$$\text{" } 0^\circ = 0.$$

—Camera Club Journal.

## Photography as an Art.

ITS REQUIREMENTS, CLAIMS, AND FUTURE AS SUCH

BY G. T. NICHOLL.

If you wish to become an artist-photographer, avoid the hand-camera as you would a plague. I do not mean you to infer from this that it is impossible to take an artistic picture with a hand-camera, because I myself have seen many proofs to the contrary. You have only to glance at the display in the windows of the Eastman Photographic Co. or the London Stereoscopic Co. to be convinced that the capabilities of the hand-camera in the artistic line are by no means limited. But my belief is that, in art, labour-saving apparatus are in many respects fatal to the development of the artistic habit. An artist is not a man who pulls a string or presses a button and leaves the rest to the fickle caprice of the goddess fortune. No! an artist is a planning, thoughtful, imaginative being, using all the talent with which every man is more or less endowed, to produce an effect which he desires. He must make up his mind to a certain degree what his work is to look like when completed. Do you think the great Turner himself, when he sat down to paint any of his wonderful pictures, did not set himself a certain standard up to which he would work, keeping in his mind's eye the effect which was presently to be portrayed on his canvas? In the same way the much-maligned photographic artist should know every detail of the picture which will reveal itself to him in the dark-room. He should know every shadow, every light, so as to form accurate ideas as to whether a plate has been over or under exposed, and act in accordance with those ideas.

And now a few words as to the way to set to work to create an artistic photographic picture.

When in the field caution is very necessary whilst prospecting for a view. "All is not gold that glitters" is a proverb which has no better exemplification than in the case of photography. For instance, the shady glen, with silver brook rippling through, gleaming with light which filters through the leafy meshes overhead; this may look a picture for a medal, in anticipation. But, alas, how often are our brightest hopes in this world blighted—even in photography! The print which results from our negative reveals no trace or semblance of the lovely scene we had thought to depict. The shady glen was too shady, the silvery brook too glittering; the one is represented only by a mass of heavy black, the other by a smear of chalky white. On the other hand, on our way home, perhaps for the sake of using up an extra plate, we take a group of common-place farm buildings, surrounded with pastures and corn-fields, a few haystacks, a country lane, taken from some distance; this has turned out one of the most charmingly artistic pictures in our collection. And why is this so? The fact has been seized upon, by those who would deny photography the honour of a place as an art, as a strong argument on their side. They say that the fact that so common-place a subject as the farm and its surroundings makes a prettier picture and more artistic than the sylvan scenery of the glen, is only a proof of how unnatural the productions of the camera often are. I say it is no proof whatever of this, and that those who say so must indeed, on this subject at least, be "sightless seers and thoughtless thinkers." If it proves anything it proves only how our artistic discernment may be blunted by familiarity with a subject. It is only yet another good illustration of the proverb "Familiarity breeds contempt." If we were in the habit of seeing the latter scenery as often as the former we should doubtless pass it by without a thought as to its artistic beauty.

Again, the fact that the attempt to reproduce the violently contrasted effects of light and shade which so enchanted us in the original has proved a failure is no proof of the inability of photography to reproduce art in Nature. It was merely a failure because the circumstances under which the scene looked

so bright were such as to hinder the lens of the camera doing its work in a satisfactory manner. There is no doubt that under special circumstances the painter would fail to give effect to the scene. And yet no one has ever been, or ever will be, bold or stupid enough to deny painting a front place in the ranks of art on that account. Those who engage in a controversy on behalf of photography as an art have a tough battle to fight. Their opponent is hydra-headed. Even supposing that they have succeeded in drawing from him the admission that pictures of great artistic merit have been produced by photography, there is yet another argument ready to hand. He will tell you that such pictures, good as they are, are not the result of a man's talent, or even of his ingenuity, but merely of the careful working of a machine. He cannot recognise that these results are not due entirely to the operation of the actinic rays upon sensitive plates, but are rather in great measure to be attributed to the manner in which the beautiful and accurate draughtsmanship of such rays has been put to service, and with all the aid that science can lend, guided by the artist with his powers of selection and arrangement, has wrought wonderful works of art which delight the eye and enchant the imagination. But I have wandered from my original purpose—that of putting before you a few hints as to the methods of obtaining artistic pictures with your camera. I considered it necessary, however, to introduce a few words on the controversy, as, though it is not one by the decision of which one way or the other the practice of photography will stand or fall, it is, I think all will agree, sufficiently important to justify the digression I have made in its behalf.

Another very important thing to be guarded against is the indiscriminate introduction of life into a picture. There is no doubt that in many cases "life" does not only heighten the interest of a picture, but increases its artistic beauty. If, however, humanity is introduced into a picture, it must be as humanity, and not be so arranged that the picture looks like the representation of some amateur waxworks. The figures should set off a landscape, not *vice versa*, if it is the landscape we intend to take. If we wish to "make up" a picture—that is, to represent pictorially a phase of life or human nature—it certainly should be done with as little "make up" and posturing as possible. Here comes in the usefulness of the hand-camera. A snap-shot may be taken of a bit of courting, or of a person seized with sudden fright, under titles such as these: "Bill and Coo," and "Oh!" without the parties concerned being any the wiser, and so natural pictures, if not always artistic ones, are secured. In cases where landscapes are to be set off by the introduction of life, a snap-shutter camera at least is absolutely necessary for success. From behind a hedge a landscape may be taken with haymakers at work, which shall draw admiration from the most determined enemies of photography as an art.

I have in my mind's eye a picture I once saw of a hayfield in which there were about twenty men and women at work. Here the photographer had shown himself anxious, no doubt, to exhibit his prowess to such a crowd of admirers. All forty eyes gazed in one direction with a fixed stare, and every form was bolt upright. This picture was labelled "Haymakers at Work." The fitter title would have been "Tention in the Hayfield." How much better the picture would have looked if the figures had been depicted in various attitudes of work.

Another very common error is that of having the main object of a picture in the very middle. Symmetry is well enough in its place, but it is seldom artistic when dealing with Nature as a model.

Taking a glance at the place art takes in portraiture, I would say that nothing disgusts me more than to see the extent to which the so-called artistic or rustic scenery is used. Only the other day I saw an instance in the window of one of our best photographers in Bond Street—a large picture, excellent in execution and finish, of a young lady in a wintry costume of furs and muff, sitting out of doors at a rustic table with a background of palms and other tropical plants. The fact was the man liked the background, and would even go to the extent of making himself ridiculous to drag it into his pictures. My only wonder is that the lady did not recognise the incongruity of her "surroundings" and insist upon an alteration. It would be so much better if it were the habit of professional photographers to consult their customers a little as to what they think would be the best styles and the best scenery. For my part I should like to see all "artistic backgrounds" and "scenic effects" at the bottom of the sea. Heaven forbid that we should ever return to the days when a white sheet or a blanket were thought sufficient

backgrounds. But if you want a portrait taken, have it taken in a natural position and amongst natural surroundings. Our forefathers did not require to be "taken" by the painter swinging in a hammock or leaning over a balustrade. I am a Conservative, and I would like a little more of the old style of art in the new science. Let those who hear me, next time they have their photographs taken, try having it done at their own homes. Of course, there are many cases in which this is impossible, especially in London, but I think if it is possible, the value of the pictures will be greatly enhanced to those who are recipients of copies. Of course, the artistic and rustic effects I have mentioned have their peculiar charm for a certain class. 'Arry likes to be taken sitting with his 'Arriet upon a swing, with his arm round 'Arriet's waist; and if he like it, it is harmless enough. But be it remembered this is not portraiture, but only the burlesque of portraiture.

The use of effects would seem to become more necessary where two or more persons form the subjects of a picture, it is true. For where one person sitting in a position of rest or standing would look very well, two or more in similar positions might look ridiculous. There are, however, many ways of avoiding this without using effects. Into these I cannot now enter.

Let me only add that I believe there are still grand things in store for photography as an art. We have only to look around us and compare the achievements of the last few years with those of the past, to see that photography daily becomes more artistic. The result is that our pictures are no longer merely relegated to the obscurity of a big album, but form an important factor in the decoration of our homes. This is as it should be. By all means let us aim at high art, but let us also seek to attain that perfection in the manipulative science upon which alone success in our endeavours depends.

## The Reflector with the Projection Microscope.

MR. G. B. BUCKTON contributes the following letter to a recent issue of *Nature*, which we think deserves the attention of all lanternists:—

"The lantern is now used for so many purposes—scientific, photographic, and recreative—that any improvement in its construction will be acceptable. When we look into this instrument whilst at work we must be disappointed at the large quantity of light lost by reflection and by dispersion—light which ought to go to the illumination of the screen. In the ordinary form of the lantern three lenses of dense glass are employed as condensers. Each of these six surfaces reflects and scatters the light, and the glass itself is absorbent of its rays.

"The dioptric construction of the projection lantern has been well worked out by Messrs. Wright, Newton, Salomons, and others, but the catoptric principle, which would eliminate almost entirely these disadvantages, has been scarcely at all studied.

"Although my experiments have been made solely with the lime-light in various forms, the following remarks may equally apply to light given by the electric arc:—

"If a reflector be used instead of the ordinary condensers it is obvious that the position of the lime cylinder must be reversed. This will present no difficulty, for the tube holding the jet can be bent into a helical form. The dark image of the lime cylinder also will have no more practical disadvantage than is experienced by a like image formed by the small plane speculum of the Newtonian telescope.

"As to the mirror itself, although a parabolic form is the most correct, a spherical surface will be sufficient for mere illuminating purposes, and thus expense may be spared in the grinding of the more difficult curve. A speculum of from 5 to 7 inches diameter, having a radial curvature of from  $2\frac{1}{2}$  to 3 inches, will grasp a large quantity of light, much more than that obtainable from the 5-inch condenser usually employed.

"Silver deposited by one of the various reducing processes on the surface of a clear glass lens will have many advantages over a metal mirror. The front surface will give perhaps the finest definition, but by silvering the back part of a spherical glass film, or that of a ground lens, the brilliant surface will remain untarnished for an indefinite time, and the whitish bloom formed by slow volatilisation of the incandescent lime is easily removed. The silver film adheres with remarkable tenacity, and it will bear a great deal of heat without blistering or becoming detached.

"I have had considerable success in constructing such mirrors from the large ornamental glass spheres blown in Germany, and silvered within by Liebig's process, viz, with milk sugar and ammonio nitrate of silver. A glass sphere of 10 or 11 in. in diameter may be easily cut into eight or nine mirrors by a red-hot iron, and this without disturbing the silvering, which will require only gentle friction with a pad of cotton impregnated with a trifle of rouge to brighten it. Thus, at the cost of a few shillings, eight or more mirrors can be made, and also provision be made against possible accidents of racking by heat.

"The light-radiant is so placed that the secondary focus is intercepted by a plano-concave lens of dense glass, as has been happily proposed by Mr. L. Wright. The convergent rays from the speculum are thus made into a parallel beam, which must be deprived of its heat by an alum-trough, for the light and heat at the substage condenser is very great.

"Convergence, I find, is usefully promoted by a plano-convex lens of about eight inches focus, placed two or three inches before the above-noted plano-concave lens. In all other respects the arrangements are like those of the usual modern projection microscope.

"I have pretty constantly used the ether-oxygen saturator, and I consider it to be perfectly safe, if ordinary precautions be taken. The oxygen, compressed in cylinders, is much recommended, as there can be no mixture of vapour, except at the right place. The U-shaped horizontal saturator, plugged with flannel, must be well charged with ether, or with the best gasoline, and care should be taken, before beginning or ending an exhibition, to shut off the oxygen tap before closing the ether tap. This will prevent the harmless 'snap' from the mixture in the small chamber at the joining of the gas tubes. If a disc more than eight feet be required for the microscope, it will be well to use hydrogen gas instead of ether, since the calibre of the jet cannot in the ether light very well exceed  $\frac{1}{4}$  of an inch.

"As an extra security, I pack the mixing chamber with asbestos fibre, moistened with glycerine; but, as before urged, the oxygen must leave the saturator, saturated.

"To insure the coincidence of the foci of the reflector with the optical axis of the microscope, it will be well to place three adjusting screws in a triangle behind the mirror, and this last may have both a small vertical and horizontal movement.

"I claim for this catoptric arrangement a larger grasp of light than can be got from ordinary lenses, and this may be effected also at a small outlay. For the amateur constructor the plan will afford many advantages."

## Scientific Research in Photography.\*

By J. REYNOLDS, M.A., F.R.G.S., President of the Brixton Camera Club.

THERE has been of late a wholesome spirit of emulation in the different classes of work, and a happy tendency among our members to abandon the old albumenised paper printing and to turn attention to the superior results obtainable by the platinum (hot and cold bath), the carbon, the bromide, the gelatino-chloride, and plain salted paper processes, specimens of each of which can be inspected to-night. The desire is to gradually raise this Club out of the narrow groove of ordinary photography, and in the near future to encourage scientific inquiry into the causes of the various phenomena connected with the subject by independent original research. More men are wanted, earnest workers in all branches which the amateur can with the aid of a little perseverance master, viz., photo-micrography, meteorological photography, photo-ceramics, and also some of the simpler photo-mechanical operations. Then others are wanted who will experiment in the direction indicated by the Diazotype, the production of photographic impressions by means of the aniline dyes; and lastly, some men with a certain amount of training in chemistry and physics, who will devote some of their efforts to the solution of that very difficult problem, photography in natural colours. A short account of what has been done in this direction from the time of Dr. Seebeck in the year 1810 downwards, to the researches of Edmund Becquerel, with dates and names of chief workers, were given in a paper by the Vice-President (Mr. W. H. Harrison), in the "Photographic News Year Book" for 1890, and anyone contemplating experiments in this direction cannot do better than refer to the article.

It appears that the first person to obtain coloured impressions upon paper prepared with chloride of silver was Dr. Seebeck in 1810.

Next, Sir John Herschel, in 1839 or 1840, in a communication to the Royal Society, stated that he had obtained a coloured impression of the solar spectrum on paper prepared with chloride of silver. Afterwards, Hunt, in 1844, stated the fluoride of silver is very sensitive to the coloured rays, and that the yellow was well marked; that particular colour could hardly be detected in the images by Seebeck and Sir John Herschel. Then followed the splendid experiments and researches of Edmund Becquerel, an investigator who did more than almost anyone to develop colour photography, and his best results were obtained by taking a highly polished silver plate and depositing thereon, by means of the voltaic current, a thin film from a solution of the perchloride of copper in an aqueous solution of chlorine gas, and subsequently drying the plate by means of a gentle heat; and on plates prepared in this way he is said to have obtained all the colours in a picture. More recently, in fact down to the present moment, M. Lippmann has not only produced photographs in natural colours, but has shown us that the result is brought about by the interference of light, and that to get a vivid impression it is necessary to have a brilliant reflecting surface in optical contact with the sensitive film, and that, no doubt, is why the coloured images which were occasionally produced on the old daguerreotype silvered plates were produced, viz., because the actual surface of the plate was iodized, so that there was necessarily absolute contact between the sensitive and the reflecting surfaces. Lippmann's plan is to coat a glass plate with collodion or some other transparent medium containing bromide or other salt of silver, and then to make the prepared plate one side of a cell or trough with the sensitive film turned inwards, and the cell so produced is then filled up with pure mercury. In this way a brilliant surface is in optical contact with the sensitive film, and after due exposure, the plate is developed with pyrogallol acid and fixed with the usual hyposulphite of soda solution, when a faintly coloured image resulted. I have tried the effect of exposing a bichromatised gelatine plate under a number of strips of different coloured glass to bright sun-light, but obtained no pronounced results; no doubt because I omitted the indispensable reflecting surface, as I find Lippmann has tried the same experiment with the addition of a reflecting surface, and has thus obtained his best and latest results.

Considering the large number of persons who from various causes practice what has been facetiously called the "black art," it seems almost impossible but that there must be a goodly number present who have had a certain amount of scientific training in chemistry and physics, and a knowledge of these subjects is an immense help no less to the beginner than to the advanced worker. I cordially invite all who have had that training and who happen to be present, to attach yourselves to the Club, and then, not only give the members the benefit of your superior knowledge, but to contribute your mite to the further development and ultimate success of our scheme for the establishment of the Society on a sound scientific basis. Let not beginners be frightened away by the projected programme. All must have a beginning, and failures frequently teach us more than our successes. I trust that this Exhibition will be the means of causing a large accession of members, for it is not to be forgotten that photography is not only one of the most fascinating and absorbing hobbies that it is possible to take up, but that it requires for its successful accomplishment patience, care, neatness, cleanliness, precision, and close observation, combined with thoughtfulness, and so directly tends to develop those qualities which are absolutely necessary if we would make life a success.

**Affiliation of Photographic Societies.**—Meeting of delegates, November 26th, Mr. W. Bedford in the chair. The report of the committee on technical lectures was read, to the effect that photography seemed the most suitable subject; the members of the committee stated that they had approached the P. S. of G. B., who had given them a favourable reply, and that they were in communication with a probable lecturer. The report was adopted. To carry the proposed lectures into effect it was proposed by Mr. Cox (North Middlesex P. S.), seconded by Mr. Clifton (Photographic Club), and carried, that a committee, to consist of Messrs. Everitt, Hodson, and Marchant, be appointed to elect a lecturer, and to report upon the best method of carrying out the scheme. A letter from the Southsea Photographic Society was read, suggesting:—(1) A means of circulating for fixed periods the more expensive works of reference on photography, amongst the societies; (2) That albums should be collected and circulated, illustrative of the best work of the various societies; (3) That sets of slides should invariably be accompanied by readings. With reference to the first proposal, which was that the committee should subscribe to some library where the works were to be found, it was pointed out that no such lending library existed that the delegates present were aware of, and that the formation of a circulating library would be impossible in the present state of the funds at their disposal.

\* A portion of the Presidential Address at the opening of the Brixton Camera Club Exhibition, November 17th, 1892.

(Letters to the Editor, continued from page 424.)

## WATKINS' EXPOSURE METER.

SIR,—During the correspondence which took place a few months back regarding the actinograph, Mr. Watkins was good enough to forward me one of his exposure meters for trial.

Having used several instruments of this kind, and found them more or less worthless, I was quite prepared to find fault with it, but after an extended trial on every kind of subject, I am of opinion that the instrument fulfils every condition claimed for it by the inventor in his printed description.

The photographic conditions during the most favourable part of the day in the summer months (when most amateur work is done) will be found tolerably uniform, and with very little experience the correct exposure for ordinary well-lighted subjects may be correctly judged without any instrument at all. The too familiar certificate of an inexperienced photographer who succeeded in exposing a couple of dozen plates consecutively, with the aid of an instrument, without the loss of a plate, is not therefore so greatly in favour of the instrument as might at first sight appear. It is in timing exposures for interiors and outdoor subjects under heavy foliage, that some kind of guide to the exposure is required. For such subjects Watkins' instrument is invaluable, as it shows the value of the light which actually reaches the objects to be photographed, and the only point left to the photographer's judgment is the colour value of the objects, which is a very simple matter if Mr. Watkins' instructions are attended to. Two objections have been made as to the efficiency of this and similar instruments; first, that the darkening by light of the gelatino-bromide paper has no constant ratio to the formation of the invisible image on a gelatino-bromide plate. After repeated trials with the instrument, I can find no ground for this objection. The second objection is, that the light may change after the exposure has been calculated by means of the instrument, or even while the plate is undergoing exposure. This objection applies to all instruments for calculating exposures, because the calculation must in all cases be made previous to exposure.—Yours truly,

W. L. NOVERRE (Colonel).

\* \* \* \* \*

## THE SPEED OF PLATES.

SIR,—In justice to ourselves we should like to refer more fully to the correspondence that you published last week under the above heading.

The plates, of which we advertised the rapidity, were tested, not by us, but by a competent, independent gentleman, Mr. Alfred Watkins.

The sensitiveness reported to us was 150 "on Watkins' scale," and we considered we were quoting an accepted published ratio, in stating that "150 Watkins' scale" equalled 100 on Hurter and Driffield's.

So soon as Messrs. Hurter and Driffield raised any doubt as to the accuracy of the figures on their scale, we immediately withdrew their name from our advertisements, being quite content to accept the reading of the "Watkins' scale" alone, especially when given by such a practical expert as Mr. Watkins.

We do not care to adopt the Hurter and Driffield actinograph until it is recognised as being a standard instrument by the Photographic Society of Great Britain, or by a suitable body of scientific men capable of deciding its merits. The mere fact of its being adopted by one or two plate makers has no influence with us whatever. Meanwhile we are satisfied to have our plates tried by the Watkins method, being the *only one* based on an actual camera test, we estimating that 999 plates out of 1,000 are used in the camera.

The whole question of branding the sensitiveness of plates on each packet is a most serious one, both to the manufacturer and the trade. As manufacturers we have nothing to fear in the future in respect to rapidity if we branded our plates, but the interests of the trade must be considered.

The system of branding plates adopted by manufacturers using Hurter and Driffield's actinograph may be fair to the purchasers, but are most unjust to the trade (both wholesale and retail) that stock their plates. Our plates, if branded this week "100" Hurter and Driffield, would be at a heavy discount (practically, dead stock) if we were to issue 125 next week. Who ought to bear such a loss? Surely not the trade, who stocked our goods on our representations of only a week since.

Our company will not adopt any system of branding plates that is detrimental to the trade's interests. When it can be clearly shown that the branding of plates would be advantageous to the trade we shall be only too pleased to adopt their views.—Yours, etc.,

THE IMPERIAL DRY PLATE CO., LD.

(T. E. H. Bullen, Secretary.)

Cricklewood, N.W., Dec. 5th, 1892.

## A CORRECTION.

SIR,—I beg to draw attention to an obvious error in the report of a paper on "Multiple Coated Plates," read by me before the West Kent Photo. Society, in which I am made to say, "that for ordinary work where the correct exposure is known. . . the Sandell plate shows great and invaluable superiority," etc., etc.

As this is exactly the reverse of what I did say, I trust that you will be able to find space either for the insertion of this letter or for the correction of your notice.—I am, etc.,

GREGOR GRANT.

\* \* \* \* \*

## "AMUSING THE ORPHANS."

SIR,—Kindly allow me to thank those of your warm-hearted Scotch readers who responded to my appeal for magic-lantern slides.

We have children here from Scotland, Ireland, Wales, and the Isle of Man, although the majority are of English parentage.

Cannot I persuade some more of the subscribers to the AMATEUR PHOTOGRAPHER to afford me the pleasure of thanking them? I will send them a little pamphlet containing information about the Home with illustrations copied from photos.

I beg of them to look through their photographic paraphernalia, and see if they cannot make their own Christmastide happier by helping to make those happy who have no holidays from the Home, from the time they enter it at eight until they leave at fifteen years of age.

Craving pardon for encroachment on your space, I am, etc.,

A. MITCHELL (Head Master).

R. A. O. A., Camberley, Surrey.

\* \* \* \* \*

## LANTERN-SLIDES OF LIFE AND CHARACTER.

SIR,—I am desirous of obtaining studies and life and character in all parts of the world, and although I know it is a tall order, yet I venture to utilise your columns (with your kind permission) to make known my yearning desire. First, however, I don't want something for nothing, but for every slide sent me an equivalent will be given. My offer is to give slide for slide.

Any of your readers who may be in possession of hand-camera studies of street life, native characters or scenes, which will illustrate the life of the particular country, I should be glad to hear from.

I will exchange any number (not exceeding eighteen) slides of English street life and character for a corresponding number from a foreign or colonial fellow worker. Although hand-camera shots would be preferred as giving better renderings of life, yet I by no means wish the series thus limited. My object is to form a set of slides of an interesting and instructive nature which will be ready by next season. I should be glad to hear from any one in this country as well who may possess suitable slides taken by them on a holiday trip abroad.—Yours, etc.,

47, Hagley Road, Birmingham.

WALTER D. WELFORD.

\* \* \* \* \*

## LANTERN SLIDES.

SIR,—In reference to the suggestion made by Messrs. Elliott and Son, and also to that of Mr. W. P. Craig in your issue of the 2nd inst., as to the reduction of contrast between the picture projected on the screen and the surrounding portion, I think you will agree with me that semi-transparent paper and the like would be useless for this purpose; and the painting suggested by Mr. W. P. Craig would be tedious, as well as requiring great care and skill in producing good results.

Now, I would suggest that a better effect could be obtained by photographically printing a mask of any desired shape or size around the view or subject.

This is easily accomplished in the following manner:—Having previously printed the required subject from a negative on to a lantern plate, either by contact or reduction through the camera, and masking that portion of the negative not to be included in

the finished slide, I then take a glass of quarter-plate or lantern size, and affix thereon and in the centre thereof a piece of opaque paper, cut to the size of the required aperture in the mask; placing this in the printing-frame, paper side uppermost, I place thereon (film side down) the already exposed lantern plate, so that the portion on which the view or subject has been printed is covered by this opaque mask. The remaining margin of the plate is then exposed to light, and the whole developed and fixed in the ordinary way; the result being a picture surrounded by a mask of any required density or colour, due to variations in exposure and development. This colour can still be further altered by "local toning," intensifying, etc. We have thus a mask, surrounding the image projected, equal to it in texture and beauty. Several modifications will suggest themselves, such as printing the mask on the cover glass, printing the title of the subject on the mask, so as to appear with the subject on the screen, etc.

I may mention, *en passant*, that I have made admirable focussing screens for use in focussing microscopic objects, reduced images, etc., by this procedure, viz., exposing a bromide, or preferably a chloride of silver plate to the action of light, and developing tentatively with a weak developer to a thin grey density and then fixing.

With such a screen and the use of a focussing glass, the image can be focussed to a nicety, the deposition of silver (on the screen) being so fine, and the grain does not show up with the magnifier, as is the case with the finest ground-glass.

I hope soon to contribute an article to your *Lantern Screen* on "Local Toning and the Colouring of Lantern Slides Chemically," being the outcome of a series of experiments conducted during the past few months.

Thanking you in anticipation for inserting these suggestions, I am, yours, etc.,  
D. G. GORDON.

## Apparatus.

### THE TODD-FORRET MAGNESIUM FLASH-LAMP.

A. H. BAIRD, of 15, Lothian Street, Edinburgh, has sent us some specimen illustrations of work, interiors, taken by aid of the above flash-lamp, and they only confirm the good opinion we hold, based on experience of the capabilities of the same. In town during these dark days this lamp is of great value.

### ACID FIXING SALT.

R. W. Greeff and Co., of 29, Mincing Lane, E.C., have sent us a sample of the above which they have placed upon the market.

One part of this salt dissolved in eight parts of water forms a clear acid fixing bath which prevents staining and frilling of the film, and the bath keeps its own colour far longer than the ordinary fixing bath. The salt dissolves easily and quickly, and should be of value to all who like clean fixing baths and clean films.

### CADETT'S "LIGHTNING" PLATES.

Cadett and Neall, of Greville Works, Ashted, have made yet another advance in the speed of their plates, and that without any sacrifice of quality. The new plates they have sent us register 130 on Hurter and Driffield's scale, and 195 on Watkins'. The possibilities of work that this increase opens up are, of course, almost unbounded, and should the speed still further increase, we shall soon expect some extraordinary revelations. Portraiture in ordinary sitting-rooms will become an everyday occurrence, and the far-famed story of the detective who took a negative of a burglar with a hand-camera in a London slum will be a reasonable possibility even if not *un fait accompli*.

## Reviews.

*Photo-Mechanical Processes.* By W. T. Wilkinson. Published by Hampton, Judd, and Co., 13, Cursitor Street, E.C.

Himself a practical worker, Mr. Wilkinson has long been known as a practical writer on the text of this book, which includes photo-zincography in line and half-tone, photo-litho and collotype. We can recommend this book as extremely useful to all desirous of entering into these branches of photography, but we regret that

in some cases it is not more complete and full. As an instance of this, we note that the preparation of half-tone blocks on copper, a process which certainly gives the finest results, is dismissed in three lines. And we find no mention, or one equally as brief, as to using metal plates for collotype.

*Manuel de Chimie Photographique.* By Mauméné. Published by Société d'Éditions Scientifiques, 4, Rue Autoine-Dubois, Paris. Price 5fr.

This manual of 500 pages is not a work which will be taken up by the dilettante or dabbler, but to the student it will be of very great value. Each chemical used in photography is treated of at length, its preparation and uses, and considerable valuable information is collected together.

## Concerning Mountants.

BY CHARLES MACLAURIN.

A GOOD mountant is such an important and useful thing that no excuse is needed for devoting a special article to it. I shall try to be both clear and concise in what I have to say, for nobody ever reads a long, sham-scientific-style sort of article—at least, such is my experience.

One hears a great deal about various mountants—glue, gelatine, arrowroot, and so forth—but my own experience is that nothing comes up to our old friend starch. Clean, inexpensive, not injurious to the print, easily kept, easily made, and easily applied, it is undoubtedly one of the best mountants we possess; but it must be good starch. I think it is because most people get the cook to make their starch for them that it has fallen into such disrepute. That estimable female never bothers her head about such a little point as crushing it up properly; it is really a matter of supreme indifference to her whether it sticks or not. Now, there is one way to make starch, and one way only. Get a cup, and put into it about a tea-spoonful of starch, and mix with cold water till it is about the consistency of cream. Pound the starch very fine, leaving no lump big enough to see. Then pour on boiling water—really boiling, mind—till it forms an emulsion, and the starch is made. If it is too thick—which is not likely, by the way—add more hot water.

You must add some antiseptic to waylay the *bacterium termo*, or your starch will only keep a few days. There are many such—methylated spirit, alcohol, corrosive sublimate, carbolic acid, oil of cloves, and boracic acid are the most useful.

Methylated spirit used to be my favourite. I used to add it after the starch was made, having purposely made the latter too thick, and thin it down with spirit. However, the new Excise regulations have turned methylated spirit into such a fearful compound of filth that I am really afraid to trust a delicate print to its tender mercies.

Alcohol is an excellent antiseptic, but is expensive. Use it in the same way as methylated spirit. Whiskey will not do—even Irish, which Scotchmen consider the nearest approach to prussic acid that there is, I believe.

Corrosive sublimate (1 in 1,000 solution) and carbolic acid (1 in 20) are, of course, *facile princeps* among antiseptics; but as they are sold under the Poisons Act the non-medical reader will have difficulty in getting them. Both are most virulent poisons; the corrosive being poisonous both when it gets into the blood by a scratch or wound and when it is swallowed, so they should not be left about if the reader gets hold of them. Strong carbolic acid may be applied after the starch is made, while it is still warm. Twenty or thirty minims of it will keep four ounces of starch till Doomsday, if it is well shaken up. But be careful what you do with these fearful poisons.

Oil of cloves is an excellent preservative. However, I do not care for the smell of it myself, so I have little practical experience of it. I believe a tea-spoonful of the oil to four ounces of starch is sufficient.

And now we come to my own favourite, boracic acid. It is cheap, fourpence an ounce, which will do for quarts of starch—not poisonous, and very efficacious. In addition, a solution of it at 100 deg. F. is the very best thing you can get for sore eyes.

To make starch with it, put a little into the first water you use; boil it till it dissolves, for it dissolves very slowly in cold water. Then mix up the starch thoroughly with it, and proceed as before. About a tea-spoonful of the crystals will keep four ounces of starch indefinitely.

By the way, a solution of boracic acid is a useful thing to have about the house. If a dog bites you, or a cat scratches your hand, one should always wash the wound both in hot water and some antiseptic, such as boracic or Condy's fluid, to prevent blood-poisoning, for one never knows what putrid matter the animal may have been

## Xmas Annual of the "Practical Photographer."

This new and unique production consists of an artistic large quarto portfolio, containing eight choice studies, reproduced from photographs, and printed on antique plate-sunk cards. A leaflet with a short description of each of the studies is included. These pictures adapt themselves either for framing or for a place on the drawing-room table. The Annual would form a most appropriate Christmas present. Price 1s., post free 1s. 3d.

The studies are by the following artists: Harold Baker, S. N. Bhedwar, W. J. Byrne, Thomas Scotton, F. M. Sutcliffe, W. Ethelbert Henry, Richard Keene, Robert Slingsby.

 As the edition is positively limited to 2,000 copies, orders should be placed at once to avoid disappointment.

## The Xmas Double Number of

### "The Practical Photographer" Forty

pages of matter. Twenty Illustrations in the text. Six magnificent supplement illustrations in colours. Principal contents:—Artistic Printing, by Valentine Blanchard—Sport without Bloodshed, by Y. Wyddfa—Photographic Travellers, No. 6, H. M. Corthwaite—Opal Bromide Plates, etc., etc. "The Double Number of 'The Practical Photographer' marks an era in Photographic Journalism." Price 2l., post free 3½d. Annual Subscription, 2s. 9d., post free.

Specimen of Illustrations in "The Practical Photographer."

## The Volume of "The Practical Photographer" for 1892. Bound in

neat red cloth, gilt lettered, over 330 pages, more than 200 illustrations. Superior toned paper, 2s. 6d.; post free, 2s. 10½d. A practical 'Xmas present.

The whole stock just purchased from Mr. J. WERGE. Reduced from 5s. to 3s. 6d.

## The Evolution of Photography.

By JOHN WERGE. With a Chronological Record of Discoveries, Inventions, etc. Contributions to Photographic Literature, and Personal Reminiscences extending over forty years. Illustrated with ten collotype portraits. Neatly bound cloth. 312 pages. 3s. 6d.; post free, 3s. 9d.

"The book is full of interest, even for the general reader."—*Graphic*.

## THE AMATEUR'S FIRST HANDBOOK OF PHOTOGRAPHY.

A Complete Guide and Instructor in the Art of Modern Photography. The sixth edition contains much additional matter and a charming photo-process illustration. 6th edition. 14th to 19th thousand. Price 6d.; post free, 7d.

"The fact that it has run through so many editions speaks for itself as to the value of the book."—*Photography*.

## BROMIDE PAPER.

Instructions for Contact Printing and Enlarging. By Dr. E. A. JUST. Translated by Walter E. Woodbury and H. Snowden Ward. With bromide paper frontispiece and upwards of 30 illustrations in the text. Demy 8vo, price 1s.; post free, 1s. 3d.

"It is perhaps the most exhaustive monograph on the subject yet issued, no detail connected with bromide printing and enlarging being omitted."—*British Journal of Photography*.

## THE PRACTICAL PHOTOGRAPHER'S

**LABEL BOOK.** With antidote for each poisonous chemical clearly printed on the label. Labels varnished, rendering them practically impervious. The perforating is such that any label can be removed without disturbing any of the others. The most unique label book ever published. 6d.; post free, 7d.

"This is certainly the best label book which has yet been issued."—*Amateur Photographer*.

"A distinct advance upon what has been done before in this direction."—*Photographic News*.

## PHOTO-MECHANICAL PROCESSES.

By W. T. WILKINSON. The well-known standard handbook of the photo processes. Revised up to date and partially re-written. Full practical instructions in photo-zincography in line, photo-zincography in half-tone, photo-lithography in line, collotype. 148 pages, 8vo, stiff cloth. Price 5s.; post free, 5s. 5d.

## SPECIAL NOTICE.

feeding on. Even the harmless necessary cut finger should be treated antiseptically. Not long ago a young friend of mine was seriously ill of blood-poisoning from neglecting a simple scratch of a penknife. Boracic acid is as good as anything for this. It is also useful for rinsing out the mouth with; if every one rinsed his mouth out with boracic twice a day—a thorough rinse, of course—the dentists would not have much work to do.

Well, I have wandered from my original subject; but the few hints above are certain to be useful to some one or other. They have often enough been useful to myself.

## Societies' Notes.

MESSES. WHITE AND BURROUGHS in consequence of pressure of business being unable to devote sufficient time to the somewhat arduous duties of Honorary Secretary and Hon. Assistant Secretary of Croydon Camera Club, their duties have *pro tem.* been undertaken by Mr. J. Packham, of 17 Katherine Street, and Mr. A. Hirst, of West Croydon, to whom for the future all official communications should be sent.

THE Guildford Photographic Society have opened a reading-room at 36, High Street, where many of the photographic papers besides the ordinary magazines are to be seen.

As is probably well known, Plymouth has been selected as the locality for next year's Convention, and the Devon and Cornwall Camera, as the issuers of the invitation, hope to secure the co-operation of the townspeople and of all the clubs in the locality, to the extent, at least, of a large accession of members to the Convention.

## Societies' Meetings.

**Aston.**—A meeting was held on the 1st inst. There was a large attendance, and the chair was taken by Mr. Tylar (Vice-President). The chief business was the formulation of rules, and the arrangement of programme, the first issue of which will be ready early in the New Year; several really instructive items have been arranged, suitable to the requirements of a society of its kind, and much useful work is anticipated by the members, who are entering into the affair with zeal. Ladies and gentlemen wishing to become members should please communicate with Frederick W. Pilditch, Hon. Sec., 133, Wells Street, Aston.

**Birmingham** (Photographers' Union).—A meeting was held on 26th ult. Mr. Prince (President) occupied the chair. A magic lantern demonstration on members' lantern slides was given with great success, and much appreciated by the members and visitors present. Three new members were enrolled. On December 9th inst. a paper will be read by Mr. P. H. Foster, on "The Application of Elementary Art Principles to Photography."

**Burnley.**—At the meeting on the 30th ult., Mr. John Butterworth, J.P., presided, and there was a large attendance. Mr. B. Wollaston,

of the Platinotype Company, gave a most interesting address, accompanied with experiments, bearing upon the development of platinotype prints. He showed how various tints up to sepia might be obtained, and also how the development might be retarded by the use of glycerine.

**Cardiff.**—A first-class set of slides illustrating hand-camera work were passed through the lantern on Friday evening. The series comprised scenes in the Rhondda colliery districts, Barry Dock, and street-life in the East-end of London. The photographs were all taken personally by the lecturer, the Rev. A. T. Fryer, and formed the basis of a most instructive and interesting discussion. The lantern was ably manipulated by Mr. S. W. Allen. The following gentlemen were elected ordinary members of the society:—Rev. H. R. John, Mr. Benjamin Evans.

**City of London College.**—On 30th ult. lantern evening. Slides by Messrs. Fell, Thirkettle, Adams, Lawless, and Cook were passed through the lantern, including slides of locomotives of many of our railways, slides from negatives taken during the society's outings last summer, and a portion of a set illustrative of river mining in California. Prints from the negatives of the latter were handed round by Mr. A. W. Cook, and prints of scenes in Switzerland by Mr. Goudey.

**Croydon** (Camera Club).—On 5th inst., the President, Mr. H. Maclean, F.G.S., in the chair, Mr. W. H. Smith demonstrated in very complete fashion the valuable power available in platinotype printing by the employment of glycerine in conjunction with the usual potassic oxalate developer, whereby some portions of a print may be more quickly developed than other parts. The use of the oxy-magnesium lamp for printing was also shown.

**Croydon** (Microscopical and National History Club, Photographic Section).—Ordinary meeting on 2nd inst., Mr. W. Budgen in the chair. Subject, "Blocking-out and Printing-in." The chairman, after introducing the subject, passed round a set of prints illustrating the various difficulties encountered when printing-in clouds, etc. Various methods were then described, showing how they might be overcome by the judicious use of tissue paper and masks, or by painting with oil colours on the back of the negative. The addition of figures to a landscape on albumen paper did not present any special difficulty if the figures were first printed and then, after they had been carefully painted over with Indian ink, the landscape printed. When gelatine paper was used, a mixture of gamboge with turpentine, or other medium which did not affect the gelatine, was suggested in place of Indian ink. Those who wished to refresh themselves on the subject were referred to a series of articles by Mr. V. Blanchard, on "Artistic Printing, or what to do with the Negative," now appearing in the *Practical Photographer*.

**Darlington.**—Meeting was held on 30th ult., when the lantern slides of Teesdale scenery, made by the members of the "Teesdale survey" set, were exhibited on the screen by means of the new lantern. For the benefit of the less experienced members, as each slide was shown each maker explained the process he had adopted in its production. Two new members were elected.

**Derby.**—On 30th ult. there was a very large and evidently interested audience at the St. James's Hall, when Captain Abney, President of the society, read a paper on "Hand-Cameras and Shutters." Mr. R. Keene presided, and Captain Abney, in the course of his address, threw out many useful hints for the guidance of photographers, explaining in a concise and lucid manner the intricacies of the hand-camera and its appurtenances. The better to explain his subject the lecturer illustrated his remarks with a variety of diagrams and photographs shown on a sheet by the aid of a powerful oxy-hydrogen lantern. The paper was followed with the keenest interest and attention throughout.

**Devon and Cornwall.**—At the fortnightly meeting held on the 28th ult. the Indian and Colonial set of lantern-slides, circulated under the P. S. G. B. affiliation scheme, was exhibited. There was a good attendance of members, the President, Colonel Barrington Baker, being in the chair. In addition to the above set, several members exhibited, and some very good work was shown on the screen. At the next meeting the subject will be "Developing and Developers," and demonstrations are being arranged to exhibit the properties of pyro, hydroquinone, eikonogen, Rodinal, and Amidol. It is also hoped that the series of slides entitled "Places to be Visited by the Photographic Convention of 1893" will then be ready and be exhibited prior to being sent on its travels among the societies.

**Hackney.**—The weekly meeting held on 27th ult. was under the chairmanship of Mr. W. L. Barker. It was decided to hold a smoking concert on January 3rd at the Club premises. Mr. Roofe showed a P.O.P. (Ilford) print which had been in the frame three weeks but was not stained in any way. Mr. Beckett showed two prints, one on platinotype paper and the other on silver paper. Both had been kept in a very damp place. The platinotype print, however, was perfect, whilst the silver print had faded considerably. Mr. Wire and Mr. Houghton both showed flashlight pictures. M.

Cross showed some negatives, and asked what was the matter with them. Mr. S. Beckett was of the opinion they were under-exposed and out of focus. Other work was shown by Messrs. Nunn, Moore, Sodeau, etc. Mr. Jno. Reynolds exhibited an Anschütz Tachyscope, which was on the principle of a wheel of life. Mr. Funston asked how permanganate of potash is used as an intensifier as per Wall's "Dictionary." Mr. Beckett thought it stained the negative, and thus gave more printing quality. Mr. Sodeau, however, said there was a distinct chemical action. From the question box: "What constitutes a hand-camera picture?" Considerable discussion ensued on this question, in which nearly all took part. The Hon. Secretary gave the ruling of the judges at the recent exhibition, which was, "Any camera held in the hand is a hand-camera." A vote taken on the question resulted in the following being the accepted answer:—"A hand-camera must be held in the hand only, and not on any kind of support. Instantaneity is not essential, the natural limit being a question of how long it can be held as mentioned. If placed on a stand or any other support it is no longer a hand-camera. Size is immaterial." Mr. R. Beckett said he was of opinion that the composition should also be done on the finder. The Hon. Secretary stated that next meeting would be a lantern night.

**Guildford.**—The first lantern evening was held on the 29th ult. Mr. A. E. Moon, the hon. lanternist, threw on the screen views of Wales and a set of views illustrating English and foreign cathedrals. After these were shown slides made by members of the society, Messrs. J. Russell, A. E. Moon, A. J. Moon, A. W. Bullen, J. H. Nunn, and others, which were greatly appreciated by the members and friends present.

**Harlesden-Willesden.**—The first lantern evening was held on 29th ult. A large number of slides were shown, being records of members' excursions, snap-shots, etc. A public lantern and musical entertainment was decided upon, the arrangement being left in the hands of the council.

**Herefordshire.**—An ordinary meeting was held on the 1st inst. Mr. Alfred Watkins being in the chair. The 1892 Prize Slides kindly, lent by a contemporary were exhibited, and much appreciated, especially the work of Mr. S. F. Clarke, of Louth. A discussion as to the judging of members' slides sent in competition resulted in the appointment of three non-competing members as judges, the award to be made at a special meeting on the 13th inst. The next ordinary meeting is to be held on January 3rd; subject, "A Caravan Tour Through Wales," illustrated by slides by Messrs. Edwards and Gethen; an exhibition of work of members will also be held at the same time.

**Holborn.**—On 2nd inst., Mr. Fred Brocas in the chair, Mr. F. J. Cobb gave an interesting demonstration on the use of the optical lantern. Last Saturday the annual supper of the Holborn Camera Club took place at Anderton's Hotel, Fleet Street. Mr. A. Horsley Hinton, the President of the Club, took the chair.

**Kensington and Bayswater.**—A meeting was held, Mr. S. C. Mote presiding. Three questions from the question box were read and discussed. The first was in reference to the exposure required for snow pictures; the second, as to whether it was possible that a faulty developer should produce a partial reversal of the image, as one of the members had a batch of negatives showing partial reversal, and he knew that the exposure was about correct. The President stated that if, by accident, any thio-carbonide got into the developer it would cause immediate reversal. The next question referred to enlarging from films. One of the members found that when he placed his film in the enlarging lantern it crinkled and became useless, even though he adopted the plan of tightly pressing the film between two pieces of plain glass. It was suggested that this might have been caused by the films not being perfectly dry. About ninety slides by the members were exhibited by the hon. lanternist.

**Leeds.**—The annual meeting was held on the 1st inst., Dr. Jacob in the chair. The annual report was read and adopted; it shows the present membership to be 105. The property of the society in appliances, furniture, and books is now considerable; the bookcase contains nearly all the best works published. A large number of them were presented recently by Mr. Wain Brown, Hon. Librarian. The following gentlemen were elected as Committee for the ensuing year: Messrs. E. H. Jacob, M.A., M.D., B. A. Burrell, F.I.C., Godfrey Bingley, T. W. Thornton, S. A. Warburton, Herbert Denison, Robert Steele, J. H. Walker, H. P. Atkinson, and T. Butterworth. Mr. Godfrey Bingley afterwards gave a lecture entitled "Wanderings with a Camera in 1892," illustrated by lantern slides of the views he had taken. They were much admired, and the large amount of information he gave, historical and descriptive, was much appreciated. A synopsis of the ground covered is almost all that may be given. Starting at Leeds, he showed some very good views of the interior of the Leeds Municipal Art Gallery during the time of the photographic exhibition last January, then views in Yorkshire, the borders of Lancashire and Westmoreland, then far down to Hampshire, Dorsetshire, Oxfordshire, Wiltshire, Bucks, and Herts, and a few of the adjoining counties, then amongst the picturesque scenery

of North Wales. Some interiors were shown almost free from halation, which he said were done on Eastman's thin films; he could not get them so on the thicker films. Developer used for the slides was eiko, and hydro. combined.

**Lewes.**—The members and friends who assembled on 2nd inst. in expectation of seeing the hand-camera prize prints of a contemporary were doomed to disappointment, as, owing to some cause at present unexplained, they did not reach Lewes until Saturday night. Fortunately, however, Mr. Foxall had brought a number of first-rate lantern-slides, and these were put through the lantern and much enjoyed by all present. Great interest was shown in a large selection of mounts for Christmas cards and ordinary prints sent by Messrs. Hannam and Co., Soho Square, London, and Gainsboro', and they were generally commended both for their artistic merit and their cheapness.

**Leytonstone.**—On 3rd inst. Mr. Tom Symmons in the chair. Discussion, "Photographic Dodging." Opened by Messrs. H. H. Summers and F. W. Wates. Mr. Summers commenced his paper on the bug-bear "Halation;" after describing the various causes, went on to the remedies, advocating backing the plate with vandyke brown in a creamy paste with water and a little glycerine; he also found if only present in a small degree it could often be removed from the negative with methylated spirit, applied with a piece of chamois leather. The great care that the inside of the bellows should be dead black was next gone into, he explaining that that was frequently the cause of bad negatives, particularly when using a lens of greater covering power than the plate exposed. He also mentioned the advantages of using the front or back combination of a rectilinear lens, which would be found about double the focal length of the doublet, and how often the extension of the bellows did not permit the opportunity of using it, and showed how he overcame the difficulty by having a piece of brass tubing made to extend the barrel of the lens when using the front combination. Mr. Wates here took up the parable, and went on to the question of improving or dodging negatives by means of intensification and reduction, demonstrating by means of Dr. Monkhoven's formula. He next described the means of ascertaining that the plate was in correct register with the focussing screen. The means of detecting the presence of actinic light in the dark-room. Dark slides and camera were next touched upon. How to test the focal length of any lens, and the value of any stops was next explained, and also showed a very simple view metre, and went into the different methods of vignetting, advocating tracing the outline with tissue paper, cutting out the shape on card, serrating the edge, fastening on the printing frame and packing underneath with cotton wool, and pulling the wool out into fine shreds gave a very soft vignette, and also gave a ready means of at once slightly altering the shape if necessary when printing. Blocking skies and other printing dodges were next described. Discussion followed, in which Dr. W. P. Turner, Messrs. Tom Symmons, H. E. Farmer, Leaper, J. Proctor, and A. E. Bailey (Hon. Sec.) took part. A vote of thanks to the lecturers and Chairman brought a very pleasant evening to a close. Five gentlemen were put to the vote and elected, making up the muster roll to 123. The first annual dinner takes place on the 10th inst.

**Liverpool (Y.M.C.A.)**—On 30th ult. Mr. F. B. Illingworth, Hon. Secretary of the Liverpool Photographic Society, gave a demonstration on the art of "Aniline Printing." The demonstration was in every way a success, and the lecturer illustrated his remarks with experiments in a very able and lucid manner. Mr. J. F. Stone presided.

**Maidstone.**—On the 1st inst. Mr. Andrew Pringle gave an address to the members on "Lantern-Slide Making." It embraced a thoughtful *resumé* of the artistic aspect of the subject, later on turning to the scientific side of tonality and gradation. The various processes of slide-making were then discussed, and information given on the practical working of many points in reply to questions. Mr. Pringle concluded by specially emphasising the qualities of a good lantern slide, and spoke in favour of a medium tone, neither too cold nor warm, and the necessity for all the details of the shadows being clear and visible on the screen.

**Margate.**—A meeting was held on 29th ult., in Mr. Tweedie's spacious laboratory, 54, Hawley Square (kindly lent for the occasion), to witness a demonstration on "Lantern-slide Making," given by Mr. Tweedie. Having introduced his subject by suggesting the many uses to which lantern slides may be put, whether for educational, scientific, or recreative purposes, the lecturer not only advised those who took up lantern work, to choose a certain class of work, with a definite object in view, but also advised the use of *one* make of plate with *one* developer, rather than trying first one kind, then another, eventually becoming disappointed with results, and giving up the hobby altogether. He (Mr. Tweedie) had spent a deal of time and patience, with a variety of plates and developers, but had come to the conclusion that in his hands Ilford, Alpha, and Special with hydroquinone developer gave best results, but he did not wish to dissuade others from sticking to their favourite make, if they were

equally satisfied with their results. By way of demonstrating the process, he printed (by contact) one each of the plates, giving Special 20 seconds exposures to the flame of large fan gas-burner; and Alpha  $1\frac{1}{2}$  minutes, developing with hydroquinone, the results being a fine black in the former and a nice warm tone in the latter. Later on these were projected on the screen by means of an oxyhydrogen lantern, and again, after toning, to illustrate the effect of that part of the operation. A dense negative was next subjected to the reducing action of potass. ferricyanide with marked effect. The benches of the laboratory contained a large number of slides arranged in groups of different makes, and some of each were passed through the lantern to illustrate their merits, and invite discussion. The lecturer had produced a great variety of tones, which added greatly to the effect of the various subjects, and elicited well-merited applause. The meeting was well attended.

**Newcaster**.—On the 28th ult. Mr. C. W. Hastings, of London, lectured on "Picture-making by Photography." Mr. J. P. Gibson presided, and there was a good attendance. In his preliminary remarks Mr. Hastings spoke of the fascination which the art of photography exercised over its votaries, and said it was the only hobby that had not gone out of fashion in the last fifty years. In the direction of picture-making, he emphasised the necessity of having a central idea, and spoke briefly of the subject, selection, composition, and light and shade in photographic pictures. The lecturer then displayed, by means of the lantern, a number of beautiful productions of Mr. H. P. Robinson.

**Oxford University**.—A meeting was held on 28th ult. Mr. J. L. Myres, B.A., Magdalen, gave a most interesting exhibition of his Greek slides, and amply showed that slides accompanied by a study into the subjects they represent can make a lecture doubly interesting. The following new officers were elected for next term: Assistant Secretary, Hon. G. L. Parsons, Balliol; for a vacant place on the Committee, Mr. E. F. Glynn, Merton.

**St. Bartholomew's Hospital**.—The first ordinary general meeting of this year, was held on 30th ult., Dr. Russell presiding. Mr. W. J. Armitage read an interesting and instructive paper on "Daylight Enlargements," in which he carefully explained the details of the making of enlargements by the use of an ordinary camera. After the paper there was an exhibition of prints and lantern slides by members of the society.

**West Kent**.—Ordinary meeting on 3rd inst. Mr. Dresser gave a lecture on "Amidol and its Uses." The lecturer said that he found the developer very good for negatives, bromide paper, and lantern plates, it behaving exceedingly well with bromide paper, printing and enlarging from very dense negatives. The developing formula sent out by makers, he soon gave up, it very soon turning colour. And after making several experiments he struck upon the formula which worked well: Amidol, 1 oz.; meta-bisulphite potassium, 1 oz.; water, 10 oz. To use with this Mr. Dresser makes up a saturated solution of washing soda, saturated solution carbonate of potass, and 10 per cent. solution bromide of potassium. He recommended a start with developer as follows for plates, normal exposure:—Amidol, 1 dr., saturated solution washing soda, 1 dr.; water, 1 oz.; and two drops 10 per cent. solution of bromide. This will also answer well for lantern plates. For extra density add a few drops carbonate of potass solution as required. Formula for bromide papers: Amidol solution, 6 dr.; carbonate of potass solution, 6 dr.; water, 10 oz.; 10 per cent. solution bromide, 30 drops. The lecturer recommended a trial of this developer, and handed round some prints and slides which he had obtained with good results.

**West Surrey (Photographic Society)**.—Usual fortnightly meeting held on 30th ult., Mr. James in the chair. The subject of the evening was a demonstration of the uses of Cresco-Fylma, by Messrs. Hill Bros., of Surbiton. What these gentlemen claim for their production is chiefly confined to its effect upon a film in the way of enlarging. As a means of enlarging without the inconvenience of the dark-room it is certainly invaluable. The mode of procedure, as described by Messrs. Hill, is as follows:—The negative is immersed in a diluted solution of their mixture (3 parts of concentrated solution to 1 of water) in a very short time the film leaves the glass support. After this takes place it should be left in the solution for about two minutes, and then, supported by the glass it has just left, the free film is transferred to another dish containing simply water, then the enlarging commences, and in about fifteen minutes it has reached its maximum growth of about twice its original size. The film is then floated on to its support, whether glass, porcelain, or paper it matters not, the air bells blown from under the film and then allowed to dry; after drying, it is necessary to wash the film as in an ordinary negative or transparency. The enlarged film shows no signs whatever of distortion nor loss of sharpness. In cases where the pyro-ammonia developer had been used, enlargement took place less readily and did not proceed so far. It was also pointed out by Messrs. Hill, that if the subject is badly placed upon the plate it may be slightly enlarged and shifted on the same plate. Messrs. Hill

Bros. then passed round a number of specimen enlargements. A discussion then took place, when it was pointed out that the patentees seemed to have given their attention only to the enlarging properties of their solution and had neglected the fact that they could procure a perfectly uninjured free film, which fact alone should make their article invaluable. Again, workers of the carbon process will find this solution a great boon, inasmuch as the tedious and uncertain double transfer process can be made as simple and as certain as the single transfer. All that is needed is to float the film of the negative in a very dilute solution of Cresco to avoid enlarging, and then reverse the film on to another glass. When printed, the result would of course be the same as if finished by the double transfer process.

**Wigan**.—On 1st inst. Mr. J. H. Atherton gave an interesting demonstration of the carbon process. After fully explaining the theory of the process, laying particular stress on the continuing action of light on the tissue, he proceeded to develop two prints, and finished them by the single transfer process, making one of them into an excellent lantern slide. Abundant opportunity was afforded the members of putting the fact of the tissue becoming insoluble after keeping an abnormal time to the test, as Mr. Atherton had brought a packet of tissue which he found to be quite insoluble when about to print specimens for his demonstration a fortnight ago, which demonstration had to be postponed accordingly. The only apparatus used by Mr. Atherton, beyond that necessary for other processes, was an actinograph for gauging the progress of printing, a small gas boiling stove, costing a shilling, and a tin kettle. Several questions were asked and satisfactorily answered by the lecturer, and the majority of those present expressed surprise at the simplicity of the process and beauty of results.

**Woolwich (Polytechnic Society)**.—The ordinary meeting held on 28th ult. was set apart for a members' lantern night. Over a hundred and fifty slides by Messrs. Godfrey, Forsdyke, Cregan, Taylor, and Dawes were thrown on the screen, from which selections were made for the national lantern-slide competition. Next meeting December 12th.

## To Correspondents.

All communications for these columns are to be addressed to **The Editor, "Amateur Photographer," 1, Creed Lane, Ludgate Hill, London, E.C.**

### RULES.

1. Write clearly and distinctly on one side of the paper only.
2. Write each Query or Answer on a separate sheet of paper.
3. Write the name and address legibly on the back of each communication, and sign all Queries and Answers with name or *nom de plume*.
4. All matters for these columns **MUST** be received by **TUESDAY MORNING'S POST**.
5. The Editor does not undertake to answer questions by post.
6. In answering Queries, correspondents are requested to mention, in every instance the number and full title of the query referred to.

## QUERIES.

5893. **Revolving Show Case.**—I am in want of something for showing my photographs on a stand or table, having heard that there are some which revolve and hold about a dozen views. Can anyone give me the address of a maker of this kind of thing, or any information?—**NOVICE.**

5894. **Negative.**—Would a brother amateur kindly lend me negatives of the Riviera, Naples, and Venice to print lantern slides? The utmost care will be taken of them.—**DUBLINO.**

5895. **Bromide Enlargements.**—(1) Can any reader tell me about what exposure I should give to enlarge an ordinary quarter-plate negative to whole-plate in Lavastore's Multum-in-Parvo on A or B (Eastman's) bromide paper in daylight? (2) And will anyone tell me where I can get printing paper (blue or green, I believe) for printing moonlight effects?—**J. R. COOKE.**

5896. **Yellow Tinge in Platinotypes.**—In working with platinotype paper I find in the finished prints there is always a slight yellow tinge in the dark portions of the picture, although I use four, and sometimes five, baths of hydrochloric acid. I use the cold-bath paper. If anyone could tell me the reason of this, and how to avoid it in future, I should be very grateful.—**IGNORAMUS.**

5897. **Camera Bellows.**—Would one of your readers tell me how to colour (black) a camera bellows that are a little shabby in appearance?—**M. CHENEY.**

Correspondents not seeing their queries inserted are requested to look for the same under "Editorial."

## QUERIES UNANSWERED.

Oct. 28th.—No. 5849.  
Nov. 4th.—Nos. 5832, 5854.  
" 1th.—No. 5866.  
" 25th.—Nos. 5875, 5878, 5880, 5881, 5834.  
Dec. 2nd.—Nos. 5886, 5890.

## ANSWERS.

5887. **Ferrous Oxalate.**—The formula you want is—

Proto-sulphate of iron . . . . . 1 lb.  
Hot water . . . . . 32 oz.  
Acetic acid (or citric acid  $\frac{1}{2}$  oz.) . . .  $\frac{1}{2}$  drm.

—**PEN.**

5883. **Sink.**—A strong lidless box the size you require, and about 6 in. deep, lined with sheet lead or zinc, and with a hole bored in the bottom to take a waste pipe, would suit your purpose; or get one of the ordinary zinc washing bowls and solder a waste pipe into a hole in the bottom.—**PEN.**

5888. **Sink.**—Get a whisky box, or any suitable strong box, and two sheets of lead, one a little larger than the bottom of the box, so as to leave a support for soldering, and the other large enough to go round inside box and to cover the top edge; force gently bottom piece inside, and hammer until the lead is flat to bottom; likewise put side round, and then where sides meet bottom, and one inside, scrape clean and solder. Nail lead only on top of box, or probably you will have a few leakages.—**YARDLEY.**

5889. **Negatives into Positives.**—Bleach in a solution of mercuric chloride 1 oz, water 10 oz., thoroughly wash, and when dry back with a piece of some black material, when you will see a positive effect by reflected light.—**PEN.**

5891. **Removing Stains.**—You might try dilute hydrochloric acid. If this won't answer, I am afraid nothing will.—**PEN.**

5892. **Lantern Slides by Reduction.**—I have used magnesium ribbon in the "Ever-ready" dark-room, and have not yet been smothered, so I think you may fearlessly use it for reduction in a large room. Do not use so small a stop as  $f/16$ , and Alpha plates are much too slow. I should have given with Thomas's plates and lens full aperture (say  $f/8$ ) about 2 min. Perhaps it was a very dense negative?—**PEN.**

5893. **Lantern Slides by Reduction.**—I fancy your correspondent is in the same dilemma that I have been in myself, and may be taking over for under exposure, as an over-exposed lantern plate will come out very slowly in the developer, but shows the difference between an under-exposed one by finishing very quickly, and being less clear in the high lights when fixed, while the shadows will be thin and muddy. H. P. does not say in what kind of light he works, which, of course, is an important factor in reckoning the exposure. Thomas's plates are slow for reducing. I prefer Mawson's, and find in reducing a whole-plate negative with a 5 in. focus lens, stop  $f/12$ , in good diffused light out of doors during summer months, and using a white reflector at 45 deg., the standard time is 2 min. Of course, more will be required for a dense negative. I began by giving 10 min., and thought that was insufficient because the image came up slowly, so increased the time to 22, when fortunately someone put me straight. Re the magnesium wire, the article in last week's AMATEUR PHOTOGRAPHER set me trying it for reduction. Finding the fumes decidedly unpleasant, I threw the window wide open, and then found no inconvenience; then by carrying out the instructions, with one exception, *i.e.*, burning one piece of wire instead of two, and moving it slowly about, I managed to get some good results, and found that about 9 in. of ribbon burnt at 4 in. from negative (with glass between light and negative) was right for cold tones. For warm tones use more wire.—**J. D. PEARSON.**

5875. **Acid Alum Fixing Bath.**—I have tried an acid alum fixing bath for negatives; the formula was given in one of the periodicals. It certainly was acid, but it was not a fixing bath, as the negatives would not fix in it, and were completely spoilt and badly stained. Although no doubt it is quite possible to get it to act satisfactorily, still I think it is safer to use an ordinary bath. I have found the following acid fixing bath quite satisfactory, viz.:—

Hypo-sulphite soda . . . . .  $1\frac{1}{2}$  oz.  
Meta-bisulphite soda . . . . .  $\frac{1}{2}$  " "  
Water . . . . . 10 "

for bromide paper, and for negatives the following, viz.:—

Hypo-sulphite soda . . . . . 8 oz.  
Meta-bisulphite soda . . . . . 2 "  
Water . . . . . 40 "

If developing bromide paper with iron, of course it goes straight from the developer into the fixing bath without washing, as this takes the place of the ordinary acid clearing bath. If you want to harden your negatives and papers, why not use a separate alum or chrome alum bath, and if the developer contains a carbonate such as carbonate soda or potash, etc., or sulphites, don't alum them till after fixing and washing. The following bath may be used, viz.:—

Chrome alum . . . . .  $\frac{1}{2}$  oz.  
Water . . . . . 10 "

I have seen lantern plates quite spoilt by being put into the fixing bath without having the alum properly washed out. Of course special acid fixing baths save time, but it is worth while to go to a little extra trouble to be sure of your results. I may say I have ruined bromide prints developed with hydroquinone by putting them into an ordinary clearing solution; they came out beautifully spotted, only the spots did not. I think it is safest to follow the makers' instructions, as there are often peculiarities in some brands which the makers are fully aware of, and which make it quite possible that what suits one won't suit another.—**J. W. S.**

## EDITORIAL.

**SPECIAL NOTICE.**—We are very pleased to find the replies in this column are so much appreciated, but we should be very grateful if those requiring advice would send their letters to us BEFORE TUESDAY MORNING'S POST if possible. The time occupied in replying in this column is very considerable, and owing to the often late receipt of letters, many matters have to be left over each week. This we much regret.—**ED. AM. PHOT.**

M. P.—There are evidently more things in photography than are dreamt of in your philosophy. We cannot do better than quote from Chapman Jones' "Science and Practice of Photography," as to a system of intensification: "(1) Mercuric chloride followed after well rinsing with sodium sulphite gives the little addition of brilliancy sometimes wanted in a carefully-made and successful negative. (2) Mercuric chloride on the original negatives, followed, after thorough washing, by ferrous oxalate, gives about as much increase of density as compared with No. 1, as number 1 gives when compared with the original

negative. (3) A repetition of the application of mercuric chloride and ferrous oxalate—that is, these reagents applied to the result of number 2—gives another step in the intensification (Note—the result of this treatment is about equal to the action of mercuric chloride followed by ammonia upon the original negative). (4) The result of number 3 may be treated again with mercuric chloride and ferrous oxalate, and so on, as may be necessary. (5) The fourth or fifth consecutive application of mercuric chloride and ferrous oxalate will probably give a result about equal to that of the uranium intensifier acting upon the original negative. (6) If a still greater effect is desired, the lead intensifier may be used on the original negative." Is this what you want? We should then place the series as follows: (1) Mercury and sulphite. (2) Mercury and ferrous oxalate. (3) Ditto, on result of 2, or mercury and ammonia. (4) Mercury and ferrous oxalate on result of 3, or Monckhoven's cyanide, or bromide of copper. (5) The fourth or fifth application of mercury and ferrous oxalate, or uranium intensifier. (6) Eder's iodo-cyanide intensifier. (7) The lead intensifier.

F. M. PELLATT.—Rub your mercuric chloride to powder, drop the acid on to it, and add the water warm. The quantities are misplaced; it should be, we think,

Mercuric chloride . . . . . 45 gr.  
Hydrochloric acid . . . . .  $\frac{1}{2}$  oz.

See answer above. Re-intensified negatives will keep if properly washed.

R. S., A. M. W., and R. T. O.—Many thanks for letters. We have placed the matter in the hands of the local police, and await their report before publishing anything definite.

G. E. T.—See brief leader this week.

R. BASSETT.—Let us know the focus of your lens, and then we can answer you. But we should say not.

NOVICE.—The easiest method of detaching prints from glass is to allow the same to soak for ten or fifteen minutes in warm water, to which a little acetic acid has been added, about 1 part in 20.

H. P.—The usual way is paste the back of the print thoroughly with freshly-made starch; whilst the print is still damp and on the glass, apply a piece of waterproof backing paper, allow to dry, and then mount in the usual way. You may also use an alcoholic gelatine mountant or spirituous solution of shellac and sandarac, or solution of indiarubber in benzole.

GRAVITY, BIRMINGHAM.—(1) Slightly over-printed and considerably over-toned, too much foreground and not enough sky. (2) Over-toned, and not artistic. (3) Fairly fully over-printed, and over-toned. (4) Much over-toned. (5) Traces of hypo, we should say, were the cause of yellow stains; probably your fingers were not clean. (6) You are not using suitable plates. Ilford ordinary are not suitable for this work; try their medium or rapid isochromatic, and you will get far better results. We will try and give you an article. What do you particularly want to know?

P. S. FOSTER.—Use the bath recommended in Answer 5834, and dilute with three times the quantity of distilled water; about three grains of chloro-platinite should be enough for twelve  $\frac{3}{4}$  by  $\frac{3}{4}$  prints.

K. T.—We think we answered your letter by our article last week. Try the oxalate and phosphate bath, but there should not be much change of colour in the print, whilst in the toning bath, as the tone gets colder. A simpler bath is the following:—

Sat. sol. cream of tartar . . . . .  $\frac{1}{2}$  oz.  
Chloro-platinite of potash . . . . . 1 gr.

Free your prints absolutely from silver, and after toning immerse in

Salt . . . . . 1 oz.  
Sodium sulphite . . . . . 2 oz.  
Water . . . . . 8 oz.

then wash and fix in alkaline hypo. Tone by yellow light, and be careful that all free platinum is washed out before placing in hypo.

J. W. FORREST.—You will not get warm tones on the plates you name with ferrous oxalate. If you prefer this developer, and you won't readily beat it, try the Ilford Alpha plates, and the longer the exposure, and the weaker your developer in iron, the warmer the tone. You will find full instruction for the Paget plates for warm tones on p. 384. Write to Henry Park, 6, Station Buildings, Acton Street, King'sland, for a description of Bruno's hand-camera, or, as it is up your way, call on him and see it. It would just suit you. Yes, we can lend you some slides. Write, and let us know what date you want them for?

J. E.—Do not place your sitter too near or too much in a straight line with the window. Draw up the blinds and pull back the curtains. We should think about 15 sec. exposure would be about right. Use a sheet over a clothes horse as a reflector for the shadow side. You would find some articles on "Home Portraiture" in our issues from March to June, 1891.

MRS. CLEASBY.—The films we sent you were developed with the fixed alkaline carbonates, not ammonia, and you would find that they will not give you green fog, when ammonia will. It is a little difficult to state definitely what is the cause of green fog; it may be the emulsion or from the films being stale or their having been kept in an unsuitable place.

H. HOLT.—Don't try the process if you do not like it. We only say that it does lend itself to artistic effects, and the medium-surface paper is by no means very rough.

TYRO.—(1) Sheets of opal glass, either matt surface or plain, coated with bromide emulsion, can be obtained commercially, and they only want exposing behind in close contact with a negative to artificial light and then developing with ferrous oxalate or other suitable developer. The Paget Prize Plate Co. have also introduced printing-out opals which are treated just like chloride papers. (2) To make enlargements without using a lantern, and we presume you mean by artificial light, see our leading articles, "Notes on Enlarging," p. 282 vol. xv. (3) The glasses and backs may be obtained from Fallowfield, 146, Charing Cross Road; Adams, Aldersgate 8, rect; or Percy Lund, of Bradford, make a solution of gelatine 20 gr. to the oz., clean the glass, immerse in the hot gelatine solution, immerse the print, bring the print on to glass, squeegee down well, and allow to dry.

H. F. LINGING.—You might try salts of lemon, but we should rather suggest trying to erase the ink with a sharp penknife or ink eraser.

W. G. MERRITT.—Over exposure is the fault of your bromides. Cut the exposure down one-third at least. We may probably be your way this month, and will then give you a call.

ASPIRANT.—In the first place you will hardly turn out successful work in an ordinary room. You must work either outdoor or in a conservatory. Use rapid isochromatic plates. The black backgrounds are obtained by using black velvet or deep red cloth, and there is a vignette placed just in front of the lens or between the lens and plate inside the camera. The exposure in a good light outdoor with lens at  $f/4$  would be about 5 sec. this time of the year. We shall probably have article on subject soon.

ERA.—It was a slip; we should have said chloroplatinite 2 gr. We sympathise most heartily with you all, and are not by any means satisfied that it was fair.

J. K. SMITH.—River Aire: good, only wants clouds. Kirkstall: this is a little spotty in the sky, and clouds not strong enough. Greta: good. Thornton does not want figures and wants clouds, but good technically. Copy wants clouds badly. Elephant good, but man too weak. Temple's good, but wants masking properly. Technical y all the slides are very good.

QUARTER-PLATE.—Try Fallowfield, 146, Charing Cross Road; price varies from 15s. to 21s. We should, however, prefer a bamboo, something like Park's.

HON. SEC.—Our publishers can supply you with some. 6d. each.

JACOBUS.—The best way is to fit your lens in the tube, cut a circular diaphragm so that it will just fit in the tube, then fix the lens on camera and move the stop in or out in the tube till you get the field you want covered. Probably your stop is too far off. We should say it ought to be about  $1\frac{1}{2}$  in. in front of lens. Your portrait is good, but the background is not pleasing. Thanks for good wishes.

J. B.—We shall always be glad to help you. The technical qualities of your negatives were alright, except for a little under-exposure. We like yellow negatives, preferring them above any others as giving better prints. Yes, you can certainly get very good prints from them, both in platino and carbon. The red putty answers quite as well as matt varnish. To colour your varnish yellow, add gamboge or spirit soluble aniline dye. Rehalogenisation, etc., may be done in white light. Try your luck in "Holidays with the Camera." Your platinos are a little too harsh, and No. 2 has, we should say, bronzed in printing, partly due to the harsh negatives. Your hot-bath paper would be alright.

SQUIRE.—The Carlotype Co., Rainham, Essex.

F. W. FILDITCH.—Many thanks to you and council for resolution; always glad to be of any service.

WINTERSETT.—Most certainly.

J. H. COLE.—Use the following:—Heinrich's gelatine 30 gr., soak in water for half an hour, pour off the water, melt in a water bath, and add 1 oz. of caramel. This takes a long time to dry, but when set you can squeegee a piece of red non-actinic paper to it. A better one is caramel, thick mucilage, and sienna 1 oz. of each, rub down in a mortar, and apply with a broad brush.

TYNEMOUTH.—Print deeper, tone to a rich warm brown, and trim your print down so that the three dark spots are just included on the left; with suitable clouds you would then have a picture. For information as to clouds see last week's issue, p. 408. The article will be continued. Prints sent in to our Monthly Competition are not returnable; unsuccessful ones in our large competitions are returned.

E. D.—We should say that 45 sec., No. 2, was the nearest to correct exposure. Discard hydroquinone, the cause of your muddy tone, and use ferrous oxalate. To tell the sensitised side, lay the paper on the band, and the side which cur's in is the prepared side.

FEROUS OXALATE.—The paper on Warm Tones on Bromide, in our issue for June 24, p. 484.

BROMIDE.—We should not like to say until we see a negative, but at a guess we should say over-exposure. Can you send negative up?

W. H. PRATT.—Send the camera to H. Park, 5, Station Buildings, Acton Street, Kingsland, London,

N. He repaired ours for us. If you like to send the camera up to us first, we will have a look at it.

FRED.—Marion's, 22, Soho Square, W., sell Cowan's opal printing-frames 8½ by 6½, 6s.; this size takes all smaller ones.

BLANCHE.—In albumen prints you have not only free silver, but also free acid to wash out before toning: Dipping your prints into a fairly strong solution of common salt to which some carbonate of soda has been added will obviate a long wash.

BOTANY BAY.—Solarisation means that instead of that particular portion of the paper being dark, it has turned light again: We prefer faint cream tints on grey mounts. Glad to hear you are successful with your copying now. You know of course that magnesium ribbon burnt in a box with a thin ground-glass front would reduce your exposures enormously. "Holidays with the Camera" competition closes 31st inst.; not more than twelve or less than six prints must be sent in.

MR. WHITTARD.—The large sea piece at Pall Mall was in carbon, and we do not think it possible to obtain that tone exactly. You will find instructions for obtaining all colours on bromide paper in our issue of June 24, p. 484.

J. H. B.—Your best plan would be to send the objective to Crouch, 66, Barbican, Swift, 81, Tottenham Court Road, or Wray, Laurel Villa, Highgate, who will correct it for you for a small sum, about 10s. You can use the monochromatic light to focus by; Zettnow's eupro-chromic solution being the best.

E. C. L.—Watkins gives the speeds of Marion's Ordinary 35 T.C.L. as 8, therefore the latter require 4½ more exposure.

P. HARRISON.—(1) Taken wrong way of plate, but very fair. (2) Printed too deep, wants clouds, and water too white on left. (3) Spoilt by figure, and wants clouds. (4) Flat and stained. All your prints show marks or stains from careless work.

YETRAH.—Thin and full of detail (negatives are best both for enlarging and lantern slide work).

H. J.—Thanks for letter, which is satisfactory.

ENQUIRER.—Cannot do better than stick to the plates you have been using, both for snow and copying. We hope to have article on the same shortly. To copy, merely set your camera up, focus as large as wanted, and expose; in a fair light in a room, about ten minutes is enough. You must have special printing-frames, and you cannot see through the back of opal. We hope to have an article next week on this work.

J. C. H. LEICESTER.—(1) It is impossible to use chloroplatinite of potash in conjunction with hypo, as hyposulphite of platinum is formed, which stains a very deep yellow. (2) Probably the exposure would be too long, but we are now making experiments. (3) Don't think there's a pin to choose between; we always use B. (4) Yes, always glad to loan out.

J. B.—To strengthen the shadows more than the high lights, you must use rehalogenisation, this is the only process that will do that. The intensifier you have is Monckhoven's.

AZAM.—First-class results can be obtained on A, but you must be careful in working it. We prefer A to toned B.

THORNHILL AND F. PARTRIDGE.—The application of the method described to soda and potash is easy. Work precisely the same, using citrate of potash instead of citrate of ammonia. Make the citrate of potash by neutralising 720 grains of citric acid with bicarbonate of potash, 944 grains. Dilute as wanted, by adding one part to five of water.

CYCLO.—See answer above. You cannot do better than use

Chloride of gold .. .. .	4 gr.
Bicarbonate of soda .. .. .	90 ..
Distilled water .. .. .	16 oz.

No; copies of portraits are not admissible.

AN AMATEUR.—(1) Too black in right-hand corner, wants clouds, and is too panoramic or topographical in character. (2) Water too white—print wants dodging with glycerine in developing. (3) Ditto. Taken wrong way of plate, too flat, no principal object. (4) Wants clouds; the best. (6) Too black, badly chosen point of view, no principal object.

H. D.—(1) Too much top light, and also cross lights from each side. (2) Ditto, prints over-toned. Use isochromatic plates, and give rather long exposures, and be careful to obtain thin delicate negatives without harsh contrasts. As to exposure, we are afraid we cannot give you much help, but with  $f/16$  and rapid plates about 2 sec.

GEO. WORLEDE.—You should have focussed your foreground and left the sky to take care of itself. (1) is over-toned, but No. 2 better. Be more careful in trimming your prints. We will try and tone your prints, and let you have them back this week.

## Sale and Exchange

### RULES.

CHARGE.—Twelve words or less for Fourpence.

Every additional three words, one penny. The name and address of the sender must be paid for. (A single figure, or group of figures undivided by letter, space, stop, or words, counts as one word; compound words count as two words.)

DEPOSITS.—The money for goods forwarded on approval may be deposited with the Publishers of the AMATEUR PHOTOGRAPHER, who will hold the amounts deposited until they are satisfied that the transaction has been completed to the satisfaction of buyer and seller.

ADVERTISEMENTS can be inserted under a number, the name and address being registered, and letters forwarded for a fee of 8d. to cover postage.

PAYMENTS should be made in Postal Orders or Postage Stamps.

ADDRESS.—All advertisements (which can be received up to Tuesday mid-day) and other communications having reference to the "Sale and Exchange" column, must be addressed "Sale and Exchange, AMATEUR PHOTOGRAPHER, 1, Creed Lane, London, E.C."

COMMISSION.—A charge of 2½ per cent. will be deducted from all deposits whether a sale is effected or not. Minimum charge 1s.

PAYMENT.—All payments are to be by cheques or Postal Orders, made payable to Hazell, Watson, and Viney, Ltd., 1, Creed Lane, London, E.C.

CARRIAGE must be paid on all apparatus sent for report, and they will be returned carriage forward.

REPORTING.—Apparatus may be sent to the EDITOR, AMATEUR PHOTOGRAPHER, 1, Creed Lane, London, E.C., who will report upon the apparatus to the buyer for a minimum fee of 2s. 6d., or a commission of 2½ per cent., upon the sale price of the apparatus.

Cameras, Lenses, etc.—Half-plate mahogany camera, square leather bellows, reversing and double swing back, rising and falling front, and one double dark slide, 25s.; whole-plate ditto, 32s. 6d.; 12 by 10 ditto, 45s.—Shipman and Co., Photo Printing Works, Ilford, London, E.

Chadwick's hand-camera, six dark slides, Wray's 5 in. detective lens, bamboo stand, cost £7 7s., £8 10s. taken.—E. Ravenswood, Bromley Road, Beckenham. Splendid 7 by 5 rapid rectilinear lens, good definition, f/8, only 17s. 6d.; camera and few other things, list for stamp.—Cheltenham House, Stroud.

Half-plate bellows camera, with shifting front, reversible swing back, and three double dark slides, nearly new, cost £8; also cheap half-plate bellows camera, with lens and one double dark slide, exchange the lot for Kodak or good hand camera.—James Murphy, 69, Wellgate, Lanark, Scotland.

Dark Slides.—Dark slides, five half-plate instantograph, with quarter carriers, 7s. 6d. each, 6s. 6d. without carriers; and four quarter instantograph slides, 4s. 6d. each, quite perfect; approval.—Thomas, 2, Pelham Road, High Road, Ilford, E.

Hand-Cameras, etc.—A Talmer hand-camera, R.R. lens, as new, sell for £3 5s. cash.—G. E. Franklin, Rickmansworth.

Millar's Adelpi hand-camera, Wray lens, as new, £4 10s.—E. N. Ellis, 2, High Street, Wavertree, Liverpool.

Lantern Slides.—One dozen beautiful lantern slides from negatives that have taken five prize medals, 12s. 6d. post free; sample slide, 1s. 6d.—E. Pearce, 76, Church Street, Stoke Newington, N.

Fifty fine Swiss lantern slides and 40 do. the Rhine, sell 6d. each.—G. E. Franklin, Rickmansworth.

Lenses, etc.—1892 half-plate instantograph lens and shutter, iris stops, as new, 18s. 6d.; approval.—Young, High Street, Somersham, Hunts.

Whole-plate rapid rectilinear lens, iris diaphragms, flange and cap complete, almost new, 30s.—Apply, H. M., 111, Shakespeare Road, Herne Hill, S.E.

Wray's 10 by 8 wide-angle landscape, iris diaphragm, as new. What offers? Approval; deposit.—N. Abbottsfield, Mannesland, Plymouth.

Negatives.—For sale, 20 half-plate negatives—Manx, Wales, Grange, Ingelton, Buxton, etc.—1s. each; also 70 numbers "Photography."—12, Nelson Street, Broughton, Manchester.

Rolling Machine.—Cabinet rolling machine, recently cost £7 15s.; no reasonable offer refused.—A. D. Clarke, Pailton, Rugby.

Sets.—Rough's quarter-plate pocket bellows camera, three double backs, good lens, and ash focusing tripod, first-class condition, sell for 30s., cost double.—G. E. Franklin, Rickmansworth.

Lancaster's instantograph with stand, lens, shutter, and two slides, price 28s.—No. 355, office of this paper, 1, Creed Lane, E.C.

Special.—A gentleman giving up photography wishes to dispose of his photographic outfit, consisting of Marion's rapid rectilinear lens, with four double slides, tripod, complete, £5 10s. cash, or offers.—B. Leavson, 8, Burnbank Terrace, Great Western Road, Glasgow.

£12 will purchase the following high-class apparatus: Watson's Acme camera, 13 by 13 cm. (7 by 5½), all possible movements, double extension, three double dark slides, turntable, three-fold tripod, stand, instantaneous and time shutter, Ross' whole-plate rapid symmetrical, whole-plate wide-angle lens, waterproof case, splendid condition, cost £21.—Address, Robert Tegho, Mevagissey, Cornwall.

Giving up photography. A bargain. Complete outfit, two cameras (half-plate Meagher and 10 by 8),

Ross' lens, etc., all in good condition, can be seen, £15 the lot.—L. R. Clarke's Library, 2, Colherne Terrace, Richmond Road, S.W.

**Sundries.**—40 numbers of "The Amateur," '91, 55 numbers and 8 numbers of the "Photographic News," '89 and '91, lot 4s. 6d.—Frederick Sharpe, Church Street Oakham.

**AMATEUR PHOTOGRAPHER**, first 13 vols., 8 vols. bound half calf, with extra numbers; "Quarterly," vol. 1 and numbers 6, 7, 9, 10; "Societies' Reporter," vols. 1 and 2; "Photographic News," 1884, bound; "Magazine of Art," 1889, unbound, price £3 10s.—John Stabb, 154, Queen's Road, Bayswater.

For sale, Griffiths' camera for making lantern slides from half-plates, also Robinson's half-plate R.R. lens, Waterhouse stops, and Funnell's shutter, Tylar's Aquapose print washer, four half-plate printing frames, six half-plate film holders (metal). Offers wanted.—31, St. Maur Road, Fulham, S.W.

## WANTED.

**Hand-Cameras, etc.**—Wanted, good hand-camera, Facile or other, perfect order, latest improvements, full particulars, cheap; approval.—Herbert, Blackrock, Dublin.

Wanted, Vannack hand-camera. Send full particulars to Walker, 156, Noel Street, Nottingham.

Wanted, Underwood's Sphinx hand-camera. Send cash price and particulars to Dr. Webb, 2, Brougham Terrace, West Derby Road, Liverpool.

**Lantern Apparatus.**—Wanted, lantern slide reducing apparatus, without lens; will exchange Houghton's changing tent, distilling apparatus, and other photographic sundries.—Pratt, East Bridgford, Notts.

**Lantern Slides.**—Wanted, lantern slides, state number, subjects, condition, coloured or plain, and price.—Frank Gray, Essex Villa, Stevenage.

**Lenses, etc.**—Wanted, lens for enlarging camera, about 4½ inch focus, wide-angle, cheap.—A. Dalton, Wantage, Berkshire.

**Sets.**—Anyone having a Lancaster's quarter-plate instantograph set (1891 or 1892) for disposal at a really low price, send particulars to Apel, 55, Robertson Street, Hastings.

Wanted, whole-plate outfit, such as Underwood's Instant or Convention; state full particulars and lowest price; approval; deposit.—Hargreaves, Midland Street, Widnes.

**Sundries.**—Wanted, AMATEUR PHOTOGRAPHER, January to June, 1892, cheap, unbound.—Heibers, Blackrock, Dublin.

*It is unnecessary to send an advertisement for the "Sale and Exchange" column for more than one insertion, as the goods are usually disposed of when the first advertisement has appeared.*

**Lanterns! Lanterns! Lanterns!!!**  
Slides! Slides!!! Slides!!! The largest and most varied selection in the whole kingdom. Before selecting elsewhere, call and inspect the stock of the City Sale and Exchange, 54, Lime Street, Leadenhall Street, City, where we have no hesitation in saying you will find all that you require in this way. Lanterns for sale, lanterns lent on hire, lanterns sold on commission, or taken in exchange for other apparatus. Write for special supplemental lists, Manager, City Sale and Exchange, as above.

**Bargains in Lenses.**—Dallmeyer No. 2 B portrait lens, Waterhouse stops, rack focussing, grand definition, as new, £7 7s.; whole plate Wray rapid rectilinear lens, fitted iris stops, covers well, moveable hood, quite new, £4; whole-plate Laverne wide-angle rectilinear rotating stops, as new, 30s.; whole-plate rapid rectilinear lenses, by Parker, Holborn, covers well to edges, Waterhouse stops, moveable hood, as new, 45s.; 8 by 7 Optimus rapid eurycope lens, grand definition, Waterhouse stops, as new, £5 5s.; half plate rapid rectilinear, by Crouch, Barbican, Waterhouse stops, 8 in. focus, as new, £2 7s. 6d.; half-plate wide-angle rectilinear, by Crouch, Barbican, rotating stops, 6 in. focus, quite new, 42s.; cabinet portrait lens, by Laverne, quite new, grand definition, Waterhouse stops, rack focussing, 35s.; quarter-plate Optimus detective camera lens, by Perken, Son and Rayment, Waterhouse stops, as new, 27s. 6d.; half-plate Lancaster's rectigraph lens, thorough order, covers well, Waterhouse stops, take 32s. 6d.; half-plate Lancaster Instantograph lenses, iris stops, and instantaneous shutter, 15s.; half-plate Ross rapid symmetrical lens, as new, fine definition, Waterhouse stops, £3 17s. 6d.; pair very fine Argus 5 by 4 rapid rectilinear lenses, accurately paired for stereoscopic work, fitted Waterhouse stops, moveable hood on front, and with camera division, take 42s.; Optimus quarter-plate portrait lens, rack focussing, Waterhouse stops, quite new, 21s.; 5 by 4 Optimus rapid rectilinear, by Perken, Son, and Rayment, Waterhouse stops, 27s. 6d.; Swift 5 by 4 wide-angle rectilinear, 5 in. focus, rotating stops, 32s. 6d.; ½-plate hand-camera lens, by Laverne, rapid rectilinear, adjustable focus, 15s., quite new. All above lenses are warranted as described.—On view, City Sale and Exchange Rooms, 54, Lime Street, corner Leadenhall Street, City (late Goy's Medium). Every description of apparatus bought, sold, or taken in exchange.

**Bargains in Hand Cameras.**—Crouch hand-camera, covered morocco leather, carries twenty-four quarter-plates, fitted Crouch lens, iris stops, shutter, etc., £3 7s. 6d.; Lancaster's Omnigraph, carries six quarter-plates, thorough order, with shutter, 16s.; No. 4 Kodak, as new, size 5 by 4, carries 100 films, fine rapid rectilinear lens, instantaneous shutter, in solid leather case, £7 7s.; No. 3 Kodak, as new, size quarter-plate, carries 60 films, rapid rectilinear lens, instantaneous shutter, take £5 7s. 6d.; Optimus Magazine, very finest order, Optimus rapid rectilinear lens, carries twelve quarter-plates, roller blind, shutter, focussing adjustment, £5 5s.; Rouch hand-camera, quarter-plate rapid rectilinear lens, roller behind shutter, bag changing, as new, £3 17s. 6d.; Blair's 5 by 4 hand-camera, good lens, time and instantaneous shutter, two finders, rack focussing, three double dark-slides, as new, £3 3s.; Kodak No. 1, best R.R. lens, carries 100 films, best order, in leather case, 40s.; Fallowfield's Facile, fitted rapid rectilinear lens, carries twelve quarter-plates, as new, £3 17s. 6d. All above are warranted as described. On view, City Sale and Exchange Rooms, 54, Lime Street, corner of Leadenhall Street, City (late Goy's Medium). Second hand apparatus bought, sold, or taken in exchange. Inspection invited.

**Bargains in Cameras and Sets.**—10 by 8 camera fitted all latest improvements, back and front extension, for wide-angle pictures, leather bellows, reversing back, rising and falling front, two double slides, grand condition, take £6 10s. lot; whole-plate camera, by Walker, back and front extension, rising and falling front, double extension, leather bellows, three double slides, rapid rectilinear lens, Thornton-Pickard shutter, three-fold stand and case, finest condition, £8 8s.; half-plate Optimus Rayment camera, double extension, leather bellows, rising, falling, and cross fronts, swing and reversing back, three double dark slides, book form, fine rapid rectilinear lens, iris stops, three fold ash stand and case, grand lot, £7 5s., worth double; half Spanish mahogany camera, by Lonsdale, Leeds, wide angle movement, double extension, leather bellows, etc., rapid rectilinear lens, Waterhouse stops, double dark slide, and folding stand, £4 10s.; Lancaster's half-plate 1892 instantograph camera, all latest improvements, double extension, leather bellows, etc., double slide, quarter carrier, very fine rapid rectilinear lens, iris stops, and folding stand, set complete, 75s.; half-plate camera, by Percy Lund, back extension, conical leather bellows, three double slides, rapid rectilinear lens, shutter, folding stand, and case, as new, take £4 10s.; quarter-plate Shew's Eclipse pattern camera (pocket), reversing back, leather bellows, etc., three double slides, rapid rectilinear lens, rotating stops, and roller blind, shutter, fine lot, as new, £2 12s. 6d.; quarter-plate instantograph camera, lens, iris stops, double slide, and folding stand, 27s. 6d.; quarter plate Le Merveilleux set, by Lancaster, complete, 15s.; quarter-plate camera, thorough order, all movements, fine rapid rectilinear lens, quite new, Waterhouse stops, folding stand, and four double slides, set complete, 27s. 6s. All above sets guaranteed in every detail as described. On view, City Sale and Exchange Rooms, 54, Lime Street, corner Leadenhall Street, City (late Goy's Medium). Second-hand apparatus bought, sold, or taken in exchange. Inspection invited.

**Magic Lanterns and Slides.**—Walter Tyler's Helioscopic is perfection of all lanterns, supplied to Indian Government, School Boards, science classes, clergy, and exhibitors throughout the world. Impossible to have lanterns give better definition or more satisfactory results; specially constructed lens, which no other lantern possesses.—Walter Tyler, 48, Waterloo Road, London.

**Walter Tyler's Best Triples and Bi-unials** are unsurpassed, and perfect in every detail. Good bi-unials, mahogany bodied, brass fronts, and all improvements, £7 10s.; single lantern, with 4 in. condensers, portrait front lens, 4-wick lamp, complete, in case, 27s. 6d.—Walter Tyler, 48, Waterloo Road, London.

**Lantern Lenses.**—Specially constructed. Walter Tyler's new Helioscopic portrait combination lantern lens gives the most perfect definition and brilliancy, can be fitted to any lantern, and for excellence cannot be surpassed. No other maker has this lens, which is manufactured expressly for Walter Tyler, 48, Waterloo Road, London.

**Regulators and Gauges.**—Great reduction, in price. Either can now be had of Walter Tyler for 14s. each. The largest stock of gas cylinders in England. Best seamless steel, tested and valved, and all sizes at very low prices.

**Slides from Negatives and Pictures.**—Walter Tyler manufactures and colours slides on the premises, thus ensuring speedy delivery, and prices are most moderate.—Walter Tyler, 48, Waterloo Road, London.

**Bi-unial Lanterns.**—If you are in want of a really good bi-unial lantern, perfect in every respect, call and see Walter Tyler's entire brass fronted, mahogany-bodied, lined with Russian iron, and fitted with new best quality lenses, and sold at a most

moderate price. The top lantern will take a 4-wick lamp. These are great bargains.—Walter Tyler, 48, Waterloo Road, London.

**Hire Department** is now perfect. Largest and best collection of slides in the world; over 200,000 always in stock. Temperance, travels, Scripture, educational, comic, tales, etc. Cheaper than any other house, no extra charge for coloured slides or effects. Special terms for large quantities.—Walter Tyler, 48, Waterloo Road, London.

**Lanterns and Slides.**—If you wish to hire, purchase, or exchange, you cannot possibly do better than go to Walter Tyler, who makes this business a speciality, and you will thus save dealer's and all intermediate profits.—Walter Tyler, 48, Waterloo Road, London.

**Second-hand Lanterns and Slides** at very moderate prices, also all kinds of apparatus. Send for large catalogue, 420 pages, with instructions for working lanterns of all kinds, and costing an immense sum to produce, sent free for 6 stamps. Small catalogue and second-hand list, post free.—Walter Tyler, 48, Waterloo Road, London.

**Bijou Enlarging Lanterns.**—Finest results with Hughes's patent rectangular condensers, half the size of ordinary make, superior definition, proper diffusion of light; scientifically constructed, not commercial; several whole and half-plate for sale, cheap.

**The Marvellous Pamphengos.**—Finest oil-lighted lantern, equals limelight, stood the test of over fourteen years against all imitations, elegant solid brass fronts, best lenses, from £2 10s. each.

**Magic Lanterns, Magic Lanterns.**—Largest assortment in the world, cheapest and best, nicely japanned lantern body, 4 in. double condensers, portrait front lenses, rack and pinion, four-wick lamp, in case, £1 7s. 6d. Others more elaborate, but cheap.

**The Cowra Triple Prize Medal**, highest award, supplied to Dr. H. Grattan Guinness, Capt. C. Selwyn, Madame Adelina Patti, and the Royal Polytechnic, etc.

**The Malden Triple** supplied to B. J. Malden, Esq.; unparalleled results; Capt. Chas. Reade, R.N.

**Fine Triple Lantern**; four set of large diameter lenses, £32, cost £60. Given away.

**Special Triple**; mahogany, entire solid brass fronts, £12 12s.; a really good lantern, unequalled.

**Elegant Mahogany Bi-unial**; brass fronts, £7 10s.; blow-through safety jets, 11s.; mix gas jet, 15s. 6d.; Malden double dissolving tap, 15s. 6d.; a number of grand effects; particulars free, before purchasing. Send for Mr. Hughes's grandly illustrated catalogue, over 130 fine wood engravings, price 6d.; postage 3d.; separate list of 60,000 slides, price 6d.; postage 3d.; pamphlets free; second-hand lists of bargains.—W. C. Hughes, Brewster House, Mortimer Road, Kingsland, London, N. 50 coloured slides on loan for 3s.

**CHRISTMAS CARD MOUNTS**, gold blocked mottoes, fancy bevelled edges, various samples; 1s. and 2s., post free.—Hooper and Co., mount manufacturers, 5, Hand Court, Holborn, London. Price list of all kinds of mounts post free.

**ENLARGING APPARATUS.**—Hume's enlarging apparatus, 5 in. condenser, without objective, 61s. 6d.; with 8 in. condenser, 122s. 6d., carriage paid.—Hume, 1, West College Street, Edinburgh.

**IMPORTANT TO AMATEURS.**—Negatives skillfully retouched. Printed in silver, gelatin-chloride, etc., and Enlarged. Also Developing, Copying, etc.—Terms strictly moderate.—Address, Wilfred Emery, 24, South Street, Baker Street, W.

## THE BOOK OF THE LANTERN.

By T. C. HEPPWORTH, F.C.S.

A Practical Guide to the Working of the Optical (or Magic) Lantern—either as an Educational Instrument, for Exhibition Purposes, or as an Enlarging Apparatus for Photographers. With full and precise Directions for Making and Colouring Lantern Pictures. Price 3s. 6d., post free.

"Here we have something like a lantern manual. A handsomely bound, comprehensive work, written by an acknowledged master in lantern operations."—*Photographic News*.

"Comprehensive, and is characterised by an excellent literary style."—*British Journal of Photography*.

"It is without exception the best book that has been published."—*The Amateur Photographer*.

**PUBLISHING DEPARTMENT.**—All letters containing Subscriptions, Orders, Remittances, SALE and EXCHANGE Advertisements, or other business matters for the AMATEUR PHOTOGRAPHER are to be addressed to the Publishers, HAZELL, WATSON, and VINEY, LD., 1, CREED LANE, LUDGATE HILL, LONDON, E.C. SALE and EXCHANGE Advertisements (at the charge of Three Words for One Penny) must be received by Tuesday evening's post to ensure insertion in the same week's issue.

"Amateur Photographer" Monthly Competition, No. 43.—"PORTRAITURE AND FIGURE STUDY." Latest day, December 19th.—Prizes: Silver and Bronze Medal, with ribbon and clasp. One mounted print only to be sent in. Entry forms, etc., on receipt of stamped envelope. Address: Editor, AMATEUR PHOTOGRAPHER, 1, Creed Lane, E.C. (Prizes will be announced and photographs reproduced and criticised in the AMATEUR PHOTOGRAPHER Supplement, January 13th, 1893).

OUR American visitors at the Convention, Miss Catherine Weed Barnes and Dr. Mitchell, have, if we may judge from their notes which have appeared in some of our Transatlantic contemporaries, carried off many favourable opinions of England and English photographers, and we trust also good impressions of English scenery on their plates and films. But we venture to think that Miss Barnes has left a strong and lasting impression behind her, for we have to announce the engagement of Miss Barnes to Mr. H. Snowden Ward, the well-known editor of the *Practical Photographer*. As we understand that neither will cease from journalistic or photographic work when the partnership is completed, we shall not lose either from amongst us, and we are quite sure that all will join in wishing them success and happiness.

THE Cleveland Camera Club will hold an exhibition and conversazione on Wednesday, February 1st, 1893, and three silver and three bronze medals are offered—

*For Members only.*

Class I.—Set of prints in one mount.

*Open to All.*

Class II.—Single photographs (any subject).

Class III.—Lantern slides, sets of six.

All entry forms, with entrance fee 1s. for each picture, must be sent to J. J. Hallam, 11, Amber Street, Saltburn-by-the-Sea, by January 25th, from whom entry forms may be obtained.

THE Polytechnic Photographic Society will hold an exhibition of members' work on 31st inst. and January 2nd, 3rd, 4th, and 5th, 1893. Mr. Quinton Hogg, the President, offers a silver and a bronze medal. Mr. Howard Farmer and Mr. E. J. Wall will be the judges, and the latter will also exhibit the AMATEUR PHOTOGRAPHER Prize Slides on the 31st inst.

It is stated that Dr. Meyer, of Berlin, has discovered a process by means of which aluminium can be produced at *twopence per pound*. In 1828 the price was £1,000 per pound. The price to-day is 4s. per pound. Here we have vast possibilities opened to us. There is said to be ten times more aluminium in the world than there is of iron, lead, copper, zinc, nickel, gold, and silver combined. It is stronger than iron, and more malleable than copper, as hard as silver, and one-fourth the weight, as white as polished steel, and is unaffected by the atmosphere.

THE Woolwich Polytechnic Photographic Society will hold an exhibition on February 16th, 17th, and 18th, 1893. The judges will be Messrs. F. P. Cembrano, A. R. Dresser, and Andrew Pringle. The following are the classes:—

#### SECTIONS.

1. (For members only) Prints, any subject by any process.
2. (For members only) Lantern slides, best set of six, any subject.
3. Open to all amateurs, any subject by any process.
4. Open to amateurs who have never received an award in open exhibition.
5. Lantern slides, open to all amateurs, best set of six.
6. Hand-camera work, set of four prints taken with camera held in the hand, not on a tripod (enlargements debarred).

A gold medal (presented by the Right Hon. the Earl of Carrick), for best picture in the exhibition. Silver and bronze medals and certificates in all classes will be placed at the discretion of the judges. Entry forms, etc., may be obtained from the Hon. Secretary, W. Dawes, 145, Chesnut Road, Plumstead, Woolwich.

WE publish this week further correspondence on the unfortunate dispute about the Hackney Photographic Society's silver medal for lantern slides. The following statement of facts about this case, which promises to be at least a *cause célèbre* in photographic circles, will be interesting.

At the Hackney Society's Exhibition, the Secretary was informed that two of the slides exhibited by Mr. Austin had been previously medalled. Immediately on receiving the judges' award, Mr. Austin was telegraphed to asking whether he had sent in any medalled slides? He replied, "In reply to yours, I have not been guilty of any violation of your regulations, which I have again carefully perused."

The regulations bearing upon this subject are as follows:—

NOT FOR COMPETITION.—The Committee will be very pleased to receive pictures for exhibition and not for competition—such as medal pictures (which cannot compete), or pictures illustrating any particular process, etc. No charge for entrance would be made.

WORK DONE BY EXHIBITOR.—All work, except mounting and framing, must be done by exhibitor. No exhibitor to take more than one medal in any one class. No prize picture can compete; photographs, except in Classes E, H, I, and J, can be by any process (transparencies and opals excepted).

In Classes E, F, G, winning pictures or copies to become the property of the society.

It is evident that the committee at least consider lantern slides as pictures, because Class E is "for set of four lantern slides." A note on this subject will also be found in the report of the Hackney Society this week. Mr. Grant, the Treasurer of the society, took the trouble to go to Peterborough to compare the slides with the set sent in by Mr. Austin for the AMATEUR PHOTOGRAPHER Lantern Competition, and for which he was awarded a silver medal. In a letter to our provincial contemporary of last week Mr. Austin says that if he had had six medalled slides at hand when packing them, he would have sent the lot.

Yet this is in the face of his threat of "proceedings" against the gentlemen who said his slides had been medalled, and his statement that he had not violated the regulations.

ONE and all must regret that Mr. Austin has not seen fit to acknowledge his mistake and gracefully retire, and whichever way the "proceedings" end we are quite sure that all our readers will admire the quiet, firm stand the Hackney Photographic Society have taken, and be grateful for their attempts to settle this much vexed question of awards to previously medalled work.

PERSONALLY we think that there is not the slightest doubt about the result of legal proceedings, and that Mr. Austin's behaviour on this occasion will do much to alienate any sympathy one may have felt for him.

SURELY in the face of all this trouble we may expect some concerted action to be taken on the subject of exhibitions and medals generally.

WE wish to draw the attention of our readers to the following announcement:—

In no case will the Proprietors of the AMATEUR PHOTOGRAPHER undertake to buy or sell any goods on commission, nor will they be responsible for the safety of any negatives or prints sent to the Editor of the AMATEUR PHOTOGRAPHER for any purpose whatever, although all reasonable care will be taken of the same.

The Editor claims the right of refusing any print, lantern slide, etc., sent in for competition, without assigning any reason for such refusal.

IN the course of editorial correspondence this week, the question occurs as to whether a secretary of a society is entitled to furnish to an unknown applicant the names and addresses of the members of his society. It were difficult to say if there be an actual right or wrong in the case, but we should have no difficulty in finding an authoritative precedent for refusing the addresses of members, whilst it might be impossible to withhold a list of members' names to anyone. We believe the Camera Club adopts this rule, thereby offering a check upon the industrious advertiser, who would probably hesitate before addressing some hundreds of circulars or letters to one address, and thus betraying himself. In these days it is to be feared that too many ally themselves with private clubs, institutions, and similar bodies formed professedly for mutual aid purely for the advancement of their own individual interests.

THUS philosophising on the duties of a Hon. Secretary we are often surprised to find what an astonishing amount of real hard work these gentlemen go through, and how inadequate is oftentimes their reward, and the marvel is how these hard-working officers find time for their own photographic work in addition to their private business and social engagements. So let our friends respect the Hon. Secretary of their particular society, if he be a good one, and see they keep him, and render what help they can.

By reason of the position which the Camera Club possesses, it almost goes without saying that the papers read before its members are usually of more than ordinary merit and importance, and hence it is to be regretted that a wider circle than the members of the Club cannot profit thereby. The Committee of the Club, however, have determined to strictly reserve the right of reproducing these papers or of copying them from the Club Journal. We can hardly blame the executive for taking this step for the protection of what the members may consider their special rights, but we regret that we shall not be able in future to give our readers, many of whom are too far away to otherwise hear of or read them, the opportunity of perusing some of the interesting communications which are from time to time made to the Club in Charing Cross Road.

THE Leytonstone Camera Club held their first annual dinner on Saturday last, and a most enjoyable evening seems to have been spent. Important business matters were discussed by way of dessert, the gist of which we are not at liberty to divulge, but from what we hear it augurs well for the future of this strong and energetic suburban Society.

A CONTRIBUTOR to the current issue of *The Theatre* runs on to some length on the "Humours of Photography," portraying some of the characteristic types of visitors to West-end photographic studios. The vanities and confidences of sitters of both sexes are retailed, and, as is usual in such cases, overdrawn. Thus we are told that "fashionable photographers generally adopt one golden rule with reference to portraits of actresses; they proceed to entirely destroy all likeness in the portrait taken, and to build up a fancy picture on what is left; the result is that their photographs are considered charming," etc., etc., etc. This is all very well by way of a joke, but somehow we are still able to recognise actresses by their portraits, and vice versa. The fact is, a series of really clever studies of character written by the photographer, entitled "My Visitors," or something of that sort, might make excellent reading, but they must be truthful impressions, and the professional photographer must have leisure, and also possess artistic literary instincts. If only Mr. Rudyard Kipling, for instance, would for a few weeks take the position of reception-room attendant in a Bond Street or Regent Street photographer's, we might have some amusing sketches for a Christmas annual.

IN contact with the "sticky" surface of an imperfectly dried gelatino-chloride print, "waxed" paper may be safely used. This may be a useful hint for those who, when occasion requires, mount a print on such paper half dried—half dried because these prints become very obstinate and crisp when dry, taking a good deal of persuasion before lying flat.

WE are sometimes asked "how to make moonlight effects," by which is meant not photographs of moon-lighted landscapes, but daylight pictures which look like moonlight. Now we have repeatedly pointed out the necessity for conscientious truthfulness to nature, if we are to have our pictures infused with the poetry and sentiment inseparable from and essential to artistic work. How then is it possible to countenance a sunlight picture which, because it is under-exposed and over-printed, bears some resemblance to the effect of moonlight? Everyone knows on looking at it that it is a pictorial counterfeit and a fraud.

THE impression given is the same as by a photograph of a figure suitably costumed and environed which the photographer calls "Joan of Arc" or "Mary Queen of Scots." We know the thing to be a falsehood, and although the time may come when the photographer may be able to impart so much of the ideal into his work as to carry the spectator beyond recognition of the actual and real, yet for the present, and on existing lines, in such subjects (as in the artistic photography of the nude, which sometimes vainly aspires to suggest the classic) the photographer must recognise his limits and represent the present actual.

IN the multitude of councillors there is much wisdom! So it has been said, and out of the many opinions which last week's press alone produced, one might expect to find material enough to build up a code of laws and appoint an authority which would for ever settle this fearful question of exhibitions and medals. But we venture to say the end is not yet. The utter want of unanimity of purpose in the suggestions offered makes it hopeless that any decision can be come to which shall suit all parties, and a "controlling body" which is exclusive and limited in sympathy (and oil and water won't mingle) will only make matters worse.

To say nothing of such contributions as "Arbiters of Honour" and "Exhibitions and Judges," which, whilst

they contain some sensible suggestions, include quite as much that is quite impracticable, our contemporary, the *British Journal*, makes the original suggestion that the Photographic Society of Great Britain shall appoint a Committee to deal with it! Would you raise the dead to life? All the societies are not yet "affiliated," and some might—aye, and undoubtedly would—resent the interference of a body which they have only regarded as of an abstract existence.

WE have regarded the abolition of medals in the more important and "open" exhibitions as a not improbable consummation, though it will not be just yet. Our contemporary above referred to, however, finds it as "idle to discuss the question of abolishing medals at photographic exhibitions as it is to cast ridicule on the Prix de Rome, the Royal Society's medals, or even military medals." Rather unhappy comparisons these, and hardly likely to carry conviction. But being apparently unable to clear up the matter satisfactorily, and having delivered himself of the not very impartial statement—"Where an exhibition is organised under promises to the competitors of the award of a certain number of honours, and the latter are withheld by the judges on grounds which they themselves set up, the competitors are cheated, the society itself is insulted, and the whole business is covered with ridicule; it is, in fact, promoting an exhibition on very like false pretences,"—the writer of the article proceeds to ask some eight or nine big questions, which, however, he does not attempt to answer.

"DOCTORS DIFFER," and patients will have their say too, and it is probable that the only immediate good which will come out of the present controversy will be to make societies more careful in framing their rules, and judges more circumspect and less ready to accept office without previous inquiry as to what may be expected of them.

THE coming of snow, at least in the southern and metropolitan districts, is long delayed, but there is constantly present the soft grey haze of the damp atmosphere, and thicker mists which make landscape so picturesque and pictures so suggestive. Abundance of water, too, everywhere making reflective little pools amongst the grass, and filling the great cart ruts on the country road. Good reader, don't forget these things ere the frost descends and winter's white robe covers it all up. We strongly recommend, however, the use of a waterproof focussing cloth in place of the velvet or other fabric. The best of mahogany and leather is better protected from the moisture in the air, which at this season of the year can hardly be escaped.

ON Saturday, at a Masonic dinner at Red Hill, Mr. Ralph Robinson was invited to make a photograph of the party by flash-light. This he successfully accomplished at nine o'clock, and within an hour and a half, that is, before 10.30, the company were pleasantly surprised at having finished prints handed round for inspection. Evidently Mr. Ralph Robinson, besides being an artist, is a man of prompt business habits, a characteristic as rare amongst our professional men as is permanent success and abundance of business; and that the latter condition is dependent on the former qualities is a fair and reasonable inference.

A LETTER in these columns suggests the interesting field of "Folk-lore" as one which those who wander about in remote country regions with the camera might do well to enter. Such work would give purpose to a great deal of photography which is otherwise aimless, and be of lasting interest and use.

A CORRESPONDENT suggests the desirability of printing "Societies' Notes," "Meetings," "Fixtures," etc., so that when binding up THE AMATEUR PHOTOGRAPHER in a volume, these items, which are of transitory interest, may be cut away without disturbing the rest of the journal. We noted last week that we were near the completion of another volume, and in our desire to be ever improving ourselves and our work, these matters will be carefully considered, and what can be done shall be. Good readers, if you only knew the difficulties in the way of cutting down and yet including just enough, you would know that the Editor sitting in a big chair, conning the journals, and answering a few letters, is, in photographic journalism at least, a very ideal personage. However, we have said we are "going one better," and so we are.

## Letters to the Editor.

### PHOTOGRAPHERS AND FOLK LORE.

SIR,—The photograph of the Horn Dance, which you reproduced in your issue for October 28th last, was a boon to folklorists, and I called special attention to it at the last meeting of the Folk-lore Society. Many of your readers are probably aware that the season of Christmas is celebrated in divers parts of the country by mumming-plays, the actors in which usually appear in fantastic garb of a more or less warlike character, having swords at their sides, and perform a play, in which St. George is the central figure. Now all these popular traditional dances and folk-plays are of great interest and value to students of folk-lore, and amateur photographers have it in their power to confer a great boon upon folklorists, by recording graphically these exponents of vanishing traditions. If your readers will bear us in mind this winter, they can make their hobby the handmaid of yet another science, and receive the grateful appreciation of a large and increasing number of students.

It will not be amiss, perhaps, if I explain that the words of many versions of mumming-plays have been recorded; but we are lacking in just those features which are of most importance to the student—significant gesture, action (especially action in concert or unison), costume—features which photography, intelligently directed, can fix and record as nothing else can. For instance, there is a folk-play in Lincolnshire and Yorkshire, known variously as a Mumming-play and Morris, in which the characters unite in clashing their swords in a circular formation around the head of one who is kneeling in supplication for their mercy. In some cases the costume is of peculiar character, as in a case within my own knowledge, and here a photograph in detail, for the purpose of showing the peculiarity, would be desirable in addition to one showing the actors in a group, or in some characteristic position or situation such as above described.

Any of your readers who may be disposed to respond to the suggestion here made, will oblige by forwarding copies of their photographs to the Secretary of the Folk-lore Society, Mr. F. A. Milne, 11, Old Square, Lincoln's Inn, W.C., or to me direct.—Yours, etc., T. F. ORDISH.

41, Great Ormond Street, W.C.

\* \* \* \*

### SOUTH LONDON EXHIBITION.

SIR,—In common with other amateur photographers, we of the S. L. P. Society welcome your contributor's valuable criticism so modestly hidden under the pseudonym "Young Member."

It is always pleasing to take counsel with genius, and we sit at the feet of this modern Gamaliel; but some slight lack of knowledge of how the judges conducted their tour may somewhat temper the severity of "Young Member's" thunderbolts. The "gentlemen of good stature and physique" had been for some months engaged in crawling competitions, and were fully competent to accomplish the judging by a severe course of acrobaticism. To a lay mind it may seem somewhat humorous to know this was accomplished by the judges standing on their heads to get a correct estimate of the pictures "on the floor," but as our motto is "Photographs for photographers," we can afford to treat with silent contempt any such unseemly levity. Again, the conservators of Peckham Hall were adamant on some points; they positively refused to allow us to hang photographs, lantern slides or

otherwise, on the roof; this was severe and almost rendered our show nugatory. Does "Young Member" know of the existence of photographic palsy? This will often account for the somewhat uneven lapses which occur in lantern exhibits. We do not want applause, we do not like it even, and our President was going about with "*Timeo danaos ferentes*" writ large all over him.

"Young Member" concludes in the spirit of tempering justice with mercy. He has refrained from writing anything to cause pain to individuals. Noble youth, we thank you, the Black Broth of Sparta becomes turtle once more, the tortures of the Inquisition become a mere wild attack of (Pearson's) nettle rash. "Progressiveness" runs a strong horse, and, promising Young Member that he shall be short-coated next birthday and thanking him for the music of his rattle, we must say good night to him now.—Yours, etc., HUGH MAIN.

\* \* \* \*

### PACKING OF PLATES.

SIR,—Do you think you could persuade manufacturers of plates, through your paper, to adopt the system of packing their plates in pairs instead of in batches of four or six? It is an unmitigated nuisance to have to pack up the remaining plates of a batch, whilst retaining in the hands at the same time the pair required, for as a rule the hands must at the time be engaged with carrier, black division card, and possibly dark slide. The dark-room has inconveniences enough from its essential darkness without this unnecessary inconvenience being forced into it, and I think I am within the mark in saying that a good many amateurs lose a large proportion of their plates, especially the extra rapid ones, from this cause. In the dark the wrapper may have touched some unforeseen wet place, or in turning, something suddenly checks the arm, and out go the plates from our burdened fingers, or a plate drops from some other cause, or the carrier drops and is damaged, or such a time elapses before all can be repacked or got into the dark-slide that harm has ensued, if the room be not absolutely as white-light proof as it should be. It is quite a comfort when one gets to the last pair of a half dozen and can throw away the paper packing as soon as it is opened.

I would also throw out two other suggestions to your readers. The first is, that before writing to advocate any new recipe or operation, the fullest trial should be given to the point in question. It is worse than unkind, it is absolutely wrong, to send information which cannot be relied on and proves a failure on trial. Take the case of the advocates for printing *very* slightly deeper than required for the Ilford P.O.P. This week alone I have spoiled half a dozen prints through this advice. They were a *little darker than required*, and on going into Mason's toning bath the faces vanished altogether. With the Company's bath it proved the same.

The other point is that when people suggest things like the india-rubber solution recommended for closing up platinotype paper boxes, they should, for the benefit of country workers, give some place where the same can be obtained, or the recipe in full for making it.—Yours, etc., J. N. WILLIAMS, B.A.

\* \* \* \*

### EMPLOYMENT OF OXYGEN.

SIR,—The employment of oxygen for the limelight and other purposes has increased enormously since the commercial introduction of the Brin method, by which the gas is separated from atmospheric air by a now well-known process. The gas so obtained is practically pure, analysis showing that as now supplied by the Brin companies it contains, on an average, 95 per cent. of oxygen, the remaining 5 per cent. consisting of inert nitrogen.

The success of this comparatively new industry has been so marked, that, as a natural result, competitors, with rival processes, have come forward. Some of these met with failure at an early stage of their career, but others are supplying oxygen to the public. This is by no means a state of things to be deplored from the consumer's point of view, if the product from the one source is as good as the other, for benefit generally arises from healthy competition. But when the rival product turns out to be not oxygen, but a half-and-half mixture of oxygen and air, with a slight excess of the latter, the competition is of a decidedly unhealthy character, and is correspondingly bad for the consumer. I recently obtained a sample of gas from a dealer, which on testing (with a Hempel absorption pipette charged with metallic copper and ammonia) I found to be a mixture containing only 60.6 of oxygen. I next tested the illuminating value of this

highly-diluted oxygen with a limelight jet, and, for sake of comparison, placed by its side a precisely similar jet supplied with Brin's oxygen, and, as might have been expected, the light given by the former was little more than one-half as intense as that afforded by the latter. With the good oxygen the lime was quickly pitted, whilst the other showed no symptom of destruction. It is also to be remarked that the consumption of the diluted gas is, for a given period, about one-third more—striving with both jets to get the best possible light—than that of good oxygen. On the same principle, a mountaineer at a high altitude will pass more (rarefied) air through his lungs in a given time than he will when he is in the valley breathing that which contains the normal quantity of oxygen.

As this matter is of great importance to many workers, I trust you may be able to find room in your valued publication for these words of necessary caution.—Yours, etc.,

T. C. HEPPWORTH

(Author of "The Book of the Lantern," etc.)

\* \* \* \*

#### A NEW SOCIETY FOR HARRINGAY.

SIR,—I should esteem it a favour if you will make it known through your columns that a photographic society is about to be formed in Haringay. All who wish to join should apply to me, from whom all particulars may be had.—Yours, etc.,

8, Cavendish Road, N.

C. FRITH.

\* \* \* \*

#### SPEED NUMBERS.

SIR,—A reply to one of your correspondents in your issue of 2nd inst. gives the following rapidities of our plates:—

Ilford White Label ..	25.
Ilford Iso. medium ..	30.

figures which, we understand, are copied from Mr. Watkins.

Now, without caring to enquire what these figures mean intrinsically, we desire to say that they are absolutely untrue relatively, and we beg users of our plates to discredit entirely any speed numbers which may be applied to them by any one, and to rely only on our published details of relative speeds, which are founded on a long experience, and not on one or two experimental tests.—Yours, etc.,

Ilford, London, E.

THE BRITANNIA WORKS CO., LTD.

\* \* \* \*

#### LANTERN SLIDE CARRIER.

SIR,—I must claim space in the AMATEUR PHOTOGRAPHER to reply to Mr. R. W. James' indictment against me of infringing his patents in lantern-slide carriers.

In a footnote to his letter, you yourself say you think Mr. James has the prior claim. Were my carrier the same in principle and construction as his, I should not attempt to deny this, as his later patent (and the *only* one which bears upon the subject) appears to have been lodged in January of the present year, whereas my application was only filed in October.

But, as Mr. James is well aware, and as you, Sir, should have observed when examining his carrier, our two inventions differ entirely in every essential feature; and in proof of this I enclose photographic copies of the specification drawings of each, which I think conclusively show that my patent is *not* an infringement of Mr. James' patent.

Mr. James' letter, I am afraid, implies an accusation against me of deliberate and wilful infringement. Even if my carrier *was* an infringement (which, of course, I assert it is *not*), I could not possibly have wilfully or intentionally copied, imitated, or derived any aid or idea from his invention, for the simple reason that when I protected my carrier I had not the faintest notion that there had ever been a carrier invented with *any* form of *automatic* slide-raising or ejecting contrivance (I now find, by the way, that there are several in the market). Indeed, the specification of Mr. James' 1635 patent has not *yet* been published, nor (so far as I am aware) has the carrier actually been put upon the market, and it was not until yesterday that by the courtesy of Mr. James' patent agents, who gave me a sight of the drawing of his carrier, I learnt what the features of his invention were.

Mr. James, I am sorry to find, has been attempting to injure the sale of my carrier, by threatening my London agents, but I beg to inform dealers who are selling or wish to see my carrier, that they run no risk, and I am willing to undertake all responsibility in any action Mr. James may think fit to bring.—I remain, yours faithfully,

C. C. VEVERS.

Leeds, December 10th, 1892.

#### THE HACKNEY PHOTOGRAPHIC SOCIETY TROUBLE.

SIR,—Enclosed please find copies of further correspondence between Mr. J. E. Austin and myself.—Yours, etc.,

J. O. GRANT.

(Copy.)

"Dear Sir,—Unless I receive immediately the silver medal awarded to me for my slides, "proceedings" will be taken to recover the same.—Yours, etc., (Signed) JOHN E. AUSTIN.

"West Court, Detling, Maidstone,

"December 9th, 1892."

"John E. Austin, Esq.,—Dear Sir,—I beg to acknowledge the receipt of yours of the 9th inst., and to inform you on behalf of the Committee that the solicitors acting for the Club in this matter are Messrs. Renstead and Sharpe, 1, Finsbury Square, E.C.—Yours, etc., (Signed) J. O. GRANT.

"December 12th, 1892."

\* \* \* \*

#### EXHIBITIONS AND MEDALS.

SIR,—The plan proposed by Mr. H. Harvey-George in your issue of December 9th, has been tried and failed. About three years ago an exhibition was opened and the public were asked to vote. On the visitors entering the rooms, printed voting papers were handed to them which they were to mark with the numbers corresponding to the pictures they thought best, and to put these papers into a sealed box on leaving. It was found that many of the visitors recognised the work of their friends and voted for them regardless of the merits of their photographs; moreover the exhibition remained open for several days, and some of the public voted more than once for their friends' pictures. Comment is unnecessary.—I am, yours, etc.,

A. A. MANTELL, M.D.

SIR,—As I have never exhibited a picture, I possess but little knowledge of the working arrangements of an exhibition, but I should hardly think the proposition set forth by your correspondent, Mr. Harvey-George, *re* the judging of pictures, will find much support. He may be right about the verdict of a single judge, but when there are three or four judging, it is hardly likely they would all give the preference to a certain colour or style of a photograph. When he says that the best picture is the one which pleases the greatest number of people, and therefore the public who visit the exhibition should be the judges, I cannot agree with him. Because a picture is pleasing to look at, it does not follow that it possesses artistic merits. I have heard a person say, "I like such and such a picture, it is such a pretty bit, this waterfall or that bend in the river is so beautiful," without any idea as to whether such portions of a picture lend themselves in a fitting manner to the picture. Some so-called pretty bits—take a landscape, for instance—will have an enormous oak tree right in the foreground, standing out in a very obtrusive manner, the foliage of the tree as black as your hat, and perhaps the top of a hedge showing, with briars measuring one-eighth of an inch across; the rest of the composition, if it may be so called, looks pretty, but taking the picture as a whole, what a monstrosity it is! I feel sure that, if the mode of judging has to be changed, it must take a form different to that which has been put forward by your correspondent.—Yours, etc.,

P.

\* \* \* \*

#### SOUTH LONDON PHOTOGRAPHIC SOCIETY.

SIR,—I only propose to reply to two points in the letter signed "Young Member" in your last issue, as it deals mainly with matters which are not of general public interest, but such as should be dealt with by the committee of the society.

When the judges came to the exhibition I furnished them only with particulars of the various classes, and the numbers of the pictures entered for competition in each of them, and with this information they proceeded with their work. It was not until after the judging had been completed and the awards signed that copies of the catalogue were handed to the judges.

With reference to the showing of lantern slides, no distinction was made between any of the competitors, and if any of the pictures remained on the screen longer than others, the delay arose simply from the time occupied in finding and handing up to the operator the next set, the adjustment of the lime and matters of that kind.—Yours, etc.,

CHAS. H. OAKDEN

(Hon. Sec.)

## How to Make a Set of Photo-graphic Apparatus.

By H. J.

(Continued from page 368.)

### CHAPTER XII.

#### THE RUBY LAMP, ETC.

I INTEND to devote this, the last chapter of the series, to various small, though at the same time very necessary articles for use in the dark-room and also for printing purposes.

The first of these is the ruby lamp. At first sight it would seem that there is an abundance to choose from in the market, at prices to suit all; but what I am aiming at, and have been throughout the series of papers, is to enable any one to obtain a superior article for the same price as a cheap one would cost if bought at a dealer's, and I trust I have been successful so far, and I think I can say that the ruby lamp which is about to be described will not prove an exception.

The following sizes are for a lamp 6 in. square and 10 in. high, exclusive of ventilator in top; if larger or smaller is required, the sizes of materials must be varied accordingly. The bottom and top will be made of wood, and the sides of tin, with a piece of ruby glass in each, thus giving a chance of having four different colours if necessary.

FIG. 96.

Now for the bottom and top (A and B, fig. 96), which must be made first. Cut out two pieces of 1 in. stuff (any kind of wood will do) 6 in. square; plane up the angles perfectly true, then at  $\frac{1}{8}$  in. from the outside all round, cut a fine saw cut about  $\frac{1}{4}$  in. deep (see fig. 99, C being the outside of top—or bottom, as they must both be alike so far—and D the saw cuts). Now in one piece cut out a 4 in. circular piece out of the middle (this is for the bottom) and out of the other (the top) cut a 2 in. circle. The top is now finished, so we will proceed with the bottom. On the circular piece which is cut out screw four small brass plates, as at E, fig. 97, then place the piece in the same position as it was before cutting out, and mark where each plate comes; cut out these notches in the outside piece, so that the

FIG. 97.

circular piece will pass through easily. The tin sides must now be prepared. I find the best material for these to be the black or chocolate ferrotype plates; these are sold in sheets 14 in. by 10 in., so that the width is just right for the height of lamp, and by cutting 2 in. off the length of two sheets, it will come just right that way. We require two pieces to go round, one fitting in the saw cuts, and the other tacking round outside of top and bottom. We will make the outside first.

Take one of the sheets, now 12 in. by 10 in., and mark off  $\frac{3}{4}$  in. from each end, and also  $1\frac{3}{4}$  in. from each side, then

FIG. 98.

mark again  $5\frac{1}{4}$  in. from each end. This shows two oblong pieces  $4\frac{1}{2}$  in. by  $6\frac{1}{2}$  in.; these must be cut out, and one more sheet must be done in the same way. The two sheets when laid end to end will now present the same appearance as fig. 98, the joint of the two being in the middle of G. Each sheet must now be bent at right angles down the centre of F; to do this, lay the sheet on a piece of hard wood, the edge of which comes to the place where the bend is to be, then lay another piece of wood on the sheet, keeping its edge exactly over the other, press heavily on them with the left hand to keep them from slipping, and bend the sheet down with the right hand, knocking it flat against the

FIG. 99.

FIG. 100.

bottom piece of wood with a mallet; the angle will then be straight and true.

If made to the measurements I have given, the two pieces should just fit round the top and bottom, and the edges of each should meet at the opposite angles.

Two more sheets must now be done in the same way, but as they will fit in the saw cuts, the margins must be so much smaller; the exact measurements can be taken from the saw cuts, bringing the angles together in the same way as before. Now make eight angle pieces  $\frac{1}{2}$  in. each way as at H, fig. 99; these must be 10 in. long, and they fit inside the inner rim, and outside the outer as shown; by using these there is no need to solder the angle joints, and they

# THE LATEST SCIENTIFIC NOVELTY

(ANSCHÜTZ TACHYSCOPES).

## Amusing and Instructive.

## Xmas Annual of the "Practical Photographer."

This new and unique production consists of an artistic large quarto portfolio, containing eight choice studies, reproduced from photographs, and printed on antique plate-sunk cards. A leaflet with a short description of each of the studies is included. These pictures adapt themselves either for framing or for a place on the drawing-room table. The Annual would form a most appropriate Christmas present. Price 1s., post free 1s. 3d.

The studies are by the following artists: Harold Baker, S. N. Bhedwar, W. J. Byrne, Thomas Scotton, F. M. Sutcliffe, W. Ethelbert Henry, Richard Keene, Robert Slingsby.

As the edition is positively limited to 2,000 copies, orders should be placed at once to avoid disappointment.

"Certainly it would be difficult to imagine anything more chaste or handsomely artistic."—*Blyth Examiner*.

The whole stock just purchased from Mr. J. WERGE, who has retired from business.  
Reduced from 5s. to 3s. 6d.

## The Evolution of Photography.

By JOHN WERGE.

With a Chronological Record of the Discoveries, Inventions, etc. Contributions to Photographic Literature, and Personal Reminiscences extending over forty years. Illustrated with ten collotype portraits.

Neatly bound in cloth. 312 pages. 3/6; post free, 3/9.

"The book is full of interest, even for the general reader."—*Graphic*.

"Mr. Werge has now placed the recollections and experience of forty years in connection with the art in the form of a book, which rejoices in the title given above. His personal reminiscences of the earlier days of photography are extremely interesting reading, and as with them he combines other information relating to the founders of photographic art, the book forms practically a history of photography."—*Photography*.

The opportunity of purchasing this well-written, useful and standard book at a reduced price, ought not to be overlooked by any reader of photographic literature.

JOHN WERGE.

add to the strength of lamp as well, and they are easily made in the same way as the other angles are turned.

The outside rim can now be nailed on to the bottom, fixing the angle pieces at the same time; then push the inner rim (I forgot to mention that this should be made narrower, as shown by dotted lines in fig. 98) down into the saw cuts, and the angle pieces inside it: slide in the glass, which must be cut large enough to fill up the space all round, and then fix on the top. This is best done with

	s.	d.
Four ferrotype plates, 14 by 10 .. ..	1	6
Pinion to regulate lamp .. ..	1	0
Four small brass plates for movable bottom ..	0	3
Wire for handles .. ..	0	2
Ruby glass, cut to size (four pieces) .. ..	2	0

#### HOW TO MAKE PRINTING FRAMES.

These very necessary articles can be bought very cheaply,

FIG. 101.

screws, in case the glass gets broken at any time. Now fix a small bead round top and bottom to cover the nails and screws which will fix lamp together (see I, figs. 96 and 97).

The ventilator can now be fixed on top; this is simply two pieces of ferrotype plate bent over as shown, one at right angles to the other, so as to admit the air to pass, but at the same time prevent any light from showing. The inner piece K should be about 3 in. wide, and the other piece L about 4 in.; they will then effectually stop the passage of light. The handle of lamp is formed of two pieces of wire fixed to top and bottom, as shown in fig. 96, and bent so as nearly to come together, and also so as to stand out about an inch from glass. This is better than having the handle at the top, as the latter is liable to get hot when in use. If candles are to be used the lamp is now finished, but I like a lamp myself, so I will make it complete for those who think as I do.

FIG. 102.

The lamp must be fixed to the circular piece which was cut out from the bottom, and as it is often required to raise or lower the light, I show an arrangement for that purpose in fig. 100.

A piece of wood M is fixed on the wick regulator of lamp N, to which is fixed a string O, which passes under a short pinion P, which is fixed in a slot cut out for it in circular piece; the head of pinion projects beyond the sides of lamp, the bottom having a slot cut out to accommodate it. The lamp being fixed to the circular piece, the outside can be placed right on over it, the brass plates E passing through the slots made for them. The circular piece with the lamp on it can then be pushed round to the position shown in fig. 97, when the plates will

FIG. 103.

hold them together. The slot for pinion in lamp bottom must be made large enough so that the pinion can be used as a lever to fix and unfix the movable bottom. The four slots will admit the necessary air to feed the lamp, and small feet R must be fixed on the bottom to allow the air to pass through them.

The following is a list of the necessary fittings, with prices of same:—

and at first sight it seems as though it would hardly pay to make them, neither would it if only one was required; but as everyone requires half a dozen at least, by making them all together the game can be made to pay for the candle. The following measurements are for six quarter-plate frames; if half plate are required the sizes must be altered accordingly.

For materials we shall require a piece of some kind of hard wood, 3 ft. long, 2 in. by  $\frac{3}{4}$  in.; this must be planed up square and true on all sides, and rabbetted on each edge as shown in fig. 102. It must then be cut out in trenches as shown in fig. 101, the trenches being cut out of the widest side, or that marked A, fig. 102. When setting out the trenches, first square off one inch at each end, then four inches, then two inches for trench, and so on till the other end is reached, when it should come for another inch as when starting.

FIG. 104.

The inch pieces at each end must now be cut away, also all the two inch spaces, into the depth of widest part of wood, as shown by dotted line in fig. 102, after which the piece must be sawn down the middle lengthways, making two pieces of equal size, 1 in. by  $\frac{3}{4}$  inch.

Now prepare six pieces of the same kind of wood as the other, 5 in. long 2 in. by  $\frac{1}{4}$  in. It will be best to prepare them in one length and cut them off after; one of them must be sawn in two, making it into two pieces 1 in. by  $\frac{1}{4}$  inch. These two pieces must be

FIG. 105.

screwed into the end trenches of the long pieces, keeping the latter exactly 3 in. apart or  $3\frac{1}{4}$  in. in the rabbets, which must be placed inside just opposite to the way they were before the piece of wood was sawn in two. The 2 inch pieces can now be glued and screwed into the remaining

FIG. 106.

the other side to that shown. We now require about 2 ft. of wood of the section shown at C, fig. 104; the best way to make it is to plane up a piece 12 in. long,  $\frac{1}{2}$  in. square, and then saw it down diagonally, and then take a shaving or two off the rough; cut these pieces into  $1\frac{3}{4}$  in. lengths,

and glue one into the rabbet in the middle of each cross piece at each side, as at D, fig. 103; shorter pieces of the same must also be glued on the narrow cross pieces at the ends in the same way.

While the glue is drying, the backs can be prepared. For these we require a piece of  $3\frac{1}{4}$  in. by  $\frac{3}{8}$  in. hard wood, 2 ft. 3 in. long; this must be planed up true and level all round, and then cut into lengths of  $2\frac{1}{2}$  in., cutting them all square and planing the ends. They can then be hinged together in pairs, using one hinge for each long enough to reach across; this will be found better than using a pair of small hinges, and it costs no more.

There are also frames in the market with the back cut across near one end, the object being to allow more of the picture to be examined during printing; but it is only a fad, and it has more disadvantages than advantages, so I stick to the old-fashioned plan, which I believe to be as good as any. The glue will no doubt be dry, so that the frames can be cut in pieces, which must be done through the middle of each wide cross-piece, as dotted lines, fig. 103. They can now all be trimmed up and the sharp corners taken off with the plane, with a finishing touch with sand paper, and the frames may be called finished, with the exception of the pressure springs; these must be screwed on to the sides (one on each) at about the middle of each half of back board, and a wire staple inserted diagonally in the other sides, so that the end of spring will slide under the staple and be held there firmly.

FIG. 107.

A sketch of printing-frame complete is shown in fig. 105, all the parts being lettered for reference.

I think that all who have followed this paper will agree that it does pay to make printing frames at home, cheaply as they can be bought, the fittings costing a mere nothing, the wood ditto, and as for time occupied in making, it is not much more than has been taken up in writing this paper.

#### ECONOMICAL DEVELOPING TRAY.

All who wish to study economy by using as little developing solution as possible, should make a tray as follows, in which the plate itself forms the bottom; this will be found to save about two-thirds of the solution, as the whole is kept on the negative, whereas in the trays in ordinary use the greater part runs under the plate on the bottom of tray. Make a block of wood, as K, fig. 106,  $5\frac{1}{4}$  in. by  $4\frac{1}{4}$  in. by 1 in. thick; rabbet it all round for half the thickness as shown, so that the top is  $4\frac{1}{4}$  in. by  $3\frac{1}{4}$  in. (this is for quarter-plate; for half-plates, etc., the blocks must be varied in size accordingly). Now make a frame of  $1\frac{1}{4}$  in. by  $\frac{3}{8}$  in. wood,  $4\frac{1}{2}$  in. by  $3\frac{1}{2}$  in. inside; the sides of this are shown at L, fig. 106. When this frame is placed on the block, it will be level with it all round outside. Now all round the inside of frame fix rabbetted india-rubber moulding as at M, fig. 106 the thick part upwards as shown. The thin part of this moulding is one-eighth of an inch thick, and the thick part a quarter of an inch, so that it leaves an eighth of an inch

rabbet all round. The rabbet of moulding should rest on the top of block, when the bottom of frame (L) is resting in the rabbet in block. A small hook and eye should now be fixed on each side of block and frame, so as to fix them together; these are shown at N, fig. 106. Now to use the tray place the exposed plate on top of block K and pass the frame L over it, so that the rabbet in india-rubber moulding rests on film of plate, then press frame down and fix with hooks and eyes. The tray will now be found quite water-tight, the india-rubber making a good joint. Films and bromide paper can also be developed in a tray of this description much better than in any other, as it is kept perfectly flat during development.

#### List of Fittings for above.

	d.
India-rubber moulding, per foot .. .. .	8
Hooks and eyes, per pair (two hooks and two eyes) ..	$2\frac{1}{2}$

#### A SIMPLE FLASH LAMP.

No outfit is thought complete without a flash lamp now, so I have included one in these papers. It is very simple and easily made, and at the same time perfectly effective, and answers its purpose well. O, fig. 107, is a block of wood about 6 in. by 3 in. and 1 in. thick. On this is fixed a piece of brass tubing P, which is connected with an india-rubber tube and ball at R, the other end being bent upwards so as to stand about  $1\frac{1}{2}$  in. off the block, and is also flattened out so that the round bore of the tube is turned into a long slit. A short piece of tubing is also soldered into it at S as shown, to which a cork must be fitted. At the other end of block must be fixed a piece of gas-pipe, which is turned up and fitted with an ordinary burner T, the latter being fixed about half an inch from the flattened end of brass tubing. Now cut out a piece of tin of the shape shown in fig. 108, and fix it on the end of block over the gas-pipe, bending it forward, as shown at U. This finishes the lamp, and now for the method of using; first connect the gas-pipe with the nearest bracket, with a piece of india-rubber tubing, then place a small quantity of magnesium powder in tube S and cork it up tightly, light the gas at T, and press the india-rubber ball.

FIG. 108.

The piece of tin U answers two purposes; it spreads the flame so as to give a large surface of light, and it prevents the powder from being wasted by being blown through the flame, thus ensuring a more powerful light.

This finishes the series of papers for the present, and I hope that they may prove useful; they are all quite practical, and if anything has been passed over too lightly I shall be happy to explain it more definitely if my attention is called to it, and by permission of the Editor I hope to have the pleasure of writing for these pages again in the future.

## Study and Practice of Art in Field Photography—XI.

BY A. HORSLEY HINTON.

### CHAP. XI.—CLOUDS IN LANDSCAPE.

WE need probably use no arguments to persuade our readers that a plain white blank is quite an inadequate representation of that part of a landscape scene which is occupied by the sky, and we shall presume therefore that we have got beyond the age when it was thought desirable that the upper part of the photograph should in all cases be white, and indeed a "nice white sky" was regarded as a *sine qua non* to a good photograph.

If the direct and independent study and observance of nature had been taught and insisted upon as it should have been, and usually is now, such an error would never have become established. It is an instance of a rule or standard having been arbitrarily laid down, and thus given rise to the multiplication of error.

Look out of doors for a moment, no matter what the scene, and consider what is the relative tone, the respective *values*, as regards light and shade, between the two halves of the scene representing generally the sky and the land. We shall probably conclude that the former is the lighter half, but if we look closer and more thoughtfully we shall in nearly every case find it possible to select some spot, some object in the scene which is brighter and lighter than the sky or any part of it. Any object with a smooth and polished surface, water in some positions, a whitened cottage wall, or any white object in sunshine, a dry dusty path even, in bright light would come lighter than the sky, and hence as, in our pictures, our highest expression of lightness is white paper, it becomes obvious that if we are going to preserve the true relations between the various parts of the picture white must be reserved, as it were, to express the brightness of such objects as we have named, and the sky must fall many tones lower in the scale. Even the bright sunlit edges of the clouds are rarely white, but greys and yellows, and the lighter

clouds and blue sky are deeper still, often much lower in tone than the grass fields and heavier rain clouds are darker still.

In representing the sky in our picture so much lighter than it should be in relation to all else, it may be understood that, inasmuch as everything throughout the piece must properly harmonise if the general resulting effect is to be true, the white sky is not only wrong in itself but makes everything else appear false; it will rob the brighter objects of half their brightness, and make the shadows appear deeper and heavier. Without the sky in something approaching correct tone, concord and harmonious effect throughout the scene is impossible. So that this reason alone, though the mere desire for truthful rendering of of physical fact might suffice, will show us the necessity of very carefully studying the sky and clouds which are included in the scene or which we desire to have in our picture. The probability is that after having accustomed ourselves to look at the skies around us a little more intelligently, the student will find cause for surprise that he should previously have been influenced by the conventional ideas for so long; but in the meantime, as a training for the eye and judgment, we should advocate some little exercise and practice; thus, for instance, on every possible occasion, before any scene, ask ourselves the question, what is the lightest object—that is, what object or what part of an object approaches nearest to pure white?

In open landscape, particularly if the character be varied and water be present, we shall rarely find the sky contains the highest light. Having determined the highest light, it would be useful to hold up a slip of white paper so as to contrast pure white with the determined object. Perhaps it will fall rather below the test, often it will surpass it, as the bright glinting light or ruffled water, the edges of shiny leaves, the polished and smooth surfaces of stones and pebbles; these objects, having reflecting surfaces, will appear much brighter than white. But pure white is our physical limit in pictures (and we use the qualification "physical" intentionally, because that by careful gradation and contrast something much more luminous than white can be *suggested*), so we call our highest light white, and then proceed to place the next lightest objects in their regular order and place. By a little practice of this sort we shall accustom ourselves to fix upon the lightest object at once with very little pre-consideration.

Having cultivated the eye, we shall find it much easier to carry into practice what we have learnt, though probably the photographic rendering of tone is the most obstinate foe of the artistic photographer, and the last of a considerable number which still remains not wholly subdued and overcome. Half the battle, however, will be to know *what* we require and know our error when we have made one, and this we can never do unless we constantly study sky and land in their various relationship.

Notwithstanding the advance made in dry-plate manufacture, and even availing ourselves of the various screens, shades, and other mechanical contrivances, still we are very far from always being able to secure the kind of negative we desire, or upon which we think we may reasonably calculate upon obtaining, and it is therefore chiefly in the subsequent processes of printing that errors of the character to which we are referring must be corrected; and whereas, beyond the focussing and arranging the subject on the plate, and the trifling control during development—beyond these, the making of a negative must be admitted to be a good deal mechanical, and gives us less opportunity of using our judgment, and leaves more to blind natural forces, which it has been admitted do err, so the controllable part of the process is that which is under

our hand and eye, and within our power to greatly modify, and as it so largely depends upon our guidance there is the greater necessity for our having so accustomed ourselves to judge between the relative parts of the landscape that we shall at once detect errors of tone, errors of relation, in the print, and know what is required to correct them.

In determining the relative values of objects in sunshine, it is very important, though perhaps not at first easy, to study the objects totally forgetful of their local colour. Hence, smooth, shiny leaves of plants and bushes, although green, are at those points where they catch and reflect the light brighter than white paper. A slate roof in intense light becomes the very palest grey, and the enamelled red ware of which chimneys are made, and which are used sometimes at the apex of the cottage roof, are, when the sunlight strikes them, white, or, glistening brighter still, produce a radiating point of light. The white sails of a yacht and very many other objects will, if seen against the sky, appear lighter than the sky which forms their background; and how if we have our sky represented as white or nearly white, can we show these light objects in relief? It will be excellent exercise to be always on the look out for such a scene, such an opportunity which gives us some object which comes lighter than the sky or clouds beyond, and to endeavour to produce a photograph thereof, accurately preserving the proper relative values of these test objects. By this means we may be surprised to find how deep in tone a clear blue sky is, and how much darker than we had imagined the light rounded cloud masses really are.

On the other hand, it is, of course, exceedingly easy to err in the opposite direction, and exaggerate the depth of the sky and clouds so that they appear unnaturally obtrusive and heavy.

Whilst we have pointed out that unless we are looking directly in the direction of the sun, the *highest light* will usually not be in the sky half of the picture, yet, except in rare cases, the greatest total *volume* of light will be from the sky, so that in printing heavy clouds it should be carefully borne in mind that they must not be so dark as to bring down the total volume of light below that of the landscape. So much then for the necessity of carefully and studiously observing the relative tone of sky, and the scene which with it constitutes our picture.

There is another point from which our skies and cloud effects should be studied, and one which in some of its aspects, we think, has not been sufficiently insisted upon hitherto, and that is the extent to which, quite apart from their lighting, clouds may assist or disturb the general sentiment of the scene. Certain cloud forms are suggestive of certain ideas, and it will be important that those ideas shall not be incongruous with the prevailing sentiment of the picture. Thus the broken masses of drifting wind-blown clouds will better carry out and complete the idea of a breezy marsh-land scene than the great and solemn forms of stately clouds which rise mountain-like above the tree tops, and, indifferent to the lower air currents, move slowly across our view. In the later day, long bars, rose, gold, and purple, stretch across the sky, and behind them all from bar to bar the sun climbs down; and somehow in this simple cloud arrangement mostly of straight and parallel lines there is something which harmonises with the idea of rest and quietude, something in it suggestive of the pensive evening hour, and through the failing light the weary team is driven home, and the labourers in the field take the homeward path. Bright sunlit clouds of varied shapes, built up and moulded in the warm air, dappled and flecked with the glancing light, constantly changing in form, neither gliding nor hurriedly drifting, but seeming to dance along the clear blue sky, grained athwart all its wide expanse with buff and

gold, like floating gossamer, will be in sweet accord with the happy summer scenes of country life, the simple toil of homestead or sea-shore, the brilliancy of all the flowery fields of June, the joyousness of children's sport. Yet if the subject of our picture were to be of a more pensive kind—a solitary way-worn traveller on a lonely road—and we entitled it "Weary," or some such name, we should probably choose that the sky and clouds should be of a more serious mood.

(To be continued.)

## Silver Printing with Matt Surface.

By J. E. AUSTIN.

THIS was the subject of a lecture and demonstration given by Mr. J. E. Austin before the members of the Maidstone Amateur Photographic Society, of which he is President, on Friday, December 9th. Having for some time, he said, relinquished silver printing with albumenised paper, he had lately, about two years ago, returned to the use of silver as now set forth. Looking round the walls at exhibitions of note, hardly a silver print as usually understood, *i.e.*, with shiny surface, would be met with. The advantages of the paper he brought forward included facility and ease of preparation combined with lowness of cost, added to which was the opportunity of seeing the work as it progressed, the process, in fact, being a print-out one.

He added that he had been experimenting with the process for a year and a half, but had now brought it down to great simplicity, and would proceed to describe it exactly as he used it in his own practice.

To outline this method of printing, the paper has first to be sized and salted, dried, then sensitised, again dried, when it will be ready for printing, after which it is toned and fixed.

*Selection of Paper.*—Of the many papers tried all seemed to be suitable, but Whatman's not hot-pressed for small, and Whatman's rough for large work could be recommended. Another fine paper for quarter-plate was the plain paper brought out by the Platinotype Company in the sized or unsized condition. With this, sepia tints could be had, and with regard to the tone obtained, with the formula given almost any colour could be produced, as the sizing of each brand of paper varied, and it is chiefly this sizing that governs the tint. It is advisable to cut the paper with a safe edge, rather larger than required. Thus, for 15 by 12's, half an inch margin in each way might be allowed.

### Sizing and Salting Combined.—

Sodium chloride	...	...	...	...	5 to 10 gr.
Gelatine (Nelson's)	...	...	...	...	1 "
Water	...	...	...	...	1 oz.

Place the gelatine in the water and allow to swell for half an hour then put the containing vessel in a saucepan of hot water, stir up with glass rod, and add the salt. A temperature of about 160 deg. Fahr. will be about right.

Although there is sufficient size naturally in the paper, the addition of gelatine is better, as it increases the toughness of the coated surface, otherwise there is some tendency for the image to rub off. The use of gelatine imparts warmth of colour, besides seeming to hold the image better on the surface, but the amount should not be increased beyond that given above, because too much leads to a difficulty in the next stage.

At this part of the process trouble is often met with from a multitude of small air bubbles, causing minute spots, but they can be entirely obviated by using an ordinary shaving-brush; thus, after *immersing* in the salting solution (best used neither too cold nor warm), rub the paper over with the wetted brush, in a few minutes again rub and turn the paper over, take another piece and treat similarly, and proceed till the dish has as many as it will hold.

The sheets after soaking and treating as described are removed and hung up to dry with clips; when quite dry they can be packed away and will keep indefinitely.

### Sensitising.—

Nitrate of silver	...	...	...	...	120 to 240 gr.
Citric acid	...	...	...	...	30 "
Water (distilled)	...	...	...	...	2 oz.

A certain latitude is possible and desirable; thus for flat negatives the salting bath may contain 10 gr. of sodium chloride, and the silver bath be used weak, *viz.*, 120 gr.; while for stronger negatives, 5 gr. of salt, and silver bath the full strength, will be better, the conditions for success being, that the *stronger* the salting bath

is used the *weaker* must the sensitising one be. For general work, of course, a mean amount would be found to give good results.

The whole success of the process depends upon the way in which the sensitising is done. The silver bath should be filtered into a quarter-plate dish each time any paper is to be sensitised. A strip of swansdown calico  $4\frac{1}{2}$  by 2 in. is doubled lengthways, the long edge of a clean quarter-plate glass placed in the fold, and the calico tied on with string or cotton; this forms an efficient coating brush. Take the sized and salted paper from the store book or portfolio, lay it on a clean sheet of white blotting paper kept for the purpose, and having dipped the brush in the sensitising solution, draw the brush carefully in one direction along the paper, holding it down by the fingers at the edge, then go over the paper with the brush at right angles to the former way, continually examining the surface by the light reflected from a candle, to guard against uncoated specs. Sufficiently cover the surface, but make no attempt at saturation. Hang up, and in about twenty minutes the paper will be dry.

If in packing away, the sensitised papers are laid face to face or back to back, it is important to see that they do not overlap, otherwise marks may subsequently be noticed; if of varying sizes, the face of the smaller piece should be put next to the back of the larger.

The paper can now be printed from, but although not absolutely necessary, it is always best to *re-sensitise*, as this additional treatment ensures the production of good prints. Contrary to what would be thought, the cost is very small, and the paper will keep properly for a month.

In *Printing*, if the negative has not been varnished, to avoid the risk of spoiling by possible staining, a thin gelatine film should be placed between the negative and the paper in the printing frame; printing proceeds as usual, carrying it, however, a little darker than would be the case with ordinary albumenised paper. The prints when ready for toning can be washed or not as may be wished; the subsequent result appears to be much the same. Any toning formula may be used, such as acetate of soda, or borax, or what has proved most satisfactory, a combined toning and fixing bath, the advantage of this latter being that the prints can be taken out when a certain stage of tone has been reached, and then the fixing completed in a separate bath of hypo. Great variety of effects are thus obtained.

The Alpha combined toning and fixing bath has been used, but it must not be too strong in gold.

Hypo	...	...	...	...	...	2½ oz.
Acetate of soda	...	...	...	...	...	½ "
Sulphocyanide ammonium	...	...	...	...	...	1 "
Gold chloride	...	...	...	...	...	1 gr.
Water	...	...	...	...	...	10 oz.

*Hints on Toning.*—Only tone one print at a time, and only sufficient solution should be placed in dish to cover the paper. The first print placed in must be removed some time before the desired effect is reached, as a new toning bath is very energetic. The fixing can be finished afterward in hypo.

It may be mentioned that over-printed proofs should be touched in a new bath, if under-printed in an old one, the reduction in this case being less.

Defects in over or under printing can be remedied in a way for which it is believed some novelty can be claimed, and by taking advantage of this part of the process when the days are dull, the printing may only have proceeded to a quarter of its normal intensity; in fact, a faint image only be visible, and yet by treatment yield a good print.

In such a case to finish off, place in water for a few minutes and then develop with gallic acid before commencing to tone and fix (saturated solution of gallic acid, about one drop of this to the ounce of water). If dealing with over-printed proofs, reduce by using a very weak solution of potassium cyanide. The prints, however treated, of course, after fixing, to be thoroughly washed as usual.

In concluding his lecture, Mr. Austin said he felt sure that if the process was given a trial, carefully attending to the points he had minutely entered into, those using it would obtain as much satisfaction and success as he himself had met with.

## Platinum Toning

A. J. LEESON.\*

THE great stability of platinum makes it a very desirable agent for the toning of photographic prints, and to Mr. Lyonel Clark we are greatly indebted for the publication of his experiments and formulae in connection with this process. The chief chemical used is chloroplatinite of potassium, and it is very important to see that this is obtained. It is usually sold in fifteen-grain tubes at a cost

of about eighteenpence or one shilling and ninepence each. Apart from the stability which platinum offers, a large number of tones are obtainable simply by watching the toning, and stopping as soon as the desired tone is reached. Almost any tone from brown to black can be obtained, and this is particularly so with prints on the ammonia nitrate of silver paper (particulars of which I gave before this society last spring). I find I get very good results, too, on Edwards's matt-surface silver paper. But the use of ground glass for squeegeeing prints on Solio and other gelatine-chloride papers made these very desirable for printing on, as they tone very easily—far more easily and quickly than with gold toning. The depth to which they should be printed is perhaps a little deeper than with gold toning. When a number have been printed, they are well washed and then placed in the toning bath, which is as follows:—

### TONING BATH.

Chloro-platinite of potassium	...	...	...	15 grains
Water	...	...	...	8 ounces
Nitric acid	...	...	...	3 drops

Each print should be toned separately, and only enough of the above bath should be used at a time that will cover the bottom of the dish, on account of its expense, for after a print has passed through it chemical action is set up, and in a day or so it loses its power. This solution is very energetic, and in some cases it takes less than a minute to tone the print thoroughly. Should there be a part of the print which has not been acted upon by the platinum, if the print is again immersed that part which was untuned will catch up the toned part. After it is toned the print should be thrown into a dish of water, made alkaline by the addition of a few crystals of carbonate of soda or potash. This keeps the whites pure and stops toning at any desired point.

For warm tones this bath is too rapid, as these are obtained by stopping toning at any desired point. So that it is well to add to the above formula four times, or more, the quantity of water. This makes the print longer in toning, but enables one to watch the different stages; and when the right colour is obtained throw the print straight into the alkaline water. Several prints can be toned at the same time in this bath.

It is best to print in as warm a tone as possible, especially when warm tones are required, as it is much easier then to see what is going on in the bath. Solio paper, therefore, answers this purpose well. It gives when printed a bright red colour, and tones very easily. Mr. Clark recommends the following bath for all gelatine-chloride papers, and which I find works capitally:—

### TONING BATH FOR GELATINE-CHLORIDE PAPERS.

A.—Oxalate potash	...	...	...	2 ounces
Water	...	...	...	12 ounces
B.—Chloro-platinite of potash	...	...	...	15 grains
Water	...	...	...	½ ounce

### For Use.

A	...	...	...	...	3 parts
B	...	...	...	...	1 "
Water	...	...	...	...	2 "

*FIXING.*—After washing, fix as usual for ten minutes in 1 to 5. Always add a little ammonia to fixing bath to make it alkaline.

With gelatine-chloride prints it is well to pass them through alum bath after fixing and washing, to harden the film; they can then be squeegeed on ground-glass if a matt-surface is required, or on crown glass if enamelled surface is wanted. Matt-surface prints can be dried between blotting paper.

## Reviews.

*The American Annual of Photography and Photographic Times Almanac.* Wholesale English agent, Jonathan Fallowfield, 146, Charing Cross Road, W.C. Price 2s.

This handsome volume is this year better than ever. It contains more illustrations and more practical articles, and serving as it does as a record of the various methods of working adopted by our transatlantic cousins, it is well worth perusal by everybody. A glance at the author's index, which contains such well-known names as Lincoln Adams, Bothamley, Canfield, Corun, Duchochois, Ehrmann, Romyn Hitchcock, Lambert, Lang, Geo. Mason, Nichol, Pringle, Schumann, Watmough Webster, Clarence Woodman, will at once convince the most sceptical that there are some good writers.

The whole-page illustrations, which are thirty-six in number, include an exquisite Aristotype print, one photogravure, two collotypes, thirty-three process blocks, the latter being printed in that excellence of manner so characteristic of the American magazines. The book will form a handsome addition to any photographer's library, and there is something to be learnt from every page.

\* Extract from paper and demonstration before Birmingham Photographic Society.

## Skies in Photographs,

AND SOME

### PRACTICAL SUGGESTIONS UPON COMBINATION PRINTING.

By JOHN A. HODGES.

#### No. II.

In the previous chapter I dealt with the cloud negatives themselves, and the various modes of obtaining them. I shall now endeavour to make clear to the reader the different methods by which such negatives may be used, in conjunction with ordinary landscape subjects, for the purpose of introducing clouds into the composition, by the process known as double printing.

Now, combination or double printing does not limit one to any particular process, though it will probably be obvious that the printing-out processes will offer fewer difficulties to the novice than will those processes in which the image remains invisible until development. In a printing-out process the progress of the work can be observed, and the light action arrested at the proper time, whereas in the case of a development process one has to rely solely upon one's judgment as to the duration of the exposure. First attempts, therefore, should be made upon ordinary albumenised paper, or upon one of the many gelatino-chloride papers now in the market.

Before actually beginning to print, the landscape negative with which the sky is to be united must be carefully examined with a view to determining whether the portion representing the sky, or rather which should represent the sky, is sufficiently opaque to preserve the sensitised surface of the printing paper from degradation during printing. If it be not sufficiently dense to prevent this occurring, it must be "blocked out," which in cases where feathery foliage breaks the horizon is a difficult and somewhat tedious process. To obviate the necessity for resorting to this method, care should be taken, in developing the negatives, to obtain sufficient density in the first instance.

A tube of moist yellow ochre, or burnt sienna (water colour) should be procured. Some of this should be mixed to the consistency of cream, upon a palette or a saucer. The negative should be placed upside down on a retouching desk, or, in lieu of that, though it is a clumsy substitute and one not likely to facilitate good work, held up against a window. A *fine sable* brush is then dipped into the colour, and the outline of the horizon, and any object breaking it, is then carefully followed. This must be done *carefully*, the excellence of the final result depending largely upon the manner in which this part of the operation has been performed. This having been done, and the original outline having been carefully preserved, the remaining portion of the sky may be quickly filled in with a larger brush. I may add that I lay stress upon the employment of a sable brush for the outlining process, because I find with a camel-hair brush it is almost impossible to accurately follow a delicate outline. Those of my readers who use the brush as well as the camera will at once understand what I mean. When the pigment is thoroughly dry the negative will be ready for printing. An alternative method of stopping out a weak sky is to take a very much over-printed proof from the landscape negative, and carefully cut round the horizon with a sharp pair of scissors. The sky mask so obtained must then be very carefully adjusted to the negative and secured in position with gum.

From the negative so treated a print may now be made, and if when the landscape is sufficiently printed no brush marks or other evidence of clumsy manipulation appear upon the horizon, and the portions representing the sky remain white, the work may be considered so far satisfactory.

But before we can proceed to print in the sky, some method of shielding the already printed portion of the landscape from the further action of light must be devised. There are several ways in which this may be done. I will first describe the simplest, which presents no difficulty at all, its single drawback being that it is only applicable to albumenised paper. Some non-actinic but transparent water-colour pigment is taken (gamboge or crimson lake answers, perhaps, better than any other), and the whole of the printed portion of the landscape painted out, care being observed not to encroach above the horizon or upon the sky, which would produce white markings in the finished print. This will effectually prevent further light action upon the print. All that remains to be done is to select a suitable cloud negative, adjust it to the print, and expose the light until the sky is sufficiently printed.

The actual operation of printing will be much more easily performed if a printing-frame several sizes larger than the negatives to be printed from is employed. A whole-plate frame, for instance, should be used for half-plate negatives. That kind of frame which is provided with a plate-glass bed, but which is seldom seen in the possession of amateurs, is the best for the purpose. The advantage of the large frame lies in the fact that the extra space allows of the easy adjustment of any portion of the sky negative to the view, and the gain in convenience will at once commend itself to the reader.

Although in the foregoing directions I have described the process of blocking out, masking, and printing in, as applied to albumenised paper and other printing-out processes, identically the same system is followed when a development process is employed, but inasmuch as the effect produced is not visible until after development, it necessarily follows that the work will be more difficult. Carbon and bromide will be found most difficult, platinotype being comparatively easy, the image produced by exposure being, though faint, of considerable assistance.

The reader should not be disheartened by early failures, and would do well to remember that success in this kind of work depends solely upon the degree of manipulative skill which he can command. Now a high standard of technical ability cannot be attained in any branch of art without a considerable amount of painstaking application, and therefore he must not expect his first attempts to be the unqualified successes which inexperience might lead him to suppose they would.

It is by no means always necessary to go to the trouble of blocking out and masking as detailed above. With many landscape subjects equally good results may be obtained by far simpler means. Suppose, for instance, the subject be an ordinary open landscape, with a flat horizon, broken, however, by some tall dark poplars standing sentinel like in strong relief against the sky. At first it would seem necessary to carefully follow the instruction already detailed in regard to masking the objects obtruding into the sky, but in practice with such a subject this will be found unnecessary. A print of the landscape is first taken in the ordinary way, a suitable cloud negative is then selected, and the print properly adjusted to it, the landscape portion of the print being roughly masked with a piece of soft cloth, or even a handkerchief, care being taken to mask just up to and not beyond the horizon. No attempt should be made by this method to block or mask the trees which break the skyline, the clouds being printed right over them, for unless the clouds be printed considerably deeper than the trees themselves, no evidence of double printing will reveal itself in the finished print. The handkerchief or cloth should be slightly moved during the actual printing-in of the clouds, in order to lessen the chance of any evidence of uneven printing manifesting itself in the print.

There is another method of introducing clouds, which, in *artistic hands*, may be made to produce very fine results, but which perhaps can hardly be called legitimate photography, and I tremble to think of the indignation which pictures so treated would excite in the breasts of—ahem! our photographic art-critics. To any one who can use a brush—my facetious friends will note that I do not refer to the shaving brush nor to the clothes brush—the method is simplicity itself, consisting merely in painting suitable cloud forms upon the landscape negative itself. It is of course evident that this process is only applicable to negatives with thin skies. Ordinary water colours and sable brushes are all the materials required, but in this case an opaque rather than a transparent pigment should be employed. The painting, for obvious reasons, should be done upon the back and not upon the film itself. If any mistake be made or the effect sought for not obtained, the work can be wiped off with a damp cloth, and the painting commenced *de novo*. The colour is mixed to the consistency of cream upon the palette, a drop or two of glycerine being added to prevent its drying too quickly. A brush charged with colour is roughly dabbed on, and the cloud forms sketched out, the edges and outlines being smoothed and worked down with either the finger or a pad of cotton wool covered with wash leather, in the same way in which the colouring of a lantern-slide is effected. A trial print will determine whether the result be satisfactory or the reverse. The method is not to be commended, as I have already intimated to those who have no knowledge of painting or drawing.

I trust that those of my readers who have not before attempted to introduce clouds into their cloudless landscapes

may after reading the above be induced to make the attempt; the greatly enhanced artistic value of the photographs should be deemed ample compensation for the extra trouble involved.

## Apparatus.

### AMIDOL CARTRIDGES.

MESSRS. FUERST BROS., of 17, Philpot Lane, E.C., have introduced the new developer Amidol in small glass tubes, which can be obtained retail for 5d. apiece, and as the contents of each tube can be dissolved in 7 or 14 oz. of water, and the solution thus made will develop perfectly ten half plates, it is evident that the cost of the developer for each plate is only  $\frac{1}{2}$ d., whilst the developer may be used for more than one plate if desired. This form will be found very convenient for tourists.

### THE "OPTIMUS" MAGNESIUM LAMP.

PRICE 15s.

This the latest form of magnesium lamp introduced by Perken, Son, and Rayment, of 99, Hatton Garden, E.C., is likely to be of great service during the winter months.

The lamp, as illustrated in the diagram, has an air pump and air reservoir connected with a magnesium reservoir, and a burner which is adapted for burning methylated spirit. By one or two turns of a screw, which releases or compresses the air tube, a continuous flame of extreme brilliancy, and of about 1,000 candle power, is obtained, which obviously is considerably more than sufficient to impress the image of any person or dark room on a plate. The lamp will also be useful for enlarging and reducing, but especially for portraiture indoors during the winter months.

### THE BLACKFRIARS COMPANY'S COMBINED LANTERN MASK AND BINDER.

PRICE 1s. PER BOX.

The Blackfriars Photographic and Sensitising Company, of 1, Surrey Row, Blackfriars, S.E., have introduced

a new combined mask and binder for lantern slides, which will be of great value, and render the operation of mounting slides easier than ever. One has merely to put the masks between the slide and cover-glass, wet the edges, and turn down all round, and the operation is complete. Every lanternist should try these.

### ANSCHUTZ TACHYSCOPE.

PRICES, 5s. 6d. AND 35s. EACH.

The same firm have shown us the new and larger form of this instrument, which is usually dismissed by the would-be cognoscenti in the words, "Oh, yes, the old zoetrope." It is not quite the same, however, but the pictures used are obtained by Herr Anschutz, and are therefore individually, scientifically, and collectively artistically true. Each series of pictures, a few of which

are reproduced in page vii., form a perfect example of animal locomotion, and owing to Christmas holidays, when sometimes one's powers as host and hostess are taxed to the uttermost to provide rational amusement for visitors, this Tachyscope will be found a relief and an amusement both for old and young.

### WORMALD'S COMPOSITION METAL CUTTING-BOARDS.

PRICE FROM 3s. TO 6s. EACH.

Wormald and Co., Sutton, Surrey, have sent us a sample of the above novelty, which they are placing upon the market. These boards are made of a special composition that will neither turn the edge of the knife nor allow the paper to slip. Besides the advantages of having a good cutting surface, the board acts as a paper-weight for pressing unmounted photos. It is an extremely useful and practical adjunct to the work-room.

## Catalogues.

THE THORNTON-PICKARD MANUFACTURING COMPANY, Altrincham near Manchester.

This catalogue will be of great service to all amateurs who wish to turn out good instantaneous work. It is full of capital hints, and contains some very good illustrations of work done with their well-known shutters.

The special novelties are a new-pattern snap-shot shutter and a new safety blind, which may be fitted to any of their shutters. A new dark-slide recorder is an extremely ingenious and efficient device, which prevents exposing the same plate twice. A simple exposure table is also given, which will be useful to all tyros. Special stress is laid by the manufacturers upon the focal plane shutter, a principle which we have personally held for some time to be the best on which a shutter should be constructed, and the illustrations which are given of work done by this prove that the old bugbear of distortion of image is, as we have always held, utterly nonsensical. A few hints on practical instantaneous work, which are well worth reading, are included. We hope to notice these novelties in detail shortly.

### HAND CAMERA LENSES.

MESSRS. TAYLOR, TAYLOR, AND HOBSON have issued a supplement to their list, containing a new pattern hand-camera lens with rack focussing gear. If desired, this lens may be obtained with engraved scale of directions on tube. All the lenses are fitted with the iris diaphragm, which is operated by turning the front rim of the lens.

The following are the foci, prices, etc., of this series:—

No.	To Cover.	Approx. Eq. Foc.	Full Aperture.	Prices.
1	4 $\frac{1}{4}$ by 3 $\frac{1}{4}$	5 in.	f/5.6	£4 15 0
2	4 $\frac{1}{4}$ by 3 $\frac{1}{4}$	5 in.	f/8	3 15 0
3	4 $\frac{1}{4}$ by 3 $\frac{1}{4}$	6 in.	f/8	4 15 0
4	6 $\frac{1}{2}$ by 4 $\frac{3}{4}$	7 in.	f/8	4 5 0

Extra, for engraving focus scale on any of the above, 2s. each.

All the lenses fit the standard 1.75" flange screw. This firm, as is well known, make a speciality of standard screws, for perfecting which they received the only medal at Pall Mall this year.

**Photography and the Stars.**—Sir John Lubbock says:—"The number of the stars is enormous. When we look at the sky at night they seem, indeed, almost innumerable; so that, like the sands of the sea, the stars of heaven have ever been used as effective symbols of number. The total number visible to the naked eye is, however, in reality only about 3,000, while that shown by the telescope is about 100,000,000. Photography, however, has revealed to us the existence of others which no telescope can show. We cannot, by looking long at the heavens, see more than at first; in fact, the first glance is the keenest. In photography, on the contrary, no light which falls on the plate, however faint, is lost; it is taken in and stored up. In an hour the effect is 3,600 times as great as in a second. By exposing the photographic plate, therefore, for some hours, and even on successive nights, the effect of the light is as it were accumulated, and stars are rendered visible the light of which is too feeble to be shown by any telescope."

## Exhibitions.

Philadelphia (U.S.A.) Phot. Society	Mar. 15	April 17	April 29	Robt. S. Redfield, chair- man, Exhibition Com. 1,601, Callowhill St. Philadelphia, U.S.A.,

## Societies' Meetings.

**Accrington.**—The monthly meeting was held on the 7th inst., Mr. Cheney in the chair. Mr. Joseph Barnes gave a very interesting address, "How to make Lantern Slides," which was very much appreciated. Several exposures were made successfully and developed with Amidol, the results attained being very satisfactory indeed. Dr. Clayton exhibited apparatus for making lantern slides by reduction; a novel printing frame (made by the Rev. J. R. Rendell) for making lantern slides by contact; also a magnesium flash lamp, by the aid of which a couple of plates were exposed on the audience and successfully developed during the evening.

**Bath.**—An ordinary meeting was held on 30th ult., Mr. Austin J. King, President, in the chair. In consequence of the ensuing holiday season, the 21st of December had been chosen for the next meeting; Messrs. Powell and Perren would then give an illustrated account of their trip to Scotland. The various exhibits of the members' work during the summer were then examined. The remainder of the evening was devoted to displaying the slides. The exhibitors included the President, Mr. Austin J. King, Mr. E. J. Appleby, Mr. P. Braham, Mr. E. Lambert, Captain Molesworth, Dr. Norman, Mr. E. E. Peacock, Mr. G. F. Powell, Mr. H. G. P. Wells, and Canon Williams. Mr. Braham showed two photographs he had taken from a balloon, one ascending, altitude 4,200ft., the other descending, altitude 6,000ft., and he gave a brief account of his aerial journey, pointing out that for map work by balloon photography above 6,000ft. from the earth a peculiar fogging or obscuration was manifest.

**Blackheath.**—On the 29th ult. Mr. A. R. Dresser gave a lecture on "Enlarging," the chair being occupied by Dr. Ernest Clarke. The lecturer said that enlarged prints might be obtained from small negatives either by putting negative in camera and projecting image through camera lens on to a sheet of bromide paper, or by fixing negative in window and taking a positive from it on paper in a large camera, this being the method he used himself and recommended as being productive of the best results. All his own enlargements were made by daylight, as he considered this more satisfactory than any artificial illuminant. He explained that stopping down the lens does not increase the definition for enlarging purposes, though it may sometimes appear to do so. When a stop is used the exposure is diminished, and therefore the print, when developed, may have greater contrasts than one given the same exposure with full aperture, thus giving an effect which sometimes is mistaken for sharper definition. With regard to exposure, to enlarge from a  $\frac{1}{4}$ -plate negative of fair density up to 12 and 10 on an ordinary fine day, with stop  $f/16$ , he would give from three to four minutes' exposure, or, with a thin negative, about two minutes. He considered iron to be the best developer for bromide paper; although, as he generally toned his prints with uranium, he had given up using it, on account of the difficulty of completely eliminating the iron from the print. The slightest trace of iron will cause blue stains in the toning. The developers he recommended were eikonogen and amidol, and he gave the following formulae:—Eikonogen Developer:—Eikonogen, 1 oz.; soda sulphite, 4 oz.; potass. carb., 1 oz.; soda carb.,  $1\frac{1}{2}$  oz.; water, 30 oz.; no bromide being necessary. It is advisable to dilute this developer with half water, until you become accustomed to its action. Amidol Developer:—(A) Amidol, 1 oz.; potassium metabisulphite, 1 oz.; water, 10 oz. (B) A saturated solution of either washing soda or potass. carbonate. (C) 10 per cent. solution of potassium bromide. For use take A, 1 dram; B, 1 dram; C, 5 drops; and 1 oz. water. Prints should not be cleared until after fixing, to avoid carrying any acid into the hypo. bath. When very rough paper is used it should be well soaked in water before developing, but this paper should only be used for suitable subjects. If print appears to come up too rapidly, from over-exposure, pour off the developer, and turn print upside down in a dish of water, and leave it to develop by itself; it will rapidly gain density without fogging. In the case of a negative in which any portions are either weak or over-dense, it is better to try to counteract these deficiencies by dodging during the exposure than by trusting to local development or reduction. On December 8th a lecture on "The Optical Lantern, and how to Use it," was given by the Rev. W. H. K. Soames, Mr. W. Farrington being in the chair. The lecturer brought with him a very fine binocular lantern, the construction and use of which he fully described. In speaking of the source of light he explained the advantages of the mixed jet over the blow-through jet. The jet being nearer the lime and giving a smaller point of light, better definition is obtained; there is no flame, and very little heat, from it, and it uses considerably less hydrogen. With the blow-through jet coal-gas can be used, but hydrogen gives a better light when it can be obtained. When using these gases the bottle valves must be turned on full and the governors allowed to take the pressure, the supply being regulated by the valves to the jets care must be taken to see that these valves are

## Societies' Notes.

THE Hull Photographic Society are desirous of interchanging a loan collection of slides with any other society. Mr. E. E. Cohen, 127, Beverley Road, Hull, will answer all letters.

## "OPTIMUS" COMPETITION.

IN consequence of the number of prints which have been received since the extension of the latest date for receiving prints for the "Optimus" £105 competition, we have determined to extend the time to the 31st inst. We need hardly remind our readers that the prizes are well worth having, and the following are the classes:—

1. Landscape, with and without figure. Sub-class A, 7 by 5 and under; sub-class B,  $8\frac{1}{2}$  by  $6\frac{1}{2}$  and over.
2. Seascape. Sub-class A, 7 by 5 and under; sub-class B, 8 by 6 and over.
3. Portraiture and figure study. Sub-class A, 7 by 5 and under; sub-class B, 8 by 6 and over.
4. Instantaneous work, including also hand-camera work, limited to 5 by 4 and under.

## PRIZES.

Apparatus to the value of £15 in each of the following, viz.—Class 1: Sub-class A, sub-class B. Class 2: Sub-class A, sub-class B. Class 3: Sub-class A, sub-class B. Class 4: First prize.

**Photographing Snowflakes.**—The beauty of snowflakes when they are examined with a magnifying lens is well known. In every text-book of physics one may see drawings of those pretty six-cornered stars spreading their fine feathery branches. But even the best drawings give no idea of the real beauty of the snowflakes when they are examined under a still higher magnifying power. A Russian photographer has now found the means of photographing those images received through the microscope, and thus to fix them so that every one may admire them at his leisure. A thick woollen cloth was spread to receive the snowflakes, then they were rapidly examined, and the prettiest of them were chosen and placed on fine silk muslin under the microscope. A strong electric lamp being used to throw light upon them, their magnified images could be photographed and the most beautiful symmetrical figures, made in the finest imaginable lines, like most perfect artistic engravings, were received in this way.—*Ez.*

**The Benevolent.**—A committee meeting was held on 5th inst., W. Bedford, Esq., in the chair. There were two applications for assistance, both in money and in finding situations. Both cases had been investigated by the Secretary and by a member of the committee, and the applicants attended and were interviewed by the full committee. In both cases the desired loans were granted. The Secretary reported on the disbursements of the monies granted at the last meeting, and was able to report favourably on the progress of one or two men who have during the past few months been rescued from desperate straits by the Association. The Secretary was instructed to write to all subscribers of the Association who did not subscribe for the present year, asking them to continue their support, as the pressure of the season is being keenly felt by many photographers. The Secretary also reported that certain overcoats and boots which had come to hand had been highly appreciated by men who were in great difficulties, and asked the members present to supply certain other articles of clothing which amongst them they were able to promise.

closed before turning on the gas at the bottles. He pointed out that when a short-focus objective is changed for one of long focus, the condenser must also be changed to get a good result; to explain this he showed the different effects and sizes of discs produced with different lenses. In lighting the lantern the hydrogen must be turned on and lighted first, and then the oxygen turned on slowly, and both gases regulated until a perfect light is obtained. The lime should be turned every two or three minutes, or else with the mixed jet the flame will double back from the small pit formed in the lime and crack the condenser; it will not do this with the blow-through jet, but the flame from the hydrogen may fork out and set fire to the lantern. With short-focus lenses the light must be nearer the condenser than for long-focus lenses, but with either lens, if it is too near, a dark mark will appear on the disc; the light should be moved laterally or vertically until this mark is exactly central, and then drawn back from the condenser until the mark entirely disappears. After the lecture a number of slides were shown, the disc being thrown upon a blue distempored wall, with excellent effect.

**Bolton.**—The annual meeting was held on 28th ult. In addition to the transaction of the ordinary business, the council had wisely adopted a diversified programme. There was a paper by Mr. Collier on a summer visit to Brussels, profusely illustrated by lantern-slides. The walls of the rooms were hung with photographic specimens of every kind; the tables were crowded with choice views and stereoscopic slides; and there was also apparatus. In the unavoidable absence of the President, Mr. W. Banks was voted to the chair. Mr. C. K. Dalton, the Secretary, read the annual report of the council. This set forth that the members numbered eighty-one, and they had one of the most successful years in the history of the Society. The finances were in a sound condition. The council regretted that the proposed "survey" of the town had not been actively followed up in 1893. The report was unanimously adopted. The paper by Mr. Collier, which followed, was listened to with much interest. The meeting concluded by a lantern exhibition of the members' transparencies. It may be stated that it is contemplated to hold a public exhibition of the members' work in March next.

**Bristol.**—On 9th inst. Mr. E. Brightman gave a paper on the speed of modern dry plates and means of finding correct exposure for same. Taking one of the earliest plates on the market, Wratten and Wainwright's ordinary, as roughly about five times the speed of a wet plate, Cadett's "Lightning" plate (120 on Watkins' scale) is twenty-five times as rapid as the usual wet plate. Warnerke was the first to bring out a standard for comparison of speed, but for several reasons his was not accurate. Given the speed of a plate, and an actinometer to test the light, the question of exposure becomes a simple matter of calculation. Only two exposure meters, Watkins's, and Hurter and Driffield's, being founded on scientific principles, had survived, and are coming more and more into general use. Having used Watkins's exposure meter ever since its first introduction, Mr. Brightman finds it a most useful and reliable instrument for every photographer. Watkins's meter measures the actinic value of the light, while Hurter and Driffield gives data for calculating what the value should be. The latter claim that actinic meters are unreliable, as the light may vary in intensity during the time of using the instrument and taking the picture, but this also affects their own table of comparative brightness of light given by their meter. As a matter of fact, this quick variation rarely occurs, and when it does, the photographer would notice it and make a fresh trial. In interior work Watkins's meter makes correct exposure an absolute certainty, and if the light varies, the meter (being exposed at the same time) also records the fact. If Hurter and Driffield were to add an actinometer to their instrument it would meet every requirement of the photographer. These new rapid plates give good, dense negatives without any difficulty.

**Cardiff.**—At a meeting held on the 10th inst. Mr. S. W. Allen experimented with a single dissolving lantern designed by himself. The slide is inserted in a revolving carrier right side up, and a single movement of a small lever places a piece of ground glass in front of the exhibited slide, changes the slide, places another in position, and finally removes the ground glass. The lantern is a very small one, and was worked on an ordinary camera stand, by which great rigidity was secured. Mr. Evans adjusted Scott's Saturator to the lantern, and the result was undoubtedly far superior to the ordinary oxy-hydro light. The peculiar adventures of "Bill Adams at Waterloo," as related and designed by Mr. Allen, brought an enjoyable evening to a close.

**Cornish (Camera).**—An exhibition of members' work was held from Dec. 5th to 10th, at which a large number of people attended. In addition to the work of members, the club is indebted to the following for loan of photographs:—Bernard Alfieri, A. Horsley Hinton, Mr. and Mrs. S. F. Clarke, The Autotype Co., and the Eastman Co.

**Douglas, I.O.M.**—Meeting of the above Society on 29th ult, the President, Mr. W. Thomson, in the chair, Mr. W. Harrison gave a demonstration on development with pyro and Amidol, the last

proving very successful in bringing out detail, and the members present unanimously decided to give it a trial.

**Edinburgh University.**—A meeting was held on 8th inst., Dr. Drinkwater, President, in the chair. Mr. Hadow read a paper on "Telephotography," and exhibited Dallmeyer's new lens. Several lantern slides were shown on the screen to illustrate the uses of the lens, and an interesting discussion followed. The remainder of the evening was devoted to a social meeting and smoking concert.

**Glasgow (High School).**—The society met on 9th inst., Mr. McCall, President, in the chair. After some business, Mr. Turnbull read his essay on "The Chemistry of Light and Photography." The essayist treated his subject in a very thorough manner, and gave his hearers a very lucid account of the action of light on silver salts.

**Hackney.**—Meeting on 5th inst., Mr. R. Beckett in the chair. The Hon. Secretary presented the Society with a dark-room lamp. Mr. Groese was nominated for membership. This being an evening set apart for slides for the competition, "Hand Camera and Lantern Review," being shown, the usual business of the evening was suspended. Slides were sent in by Messrs. R. and S. J. Beckett, Grant, Carpenter, Barton, Hankins, Taverner, Sodeau, Pollard, Dean, W. Fenton Jones, Hudson, Gosling, and J. Tunston, but the first nine were the selected competitors. The selection was made without the names being made known. The Hon. Secretary announced that next meeting would be set apart for demonstration, by Mr. Walter E. Woodbury, on lantern slides, etc., by printing out.

**Hove.**—At the meeting held on the 8th inst. Mr. A. H. Webling and the Secretary (Mr. J. William-) gave a demonstration on lantern slide making. A slide was made by contact and developed with hydrokinone, Mr. Webling showing a home-made box with slide for containing the printing-frame and for making the exposure. The Secretary showed a home-made apparatus for reduction in the camera by daylight. Reduction by artificial light was not found to give good results without a condenser. A lantern-slide was made by reduction in a Cantilever enlarging apparatus and developed with amidol. Two minutes' exposure was given, using Taylor, Taylor and Hobson's D lens, 5 inch focus,  $f/11$ , from half-plate negative. The lantern plate (Ilford Special) was developed with amidol solution, as recommended by makers, 1 part, water 3 parts, with 2 gr. potass. bromide to the ounce. The result was a very good slide, which developed up rapidly of a good black tone, and without the slightest trace of veiling. The two slides were afterwards shown in the lantern. The members chosen to represent the Club in a forthcoming competition attended with their slides, which were passed through the lantern and the sets to be sent in selected.

**Liverpool.**—The twenty-ninth annual general meeting was held on 8th inst. From the report of the retiring Hon. Secretary, Mr. F. B. Illingworth, it appeared that the Association had, during the past year, taken the handsome and commodious premises which were now occupied. The new rooms were opened in June last, and although the subscription had been raised in order to provide improved accommodation, the membership had increased and there were on the rolls at the end of the year 309 members. Mr. A. J. Cleaver was elected President in the room of Mr. W. Tomkinson, who retired with a cordial vote of thanks for his successful chairmanship during the reorganisation. Mr. J. H. Welch was appointed Hon. Secretary, and Mr. P. H. Phillips re-elected Hon. Treasurer. The Council were also appointed. Subsequently the President announced the list of the Association awards in the annual competitive exhibition of prints and slides. These were as follows:—Prints, half plate and under: silver medal, Mr. G. A. Carruthers; bronze medal, Mr. F. K. Glazebrook; commended, Mr. T. B. Sutton. Over half plate: silver medal, Mr. T. F. Lloyd; bronze medal, Mr. C. A. Timmins; commended, Mr. H. Holt. Two enlargements: silver medal, Mr. T. B. Sutton; bronze medal, Mr. C. A. Timmins. Stereo slides: bronze medal, Mr. W. S. Ellsworth. Hand camera work: bronze medal, Mr. J. W. Swinden. Exhibits by those who had never won a Society's medal—bronze medal, Mr. G. A. Carruthers; commended, Mr. A. C. Batty. President's prize. Lady members, three prints, Miss Rose Collier; commended, Mrs. Marriott. Lantern slides: silver medal, Mr. H. Holt; bronze medal, Mr. J. H. Welch. The competition slides (twenty-three sets) were passed through the lantern. The collection of prints and slides will be on view at the Association's rooms for a week.

**North Middlesex.**—On 12th inst., the President (Mr. J. W. Marchant) in the chair, the meeting was chiefly engaged in the nomination of officers for election at the annual general meeting, and other formal business. A discussion took place upon the exhibition, and unanimous approval was expressed at the judges' action in enhancing the value of the certificates by reducing the number of awards to five, as the exhibits to which they were awarded were markedly in advance of the others. It was announced that the first of a series of class meetings for the instruction of beginners in technical matters would be held in the first week in the New Year. The subject had been under consideration by the

council for some time, and it had been arranged that the lessons should be confined to simple technical matters, and that the work should be done by the pupils under the instruction of one of the older members. A limited number of non-members of the Society who are beginners in photography will be welcome at these classes. Application should be made to the Secretary. Mr. J. Stewart exhibited a beautifully made hand-camera, simple in construction and action, which he had recently purchased in America, and Mr. Golding passed round for inspection a number of very fine prints.

**North Surrey.**—At their last meeting on the 6th inst., the members were particularly favoured by having the opportunity of hearing a very instructive paper by Colonel J. Gale on the production of pictures intended to be shown by means of the optical lantern, and of afterwards seeing the paper illustrated by some of the choicest specimens of this artist's choice work. On the conclusion of the exhibition of slides by Col. Gale, Mr. Harold Senior appropriately showed and explained the uses of a very neat and compact apparatus, which he had designed for the production of lantern-slides from any sized negatives by artificial light without the aid of a condenser.

**Photo. Soc. of Ireland.**—The ordinary meeting was held on 9th inst., Geo. Mansfield, Esq., President, in the chair. A very interesting collection of slides lent by the AMATEUR PHOTOGRAPHER was passed through the lantern and much admired. The Society's prize slides were also shown. Mr. Ruthven announced that an exhibition of members' work would be opened on the 16th January, 1893.

**Rochester (Naturalists' Club, Photo. Section).**—The General meeting was held on the 6th inst., Mr. C. Bird in the chair. The following were elected officers for the season 1892-3:—Chairman, C. Bird, B.A., F.G.S.; Vice-chairman, J. Whitfield; Committee, J. C. Boon, J. Hepworth, J. S. Hewitt, P. J. Neate, T. F. Tannabill, M.B., C.M., D.P.H., and R. Watts; Hon. Secretary, J. L. Allen, Clover House, Chatham. It was arranged to have the meetings during the winter, fortnightly, on Tuesday evenings at 8.15 p.m. The first meeting was fixed for December 20th, when Mr. J. C. Boon promised to read a paper on "Wet Plate Process," and to illustrate the same.

**Rotherham**—Monthly meeting on the 6th inst., Dr. Baldwin, President, in the chair. The results of the society's (members') competition were announced as under:—Class A, Six untouched negatives (President's prizes), 1, H. C. Hemmingway; 2, G. T. M. Rackstraw. Class B, Three untouched negatives and three prints therefrom taken during the society's excursions, 1, H. C. Hemmingway. Class C (for those who have not taken a society's prize), Four untouched negatives, 1, John Clarke. Four prints, Mr. W. Shephard. This class did not fill, but the Council decided that the awards should be given to Class D, Six contact prints, 1, H. C. Hemmingway; Mr. W. Mason was not far behind. Class E, Six lantern slides, 1, E. Isle Hubbard. Mr. Richard Keene, of Derby, was the judge, and he sent some useful and kindly words of criticism. Platinum prints were also shown by the Secretary, and Solio prints by Mr. Hubbard. At the Council meeting held on the following evening the annual exhibition was fixed for February 7th and 8th.

**South London.**—On 5th inst. ordinary meeting, the President, Mr. F. W. Edwards, in the chair. Owing to Mr. Maurice Howell's illness, his paper on "The Chemical Action of Intensification, with Experiments," was postponed, and in its place a demonstration of enlarging in Cresco-fylma was given by Messrs. Hill, the method of using which has already appeared in our columns. At the conclusion of the demonstration, in answer to questions, Messrs. Hill stated that the process could not be successfully worked with a negative which had been previously varnished. Pyro-developed negatives were not so suitable as those developed with hydrokinone, rodinal, or amidol, the clearing solutions containing alum used with pyro having a retarding action on their solution. They claimed that the process did not produce distortion, and in support of the contention an enlargement of the interior of a church was produced in which the lines were absolutely straight. Enlargement revealed detail which was not visible in the original negative, and a suggestion was made that this property might be made use of in revealing the structure of objects photographed by the means of photo-micrography.

**Tunbridge Wells.**—The ordinary meeting was held on the 8th inst., Mr. B. Whitrow in the chair, when the Rev. R. W. Atkinson, Messrs. Percy Dau, J. A. Mallett, Chabot, and J. Mann were duly elected members. A discussion took place with reference to the exhibition just held, and the Hon. Secretary's letter to THE AMATEUR PHOTOGRAPHER was highly approved, as at the present time the highest number of members is recorded.

**Walsall.**—The first of the elementary lectures was given on 6th inst., Mr. J. S. Wilson in the chair. The lecture, by the Rev. Peter Dean, was on "The Camera and Exposure." A most interesting

discussion amongst the members followed, and many useful and excellent hints were given to beginners by the Rev. W. T. Corfield, Mr. W. Meikle, Mr. J. H. Day, and others.

**Wolverhampton.**—At the monthly meeting held on 6th inst. the AMATEUR PHOTOGRAPHER Prize Lantern Slides were exhibited. The pictures were fully commented upon, and some of the sets were greatly admired. Mr. J. W. Evans having resigned his position as Hon. Secretary, the thanks of the society were voted him for his work for the last five years. Mr. James Gale undertakes the duties of Hon. Secretary for the remainder of the current year.

**Woolwich.**—On December 8th, the Rev. S. E. Chettoe, M.A., in the chair, Mr. John Howson gave an interesting lecture and demonstration on the working of printing-out paper, Major C. D. Davies and Mr. W. H. Dawson taking part in the subsequent discussion. At the next meeting, on December 22nd, at St. John's School, Mr. Arthur C. Baldwin will demonstrate the working of Eastman products.

**York.**—On 7th inst. a good attendance of members witnessed a successful demonstration of Enlarging by Mr. J. Dickinson, who, by means of a Hume's Cantilever lantern, produced a very fine 10 by 12 picture. An admirable paper on "Art in Photography" was afterwards read by Mr. A. J. T. Ogden, one of the masters at the York Corporation School of Science and Art. Three new members were elected and two proposed.

## To Correspondents.

All communications for these columns are to be addressed to **The Editor, "Amateur Photographer," 1, Creed Lane, Ludgate Hill, London, E.C.**

### RULES.

1. Write clearly and distinctly on one side of the paper only.

2. Write each Query or Answer on a separate sheet of paper.

3. Write the name and address legibly on the back of each communication, and sign all Queries and Answers with name or *nom de plume*.

4. All matters for these columns **MUST** be received by **TUESDAY MORNING'S POST**.

5. The Editor does not undertake to answer questions by post.

6. In answering Queries, correspondents are requested to mention, in every instance the number and full title of the query referred to.

## QUERIES.

5898. **Hydroquinone Developer.**—Can any reader of this paper tell me how to avoid getting the skies in a negative developed by hydroquinone, so terribly dense, and consequently losing all cloud effects? Does Beach's potash developer do better in that respect?—**W. F. W.**

5899. **Chemicals.**—Would any kind reader give a list of the most deliquescent chemicals used in photography, and greatly oblige?—**NOTAGIRROCA.**

5900. **Hand Detective Camera.**—I want to make a hand-camera with bag, changing box, or dark slides for twelve quarter-plates; also where to procure the fittings, and what lens and shutter? Full particulars will oblige.—**S. D. P.**

5901. **Painting Bromides.**—How can I induce bromide prints to take water-colour paint? What developer is the best foundation for painting over bromide prints?—**POP OFF.**

Correspondents not seeing their queries inserted are requested to look for the same under "Editorial."

## QUERIES UNANSWERED.

Oct. 28th.—No. 5849.

Nov. 4th.—Nos. 5852, 5854.

" 18th.—No. 5866.

" 25th.—Nos. 5875, 5878, 5880, 5881, 5884.

Dec. 2nd.—Nos. 5886, 5890.

" 9th.—Nos. 5893, 5894, 5895, 5896, 5897.

## EDITORIAL.

**SPECIAL NOTICE.**—We are very pleased to find that replies in this column are so much appreciated, but we should be very grateful if those requiring advice would send their letters to us BEFORE TUESDAY MORNING'S post if possible. The time occupied in replying in this column is very considerable, and owing to the often late receipt of letters, many matters have to be left over each week. This we much regret.—**ED. AM. PHOT.**

**J. N. WILLIAMS.**—(1) If you wish to photograph a landscape or scene by moonlight, it is quite possible to do so, and it is advisable to use the most rapid plates you can get, choose a night near full moon, when there is but little cloud about; the exposure would be about two or three hours. We are afraid it would be useless to try and take anything on an obscured night. The moon should not be included on the plate, as the motion of earth and moon will cause its image to appear as an elongated streak. You could of course print the moon in afterwards on the prints, making a special exposure for the same on a separate plate of about half second. (2) Sunsets are taken as a rule on iso p. plates. Beautiful cloud forms, and not colours, must of course determine what to take. As at sunset the light, especially on the clouds, is generally yellowish, it is unnecessary to use a screen, and should it be desired to include any portion of a landscape the screen would do harm, as the shadows are then illuminated by reflected blue light from the sky, and to use a screen means cutting that down. The most successful sunset scenes are taken on two plates, one for the sky with about 1-8th sec. exposure, and the other with longer for the landscape, and both are exposed without shifting the camera in any way. It will be then easy to print in the sky. By giving a briefer exposure you can actually

photograph the sun itself. (3) Yes, it is by no means difficult to reduce locally with ferridcyanide and hypo. We had a very valuable paper by Mr. Hodges in the April number of the *Quarterly*, which would help you very much. Working with spirit and chamois leather is by no means so difficult as you imagine. We shall be pleased to see your negatives, and are never too busy to help our readers. Thanks for pointing out slips; they will slip in sometimes, and we are always glad to have suggestions.

**E. P.**—We hope to have a paper this month on carbon printing. It is possible to tone any chloride paper with platinum, but the tones are not always pleasing. We have a series of experiments in hand which we hope to publish shortly. Try the one on p. 295.

**J. C. WOLFENDEN.**—We have not yet been able to obtain any information about the lenses.

**E. H. FORMAN.**—Always pleased to help you, and will, if you like, criticise others.

**T. G. PARROT.**—Slingsby's "Photography by Flashlight," published by Marion, is the only one we know of in English.

**C. F. ARCHER.**—(1) Certainly, if one process gives you a better result send it in. (2) No, do not use an acid bath, an acid will decompose the developing agent.

**J. S.**—Thanks for MS3.

**M. McISAAC.**—Many thanks for suggestion, which we will adopt.

**W. J. HINCKLEY.**—You cannot get over the smell, except by extra attention to cleanliness of the outside of oil reservoir.

**J. W. WESTERN.**—Try Adams, or Fallowfield, Charing Cross Road, and if you cannot get it there, call on us and we will give you some.

**PERCY HUME.**—Letter by post.

**E. P. BETTS.**—Some of the pages you do not care to keep are considered by other readers as the most valuable in the paper. We could not do as you suggest.

**O. K. O.**—No, it is not necessary to size the paper first with gelatine; on the other hand, if you do, it stands to reason the sensitising solution must remain on the surface more. The process is not more difficult than matt-surface paper.

**NOVICK, LEICESTER.**—(1) Why not try a pyro developer with sulphite, and keep a cup of acid and water by your side to dip your fingers in? Failing this we should certainly advise you to use Rodinal or Amidol. (2) We will try and let you have some negatives as you ask.

**W. PEARSON.**—We should say the value is about £3 or £4, but it is difficult to say without examination.

**HIRCUS.**—(1) Negative wants intensifying, print flat and poor. (2) Slightly over-printed, and much over-toned. (3) Over-printed and over-toned. (4) Bromide too grey; we should say it was over-exposed; give less exposure, and add bromide to the developer. (5) Insufficiently developed. (6) Over-exposed. (7) Ditto. When using Rodinal reduce exposure and dilute developer, and add more bromide. Do you want slides and prints back?

**A. P.**—No, not without permission of the publishers, which, as a rule, is easy to obtain.

**J. THOMAS.**—(1) The best time to photograph the east window and chancel of a church is in the afternoon when the light is in the west. By this means there is less chance of halation. (2) Develop with a very weak developer, that is the ordinary developer diluted with at least twice the quantity of water; allow plenty of time, if necessary an hour. (3) The exposure would be about one second, we should think.

**MONA.**—Either your lens does not cover well, or else the shutter cuts off some light from the corner of the plate. Fleetwood printed too deep, Blackpool ditto; the latter is the better of the two.

**J. B.**—It is quite possible to strip your films. Lay the cracked negative on a sheet of glass the same size, then pour on as much enamel collodion as you can get on without running off the edges. Allow the collodion to set, then place the negative on the glass in a dish (ebonite or xylonite), containing fluoric acid 1 drachm, water 10 oz., till the film begins to frill and blister, then by the aid of a soft camel's hair brush coax the film off. When quite free remove to a dish of clean water, which change two or three times in half an hour. Clean a sheet of glass slightly larger than the original, very carefully slip into the dish under the film, straighten the latter out by the aid of the brush, raise gently from the water, lay perfectly level, and smooth out by blowing and gentle brushing. We did not recommend mercury and hypo, we may have recommended mercury and sulphite. You could use Monckhoven's, but you would not have to bleach right through; see answer in last week's Editorial to M. P., for reasons of using different methods of intensification.

**J. WHITFORD.**—Glad you like the lens. We think in capable hands it will turn out good artistic work.

**AMATEUR.**—You can only copy postage-stamp to carte-de-visite or carte-de-visite to cabinet by copying same size and then enlarging.

**W. R. P.**—(1) There is no disadvantage in copying prints as you suggest, unless the illumination is unequal. It is advisable to give long exposures so as to obtain all details, and then intensify the negative if

required. (2) The metabisulphite is used to prevent any pyro staining of the film which might otherwise occur.

**KADOK.**—Your query is inadmissible.

**A. MACHEL.**—Do not soak your plate in water, and mix your developer as follows:—

Bromide .. .. .	40 drops.
Ammonia '880 .. .. .	4 .. .. .
Pyro .. .. .	1 teaspoonful.
Water .. .. .	2 oz.

Probably you are over-exposing also. Try giving the correct exposure, and then write us again.

## Sale and Exchange.

### RULES.

**CHARGE.**—Twelve words or less for Fourpence. Every additional three words, one penny. The name and address of the sender must be paid for. (A single figure, or group of figures undivided by letter, space, stop, or words, counts as one word; compound words count as two words.)

**DEPOSITS.**—The money for goods forwarded on approval may be deposited with the Publishers of the **AMATEUR PHOTOGRAPHER**, who will hold the amounts deposited until they are satisfied that the transaction has been completed to the satisfaction of buyer and seller.

**ADVERTISEMENTS** can be inserted under a number, the name and address being registered, and letters forwarded for a fee of 8d. to cover postage.

**PAYMENTS** should be made in Postal Orders or Postage Stamps.

**ADDRESS.**—All advertisements (which can be received up to Tuesday mid-day) and other communications having reference to the "Sale and Exchange" column, must be addressed "Sale and Exchange, **AMATEUR PHOTOGRAPHER**, 1, Creed Lane, London, E.C."

**COMMISSION.**—A charge of 2½ per cent. will be deducted from all deposits whether a sale is effected or not. Minimum charge 1s.

**PAYMENT.**—All payments are to be by cheques or Postal Orders, made payable to **Hazell, Watson, and Viney, Ltd.**, 1, Creed Lane, London, E.C.

**CARRIAGE** must be paid on all apparatus sent for report, and they will be returned carriage forward.

**REPORTING.**—Apparatus may be sent to the **EDITOR, AMATEUR PHOTOGRAPHER**, 1, Creed Lane, London, E.C., who will report upon the apparatus to the buyer for a minimum fee of 2s. 6d., or a commission of 2½ per cent., upon the sale price of the apparatus.

**Cameras, etc.**—For sale, a splendid 7½ by 5 camera, made this season for present owner, Honduras mahogany, all latest improvements, double extension square bellows, two double dark slides, etc., cost £10s., price £3 15s.; deposit.—No. 356, office of this paper, 1, Creed Lane, E.C.

Quarter-plate Instanto camera (with accessories) by Sharland, new last July, will take 35s. cash; carriage paid on approval; deposit.—Edward Whiteman, 22, Delvino Road, Poole Park, S.W.

Splendid 7 by 5 rapid rectilinear lens, good definition, f/8, only 1/8s. 6d.; camera and few other things, list for stamp.—Cheltenham House, Stroud.

**Dark Slides.**—Dark slides, five half-plate Instantograph, with quarter carriers, 7s. 6d. each, 6s. 6d. without carriers; and four quarter Instantograph slides, 4s. 6d. each, quite perfect; approval.—Thomas, 2, Pelham Road, High Road, Ilford, E.

**Dishes.**—Porcelain dishes. Two porcelain dishes, 12 by 10, new. What offers?—Charles Firth, Glenhurst, Heckmondwike, Yorks.

**Hand-Cameras, etc.**—No. 3 Kodak Junior for sale, new. Offers.—E. Phillips, Bridge Street, Leatherhead.

A Major Bruno's hand-camera, finder, no lens, shutter, or slide, 35s.; approval; deposit.—Robinson, Bridgewater Street, Oldham.

**Lantern Slides.**—One dozen beautiful lantern slides from negatives that have taken five prize medals, 12s. 6d. post free; sample slide, 1s. 6d.—E. Pearce, 76, Church Street, Stoke Newington, N.

**Lantern Apparatus.**—Pair (Newson's) quadruplex lamps, equal new, 80s., or sell singly.—Iliff, 11, Martineau Street, Birmingham.

**Lenses, etc.**—Lancaster's half-plate Instantograph lens and shutter, nearly new. What offers?—Albert Harris, Sandy Lane, Chorlton cum Hardy, Manchester.

Whole-plate rapid rectilinear lens, iris diaphragms, flange and cap complete, almost new, 80s.—Apply, H. M., 111, Shakespeare Road, Herne Hill, S. E.

Best French R.R. whole-plate portrait lens, price 40s., or will exchange for half-plate wide-angle R.R., suitable for instantaneous work.—Tonge, Limesfield, Ilford.

**Mounts.**—Quantity Christmas card mounts, all sizes, no reasonable offer refused.—Jarvis, 2, Barclay Street, Rochdale.

**Sets.**—Lancaster's £9 9s. enlarging or reducing apparatus with special 3 wick lamp, 8 in. condensers, objective, two half-plate slides, carrier, complete for £6 10s. cash; Lancaster's quarter-plate Instantograph, as new, lens, iris diaphragm, tripod, slide complete, 32s. 6d.; Lancaster's Multum-in-Parvo enlarger for sizes up to 15 by 12, with five carriers, cost £2, take 27s. 6d.—Dunstan, Bull Street, Harborne, Birmingham.

Thornton-Pickard half-plate Tourist camera fitted with revolving turntable and tripod, also revolving front panel, on which are mounted 9 in. focus Beck R.R. lens, with iris diaphragm, and Dale's 6 in. focus wide-angle R.R. lens, three double backs, also Shew's whole-plate adapter, with two double backs, extra front panel, and Dale's 12 in. focus R.R. lens, solid leather case, etc., all in first-class order, cost over £30. Apply first by letter to B. J. Grover, East Lynn, Woodbury Down, N.

Lancaster's quarter-plate Instantograph camera, lens, shutter, tripod, focussing cloth, two double backs, and sling case, £2; also Griffiths' guinea hand-camera, 10s.—A. Johnston, 54, Underhill Road, Forest Hill, London, S.E.

**Sundries.**—Collection 100 rare foreign butterflies, in case, 85s.; case 100 foreign beetles, 15s.; exchange in photography.—Gittins, 7, Boulter Street, Oxford.

Beautiful mellow tone violin, in perfect preservation and full size, suit lady or gentleman for solo or orchestral playing, handsome model, with case, bow, resin, mute, tuning fork, and music, take 17s. 6d. lot; special opportunity for obtaining a bargain; bound to please; make very acceptable present; approval.—Miss Francis, 35, Christchurch Street, Ipswich.

Fine toned roeewood zither, perfectly new, will sell for 15s., or exchange for anything its value in photography.—Ernest Smith, Cottages, Norfolk Park, Sheffield.

## WANTED.

**Burnisher.**—Burnisher, small size, must be cheap.—Sewell Brady, Portsmouth Road, Long Ditton, Surrey.

**Cameras, etc.**—Wanted, good half square camera, cheap for cash, no lens or stand.—C. H., 21, Frances Street, Reading.

Wanted, whole extra special camera (or similar) and one or three slides, in exchange for half new Instanto, with three or six slides, and cash difference, or case, lens, enlarging camera, etc., etc.—Samuel Bartlett, Stratford-on-Avon.

**Cameras, Lenses, etc.**—Wanted, half-plate camera, second-hand, of good make, R. Rectigraph lens, iris diaphragms preferred, light, compact, must be cheap; deposit; approval.—C. Turner, 79, North Road, Bishopston, Bristol.

**Enlarging Apparatus.**—Wanted, Lancaster's Multum-in-Parvo to enlarge to 10 by 8, cheap for cash.—Leonard, London House, Carshalton.

**Lantern Apparatus.**—Wanted, good lantern screen, 8 or 9 ft., complete, for cash; also good slides of the Rhine, no rubbish.—G. Butterworth, Bank Street, Darwen.

**Lenses, etc.**—Wanted, half-plate R.R., good maker; also quarter ditto, for cash.—Hy. Jones, Buckingham House, Cleveland Street, W.

Cabinet portrait lens by good maker, cheap for cash.—N., 1, Dunkeld Villas, Mutfey, Plymouth.

**Negatives.**—Wanted, one first-class half or whole plate negative of statuery for reproduction.—2, Holmes Street, Derby.

**Sets.**—Wanted, Watson whole Acme camera, four double dark slides, turntable, stand, case, Ross universal symmetrical lens to fit same, with iris diaphragm.—Pollard, Eastview, Western Road, Cheltenham.

Wanted, half-plate aluminium set, cash. Letter to Mr. White, Adelaide, Blackpool.

Wanted, 10 by 8 or 12 by 10 portable camera, lens, slide, and tripod; approval; deposit. Particulars and price to Dorman, Ordsal Electrical Works, Manchester.

It is unnecessary to send an advertisement for the "Sale and Exchange" column for more than one insertion, as the goods are usually disposed of when the first advertisement has appeared.

**Bargains in Hand Cameras.**—Key hand-camera, by Platinotype Company, rapid rectilinear lens, shutter and six slides, size quarter-plate, finest order, £4 12s. 6d.; O Daylight Kodak, rapid rectilinear lens, rotating stops, shutter, finder, etc., covered morocco, carries 24 films, quite new, £3 15s.; Crouch hand-camera, covered morocco leather, carries twenty-four quarter-plates, fitted Crouch lens, iris stops, shutter, etc., £3 7s. 6d.; Lancaster's Omnigraph, carries six quarter-plates, thorough order, with shutter, 16s.; No. 4 Kodak, as new, size 5 by 4, carries 100 films, fine rapid rectilinear lens, instantaneous shutter, in solid leather case, £7 7s.; No. 3 Kodak, as new, size quarter-plate, carries 60 films, rapid rectilinear lens, instantaneous shutter, take £5 7s. 6d.; Optimus Magazine, very finest order, Optimus rapid rectilinear lens, carries twelve quarter-plates, roller blind, shutter, focussing adjustment, £5 5s.; Crouch

hand camera, quarter-plate rapid rectilinear lens, roller behind shutter, bag changing, as new, £3 17s. 6d.; Blair's 5 by 4 hand-camera, good lens, time and instantaneous shutter, two finders, rack focussing, three double dark-slides as new, £3 3s.; Kodak No. 1, best R.R. lens, carries 100 films, best order, in leather case, 40s.; Fallowfield's Facile, fitted rapid rectilinear lens, carries twelve quarter-plates, as new, £3 17s. 6d. All above are warranted as described. On view, City Sale and Exchange Rooms, 54, Lime Street, corner of Leadenhall Street, City (late Goy's Medium). Second hand apparatus bought, sold, or taken in exchange. Inspection invited.

**Lanterns! Lanterns!! Lanterns!!!** Slides!! Slides!!! Slides!!!! The largest and most varied selection in the whole kingdom. Before selecting elsewhere, call and inspect the stock of the City Sale and Exchange, 54, Lime Street, Leadenhall Street, City, where we have no hesitation in saying you will find all that you require in this way. Lanterns for sale, lanterns lent on hire, lanterns sold on commission, or taken in exchange for other apparatus. Write for special supplemental lists, Manager, City Sale and Exchange, as above.

**Bargains in Cameras and Sets.**—10 by 8 camera fitted all latest improvements, back and front extension, for wide-angle pictures, leather bellows, reversing back, rising and falling front, two double slides, grand condition, take £6 10s. lot; whole-plate Optimus Raymont camera, double extension, leather bellows, rising, falling, and brass fronts, three double dark-slides, Optimus rapid rectilinear lens, Waterhouse stops, three fold stand and case, lot as new, £11 5s.; whole-plate camera (British), by Chapman, double extension, leather bellows, rising front, etc., very fine rapid rectilinear lens, Waterhouse stops, three double slides, folding stand and case, grand lot, as new, £8 5s.; half-plate camera by Houghton, Holborn, double extension, wide-angle movement, rising and falling front, leather bellows, etc., rapid rectilinear lens, iris stops, three double slides, three-fold stand and case, as new, £3 10s., warranted; half Spanish mahogany camera, by Lonsdale, Leeds, wide angle movement, double extension, leather bellows, etc., rapid rectilinear lens, Waterhouse stops, double dark slide, and folding stand, £4 10s.; Lancaster's half-plate 1892 instantograph camera, all latest improvements double extension, leather bellows, etc., double slide, quarter carrier, very fine rapid rectilinear lens, iris stops, and folding stand, set complete, 75s.; half-plate camera, by Percy Lund, back extension, conical-leather bellows, three double slides, rapid rectilinear lens, shutter, folding stand, and case, as new, take £4 10s.; quarter-plate Shew's Eclipse pattern camera (pocket), reversing back, leather bellows, etc., three double slides, rapid rectilinear lens, rotating stops, and roller blind, shutter, fine lot, as new, £2 12s. 6d.; quarter-plate instantograph camera, lens, iris stops, double slide, and folding stand, 27s. 6d.; quarter-plate Le Merveilleux set, by Lancaster, complete, 15s.; quarter-plate camera, thorough order, all movements, fine rapid rectilinear lens, quite new, Waterhouse stops, folding stand, and four double slides set complete, 27s. 6s. All above sets guaranteed in every detail as described. On view, City Sale and Exchange Rooms, 54, Lime Street, corner Leadenhall Street, City (late Goy's Medium). Second-hand apparatus bought, sold, or taken in exchange. Inspection invited.

**Bargains in Lenses.**—0 by 7 Optimus rapid Euryscope lens, Waterhouse stops, moveable hood, grand definition, as new, £5 5s.; whole plate portrait lens, Waterhouse stops, rack focussing, covers well, as new, 55s.; whole-plate Laverne wide-angle rectilinear rotating stops, as new, 30s.; whole-plate rapid rectilinear lenses, by Parker, Holborn, covers well to edges, Waterhouse stops, moveable hood, as new, 45s.; 4-plate rapid rectilinear, by Crouch, Barbican, Waterhouse stops, 8 in. focus, as new, £2 7s. 6d.; 4-plate wide-angle rectilinear, by Crouch, Barbican, rotating stops, 6 in. focus, quite new, 42s.; cabinet portrait lens, by Laverne, quite new, grand definition, Waterhouse stops, rack focussing, 35s.; quarter-plate Optimus detective camera lens, by Perken, Son and Raymont, Waterhouse stops, as new, 27s. 6d.; half-plate Lancaster's rectigraph lens, thorough order, covers well, Waterhouse stops, take 32s. 6d.; half-plate Lancaster Instantograph lenses, iris stops, and instantaneous shutter, 15s.; half-plate Ross rapid symmetrical lens, as new, fine definition, Waterhouse stops, £3 17s. 6d.; Ross' No. 2 portable symmetrical, rotating stops, 4 in. focus, finest order, 42s.; Shew's C. D. V. portrait lens, rack focus, Waterhouse stops, finest condition, 17s. 6d.; pair very fine Argus 5 by 4 rapid rectilinear lenses, accurately paired for stereoscopic work, fitted Waterhouse stops, moveable hood on front, and with camera division, take 42s.; Optimus quarter-plate portrait lens, rack focussing, Waterhouse stops, quite new, 21s.; 5 by 4 Optimus rapid rectilinear, by Perken, Son, and Raymont, Waterhouse stops, 27s. 6d.; Swift 5 by 4 wide-angle rectilinear, 5 in. focus, rotating stops, 32s. 6d.; 4-plate hand-camera lens, by Laverne, rapid rectilinear, adjustable focus 15s., quite new. All above lenses are warranted as described.—On view, City Sale and Exchange Rooms, 54, Lime Street, corner Leadenhall Street, City (late Goy's Medium). Every

description of apparatus bought, sold, or taken in exchange.

**Magic Lanterns and Slides.**—Walter Tyler's Helioscopic is perfection of all lanterns, supplied to Indian Government, School Boards, science classes, clergy, and exhibitors throughout the world. Impossible to have lanterns give better definition or more satisfactory results; specially constructed lens, which no other lantern possesses.—Walter Tyler, 48, Waterloo Road, London.

**Walter Tyler's Best Triples and Bi-unials** are unsurpassed, and perfect in every detail. Good biunials, mahogany bodied, brass fronts, and all improvements, £7 10s.; single lantern, with 4 in. condensers, portrait front lens, 4-wick lamp, complete, in case, 27s. 6d.—Walter Tyler, 48, Waterloo Road, London.

**Lantern Lenses.**—Specially constructed. Walter Tyler's new Helioscopic portrait combination lantern lens gives the most perfect definition and brilliancy, can be fitted to any lantern, and for excellence cannot be surpassed. No other maker has this lens, which is manufactured expressly for Walter Tyler, 48, Waterloo Road, London.

**Regulators and Gauges.**—Great reduction, in price. Either can now be had of Walter Tyler for 14s. each. The largest stock of gas cylinders in England. Best seamless steel, tested and valved, and all sizes at very low prices.

**Slides from Negatives and Pictures.**—Walter Tyler manufactures and colours slides on the premises, thus ensuring speedy delivery, and prices are most moderate.—Walter Tyler, 48, Waterloo Road, London.

**Biunial Lanterns.**—If you are in want of a really good biunial lantern, perfect in every respect, call and see Walter Tyler's entire brass fronted, mahogany-bodied, lined with Russian iron, and fitted with new best quality lenses, and sold at a most moderate price. The top lantern will take a 4-wick lamp. These are great bargains.—Walter Tyler, 48, Waterloo Road, London.

**Hire Department** is now perfect. Largest and best collection of slides in the world; over 200,000 always in stock. Temperance, travels, Scripture, educational, comic, tales, etc. Cheaper than any other house, no extra charge for coloured slides or effects. Special terms for large quantities.—Walter Tyler, 48, Waterloo Road, London.

**Lanterns and Slides.**—If you wish to hire, purchase, or exchange, you cannot possibly do better than go to Walter Tyler, who makes this business a speciality, and you will thus save dealer's and all intermediate profits.—Walter Tyler, 48, Waterloo Road, London.

**Second-hand Lanterns and Slides** at very moderate prices, also all kinds of apparatus. Send for large catalogue, 420 pages, with instructions for working lanterns of all kinds, and costing an immense sum to produce, sent free for 6 stamps. Small catalogue and second-hand list, post free.—Walter Tyler, 48, Waterloo Road, London.

**Bijou Enlarging Lanterns.**—Finest results with Hughes's patent rectangular condensers, half the size of ordinary make, superior definition, proper diffusion of light; scientifically constructed, not commercial; several whole and half-plate for sale, cheap.

**The Marvellous Pamphengos.**—Finest oil-lighted lantern, perfection, equals limelight, stood the test of over fourteen years against all imitations. Over 3,000 sold; supplied to the Government, School Boards, Science Teachers, the Clergy, and Institutions. Elegant solid brass fronts, high-class lenses, unequalled for definition and brilliancy, from £2 10s. each.

**Magic Lanterns, Magic Lanterns.**—Largest assortment in the world, cheapest and best, nicely japanned lantern body, 4 in. double condensers, portrait front lenses, rack and pinion, four-wick lamp, in case, £1 7s. 6d. Others more elaborate, but cheap.

**The Docwra Triple Prize Medal**, highest award, supplied to Dr. H. Grattan Guinness, Capt. C. Selwyn, Madame Adeline Patti, and the Royal Polytechnic, etc.

**The Malden Triple**, supplied to B. J. Malden, Esq.; unparalleled results; Capt. Chas. Reade, R.N. **Fine Triple Lantern**; four set of large diameter lenses, £35, cost £60. Given away.

**Special Triple**; mahogany, entire solid brass fronts, £12 12s.; a really good lantern, unequalled.

**Elegant Mahogany Biunial**; brass fronts, £7 10s.; blow-through safety jets, 8s. 6d.; mixed gas jet, 12s. 6d.; Malden double dissolving tap, 12s. 6d.; a number of grand effects; particulars free, before purchasing. Send for Mr. Hughes's grandly illustrated catalogue, over 180 fine wood engravings, price 6d.; postage 3d.; separate list of 60,000 slides, price 6d.; postage 3d.; pamphlets free; second-hand lists of bargains.—W. O. HUGHES, Brewster House, Mortimer Road, Kingsland, London, N. 50 slides, all coloured, on loan for 3s., in special despatch boxes.

**EDITORIAL DEPARTMENT.**—All Literary Contributions, Queries and Answers, Photographs for Competition or Criticism, Books or apparatus for Notice or Review are to be addressed to the EDITOR, AMATEUR PHOTOGRAPHER, 1, CREED LANE, LUDGATE HILL, LONDON, E.C. (All communications should reach the Editor on Tuesday.)

**TERMS OF SUBSCRIPTION.**

UNITED KINGDOM.....	Six Months, 5s. 6d.	Twelve Months, 10s. 10d.
POSTAL UNION.....	6s. 6d.	13s. 0d.
OUT OF POSTAL UNION — "	7s. 9d.	15s. 3d.

**TRADE ADVERTISEMENTS** are received up to Tuesday morning.

**PUBLISHING DEPARTMENT.**—All letters containing Subscriptions, Orders, Remittances, SALE and EXCHANGE Advertisements, or other business matters for the AMATEUR PHOTOGRAPHER are to be addressed to the Publishers, HAZELL, WATSON, AND VINEY, LD., 1, CREED LANE, LUDGATE HILL, LONDON, E.C. SALE and EXCHANGE Advertisements (at the charge of Three Words for One Penny) must be received by Tuesday evening's post to ensure insertion in the same week's issue.

**"Amateur Photographer" Monthly Lantern-Slide Competition, No. 44.**—Latest day, January 14th.—Prizes: Silver and Bronze Medal, with ribbon and clasp. Two slides to be sent in. Entry forms, etc., on receipt of stamped envelope. Address: Editor, AMATEUR PHOTOGRAPHER, 1, Creed Lane, E.C. (Prizes will be announced and slides reproduced and criticised in the AMATEUR PHOTOGRAPHER Supplement, January 28th, 1893).

We give you greeting, good reader, and wish you well for the festive season and the coming year. Christmas comes in strange unwint'ry garb. Of all times of general vacation the present is one when least opportunity is likely to occur for photographic exercises, and but for the lantern and the amusement which the young portion of the family circle derives from its display, our favourite pursuit will for a little while give place to social obligations, and the door of the dark-room will probably remain locked for a few days. Anon with December past, and the days of '93 commenced, the coming season will seem close at hand, and unfilled intentions of last year, and fresh ones arising from past experience, will awaken early activity.

AMONGST the many exhibitions announced for the early part of next year is that of the Woolwich Polytechnic Photographic Society, of which Mr. A. R. Dresser has lately become President. There are one or two points worthy of notice amongst the rules and conditions; thus with regard to the awards it is stated that "silver and bronze medals and certificates in all classes will be placed at the discretion of the judges." Thus the judges are distinctly given a free hand in the matter of awarding or withholding according to their discretion, and, again, whilst previously medalled pictures are prevented from competing, it is stated that awards received from photographic journal competitions do not debar. In these two instances it would seem that our Woolwich friends are wisely profiting by the past experience of certain other societies.

We also note with pleasure the much broader principle inculcated in the arrangement of the classes. They are only six in number:—(1) Members' prints; (2) Members' lantern slides; (3) Open amateur lantern slides; (4) Open amateur pictures; (5) Open to amateurs who have never received an award in open exhibition; (6) Hand-camera work. There is here opportunity of hearty approval, only qualified by regret that the amateur is made prominent to the disqualification of the professional, a division as arbitrary as it is rapidly becoming unpopular, and we can hardly see the purpose of Class 5, except as an ill-advised means of encouraging the young aspirant. Happily, there is the discretion of three good judges, Messrs. F. P. Cembrano, A. R. Dresser, and A. Pringle, to look to, though we venture to suggest that Mr. Dresser being President would have acted more wisely in leaving the judging to those not directly interested in the Society.

PARTICULARS of the above exhibition should be obtained from Mr. W. Dawes, 145, Chesnut Road, Plumstead, Woolwich, and

we would point out to our readers that as awards received from AMATEUR PHOTOGRAPHER and other journal competitions will not disqualify, some of the contributors to our competitions should stand a good chance of being amongst the winners.

WE do not know whether the "European lady" whose adventures in Thibet are told in the *Gentlewoman* of last week was awakened to photographic practice by the perusal of the useful articles which, it may be remembered, the Rev. F. C. Lambert recently contributed to this excellent ladies' paper; but the fair European appears to have pursued her camera work with more enthusiasm and pluck than discretion, and it may be hoped has secured a sufficiently satisfactory result to reward her enterprise.

Notwithstanding the opposition which the native Lamas, prompted by religious superstition, offered when their own photographs and that of their temple were attempted, the camera was duly set up and the exposure made when half a dozen fierce Thibetan dogs, who had been let loose meanwhile, rushed up, seized her staff with their teeth, wrested it away from her, and she was only saved from further molestation by her companions, who succeeded in keeping the dogs at bay, and escorting her through the gateway. The scowling Lamas stood round like statues, draped in their crimson scarves, and never moved a finger to call the dogs off or render assistance.

Such is photography in Thibet.

SOME experiments in photographing the movements of the growing parts of plants have recently been made with interesting results. Who has not admired and wondered at the beauty of the curves in the delicate tendrils and young stems of such climbing plants as the convolvulus or hop plant? And the beauty of the growth of such plants, when we are told the "movement of the young stems consists of a succession of irregular circular or elliptical curves which vary every moment even in their direction," can be better understood than expressed. By a successive series of photographic records some interesting facts are revealed. Thus, for instance, it is found that even when asleep, plants move, not, as was formerly supposed, interruptedly, but continuously.

THE application of photography to botanical and natural history studies has often been advocated, and as many of our readers will, perhaps, be shortly laying their plans for a fresh season's work—we are only a week distant from the particular period of the year which is productive of a plentiful crop of good resolutions—and as all have not the desire or special ability for the artistic, we would remind them of such fields for work as those above indicated.

Think how the value of the carefully arranged entomological collection would be enhanced if each species were accompanied by a photograph of the living larva, chrysalis, and, perhaps, of the natural food-plant.

THE collector has never yet fully succeeded in preserving satisfactorily the larval or caterpillar state of the beautiful butterfly or moth forms which fill his cabinet. A dried specimen, stiff in form, faded in hue, or preserved in glycerine or spirits, abnormally distended or contracted, is difficult to observe through the sides of the glass bottle; an accurate drawing but better still a photograph, would, if once adopted, become to be regarded as an essential accompaniment of every collection which makes pretence to being complete and scientific. There is more of beauty and of interest in the "grubs," large and small, which denude our fruit trees of foliage, and riddle our rose petals with tiny holes, than the general world wots of.

THE *Newcastle Daily Chronicle* finds that "photography

is rapidly advancing to the dignity of a fine art," and further states that "hitherto the arbitrary lines and shades of camera pictures have prevented them being regarded as artistic, but photographs are now becoming less mechanical." This may not be very intelligently expressed, though there is some truth at the bottom of it.

THE foregoing appears to have been prompted by the contemplation of Messrs. W. and D. Downey's so-called "art studies." In connection with these the same writer says, "Another matter of interest in connection with this new departure in photography is the fact that the prints can be worked from the photo plate in the same way as engravings." Here again there is some truth at the bottom, presuming photography or collotype to be referred to, but the above expressions are rather misleading. Truly a little knowledge is a dangerous thing.

THE writer of "Photography for Ladies" in *The Queen*, warns his lady readers off hand-camera work—which, he says, "I do not recommend, as, though a skilful and artistic worker may produce good work, the majority of hand-camera negatives are fit only for the rubbish heap. The facility with which these cameras can be carried, the small cost of the plates which are used with them, the readiness with which exposures are made, all tend to induce carelessness. Hand-cameras have their uses, but I am sure that a stand camera of larger size will give more satisfaction to the worker, and the pictures produced with it more pleasure to her friends." The inducing to carelessness is a too evident feature in a great deal of snap-shot work which one sees about. A hand-camera is in no wise a stepping stone to larger work. It needs a good photographer to use a hand-camera with proper measure of success.

THE work of photographing some of the unique treasures of the Bodleian Library appears to be favourably progressing. Two of the latest productions are photo lithograph fac-simile prints of Columbus's letter, dated 1493, recounting his discoveries to Sanxis, treasurer of Aragon, and Caxton's advertisement (A.D. 1477) of the Salisbury commemoration services. The reproductions are published by Mr. Bernard Quaritch, at Piccadilly, and by the Clarendon Press, Oxford.

WHILST OUR AMATEUR PHOTOGRAPHER competitions by no means lack support, as may be seen from our periodical supplements, still there are many who do not send in to either, because they look upon journal competitions as somewhat *infra dig.*, or from a timidity which might find expression in the oft-quoted "Fain would I climb but that I fear to fall."

To the first we would point out that the character and quality of many of the competing photographs is such that there are few, if any, who need be ashamed of running with them; moreover, it might not be invidious to cite the names of some of the foremost workers of the day who a year or two back were amongst our medal winners. To the timorous we should like to hand a letter just received from one who early this year took a medal for "A Village Smithy." He has since then been half the world over, and now fills a post of some importance in the photographic department at the "World's Fair," which he says he should not have secured but for his medals.

MANY to whom the necessity for hard work looks remote may one day be glad to have photography to lean upon, nor need it prove an insufficient staff with the innumerable commercial applications which multiply almost daily

A CONTEMPORARY expressly devoted to the scientific and mechanical interests is responsible for the following:—"At Erroll the other day the telephone linemen were called to repair a break. The wire had been fused by lightning, and on one of the white insulators the workmen, it is said, found a distinct picture of the roof of a neighbouring house, the picture evidently having been flashed on the porcelain by the lightning." Not more wonderful is the patience of an enlightened public, a considerable percentage of whom are practically acquainted with photography, that will still tolerate such rubbish in the newspapers and magazines for which they pay, and to the perusal of which so much time is devoted.

NOTHING daunted by the troubles which now almost proverbially follow a photographic exhibition, the early months of the year will keep the persistent exhibitor busy in sending out, packing, and unpacking his pictures, for already the exhibitions announced are numerous—Ryde, Isle of Wight, on January 4th and 5th; West London, January 10th; Holborn, February 18th; Cleveland Camera Club, Middlesbrough, February 1st; Woolwich, February 15th, etc.; Forfar, N.B., March. Others, too, are rumoured but not definitely fixed.

STILL the exhibition controversy continues; indeed, our Coventry friend contained little else last week, and although the discussion is quite perennial in its recurrence, this time it seems to have caught hold rather more severely. Every one has something to say on the subject; nearly everybody feels tempted to rush into print about it. There does not appear to be much good come of it all as yet, but it has probably set a good many more thinking, and with the result that gradually the popular mind will become reconciled, first to the simplification and then to the abolition of classes; and next—it is only a step further—abandoning medals altogether, and the appointment of a capable and critical hanging committee.

MR. F. M. SUTCLIFFE pronounces strongly in this direction. He says:—"Have no rules at all, tell your judges to make awards to any exhibits that strike them as worthy of distinction. As long as exhibitions are hampered with regulations and distinctions, often difficult to understand, and classes are tolerated, they will not ever be looked on as a show of pictures in the highest sense of the word."

FOR the purpose of presenting the medals and diplomas awarded by the judges in the photographic competition held in connection with the recent Stanley Show at the Agricultural Hall, the Stanley Cycling Club are giving an invitation "Bohemian Musical Evening," which will take place at the Wortley Hall, Seven Sisters Road, N., on Monday evening, January 9th, to which ladies are also invited. In addition to the musical part of the programme, the slides received in the competition will be shown, and other interesting and amusing items arranged. Admission will be by invitation ticket, which can be had by application to Mr. Herbert Smith, 29, Finsbury Pavement; or to Mr. Wm. Goddard, the Hon. Secretary of the Stanley C. C., 261, Seven Sisters' Road, N.

WE again draw the attention of our readers to the fact that we have had placed with us for loan a set of slides of the "Peak District," which we are willing to loan to any one, on condition of carriage being paid. The slides are accompanied by a printed description, and they will help to fill a blank for a society's meeting.

THE latest date for "Holidays with the Camera" and "Optimus" 100 Guinea Competition is December 31st.

WE have received from Herr Anschütz some striking examples of his well-known instantaneous animal studies, which come as a gentle memento of a trip we had up the river with him and a few friends, including Miss Barnes, on an Immisch electric launch, a short time ago, which, despite the cold day, was very enjoyable.

HERR ANSCHÜTZ seems to be but little known amongst photographers generally, Muybridge having eclipsed him, not in quality of work, but by lecturing so freely; and yet both have in their way done excellent work. However, now there is every prospect of not only photographers, but the public at large becoming better acquainted with his work.

The Electrical Wonder Co. are now placing upon the market a penny-in-the slot machine, which, on the strength of the penny, shows for a short time some of Anschütz's instantaneous studies, in rapid motion. So exquisitely are these produced as transparencies, and so life-like the impression, which is of course due to the persistence of vision, that we think this new wonder will become a very good thing.

WE need not of course point out that it would be quite possible to adapt this contrivance to the lantern, and for photographic exhibitions and soirées it will prove of very great attraction. And we recommend all secretaries of societies to secure one for exhibition.

#### ONE OR TWO CORRECTIONS.

IN our issues of September 30th and November 11th Mr. Mason suggests a particular method of procedure and a bath for toning gelatino-chloride prints. To distinguish these baths many of our readers have called them "Mason's baths," and whilst we do not for one moment object to give Mr. Mason the credit of having discovered these particular formulæ, it is only fair to point out that the use of an alkaline chloride in conjunction with a sulpho-cyanide is by no means new, having been recommended by Liesegang in the *Photographisches Archiv*, November 1867, and Hughes in the same year also suggested it with the addition of a sodium salt of feebly alkaline power, such as the tungstate or phosphate.

The advantages of adding a soluble chloride are that toning takes place rather quicker and more regularly; the disadvantage is that metallic gold is soon deposited on the sides of the stock bottle.

The particular point to which, however, we wish to draw attention, and which we may have seemed to approve of, is, the directions to place the print *unwashed* in the toning bath. This is a great mistake, as nearly every chloride paper in the market contains free acid, which carried over, as it must be, to the fixing bath, will cause the setting free of sulphur, and consequent sulphuration of the print. Either the prints should be thoroughly washed, or else given a soaking in an alkaline carbonate.

All sulpho-cyanide toning baths are faintly acid, and it is far better, as we have found in practice, to make the bath distinctly alkaline by the addition of twenty or thirty grains of carbonate of soda to every forty grains of sulpho-cyanide. Alkaline sulpho-cyanide baths tone very regularly, as quickly as the ordinary, but do not keep their activity quite so long. This may, however, be easily restored by adding a little fresh gold.

#### THE USE OF DIAPHRAGMS IN ENLARGING.

In a paper read before the Blackheath Camera Club, and reported in our issue of 16th inst., p. 454, Mr. Dresser is reported to have said, "That stopping down the lens does not increase the definition for enlarging purposes, though it may sometimes appear to do so." There are two questions to decide: (1) Is

Mr. Dresser reported correctly? (2) Is Mr. Dresser correct? The first we may accept as proved, because the statement is so emphatic, so striking, and so specially dwelt upon. Is Mr. Dresser correct? Mr. Dresser will answer it through our quoting from his little work entitled "Bromide Enlarging," published at the beginning of this year. The passage will be found on page 24: "The image having being (*sic*) focussed and made quite sharp by the use of such a diaphragm as is found necessary, etc." Thus Mr. Dresser writes at the beginning of the year, and now at the close he says stops are utterly useless. Which statement is right? Certainly not the latter. We say that stops do improve the marginal definition in enlarging, and we have thought it right to draw attention to the point so that younger workers may not be led astray.

## Letters to the Editor.

### PACKING OF PLATES, ETC.

SIR,—I read with much interest Mr. J. N. Williams' letter in your issue of 16th December last on packing plates, and though, after what he said, it is perhaps hardly necessary to further broach the subject, I must say that I fully endorse his opinion in every way.

I cannot see why plates should be packed up in bundles of six or four, as to my mind there is not the slightest use in it. I have often found myself that when wanting to fill one double slide, all my plates are packed in fours; consequently, one pair *must* remain open (while the others are being put in the slide or packed away again), and so are liable to wet, dust, and fog. I feel sure it would be beneficial to all photographers, amateur or professional, if this suggestion would only be adopted, while it would not, I think, be any more trouble or expense.

There is another little matter which I think it would also be beneficial if makers would agree to carry it out. It is to have screws for camera stands the same size (I am referring, of course, to the one with which the camera is held on the stand), so that if one loses a screw for his half-plate camera, all he has to do is to go to the nearest photographic dealer and get a half-plate camera screw, instead of being at the necessity of having one made and fitted on purpose. Of course, *if one has time*, the makers can be written to for one, but one has not always time. Of course, these little matters may be considered trifling, but where improvements (and I think most will agree that they are improvements) can be made without trouble or expense, I see no reason why they should not be adopted, and I think your paper one of the best mediums for bringing about these little improvements.—Yours truly,

J. R. COOKE.

\* \* \* \*

### SOCIETY FOR HARRINGAY.

SIR,—I notice in your issue of the 16th inst. that there is a proposition to start a new photographic society at Haringay.

In case your correspondent, Mr. C. Frith, should not be aware of the existence of the North Middlesex Photographic Society, I beg to point out that the society's rooms are at Jubilee House, Hornsey Road, a distance of about one mile from the centre of the Haringay district.

If Mr. Frith will attend one of our meetings we shall be glad to see him, and he will learn for himself the nature and scope of the society I represent, and I feel sure he must come to the conclusion that there is no necessity to attempt to form another society in this district.

Having frequently observed and appreciated your valuable remarks as to the wasted (though well-intentioned) energies in the formation of societies close to each other must be my apology for troubling you with this communication.—Yours, etc.,

J. McINTOSH (Hon. Sec.).

\* \* \* \*

### EXHIBITIONS AND MEDALS.

SIR,—The very obvious objections alluded to by correspondents, last week, to Mr. Harvey-George's plan of popular judgments would alone be fatal, but they are not the only ones. Surely no artist would send work to be judged by the ordinary public. The general temptation would be to exhibit works of common-

place domestic interest, or clap-trap effects which should catch the public eye, rather than a higher class of work which would run the risk of being "over the heads" of the public.

But I notice that no allusion is made to the suggestion that competitors should be classed according to previous wins, *i.e.* bronze medallists, silver medallists, and so on. Personally, I rather like this notion, as the mere exhibiting in the higher classes would be no small honour. The tendency in some directions, unfortunately (and funnily), appears to be "Bother the honour; give us medals!"

Of what earthly value as distinctions can medals be when granted under such conditions as those recently adopted by a society? Had a class consisted of four desperately bad "pictures," I suppose each would have received an award. Very qualified approval from the Tunbridge Wells judges would, I submit, be a greater distinction than any possible award under the other conditions referred to, which are beautifully calculated to bring medals and awards into general, and too often well deserved, contempt.

Whether, under all the circumstances, the action of the Tunbridge Wells judges was fully justified is quite open to debate; that it was a step in the right direction, I have no doubt.

Does not the tone or some of the correspondence on the subject of medals reveal an eminently unphilosophic state of mind, and very mixed ideas on the function and purpose of awards? Surely a sensible amateur's pleasure in photography may be expected to consist in his actual work, rather than in the contemplation of medals whose value is becoming more and more problematical.—I am, yours, etc.,

H.

\* \* \* \*

### FILLEBROOK ATHENÆUM PHOTOGRAPHIC EXHIBITION.

SIR,—As applications for entry forms are already coming in, will you kindly allow me, through your columns, to say in reply to these applications, that the forms in question will be issued very shortly. Meanwhile it may be interesting to mention that there will be no classes except a Champion class, that no distinction will be made between amateurs and professionals, and that Messrs. F. P. Cembrano, jun., Walter L. Colls and John A. Hodges have kindly promised to act as judges.—I am, yours, etc.,

JOSEPH W. SPURGEON (Hon. Sec.).

Drayton Road, Leytonstone, Essex.

\* \* \* \*

### RUBBER SOLUTION.

SIR,—*Re* letter from Mr. J. N. Williams, in your issue of the 16th inst. Rubber solution is now procurable from any respectable photographic material dealer, waterproof or rubber merchant, cycle agency, or direct from Messrs. Mawson and Swan. To make the solution, dissolve pure rubber in benzole or wood naphtha to the consistency of syrup; a small quantity of the solvent must be added occasionally to make up for evaporation. More difficulty will be experienced in procuring the pure rubber than the ready-made solution, so I would advise Mr. Williams, or others, to use the latter.

I cannot understand Mr. Williams's difficulty with P.O.P. I have used it for two years with the Company's bath, also P.O.P. and Eastman's with Mason's recent bath, and have always found that prints lose just a little, as stated. There must be something wrong with the particular sample of paper he is using (which is rare), or the baths have not been made up properly. Was the exact quantity of sulpho-cyanide used? and was the chemical fresh and good? If Mr. Williams is sure that his baths are all right I advise him to send a piece of unused paper with batch number, an untuned print, and a toned print to the Britannia Company, who will, I am sure, put him right.—Yours, etc.,

Dec. 15th, 1892.

JOHN MARSHALL.

### THE "BENEVOLENT."

SIR,—I enclose a brief report of the last meeting of the Benevolent Committee, and shall esteem it a favour if you will give me space to make a special appeal for subscriptions *before the end of the year*. I regret that in sending the usual applications to old subscribers I made the mistake (easily possible to a new hand) of stating that our financial year ended on February 28th, 1893, but though the annual meeting is held about then, I find that the balance-sheet is made up to December 31st. The association has been very well supported of late by the larger

OTHER TOWNS IN FUTURE ADVERTISEMENTS.

subscribers and donors, but we hope to have a great many more of the smaller annual subscriptions (minimum half-a-crown). The money spent in relief will probably prove to be slightly less than last winter; but there is every prospect of considerable calls during the next few months—which will, of course, not come into the next balance-sheet. The diminution in the relief paid in 1892 arises from two causes: (1) from the fact that in the first three months of the year there were no applications (though the latter half of the season is generally busiest); and (2) from the fact that the committee has been able to find work instead of money for some of the most pressing cases in the present season.

I hope to receive a general and generous response while the Christmas goodwill warms the heart of your readers.—Yours, etc.,

H. SNOWDEN WARD,  
Hon. Sec.

Memorial Hall, E.C.

#### AN EFFECT OF ALUM ON GELATINE PLATES.

SIR,—There is a curious phenomenon I have noticed in connection with the action of alum on gelatine plates which may be of interest. Perhaps it has been published already, and if so you may be able to explain the cause of that effect. The plates I used were Paget 50 Lightning Cadett, but no doubt the same phenomenon can be seen with any other plate.

After exposing and developing with pyro-soda developer, and washing in water, I place my plates into a saturated solution of potash alum. Several weeks ago I noticed that a momentary phosphorescent gleam of light came from the gelatine plate at this point. The effect was seen much better in total darkness, when perhaps I fancied I noticed the image on the plate lighted up. It is a faint gleam of light, but sufficiently distinct. It is not bright enough to fog a rapid plate.

After allowing the plate to remain in the alum solution for a minute or two, I immersed it in water again, when there was another gleam of light, but much fainter. The colour of the light seemed to be of a bluish tint.

This effect comes once at each of these operations; it does not recur on lifting the plate out of the alum solution and re-immersing it.

What is the cause and nature of this light? Is it phosphorescence, or due to a chemical action between the gelatine and the alum (the tangible result being the hardening of the film), or is it electric and caused by the meeting between the alum solution and the gelatine containing oxy-haloid of silver?

Further experiments may show what this is, but if this phenomenon has already been published it would be useless to waste time over it. I hope you will allow space for this letter in the AMATEUR PHOTOGRAPHER, if it is at all new and of sufficient interest, and thanking you in that expectation.—Yours, etc.,

WM. S. ANDERSON.

[This phenomenon has been noted several times before, but never satisfactorily explained.—Ed.]

#### LANTERN SLIDES.

SIR,—Our slides illustrative of "Linen and its production" will be lent to those interested, on payment of a small fee to cover postages. Borrowers of course must pay carriage both ways. They are in charge of our curator, Mr. J. C. Middleton, Market Street, to whom application ought to be made.—Yours, etc.,

JAMES D. ROFF  
(Hon. Sec.)

Brechin, N.B.

\* \* \* \*

#### WHAT CONSTITUTES AN "AMATEUR"?

SIR,—Whilst I have no desire to be threatened with proceedings, and harassed conjuring up pictures of oakum-picking and the treadmill, there is a matter which has struck me so forcibly in connection with the ruffling of Mr. Austin's feathers at Hackney, that I feel constrained to brave that gentleman's wrath, and ventilate the matter, even at the risk of receiving a letter from his legal adviser.

The question of what constitutes an amateur crops up as regularly as the influenza or sea serpent, and I have no desire to start the controversy again, but will you kindly inform me how anyone can sell their pictures at an exhibition, or elsewhere, and yet pose as an amateur? Am I not right in surmising that those doing so may be disqualified?

In athletics a hard and fast line is clearly defined, as anyone competing for a money prize is for ever disqualified from again

entering as an amateur. Surely we photographers wish ourselves to be considered *sans peur et sans reproche* as much as sprint racers and hurdle jumpers, and yet is it a wonder that the title "Amateur" so often raises a smile on the face of our professional brethren?

Might not a new class be organised and designated

SHAM-ATEUR.

\* \* \* \*

#### LANTERN-SLIDE CARRIER.

SIR,—I must ask you to kindly allow me space to reply to Mr. Vever's letter in your issue of the 16th inst.

I can only judge that Mr. Vever's remarks are made for the purpose of bounce, and not as expressing his firm conviction in the matter, because anyone who has the smallest capacity for judging the identity or otherwise of invention, could not arrive at the conclusions expressed in his letter. I have lately submitted the matter to several patent experts in London, who are unanimous in their opinion that the inventions are identical, and that as our patent is prior dated we have the prior claim. This confirms your opinion on the matter.

As Mr. Vever has seen the drawings of both specifications, viz., his and ours, and cannot see the identity of principle in both inventions, perhaps he can see how his carrier is covered by our first and second claims, which read as follows:—

1st.—"In a lantern-slide carrier, a sliding-frame, having lifting levers pivoted thereon in combination, with means for the operation of the said levers during and by the sliding movement of the slide-carrier."

2nd.—"In such a lantern-slide carrier, a pivoted lifting lever in combination with an inclined plane upon the frame in which the slide-carrier moves, and adapted to engage with the said lever to effect the lifting of the lantern-slide, substantially as described."

Whatever my letter might be made to imply, as to deliberate and wilful infringement it was never meant, as it is quite possible for two people to invent the same thing simultaneously without any connection with one another, but if Mr. Vever still maintains his present position, and sells his carriers, I have no hesitation in saying that such acts will be deliberate and wilful infringement.

Thanking you for the space in your valuable paper,—I am, yours, etc.,

R. W. JAMES.

\* \* \* \*

#### A CORRECTION.

SIR,—Allow me to correct an error which appears in your abridged report of a paper read by myself at the last meeting of the Bristol and West of England Amateur Association.

In your report I am represented as stating the Cadett "Lightning" plate to be *twenty-five* times as rapid as an average wet-plate. This should be *one hundred and twenty-five* times as rapid.

The words actually used were as follows:—"Taking one of the earliest plates on the market (Wratten's ordinary), which was estimated roughly at five times the speed of a wet-plate, and comparing it with one of the most recent rapid makes (Cadett and Neall's Lightning plate), I find the latter to be twenty-five times as rapid as the former, and admitting, for the sake of comparison, the relative rapidity of Wratten's and the wet-plate to be correctly stated, we arrive at the conclusion that the Cadett plate is one hundred and twenty-five times as rapid as the wet-plate."

I must ask you to kindly make this correction in your next issue, as such an error, if left uncorrected, might be calculated to do an injury to Messrs. Cadett and Neall, to whom great credit is due for placing upon the market such excellent plates.

Allow me at the same time to recommend these plates to my brother amateurs; for speed, they outstrip any plate I have ever used, and, unlike many of the excessively rapid plates, they develop easily, giving clear shadows and full printing density without forcing.—I am, etc.,

EDWARD BRIGHTMAN.

SIR,—There is a slip in your issue of last week, in the report of Mr. Brightman's paper.

Cadett and Neall's Lightning plates are one hundred and twenty-five (not twenty-five) times the rapidity of the average wet plate. You will see this is a great difference. I am afraid I made the mistake in the report sent you.—Yours, etc.,

HERBERT A. HUTCHINSON.

## Apparatus.

### HOUGHTON'S NEW HINGED SPRING PRINTING-FRAME.

GEO. HOUGHTON AND SON, of 89, High Holborn, have sent us a sample of this little improvement in printing-frames, which is extremely simple and yet practically an advance, because by its

use there is less likelihood of a print shifting during printing, and besides it is less trouble.

The springs are hinged and are held in position by the catch A (see figure), and released by pushing back the same.

The frames are well and substantially made of teak or oak, and retail at the following prices: quarter-plate, 6s.; half-plate, 12s.; whole-plate, 24s. per dozen.

### THE "OPTIMUS" UNIVERSAL COPYING APPARATUS.

So many of our readers know the cost of large diameter condensers that they will be glad to hear of this, the latest novelty turned out by Perken, Son, and Rayment, of 99, Hatton Garden, E.C., and more especially as it is a copying, reducing, and enlarging camera in one. As will be seen from the diagram, it consists

of two portions, the camera proper and the illuminating chamber. This latter is made of stout metal with an opal glass front, and a series of carriers which may be shifted up and down, or from side to side, so that any portion of a negative may be utilised. The illuminating power is obtained from two Argand paraffin lamps, which can be raised or lowered in the chamber, thus adapting it to large or small negatives. The light is also reflected on to the front by special reflectors, and from a critical examination of an enlargement we have no hesitation in saying that the illumination of the negative is quite equal and so bright that small print could be easily read on the screen. The camera has, as will be noted, a double extension by screw, and is also provided with a swing back, so that converging or diverging lines in the original negatives which should be parallel may be corrected.

It is well made and finished in mahogany, and as the price will without the lens be about £5 it will be within the reach of

all. It is just the instrument for a provincial photographic society that wants a universal lantern slide and enlarging camera, and should solve many a difficulty that is met with by users of small plates.

It may be of interest to note that enlarging from lantern plate to 12 by 10, the exposure for rapid bromide paper was only four minutes.

### SCHNAPEK'S ELECTRIC RETOUCHING APPARATUS.

Mr. C. A. Rudowsky, of 3, Guildhall Chambers, E.C., has shown us in operation this novel assistance to the retoucher.

A special cell is connected, as shown in the diagram, to the

motor, which is hung on the retouching desk, the negative being just allowed to rest on the small tongue 3. The pencil is held

steady, and the negative is moved up and down either slowly or quickly, so that it is very easy to obtain any sort of grain. Using one of the cells three or four hours a day, it will last for more than a year, and at the price of 36s. cannot be called dear, considering the great saving of labour and time.

### ELLIOTT AND SON'S WAVE STUDY.

Messrs. Elliott and Son, of Barnet, have sent us a 24 by 18 enlargement of Mr. Birt Acre's well-known wave study. As an example of carbon work it is perfection, and as a picture very fine, the effect being heightened by the peculiar wave-green colour of the pigment. It will form an ornament to any photographer's home. It is sent out mounted on stout boards ready for framing, price 15s.

## Construction of Twin-Lens Hand-Camera.—I.

BY ENN ESS.

OF the various classes of hand-cameras now offered to photographers, amateur and otherwise, such to which the system of twin, or duplex, lenses has been applied bear the palm in the eyes of those who have had general all-round experience with them. And as the favour they have so far established will doubtless extend, a short discursive paper on their construction will, it is hoped, prove acceptable to many, at this season of the year, when tools used in joinery may find more place for work in their hands than chemicals used in photography.

The leading points of difference between the ordinary hand-camera and that now under consideration may be reckoned at three, viz.:

- (1) Two lenses are used in lieu of one.
- (2) The picture reflected on the ground glass screen of the finder is identical in size, as in other respects, with that thrown on to the sensitised plate.
- (3) Focussing can be carried out from infinity to within the shortest distance of the object the extending capabilities of the camera will admit of accurately, the picture thrown on to the finder screen being the absolute guide.

Now, as compared with an ordinary hand-camera, what gain is obtained from these three points of difference?

The first, *per se*, may by some perhaps hardly be termed a gain, involving as it does an extra initial outlay. That which follows on it, however, entirely casts this objection to the winds.

That gain accrues from the second, none who have had much use of an ordinary hand-camera will for a moment contest. The pleasure of seeing the picture before one the absolute size that it will appear on the developed plate, is well worth the small additional cost incurred. Whilst the advantage set forth under the third point of difference is perhaps the greatest, namely, entire absence of any necessity to "judge distance," focussing being as absolutely correct as when carried out with an ordinary camera on a tripod, under cover of a head cloth. So that one is not called upon to consider whether the object it is desired to photograph is at the correct distance required by the equivalent focal length of the lens in use, should the camera be of the, so termed, fixed-focus type—or if it be of an adjustable focus make, with a set scale of distances, to judge whether the object be fifteen, eighteen, or twenty feet away—such judging distance exercises being, except to the most practised eye, fatal to a well-defined negative.

The main advantages of the twin-lens system having been thus summarised, the uses to which the two lenses are put may be described; and it may be as well to note here, by way of parenthesis, that the two lenses used must be absolutely identical in every essential, so that the picture thrown by one shall not differ in one iota from the picture of the same object thrown by the other.

One of the two lenses is attached to the lower half of the camera lens board, and is that through which the rays of light pass to the sensitised plate, the lower portion of the camera being, in fact, the picture chamber.

The second lens is fixed to the upper portion of the lens board, the rays of light passing through it being reflected from a mirror placed behind it to the ground-glass screen placed over the mirror. The upper portion of the camera, therefore, represents on an enlarged scale the view-finder of the ordinary hand-camera, the second lens taking the place of the small double convex lens usually found in the latter.

The equivalent focal length of the lenses to be used being known, the first matter for consideration in the construction of a twin-lens hand-camera is the arrangement of the reflecting chamber, and this consists in the proper adjustment of the mirror with reference to the lens, and of the ground-glass screen with reference to the mirror. It is here assumed that quarter-plate R.R. lenses of  $5\frac{1}{2}$  in. equivalent focal length are to be arranged for.

In the diagram (fig. 1), the line AB represents the equivalent focal length of lens, A being lens diaphragm; CD position of a quarter-plate ready for exposure; AC, AD extreme upper and lower rays of light touching the plate. From C draw CE at an angle of 45 degs. to AB (or horizon); this line represents the

correct position and depth of the required mirror. Draw FH perpendicular to CE, make angle HFL equal angle AFH. Why? Because the angle of incidence equals angle of reflection, the angle of reflection here being AFH. Make FL equal FB.

Draw EP at right angles to EC, and make angle PEO equal angle AEP for same reasons as above. Mark off EO equal ED, and join CO, which will represent the correct position of ground-glass screen with reference to mirror CE.

The central ray of light, AB, passing through the lens, which would impinge on plate CD at B, strikes the mirror at F, and is reflected thence to ground-glass at L; in the same manner the

FIG. 1.

ray AD, striking the mirror at E, is reflected to the ground-glass at O. From this it will be noted that the points OLC on the ground-glass correspond respectively with the points CBD on the sensitised plate, and their respective distances from point A (diaphragm of lens) are equal.

Here then is the mode of adjustment of lens, mirror, and ground-glass screen of the "finder" of a twin-lens hand-camera, as offered by dealers.

A question that presents itself is: Why is the angle of 45 degs. for the mirror adhered to by them? Is it the best, or is it

FIG. 2.

simply that one maker follows in the wake of others, without troubling to enquire?

The mirror being placed at this angle, the ground-glass, upon which the picture is thrown, must lie horizontal, which necessitates a constrained position of the head, and an unnatural angle of sight for the eyes in viewing the picture.

When a picture or book is held in the hand to be examined or read, neither is held horizontally. The position which either appears naturally to assume is at an angle to the horizon, and this angle will be found *almost* invariably one of from 25 deg. to 30 deg. This may therefore be accepted as the inclination at which an object, within a foot or so of the eye, can most agree-

ably be scanned by it. It follows then that the position of the glass screen of the finder should assimilate itself in some degree with the above, in order to relieve the eye from any constraint.

To meet the change, the angle of the mirror to the horizon must be reduced, by doing which the angles of reflection and incidence of the rays of light are enlarged; upon which it follows that a greater number of rays are reflected from the reflecting surface. So that a mirror placed behind the lens at an angle of 35 deg. to the horizon throws more rays on to the ground-glass than one placed at an angle of 45 deg. thereto; resulting in the picture being brighter.

The construction necessary to meet the changes in position of mirror and glass screen above advocated is carried out in fig. 2, II., which it will be noted follows exactly upon the lines adopted in fig. 1, in which the mirror is placed at an angle of 45 deg. The same lettering being used in both will allow the reader interested in the subject comparing the two diagrams the more easily.

In fig. 2, the mirror CE is set at an angle of 35 deg. to the horizon, which throws the ground-glass screen up to an angle of 20 deg. The mirror in this case becomes somewhat longer from C to E than in the other, otherwise the measurement will be found to correspond in both.

No difference whatever appears in the construction of the picture, as seen on the ground-glass, whether it be reflected by the mirror at an angle of 45 deg. or by that at 35 deg., the difference observable being the brightness of the latter as compared with the former.

## Study and Practice of Art in Field Photography.

BY A. HORSLEY HINTON.

### XI.—CLOUDS IN LANDSCAPE.—*Continued.*

The foregoing remarks are no mere fanciful idea of the writer's, and will probably be well worth your while to think over; and it will require the nice cultivation of taste and judgment before we may be able to determine the character of cloud best suited to our subject, and this especially because *the clouds present at the time of photographing the landscape may not always be those best suited for the purpose of our picture.* For instance, at the present moment of writing there is a blustering, wintry wind, which resounds against the corners of the house, bending low the naked branches of the trees, and driving the grey smoke wreaths across the clump of trees; the fallen leaves, such as are not too sodden with recent rains, are scattered hither and thither, everything on the country side is significant of the bleak and stormy winter wind, and yet overhead there is a clear, cloudless sky, foretelling a coming frost; only in the west, where the sun is approaching the horizon, is there a belt of solid-looking clouds, very gorgeous in outline, and where the sun illuminated the thinner clouds between, but these clouds, deep purple and gold, seem almost motionless; there does not appear anywhere in the heavens the least indication of wind, nor any response to the buffeting and noisy commotion which is going on below. We can hear the tempestuous sound, and can feel the keen, cold blast, and as neither of these senses are brought directly into play in picture-making, it will be desirable to help the expression of wintry wind by employing such a sky as our feeling may direct.

We are now brought to consider the question of the desirability of obtaining a negative which shall have on it both landscape and clouds in correct value, and thus obtain our print in one operation; or the opposite method of printing from two negatives, on one of which is the landscape with the sky half rendered opaque, so as to prevent the light penetrating, and a second negative which shall contain the particular clouds which we have determined to use and print into the blank left by the first.

Now many writers have pronounced strongly in favour of obtaining both clouds and landscape on the same negative, and have proposed various methods of procedure by which this not too easily secured result may be gained, such as unequally exposing the plate, local development, local reduction, etc. To make such a negative no doubt means a great advance in technical skill, and will make good the photographer's claim to being a clever craftsman, but if what we have said as to the frequent unsuitability of the clouds present for pictorial purposes is true, and unless the whole object of artistic or picture work be merely to produce a mirror-like record of nature (and this we unhesitatingly assert is by no means the *ultima thule* of artistic endeavour), it will be seen that the "clouds on the same negative" method is by no means without serious objection. It may, perhaps, be argued that if the clouds be unsuitable they can be masked out whilst printing, but the masking-out of a thin cloudscape in the presence of an intricate sky-line is by no means an easy matter, and, moreover, in development or exposure so much attention being paid to the preservation of the clouds makes it more than likely that the important features of the view itself may suffer proportionately, and though we be ever so skilful, the *best* of the clouds and the *best* of the landscape probably never are secured on the same negative in their *absolutely correct* relative value—that is to say, we may have a satisfactory plate of the landscape subject, and with it the sky and clouds nicely rendered and sufficiently thin to print at the same time and without any dodging, yet in such an instance had a careful record been kept and a just comparison made, in nearly every case it will be found that a compromise one way or the other has been made—either the clouds are printed rather weaker than they should be in order not to overdo the accompanying scene, or the latter has been carried further and is somewhat too dark in order to bring out the lighter portions of the sky. Two negatives, in each of which the utmost had been done to preserve the individual characters, each produced independently, yet with due regard to their ultimate combination, would, in our opinion, have been the better method. Other reasons might be shown for not (except on rare occasions) attempting to retain the clouds on the one negative, but for the present the above may suffice.

The chief argument in favour of retaining the clouds on the same negative is perhaps that by so doing we remove the danger of having clouds in the picture, the illumination of which is incongruous with the lighting of the rest of the picture, and again there will be no fear of the *perspective* of the clouds being incorrect.

It requires greater knowledge of nature and finer judgment than might be supposed, in order to insure our introduction into the landscape clouds from a separate negative taken at perhaps a quite remote period and station which shall not create a suspicion on the part of the spectator that the direction of the light is identical in both negatives. Moreover, unless the photographer possess knowledge and a trained perception of things it is by no means unusual to introduce clouds, the perspective of which will at once betray their having been taken from a totally different position. Thus, clouds taken high above the horizon or near the zenith will by no means do if printed close above the horizon of the picture. We see the clouds overhead as it were "broad-side" and in front of or at right angles to the line of view, but as these become more remote we view them obliquely, and perspective influences their form as much as it does terrestrial objects.

Faults in both these directions, however, will be made by those only whose knowledge and observation is incomplete, so that except for the very beginner we can see but little

advantage in securing the clouds present at the same time as we photographed the landscape. Even if the clouds be in every day desirable, it will be best to expose one plate for the terrestrial part of the picture, and a second immediately afterwards for the sky, giving each the exposure and subsequent treatment best suited to their respective character.

Finally, let it be kept well in mind that an attractive or effective cloudscape is by no means always an essential contributory to a perfect picture. In many instances a flat tone with little or no indication of clouds will be best suited to harmonise with the view. If the interest in the subject be not very assertive and is not dependent upon the time of day (such as "Evening," "Daybreak," "Coming Storm," etc., which would largely depend upon suitable cloud effects), then it will be best to keep the sky portion of the picture very quiet and subdued so as not to detract from the interest of the principal object. In this as in other particulars it is not a matter for instruction or a thing that can be laid down, by rule, it is entirely a matter of feeling and conscientious observation.

Perhaps the reason why so many err in respect to the representation of clouds is because, intent upon the tangible and approachable things around, the perceptions have been but little trained to observe all the wonders and beauty which canopy our earth. Thus Mr. Ruskin writes, "It is strange how little in general people know about the sky. . . . One says it has been wet, and another it has been windy, and another it has been warm. Who among the whole chattering crowd can tell one of the forms and the precipices of the chain of tall white mountains that girded the horizon at noon yesterday? Who saw the narrow sunbeam that came out of the south, and smote upon their summits until they melted and mouldered away in a dust of blue rain? Who saw the dance of the dead clouds when the sunlight left them last night and the west wind blew them before it like withered leaves? All has passed unregretted as unseen; or if the apathy be ever shaken off even for an instant, it is only by what is gross or what is extraordinary."

The spirit of this last sentence should be carried in mind. It is not the grand, the spectacular, the phenomenal in the heavens which will help us in our picture, but rather the quiet subtle beauty, full of sweet expressiveness, which, rightly portrayed, shall instil into our picture a poetry inseparable from the passing to and fro of rain and sunshine, storm and shadow, the bloom and flush of morning mist and splendour of the day's decline. Study all this with the respect which the subject deserves. There is surely something in the exalted splendour and far-off mystery of cloudland which commands our reverential thought.

A general meeting of the Staffordshire Photographic Survey Society was held on the 12th inst., Mr. Charles Lyham in the chair. There was a very large number of members present. Mr. Buchanan Wollaston, of the Platinotype Company, delivered a most interesting lecture on the platinotype process. In the course of his lecture Mr. Wollaston pointed out the usefulness of the platinotype printing in such an undertaking as the photographic survey of Staffordshire. The process was one of absolute permanency, and its artistic merit was far in advance of any other method of producing photographic prints. Many attempts have been made to destroy the platinotype image without success. The lecturer gave a most elaborate demonstration of printing, and showed excellent results, developing in front of his appreciative audience many beautiful pictures illustrating the different tints that might be got on the platinotype paper. After his lecture, many questions on the process were asked of Mr. Wollaston, which he replied to at great length.

## How to Print in Carbon.

By JOHN A. HODGES.

It has always been a matter of wonderment to the writer that carbon, or pigment, printing should have been so little practised by amateurs. The only probable reason that can be suggested for its lack of popularity must be assigned to a general ignorance of the simplicity of the process and the ease with which a practical knowledge of the working details of it is acquired. There are, however, at the time of writing, certain indications that would tend to the belief that interest in carbon printing is being aroused, and the Editor tells me that he is constantly receiving inquiries upon matters of detail incidental to the working of the process.

It will not be gainsaid that permanence is one of the most important attributes of any photographic printing process; and in this respect carbon is unrivalled, except perhaps by platinum. It is very much to be regretted that photographers, as a body, pay so little attention to the question of permanency of their photographs. It is a subject which might worthily receive some of the attention which is so liberally bestowed upon far less important matters. An esteemed writer recently openly expressed the opinion that only permanent photographs should be admitted to the walls of an exhibition, and there would seem to be good sound sense and reasoning in the suggestion.

The stability of a pigment print does not rest upon mere assertion or conjecture. The process has passed from the period of infancy to ripe maturity, and the test of time has amply proved its right to rank with the most permanent of photographic printing methods. The image consists merely of carbon in the form of a pigment and gelatine, the latter converted, by the reaction between it and the bichromate of potash, into a substance almost resembling leather. Fading, strictly so called, is a matter of impossibility with a carbon print; the only possible cause of deterioration is damp. Long exposure to an excessively humid atmosphere will sometimes cause a kind of mildew or fungoid growth to appear on the surface of the print, which a soft damp sponge carefully applied will at once remove.

A further, and from a different point of view almost equally important, advantage of carbon printing is the variety of treatment and range of colour at the disposal of the worker. Any colour from Indian ink to red chalk can be obtained, and, moreover, there is no uncertainty in the duplication of a particular shade of colour. Two prints or two thousand may be produced at will of exactly the same tint, and without the least variation in colour. In regard to "quality," carbon prints compare favourably with other processes, and in some respects, particularly in the rendering of shadow detail, they far excel platinotypes and bromides. Any kind of surface may be produced at the will of the operator, its nature depending upon the character of the temporary support employed. Those for whom the high glaze of a squeezed gelatino-chloride print have charms may obtain a surface rivaling that process in brilliancy, whilst those who prefer the less meretricious but possibly more artistic matt surface of platinotype may, without difficulty, obtain exactly the effect desired. Nor is one confined to the use of any particular kind of paper for the final support, a very smooth or very rough paper being equally applicable. As an instance of the great variety of treatment permissible, attention may be directed to the exhibits of Mr. Bedford and Mr. Yeo, at the last exhibition in Pall Mall. The former gentleman showed some striking pictures of a warm sepia colour, on very rough Whatman paper, their characteristic features being boldness and breadth of treatment, and but for the catalogue the uninitiated would probably have pronounced them to be "platinum-toned silver prints." Mr. Yeo's pictures, also in carbon, were of a totally different character; being of small dimensions, certainly not larger than half-plate, and delicately printed on India paper in red chalk, soft, and full of the most delicate gradation. I merely call attention to these pictures as an instance of the versatility, if I may use the expression, of the process. The attainment of such markedly different results would, I think, not be possible by any other process to the ordinary practical worker.

In order to remove the impression, which is certainly an erroneous one, that pigment printing is difficult, it may be well, before proceeding to detail the practical directions for working, to give a brief outline of the process.

The carbon process was first introduced by Mr. Swan more than twenty years ago, but has since been considerably modified and improved. The tissue consists of prepared paper, which has been evenly and uniformly coated by machinery upon one side with a mixture of gelatine, sugar, and pigment. In this state it is insensitive to light, and will keep, if properly stored, for an indefinite period. It should be cut to size, and kept under pressure in a dry, cool atmosphere. Extremes of temperature will cause it to deteriorate; hot weather

will make it horny, and damp weather cause it to absorb an undue amount of moisture. In order to make the pigmented tissue sensitive to light, it is immersed, face downwards, in a solution of bichromate of potassium. It is then removed and dried. Tissue so prepared will retain its keeping qualities under favourable conditions for about a week, but the best results will always be obtained from tissue freshly sensitised. The reader need not even go to the trouble of sensitising the tissue, for the Autotype Company, and also Messrs. Marion, supply tissue ready sensitised, which will keep in good condition for at least a fortnight. The sensitised tissue is exposed to light under the negative, the duration of the exposure being estimated, not by an examination of the tissue, which undergoes no visual change, but by the discoloration of a piece of sensitised paper placed in an instrument called an actinometer, hereafter to be described. Development is effected by immersing the exposed tissue in warm water. The *rationale* of the process is as follows: Gelatine which has been mixed with a solution of bichromate of potassium will, if it be exposed to light, become insoluble. Upon this curious property the carbon process is founded. When the exposed tissue is placed in the warm water, the gelatine not acted upon by light, representing, of course, the high lights, sky, etc., in the picture, is dissolved away, the more or less insoluble portions remaining and forming the image.

The above is a very brief outline of the process, though in practice there are some very important modifications and matters of detail to be observed, to which attention will be directed in due course. My object now is to introduce the subject to the reader in such a way as to demonstrate the simplicity of the process, and induce him to give it a fair trial.

I have said nothing at present on the question of cost. Pigment printing, however, is the most economical of processes, rivalling albumenised paper in that respect; which in itself is a matter of no small importance to a great many. Nor is the initial cost of the necessary apparatus at all alarming, the expensive outfits enumerated in dealers' catalogues being entirely unnecessary. Most of the necessary apparatus will probably already be in the possession of the reader, but in order that he may know what will be required, I have drawn up the following list, and have placed the approximate price against each article:—

	s. d.
A tin or enamelled iron dish, about 20 by 16, and 6 in. deep. A large baking tin would do, probable cost about	2 6
A strong iron support to hold the dish over the gas-stove, probable cost about	2 6
An atmospheric gas-stove	2 6
Or a small paraffin stove, cost	3 6
Two deep porcelain dishes, 12 by 10	4 0
A thermometer...	1 6
A squeegee	1 0
One dozen wood clips	1 0
Three pieces of glass (patent plate), 10 by 8	3 0

As I have said, probably many of the above articles will already be in the reader's possession, and the price of such would be deducted from the total cost.

The following materials and chemicals will be necessary:—

Pigmented tissue.  
Single transfer paper.  
Sawyer's flexible support (for double transfer).  
One quire of blotting paper.  
One ounce French chalk.  
Four ounces plain collodion.  
One pound of alum.  
Quarter pound of bichromate of potash.  
Half-dozen indiarubber finger stalls.  
One ounce pure bees-wax.  
One ounce benzole.  
Some strips of opaque black paper gummed to form "safe edge."

Having procured the above, the reader will be ready for work.

## Pin-hole Photography.\*

BY J. FAVRE-BRANDT.

ATTENTION has been called many times to the quality of photographs that can be obtained in a darkened chamber, or camera, without special optical apparatus, simply by means of a small hole in a very thin plate.

Amateur photographers can make pictures, pretty large in size, of

landscapes and even of monuments, without being obliged to buy lenses costing from 10 dols. to 300 dols.

No doubt to reproduce plans and engravings it is necessary to use the famous lenses of Ross, Dallmeyer, Beck, Hermagis, Francais, Nadar, and others. But we wish to perceive, when we examine a photograph, the particular effect which is produced on a more or less near-sighted eye by its entire surroundings, when it looks at nature from a little distance. It seems to us that suppressing the lens and replacing it by a pin-hole gives more artistic results as far as regards monuments, or landscapes without moving figures.

"Nevertheless, far from us," says the AMATEUR PHOTOGRAPHER journal, "is the idea of crying down the photographic lens which has in the last year attained so great perfection; for in the greater number of cases these instruments are, and will remain, indispensable." But leaving out the instantaneous photograph which has such charm for the amateur; and the portrait, the speciality of the professional, let us confine our ambition to obtaining in as artistic a manner as possible either landscapes or copies of monuments; and of these latter there are certainly no lack in Japan.

M. Meheux says that the most suitable hole is round, and drilled in a plate of copper or sheet brass of  $\frac{1}{10}$  millimetre in thickness; it is necessary that the borders show no burr and are bevelled, forming a cone.

Captain Colson has remarked that, although the depth of focus is unlimited, the greatest sharpness of definition for each size of hole is found at a determined distance, and he has succeeded in finding the proper focal distances for different diameters of holes; he has thus found that:—

The best definition for a hole $\frac{1}{10}$ millimetre is at 11 centimetres.	
" " $\frac{1}{8}$ " " 20 "	
" " $\frac{1}{6}$ " " 30 "	
" " $\frac{1}{4}$ " " 44 "	

It may be mentioned that the size of the object to be reproduced is proportional to the distance from the apparatus, and to the distance from the hole to the sensitive surface.

It follows from this rule, that after having taken, for example, one view of an entire cathedral with a focal length of 20 centimetres, say with the  $\frac{1}{10}$  millimetre diameter of hole, if we wish to have the details of the gateway without moving from our place, it is sufficient to lengthen the focus to 44 centimetres and to use the  $\frac{1}{4}$  millimetre hole.

We may further remark that the *Stenope*—the name given to the above mentioned plates—easily includes an angle of 100 degrees, or even more, without at all deforming architectural lines, and without destroying the perspective, which is far from being the case with even the most perfect wide-angle lens.

The length of exposure presents much less difficulty than with lenses. Unless we expose enormously beyond the proper time, it is nearly impossible to over-expose; we can always obtain a good negative by developing intelligently.

Nevertheless, if one must have a general approximate rule, we may say as a general proposition that the time of exposure is at least twenty-five times longer with the  $\frac{1}{10}$  mm. hole than with a lens focussed upon the same view and provided with a medium diaphragm; fifty times longer with the  $\frac{1}{8}$  mm. hole; one hundred times longer with the  $\frac{1}{6}$  mm. hole; and two hundred times longer with the  $\frac{1}{4}$  mm. hole; it being well understood that we use the focal lengths corresponding to these holes.

But we can modify these times of exposure without over-exposing the plate. On the whole this depends very much on the plates, the developer, and the actinic power of the light. Experience will be the best guide for every class of picture. Just the same as in nature, the sun has here great influence on the clearness of the view, more than it has when using lenses.

To sum up the advantages of using the *Stenope*:—

- (1) More artistic definition than with a lens.
- (2) Unlimited depths of focus.
- (3) Perfect perspective for lines in architecture.
- (4) Mathematical exactness in the scale of plans.
- (5) The angle of view can include as much as 170 degrees.

All the proofs, under the numbers 1, 2, 3, and 4, represent the same subject, and are taken with the same apparatus from one and the same distance, say 20 metres from the corner of a house marked A. The number representing the house and garden was taken with the  $\frac{1}{10}$  mm. hole, distance from hole to sensitive plate 11 centimetres, time of exposure 1 min. 25 sec.

No. 2 view from same plate with the  $\frac{1}{8}$  mm. hole 20 centimetres from the plate.

No. 3 is taken with the  $\frac{1}{6}$  mm. hole, 30 centimetres from the plate; and finally, No. 4 is taken with  $\frac{1}{4}$  mm. hole, 44 centimetres from the plate; distance between the apparatus and the house 18 to 20 metres. Time of exposure varies in the different numbers from 1 min. 25 sec. to 2 min. 30 sec.

\* Read before the Photographic Society of Japan.

he treats us to "Some photographic methods of book illustration," which, unfortunately, he condenses into some twenty pages. Had he condensed to invisibility some of the contributions and enlarged his own, we should have been better pleased; still, from each article there is some hint or suggestion to be gathered. The frontispiece is a colotype by Messrs. Morgan and Kidd, and five process-block illustrations, which are excellently printed, are also included. We all look for the "B. J. A.," and here it is and well worth the money—if for paper only.

*The Year-Book of Photography for 1893.* Edited by T. C. Heworth, F.C.S., and published by Alexander and Shephard, 21 and 22, Farnival Street, E.C. Price 1s.

The Editor is to be congratulated upon the improvement in the turn-out of this annual, both paper and printing being decidedly an improvement on previous year's issue. It contains the usual run of annual articles and also two collotypes, one from a negative by the Editor, in which the surroundings are hardly in keeping with the figure.

### WORK WITH A HAND-CAMERA.

AT the ordinary meeting of the Putney Society, Dr. W. J. Sheppard in the chair, the programme of the evening was "Work with a Hand-camera," by Mr. A. R. Dresser. Mr. Dresser was unfortunately unable, through illness, to be present, but Mr. Henry Crouch, the well-known optician, kindly came in his stead, and from notes supplied by Mr. Dresser, supplemented by his own experience, gave the members much useful information and advice on the subject. In a short preface, Mr. Crouch said that there could be little doubt but that the "ordinary" cameras were being gradually superseded by the hand-camera, and that sooner or later the former would be a thing of the past. There were several reasons why this should be, but the two chief were the improvements in hand-cameras, and that plates were now made of such greatly increased sensitiveness that sufficient exposure could be obtained for snap-shots even in what would quite recently have been considered too dull a light. With regard to the cameras, every year showed a marked alteration for the better; attention had been successfully given to the lens, shutter, and changing mechanism, and extra movements had been added, such as focussing, rising front, and swing back.

Hand-cameras might be divided broadly into two classes, viz., magazine, and those where the ordinary dark slides were used. Each system possessed advantages peculiar to itself, and it was a matter of individual opinion or special requirements that determined the question which camera was the most suitable. No camera should be expected to meet all wants. Some people desired to do very quick work; to them a magazine camera would offer advantages. Others wished to get the best results under very varying conditions; for such the double backs or roll-holder would be preferable. For all-round work he had personally no preference, but thought that good and artistic work could be done with any good magazine or double-back camera, if workers would only take the trouble to make themselves acquainted with the mechanism and the extent and limitations of the power of their camera. Mr. Dresser had successfully worked the rollable film, and this method had the great advantage of compactness, lightness, and ease of changing, but it would appear from general practice of average workers that these advantages were not unfrequently considered to be more than counterbalanced by the subsequent trouble and uncertainty in development, etc.

Mr. Crouch then proceeded to deal in detail with the main parts of the hand-camera, commencing with the lens. He said that in hand-cameras the mistake was often made of using an inferior lens, in fact, one that no serious photographer would dream of placing on his ordinary camera. This was all the more inexplicable when it must be obvious that the conditions of successful work with a hand-camera were far more difficult and required higher optical qualities in the lens than were generally found necessary in ordinary work. In order to obtain a suitable extent of view, and to be able to take in objects fairly near as well as at a distance, it was necessary that the lens should be of a comparatively short focus. For a quarter-plate Mr. Dresser used by preference one of  $4\frac{1}{2}$  in. focus. Mr. Crouch personally preferred one of about 5 in., but it might be laid down as a rule that the focus should be between  $4\frac{1}{2}$  and  $5\frac{1}{2}$  in., and certainly not more than 6 in.; if more than 6 in., the chief objects within 25 or 30 ft. would be out of proportion to the plate, and successful photography of street scenes and subjects in any but very open views would be extremely difficult. As regarded aperture, he had made lenses working at  $f/5$ , but they were not to be recommended except to the most expert workers, who would only use them at this aperture with the greatest discrimination;  $f/8$  was, generally speaking, the largest aperture at which any lens would work satisfactorily as

regards covering power and depth of focus, and as a rule a smaller stop should be used if possible, so that when the principal object is in focus, the foreground as well as the distance may be fairly sharp. As a large aperture required very much more judgment and experience in working than did a moderate one of say  $f/11$ , or  $f/16$ , he recommended beginners to commence with the smaller, and only by slow degrees and after careful study of results, to increase it. A rapid rectilinear lens was by no means necessary, and Mr. Crouch said that for landscape, and, indeed, for nearly all subjects except architecture, a good single lens was preferable, as it undoubtedly gave pictures of greater brilliancy. This result was, he thought, to a great extent due to the fact that the diaphragm was placed in front of the lens, and, therefore, a larger quantity of light could enter than was possible when the diaphragm was placed between the combinations, as in lenses of the R. R. type. The single lens had also the advantage of being considerably cheaper, a really good one being about the same price as an R. R. of comparatively inferior quality. As a first-class lens was the first consideration in hand-camera work, he strongly urged everyone who desired to do good work to see that his camera was fitted with as good a lens as he could afford to provide.

As regarded shutters, there was an almost endless variety. He thought a good one should work with certainty at from 1-200th to 2 sec., and the best place for it was near the diaphragm or immediately in front of the plate, the latter being theoretically more correct, but after careful comparison of results he had come to the conclusion that there was practically little or no difference, but as the shutter working near the diaphragm could be more compactly arranged and had several other advantages, he preferred it on the whole to other forms. It was necessary that all parts of the shutter should be very strongly made, so as to be able to resist the very considerable strains due to a high speed, and it should be as simple as possible, so as to be unaffected by small particles of dust and other vicissitudes, which he had known to seriously interfere with delicate mechanisms at the critical moment. For occasional work, Mr. Crouch advised a fixed-focus camera, but for those with leisure and in constant practice better work would be possible with the power of altering the focus; this would, however, probably mean many failures until they were able to judge distances quickly and correctly. He had found finders a great nuisance and quite unnecessary, and he strongly advised members to do without them. By practising pointing the camera he ventured to assert that in a very short time they would acquire the necessary proficiency to get the subject properly on the plate, and the finder would not be missed. As to the proper way of holding the camera, he did not think that any one position would meet all requirements; for near objects he held it in front of him about 4 ft. from the ground, sometimes considerably lower; for far objects he held it higher. In this connection he had found a rising front of great assistance, as a very slight rise or fall of the front was equivalent to altering the height of the camera several inches. Using the camera in this manner, without finders, he claimed to be able to get in exactly what he wanted with greater speed and ease, and with less trouble in keeping lines parallel and true.

There were now so many good plates and films that it would be invidious to advise the use of any one, but it should be remembered that for hand-camera work a brand having an emulsion rich in silver was much more necessary than when slow exposures were given. His advice was, having found a good brand of plates or films and suitable developer, stick to them. He regarded development as one of the chief means towards a good result. When a plate had had an exposure of only  $\frac{1}{100}$  sec., much experience and careful thought were necessary. The following formula had, in his hands, given excellent results, viz., eikonogen 1 oz., sulphite soda 4 oz., carbonate potass. 1 oz., carbonate soda or washing soda  $1\frac{1}{2}$  oz., water 30 oz., and any hydroquinone developer, one without *caustic* soda by preference. With very fast exposures two parts eikonogen solution should be added to one part of the quinol, to begin with; if this does not act sufficiently quickly, pour it off and use the eiko. alone, adding saturated solution carbonate potassium till the plate begins to fog. Some plates would stand up to 1 drm. per ounce, and others would not stand any addition. It would thus be seen that a strong developer should not be used to start with. Begin with a normal developer until image is fairly out, and then strengthen until the plate will bear no more. Perhaps a still better developer for general work, and lantern slides, bromide papers and exposures from  $\frac{1}{100}$  to  $\frac{1}{10}$  sec., is Rodinal, 1 part to 20 parts water; should there be any difficulty in getting density, the developer should be poured off and hydroquinone used. He, however, thought that the best developer for snap shots would be found in Amidol, but was unable to say definitely, having had only two chances to try it; however, on those occasions he had obtained marvellous detail and density, using the following formulæ: (1) Amidol 1 oz., meta-bisulphite potassium 1 oz., water 10 oz.; (2) saturated solution of potassium; (3) 10 per cent. solution potassium bromide. For

use, take No. 1 1 drm., No. 2 1 drm., No. 3 5 drops, water 1 oz. Should exposure have been very rapid, leave out No. 3; if necessary to increase density, add 20 to 40 drops more of No. 2. The image would flash up at once, but the plate would not fog unless very much over-exposed. In cases of over-exposure more bromide should be used, but developer should not be weakened by the addition of more water.

After Mr. Crouch's lecture about eighty slides made by Mr. Dresser were passed through the lantern and met with hearty applause from those present. An album containing a large number of prints was also passed round, showing the very excellent work done by him under varying conditions. Mr. Crouch's "Dresser" hand-camera was shown and explained, the members expressing their high appreciation of its design and workmanship.

## Societies' Notes.

WE are requested to state that the new Secretary of the Fairfield Camera Club is Mr. S. O. H. Kean, 6, Balmoral Road, Fairfield, to whom all communications should be addressed.

THE Toronto (Canada) Camera Club will hold their second annual exhibition on January 12th, 13th, and 14th, 1893. Entries close on January 8th, 1893.

THE Torquay Phot. Soc. will hold their first exhibition from February 14th to 18th, 1893. The following are the classes and conditions:—

*For Members' Only.*—(1) Architecture and interiors, (2) genre and portraits, (3) landscape, (4) lantern slides (set of six), (5) marine, (6) six prints from negatives taken with a hand-camera, (7) enlargements.

*Open Classes.*—(8) Architecture and interiors, (9) genre, (10) landscape, (11) lantern slides (set of six), (12) marine, (13) portraits and figure studies, (14) six prints from negatives taken with a hand-camera, (15) enlargements, (16) for ladies only (any subject).

*Conditions.*—(1) That the exhibition be held at Iredale's Art Gallery, Strand, Torquay, on the 14th, 15th, 16th, 17th, and 18th February, 1893. (2) That all members' exhibits must be the work of the exhibitor, including exposure, development, retouching, printing, toning, and mounting. (3) That all exhibits must be sent in to the Hon. Sec., addressed to him, care of Mr. Andrew Iredale, 13, Strand, Torquay, on or before February 9th, carriage paid, at the owner's risk, duly mounted and classified; any question of classification to be left to the Committee, and in case of any dispute to be referred to the Judges. Enlargements to be eligible in all the members' classes. (4) The Judges shall have power to withhold the medals in any of the members' classes, and also in the open classes (with the concurrence of the Committee) on the ground of insufficient merit, and their decision shall be final. (5) That all exhibits be sent in with the title and exhibitor's name written on the back. (6) That no competitor shall take more than one prize in any class. (7) That the entrance fee for each frame or mount in the open classes be 1s. 6d., and 1s. 6d. for lantern slides, which fees must be sent to the Hon. Sec., with the advice form annexed, not later than February 3rd, to be entered in the catalogue.

Every possible care will be taken to protect exhibits, but the Committee will not be responsible for any loss arising from fire, accident, or other cause. An experienced packer will be employed. Silver and bronze medals and certificates are offered in all classes. The President has kindly placed three silver medals at the disposal of the Judges for award in Nos. 1, 3, and 5 of the members' classes.

## Societies' Meetings.

**Ashton-under-Lyne.**—On the 13th inst. Major Bradley presiding, and before a very large gathering of members and friends, the AMATEUR PHOTOGRAPHER 1892 Prize Slides were exhibited. Mr. R. T. Marsland worked the lantern (biennial), and the Secretary (Mr. G. H. Dean) read from the somewhat tattered manuscript the names of competitors and the titles of their pictures. Some of the slides were very good and loudly applauded. The slides of Mrs. F. Clarke were very much admired.

**Bournemouth.**—On 14th inst. a very successful evening was spent, when THE AMATEUR PHOTOGRAPHER Prize Slides were exhibited, and were much admired by those present. Some 150 slides were passed through the lantern, the description of each being given by Mr. P. H. Price. Many of them were criticised and afforded a great amount of instruction to slide-makers present.

**Brechin (Phot. Assoc.).**—For the past year this association has been engaged preparing slides to illustrate linen manufacture. These are now completed, and on Wednesday evening, December 14th, Mr. D. H. Saunders (Dundee) gave a lecture entitled "Linen and its Production" before an audience of about 1,000 persons. The lecture was illustrated by seventy slides prepared by the members of the association, and was listened to with great attention. The lecturer was thoroughly at home in his subject, and slides of the processes of bygone days, such as the spinning wheel, hand looms, etc., gave him an opportunity of referring to the past history of linen manufacture in Scotland, with all its romantic incidents, of which he was not slow to avail himself. Suitable songs by Miss Johnston and Mr. Duncan were sung at intervals, and proved most acceptable. The slides were considered to be most admirable illustrations of the processes, and the positions of the people at work.

**Chorley.**—On 7th a meeting was held, when a demonstration was given by the President (Mr. J. T. Brierley, F.C.S.) on the "Autotype Process of Carbon Printing." Mr. Brierley had previously printed some of the tissue, so as to show the prints in their various stages of development, etc., showing both the single and double transfer processes and an easily made actinometer for gauging the necessary exposure for a correct print, as well as several specimens of opal. During the evening members were invited to compete and carry out the various processes. At the close of the demonstration a number of specimen prints for the members' inspection, kindly sent down by the Autotype Company, were handed round and were much admired, Mr. Brierley presenting all the members present with trial pieces of tissue. Previous to beginning the demonstration, Mr. Brierley showed the company present the photographically active light rays, as differing from the non-actinic, by means of the spectroscope.

**Crews.**—A very pleasing and successful entertainment took place on the 14th inst., the President (Rev. W. G. Rainsford, D.D.) in the chair. There was a very good attendance of members and friends. There were upwards of 150 slides thrown upon the screen, and, judging from the hearty applause, they must have been heartily appreciated. The subjects were Channel Islands, statuary, and Irish scenery. The pictures were explained by Dr. Rainsford and the Secretary (Mr. T. Gorrell). The Channel Island slides were the work and kind privilege of W. Tylar, Birmingham, and were considered extremely good for hand-camera work, especially the low-priced 12s. 6d. A beautiful sample of Tylar's binocularscope for viewing lantern slides was exhibited, and liked very much. Also a Tylar's new frame for lantern-slide making; this was very greatly admired.

**Croydon (Camera Club).**—Lantern night, the President in the chair. Messrs. Sladden, Oakley, Maclean, Weston, Corden, and Holland showed slides. It was notified that Mr. G. R. White had resumed his secretarial duties. The next meeting will be on 2nd January, when a debate on "What is now the best printing process?" will be opened by the President; prints in illustration of various processes will be shown, and a number of different methods of printing will be advocated by those who have signified their intention to take a leading part in the evening's proceedings.

**Croydon (Microscopical).**—Lantern evening on 16th inst., Society of Arts' loan series of Chicago slides. The President, Mr. Lovett, read a short paper, which, after briefly reviewing the history of the city, was devoted to an account of the World's Fair to be held in 1893. The slides included views of the city and the principal

## The Cheap Detective Series.

loth bound, good quality boards, not the cheap wood pulp boards usually sold, which are far from pure. Lettered on front, "Photographic Views." Upright or oblong.

For  $\frac{1}{4}$ -plate, 1/- each.

For  $\frac{1}{2}$ -plate, 2/- each.

## The Professional Specimen Album.

For show-room use. A new and elegant arrangement of each page admits of the photograph being inserted in a moment, without the labour of pushing up as in ordinary albums, and the troublesome elastic in the usual table display albums. The album closes uniformly whether full or empty, and no bursting of the back is possible.

Elegantly half-bound, 10 leaves (16 x 13), holding 36 C.-de-V.'s and 64 Cabinets, lettered in gilt, "Portraits," 25/-

Ditto, in superior full morocco, highly finished, 35/-

## The Interchangeable Leaf Series.

Prints may be burnished or rolled. Leaves that become soiled may be removed. One really good quality album back may be used, and thousands of spare pictures kept in drawers or store boxes. Numerous kinds of mounts are supplied.

PRICE LIST of Cases only. To hold 25 or 50.

				Extra Finish,
8 x 6 ...	Cloth, 2/3	Half-Roan, 3/9	Full morocco, 4/9

We make almost every kind of Album to order, and shall be glad to quote for large or small quantities. COMPLETE CATALOGUE OF PHOTOGRAPHIC REQUISITES, POST-FREE, 3d.

FACTORY: The Country Press, BRADFORD.

LONDON WAREHOUSE:

Memorial Hall, Ludgate Circus.

public buildings, sketches and plans of the Exposition buildings and grounds, with photographs of them now nearly finished, which gave one a good idea of the general appearance which the Exposition would present when opened.

**Derby.**—A meeting was held on the 13th inst., when a lecture and demonstration on the "Platinotype Process" was given by Mr. S. G. B. Wollaston, of London. Mr. R. Keene occupied the chair, and there was a large attendance of members. In connection with the summer outdoor meetings prizes were offered for the best pictures taken by amateur members only. First prize, silver medal, given by Mr. W. Bemrose; second prize, bronze medal, given by Mr. W. T. F. Rowney; third prize, certificate of merit, given by the society. The pictures having been judged by Captain W. de W. Abney, R.E., F.R.S. (President), his decision was announced as follows:—First prize, Mr. A. H. Bennet; second prize, Mr. F. E. Bemrose third prize, Mr. J. Riches.

**Durham.**—A meeting was held on 10th inst. Vice-President Councillor E. White in the chair. The Chairman introduced Mr. J. Brown, of the Newcastle and Northern Counties' Photographic Association, who gave a very interesting and instructive lecture, entitled "Some Hints on Landscape Work; What to Do, and What to Avoid." The lecture was illustrated with limelight views, showing good and defective points in composition, lighting, artistic arrangement, etc. Mr. Brown handled his subject in a happy and masterly manner, and many of the beautiful slides shown as perfect specimens by Mr. E. G. Lee were deservedly applauded. An exhibition of members' work will be held on Tuesday, Feb. 14th, 1893.

**East London.**—General meeting on 13th inst., Mr. F. Uffindell; Vice-President, in the chair. Mr. Pasco gave a very interesting lecture upon "Norfolk Broads," illustrated with photographic views kindly lent by the Great Eastern Railway Company.

**Fairfield.**—The first annual meeting was held on the 13th inst., when the President, Mr. J. L. Mackrell, presided over a large attendance of members. The prints and slides sent into the annual competition were on view, and the judges awards given as follows:—Class A, the club silver medal and clasp, Mr. Harry Holt. Class B, bronze medal, C. A. Timmins. Class C, bronze medal, S. H. I. Smith; highly commended, F. H. Elsyby. Class D, bronze medal for slides, T. E. C. Wilson. In all classes the work was of exceedingly high standard, and the announcement of the awards called forth loud applause. The annual report was then given by the Hon. Secretary, who briefly reviewed the year's work, and congratulated the club on the rapid progress it had made. This was followed by the Treasurer's financial statement, which showed a goodly balance on the right side. After the adoption of these reports, the election of office-bearers for 1893 took place, the following gentlemen being elected: President, H. J. Mallabar; Vice-President, C. A. Timmins; Council, Messrs. F. H. Elsyby, H. Forrest, H. Holt, J. L. Mackrell, J. Samuel, S. H. J. Smith; Hon. Librarian, G. W. L. Lenton; Hon. Auditor, T. E. C. Wilson; Hon. Treasurer, W. T. Sutton, 27, Seldon Street; Hon. Secretary, S. O. H. Keay, 6, Balmoral Road.

**Guildford.**—On 15th, Messrs. Hill Bros., of Surbiton, demonstrated the working of their "Cresco Fylma" solution before members of this Society. The manipulations were most simple, and the results obtained fully satisfied everyone, a half-plate transparency being enlarged to whole-plate, and transferred to an opal plate, also a 5 by 4 to 6½ by 5, and a lantern plate to 4½ square. Very slight loss of density took place, and an actual increase of detail. No distortion took place in any case. On January 3rd the AMATEUR PHOTOGRAPHER Prize Slides will be shown at the Society's meeting.

**Hackney.**—Ordinary meeting held on 13th inst., Mr. T. Houghton presiding. The Hon. Secretary showed several specialties sent by Mr. Ververs, of Leeds. Mr. Hudson passed around a plate which had been very badly stained, but which Mr. Beckett had cleared of iridescence by Farmer's reducer. Mr. Wire showed some flashlight work he had done with the use of a Todd-Forret lamp. Mr. R. Beckett passed around a photograph of himself which had been taken by flashlight by Mr. Nievsky with his combined apparatus. Mr. A. Barker showed a photograph he had taken of a spark from the Wimshurst electric machine. The Chairman handed round a broken lantern-slide which was valuable to him, and asked for opinions as to how to repair it. Mr. Dean advised using Canada balsam to cement plain glass on to it, then removing the cover, print a negative from it by contact in diffused light. Mr. R. Beckett advised using a roasting jack. Major Bruno's design of hand-camera was then explained by Mr. Beckett. It was made by Mr. Park, of Kingsland. The chief points were, a dark-slide or roll-holder could be used, extending front, sliding, focussing screen, swing-back, rising front, etc. Mr. Hudson showed his Thornton-Pickard shutter. He had a hole in the blind, but by using a small piece of court plaster it was successfully repaired. Mr. Walter Woodbury then gave a demonstration of the Paget print-out lantern-slides and opal plates. A special frame was necessary to print opals, and he showed one the firm were bringing out capable of taking any

size upwards, from lantern size to half-plate. Lantern plates could be successfully printed in ordinary quarter-plate frame, as the density could easily be judged by looking through one side. Perfect contact was absolutely necessary with lantern-slides, as otherwise fuzziness would become a defect fatal to lantern-slides. The lecturer then made some exposures with the platinotype lamp successfully. Ordinary toning bath can be used, but if combined bath is used the density must be a little greater. Several members took samples and promised to bring up results next lantern night.

**Japan.**—The regular monthly meeting was held on 4th ult. Work done by Messrs. C. D. West and W. K. Burton during the summer vacation was on exhibition. The regular meeting began at 5 p.m., Mr. G. Gilbert in the chair. The following gentlemen were unanimously elected members of the society:—Messrs. A. B. Brown, J. B. M. Barrett, P. C. E. Choissone, and T. Kiyokawa, Drs. E. Scriber, and Augustus Wood. Mr. Tanaka showed some results of experiments in collotype. They were not quite perfect, but were remarkable as the results of first attempts in this difficult branch of photo-mechanical work, the more especially as Mr. Tanaka had worked entirely from written instructions. After trying various more or less complicated formulae, he had settled on the following:—Bichromate of ammonium, 1 gram; pure gelatine, 6 grams; water, 70 c.c. He had found an admixture of isinglass, even in small quantities, the reverse of an advantage. Messrs. W. K. Burton and K. Arito showed the results of experiments in orthochromatic work. They had set themselves the task of getting photographs showing a brilliant pure scarlet, a bright but darkish blue, and a pure chrome yellow, in their true value. If these could be shown truly all other colours could. They had succeeded best with a mixture of eosine and cyanine. Eosine was a strong sensitiser for the yellow and the green, cyanine for the red and the orange. The following formula was used:—Cyanine solution, 1 part in 1,000, 1 part; eosine solution, 1 part in 1,000, 1 part; ammonia, 10 per cent. solution, 4 parts; water (distilled), 14 parts. The plates were bathed for two minutes and dried. Of course, such plates need the extremest care in working. A yellow screen was used with plate-glass sides, inclosing ¼ in. thickness of the following solution:—Picric acid, 1 part; water, 500 parts. The intense but very light yellow colour of a picric acid solution seemed particularly well suited to orthochromatisation. With a denser solution than that mentioned it was possible to overdo the orthochromatisation. The exposure needed was ten times that with the same plate untreated, but without any yellow screen. Mr. J. Favre-Brandt sent a most interesting paper on "Pin-Hole Photography" (photography without a lens), along with samples of the work done, and of the pin-holes used. It was agreed that these samples were remarkably good. In fact, in some respects, they were better than photographs taken with a lens, showing a pleasing softness. The exposures had been from one to about five minutes. The unusual excellence of these results was probably due to the great care with which the pin-holes were prepared. They were in thin plates of nickel, were perfectly circular, in each case of the exact diameter that would give the finest definition with the focal length used, and the edges were delicately bevelled. Mr. Favre-Brandt's paper was in French, and a translation appears in another column of this issue. Mr. Kajima Sebi showed a hand-camera in the form of an opera glass. The arrangement on the whole was ingenious, but samples of work done by the camera were much under-exposed. The lens working at about 1-16 was far too slow for this kind of work, especially as the shutter was one that gave a bad co-efficient of light. Further, there was no means of adjusting the focus. Mr. T. Kiyokawa presented the society with a bottle of retouching solution. This was to be applied to the plates whilst still wet, after fixing and washing. It was evidently an aqueous solution. Mr. Tanaka was asked to take the bottle with him, to try the solutions, and to report to the next meeting.

**Kendal.**—On 14th inst. a meeting was held. After the ordinary business of the evening, which comprised arrangements for a lantern slide competition to be held next March, Mr. Joseph Severs read a most interesting and instructive paper on "Photo-micrography," or the science of photographing microscopic objects for use on the lantern screen. He described its advantages, one of which was the accuracy with which any minute object could be reproduced by the lens, as opposed to the old plan of drawing them, an artist being apt to draw what he expects to see rather than what he does see. The microscopic lens was not always suitable for photography, and ought to be tested before using it for such, as the visual rays of the spectrum were not equal to the chemical rays, the latter having greater refrangibility, and, therefore, an object which would be in perfect focus in the microscope, on the photographic plate would be simply a blur; for the chemical rays were always behind the visual ones. Mr. Severs showed with his microscope and camera how to set about operations for photographing a microscopic object. Some negatives and very beautiful prints were handed round for inspection at the close of the meeting.

**Kensington and Bayswater.**—A meeting was held on the 19th

inst., presided over by Mr. F. A. Hahn. Messrs. Burton and Braham, from the Autotype Company, gave a practical demonstration on the carbon process, or, as it is now more correctly termed, "pigment printing."

**Liverpool (Camera Club).**—The usual meeting was held on 14th inst., when an interesting demonstration was given by Mr. T. Edwards on "Lantern-Slides, Reduction from half-plate." Mr. Edwards in the course of his remarks described the making of a simple camera for reducing purposes, and with one of which he proceeded to reduce from half-plate to lantern-slides. The club's second annual fancy dress ball took place on Monday the 12th inst., in the City Hall, Eberle Street, and was a great success. The costumes were finer and more elaborate than last year, and comprised Eastern princesses, Italians, Greeks, Minnie Palmers, the Seasons, Witches, Romans, courtiers, clowns, etc., etc., the spectacle when all were dancing being brilliant. During the evening several groups were taken by flashlight.

**Manchester.**—The regular monthly meeting was held on 13th inst., Mr. J. W. Wade in the chair. THE AMATEUR PHOTOGRAPHER Prize Slides were thrown on the screen and described by Mr. Shirley. It is noticeable that all the prizes in Class 4, architecture, were obtained by members of the Society. During the interval Messrs. Beck's representative described the "Frena" hand-camera. A number of snap-shot slides by members were shown on the screen. Many of these possessed considerable merit, and were a distinct improvement on previous exhibits of the same kind. Perhaps this is owing to the slides having been carefully selected by a committee from those sent in. The exhibitors were Messrs. Gilmore, Shirley, Irvine, Wade, Yorston, Gilchrist, H. Wade, Bradburn, Holmes, Smedley, Shaw, and Robinson.

**Midland.**—An ordinary general meeting was held on the 16th inst. The chair was occupied by the President (Dr. Hall Edwards), who delivered an address on Mr. Frederick Iles' "Chromotone Process" (patent). This is a new process whereby a large range of new colours can be obtained upon any silver deposit either on prints or lantern slides. The lecturer explained that Mr. Iles had confided his discovery to him, and that during the last three months they had experimented with it with such good results that a patent had been obtained. A large number of bromide prints treated with the Chromotone bath were exhibited. The tones obtained varied from a slate-green colour to a bright blue. Some of them were much admired, and will undoubtedly lend themselves with good effect to many branches of our art. A large range of greens could also be obtained by first treating the print in a special uranium bath, then in the Chromotone bath. Some of the prints exhibited both blue and green, producing a very pretty effect, especially in seascapes, when the sea could be produced in one colour and the clouds in another. The lantern slides exhibited were very beautiful. A very much larger range of tones was produced than in the prints. This was accounted for by Dr. Hall Edwards, by the fact that very few experiments had been made with papers, whilst lantern plates had been largely used. He was of opinion that any tone shown through the lantern could be obtained on paper. All the prints shown were made upon Ilford rapid bromide paper, developed with hydroquinone. Many other tones could be produced with other papers, Alpha paper especially lending itself to green tones. The compositions of the baths were not made known, but as they are shortly to be put on the market, photographers will be able to try them for themselves. The lecturer described the process as being exceedingly simple, any special tone being obtained with the greatest ease. He had every reason to believe that the colours were as permanent as the prints themselves.

**Oxford.**—At a special meeting held on December 15th the Indian and colonial slides, circulated by the P. S. G. B. affiliation scheme were exhibited in the President's lantern, who afterwards showed a set of fine slides of the Niagara Falls by the Woodbury process.

**Philadelphia.**—A meeting was held on 9th ult. the President (Mr. Joseph H. Burroughs) in the chair. The Board of Directors reported the election of the following active members: Messrs. Richard Paxson and William G. Hopper. It was also announced that the President had appointed the following committee to conduct the sixth annual photographic exhibition under agreement with the Society of Amateur Photographers of New York and the Boston Camera Club: Robert S. Redfield, John G. Bullock, Charles R. Pencoast, Charles L. Mitchell, M.D., and Edmund Stirling. The exhibition will be held April 17th to 29th, 1893, in the galleries of the Pennsylvania Academy of Fine Arts, and every effort will be made to make it the most interesting and successful of the series yet held. The resolution offered at the last stated meeting to amend the bye-laws so as to make a change in the meeting night, was discussed at considerable length, and finally, on motion of Mr. Coates, was laid on the table. A number of photographic novelties were shown by Mr. Morris Earle, among which were: Celluloid trays of special construction, and made in various colours; a transparent tray with a well at one end to hold the developer when tray was

raised to examine the negative through the bottom. He also showed and described the Frena magazine hand-camera, made by Messrs. R. and J. Beck, of London. The camera used cut celluloid films,  $3\frac{1}{4}$  in square, the magazine containing forty such films. Dr. Mitchell showed negatives made under similar conditions with the Ross Concentric lens and Ross Portable lens, which afforded an opportunity for studying the comparative advantages of the two lenses for different classes of work. An interesting collection of lantern-slides was shown and described by Mr. John C. Browne, illustrating a recent trip made by him to Alaska.

**Phot. Soc. of Great Britain.**—Ordinary meeting on 13th inst., the President, Captain W. de W. Abney, in the chair. Seventeen new members were elected, and it was announced that the following societies were admitted to affiliation:—Hackney Photographic Society, Cheltenham Amateur Photographic Society. Major Leonard Darwin, R.E., M.P., read a paper on the "Testing of Photographic Lenses at Kew," in which he detailed the various points to be dealt with, and how they had been met, after which some slides were passed through the lantern of the lens-testing apparatus, and its special points indicated by Major Darwin. Mr. W. E. Debenham spoke of the desirability of such an institution, and trusted it would clear away some of the old long-cherished misconceptions as to the peculiar virtues of certain lenses, such as their "depth of focus." He would suggest the use of the word "defining" rather than "covering," using the former with reference to a certain standard of definition. Many people prefer a picture darker towards the margin, so that in this case they might think it desirable to use a larger stop than the largest mentioned on the certificate. Mr. T. R. Dallmeyer had been to Kew and was greatly impressed with the value of the work done there. He himself was in favour of the C. I. system, although he had advocated a similar one, the unit of which was  $f/\sqrt{10}$  rather than  $f/10$ . From a practical point of view it was important to note the number of concave surfaces directed towards the plate, which often threw back on to the plate images of its bright parts, acting, in fact, as concave mirrors. Mr. J. R. Gutz remarked that the actual maximum aperture of the diaphragms was not necessarily the effective aperture. Mr. Hugo, who does the practical work of the lens-testing at Kew, remarked upon the very accurate nature of the results obtained. Mr. Chapman Jones doubted whether simple investigation was sufficient test for flare-spot. He had recently been using two lenses which had never noticeably possessed this defect, and, on using a smaller stop than usual, however, both had given a flare-spot which had not been visible on the focussing screen, on account of the poor illumination caused by the small stops. Mr. Francis Galton, F.R.S., remarked on the rapidity and accuracy of the testing apparatus designed by Major Darwin. Major Darwin said that the Kew Committee would consider the suggestions made. They kept a sharp look-out for the flare-spot with small stops. One difficulty at Kew arose from the atmosphere, which prevented any attempt to test on distant objects. The President, in moving a vote of thanks to Major Darwin, suggested that if a lens was obviously bad, the best way would probably be to mark it bad, as was done in the Science and Art Department with examination papers, and waste no time in accurate measurements.

**Uttoreter.**—On 16th inst. Mr. S. G. Buchanan Wollaston gave a lecture and demonstration on "Platinum Printing Processes," in the town-hall. There was a full attendance of members, and the greatest interest was shown in the demonstration. Mr. Wollaston developed a number of prints by the cold-bath process, correctly, under and over exposed. A large number of mounted specimens were handed round, which were greatly admired.

**West Surrey.**—The fortnightly meeting was held on the 14th inst., Mr. Geo. Davison in the chair, supported by Messrs. W. Winsford and J. L. Lyell. Four gentlemen were nominated for election as members of the society. The President (Colonel J. Gale) then read a short paper upon the capabilities and pleasures of photography generally, after which he exhibited upon the screen transparencies of his last season's work, explaining and detailing incidents connected with them in a manner that was most entertaining to those present.

**Woolwich (Polytechnic).**—The ordinary meeting was held on 12th inst. A quantity of slides by Mr. Dresser, including some of his Wild West pictures, were passed through the lantern and much admired. Prospectuses of the coming exhibition of the society were distributed.

The Record Press, Limited, 376, Strand, London, W.C., will shortly issue, and simultaneously in the United States, "On Sledge and Horseback to Outcast Siberian Lepers," by Miss Kate Marsden, which promises to be one of the most interesting and graphic books of the season. It is dedicated, by special permission, to Her Majesty the Queen, and is illustrated with original drawings, sketches, photographs, etc.

## To Correspondents.

All communications for these columns are to be addressed to **The Editor, "Amateur Photographer," 1, Creed Lane, Ludgate Hill, London, E.C.**

### RULES.

1. Write clearly and distinctly on one side of the paper only.
2. Write each Query or Answer on a separate sheet of paper.
3. Write the name and address legibly on the back of each communication, and sign all Queries and Answers with name or *nom de plume*.
4. All matters for these columns **MUST** be received by **TUESDAY MORNING'S POST**.
5. The Editor does not undertake to answer questions by post.
6. In answering Queries, correspondents are requested to mention, in every instance the *number and full title of the query* referred to.

## QUERIES.

5902. **Backing Plates.**—Could anyone tell me what is meant by "backing" plates, what are the advantages of it, and how I could do so?—IGNORAMUS.

5903. **Lens.**—Will some of your readers be kind enough to state difference between a R. wide-angle lens and a wide-angle combination lens, the advantage one has over the other, and the reason? All the ruling factors to be the same as to focus and light and subject and exposure.—A. JACK.

Correspondents not seeing their queries inserted are requested to look for the same under "Editorial."

## EDITORIAL.

**SPECIAL NOTICE.**—We are very pleased to find that replies in this column are so much appreciated, but we should be very grateful if those requiring advice would send their letters to us BEFORE TUESDAY MORNING'S post if possible. The time occupied in replying in this column is very considerable, and owing to the often late receipt of letters, many matters have to be left over each week. This we much regret.—ED. AM. PHOT.

M. A.—Probably your opal is too thick. We have just seen an arrangement in which two lamps were used side by side with opal in front and opal reflectors, which answers perfectly. Try for thinner opal, or if you cannot get it make it yourself by coating a sheet of glass with an emulsion of sulphate of baryta, which will stop out less light.

H. W.—Surely our articles on apparatus making will help you. It is merely a question of alteration of measurements. You could obtain all the parts of a camera from Lonsdale Bros., 3, Cookridge Street, Leeds, far cheaper than you can make them.

J. C.—(1) You can obtain from almost any dealer fluffless blotting paper, which may be used to blot off the superfluous moisture from print, and then let it dry spontaneously. (2) The prints should be mounted when just beginning to curl. (3) It is not advisable to use blotting paper. Try waxed or stearin paper, to be had from most chemists. (4) It is not advisable to apply pressure to the album.

F. DUNDAS TODD.—Many thanks for your letter. Send us a note or two, and we will send you on the AMATEUR PHOTOGRAPHER each week. Glad to hear things are lively with you, and we will bear the subject in mind.

E. W. MALE.—We think that stereoscopic transparencies when well made are the very finest productions of photography. It is a branch well worth taking up. Yes, the measurements are made from the centres of lenses. As a rule the enlarged negatives give quite as good prints as the original.

G. MANTELL.—In English the best work is Bousfield's "Photomicrography," see our issue of Nov. 18th, p. 368.

HARVEY.—(1) If you rack your lens out to 22 inches, and place the photograph 22 inches in

front of same, it should be merely a question of shifting the lens slightly to obtain sharp definition. Try again, and if not successful, call on us and we will try for you. (2) You can either paste papier mineral or tissue paper on the back of your negative, and when quite dry carefully cut out the paper covering the window, then take a brush charged with thick gamboge and go over the whole of the paper, not touching the window; this will allow the window to print through, whilst holding back the rest. An alternative plan was discussed by Mr. J. McIntosh before the North Middlesex Society, and reported verbatim in our columns a month or two back. This is one of the most valuable processes we have for harmonizing harsh negatives, and is just applicable to your case.

A. W. COOK.—We have thrown your slide on the screen, and should say that after the best part of the exposure had been given, there was a slight movement of the camera. The slide is under-exposed, but the shadows about right in density. The probable effect of coupling the oxygen on to the hydrogen tube would be such an explosion as not to leave you to tell the tale.

YELTRAH.—We have not a negative by us such as you describe, but will see if we can make you one.

E. G. K.—Chapman Jones' "Science and Practice of Photography," price 2s. 10d., from our publishers.

NOVICE.—It is utterly impossible to fix any silver prints without alteration of colour.

J. G.—The plate having been well cleaned is coated with collodion.

Ammonium iodide .. ..	40 gr.
Cadmium bromide .. ..	12½ "
Pyroxyline .. ..	50 "
Alcohol .. ..	5 oz.
Methylated ether .. ..	5 "

When the collodion is set, the plate is lowered into a silver bath of—

Nitrate of silver .. ..	320 gr.
Potassium iodide .. ..	1 "
Distilled water .. ..	8 oz.
Nitric acid .. ..	1 drop.

and moved up and down once or twice, then placed in the dark slide and exposed whilst still wet, and developed with

Ferrous sulphate .. ..	300 gr.
Glacial acetic acid .. ..	200 minims.
Spirit .. ..	½ oz.
Distilled water .. ..	10 "

The developer is flowed on the plate, and when developed sufficiently, the plate is fixed with hypo. You had better obtain some manual on the subject. Jabez Hughes' "Principles and Practice of Wet-plate Photography" is good.

J. S.—Many thanks for MSS.  
H. H.—A good subject, utterly spoilt by over-printing; it wants about half the depth of colour.

W. BINKS.—Pleased to see any number of prints you send up.

T. W. W. MELHUSH.—We are making enquiries, and will write you.

H. PRESS.—Our publishers can supply you with the book you name.

QUESTOR.—The negative is rather hard, and wants printing rather less in a bright light. It is over-toned.

A. SILVER, JUN.—Yes, your print was duly entered.

H. DEAN.—Next year we shall try and print the MSS. for lantern slides.

C. H. C.—(1) The diaphragms are marked on Dallmeyer's decimal system, and correspond to f/8.5, f/10, f/12.25, f/16, f/22.3, f/32. (2) The brown tinge is probably due to not washing the negative thoroughly free from hypo, and then not washing sufficiently between the mercury and ammonia.

H. HOLT.—If you will send us the reproduced negative we shall be much obliged. No. "Our Lantern Screen" appears on the last Friday in the month as a rule, but will be put off till January 6th, in consequence of Christmas week.

IGNORAMUS.—You may not have properly adjusted your lamp, etc. Try moving your lamp further from or nearer to the condensers till you get the maximum illumination on the screen; besides, you do not say what size disc you are using. Above six feet is almost an impossibility.

SENLAC.—The 5 by 4 lens you name will cover a quarter-plate sharply, but as depth of focus decreases as the aperture increases, it obviously possesses less depth than when working at f/8. No doubt lens can be as good for landscape work as a single lens, because there are more reflecting surfaces, but when a doublet is stopped down to f/22, it is practically equal in every respect to a single lens.

T. S. D.—Very glad to welcome you back again to the fold. The numbers you want are August 5th, 12th, 19th, 26th, September 9th, 16th, 23rd, 30th, Oct. 7th, 21st, November 18th.

CYCLE.—(1) A very weak bath composed of

Potassium ferricyanide .. ..	5 gr.
Ammonium sulphocyanide .. ..	10 "
Distilled water .. ..	2 oz.

will help you. (2) Black points caused probably by particles of metal in the paper itself, reducing the silver. (3) See answer to T. S. D. above. (4) We will write short leader for next week on this.

J. B.—The thick collodion will not affect the printing qualities of the negatives. Fluoric acid is nasty stuff to handle; it can be obtained commercially in

indiarubber bottles. The best way to use it is to measure out 15 drachms of water in a 2 oz. measure, and pour one drachm of acid into it, then dilute at once to 10 oz. of water, and place in an ordinary ebonite developing dish, and as soon as your negatives are stripped throw it away. To make a transparency for duplication of a negative, it is advisable to use an ordinary dry plate, and at a distance of about two feet from a No. 5 Bray burner, with a sheet of opal over the printing-frame, give about ten seconds' exposure, develop in the ordinary way with pyro and ammonia, and the result should be exactly the same character as a negative that is no clear glass, no heavy shadows, but thin and delicate. The hypo was of course a clerical error. We could not alter the date this year, but we will think it over.

A. J. NICHOLLS.—You do not state what pictures you want to copy. If they are coloured pictures, then you must use isochromatic plates. Anyhow these plates would shorten the exposure enormously. If you use a paraffin lamp and lantern plates, the exposure, we should say, would run into hours.

AMATEUR.—It is not so easy to obtain a black tone on chloride paper. The best method is to print under green glass very deep and tone in a bath of

Chloride of gold .. ..	4 gr.
Uranium nitrate .. ..	4 "
Salt .. ..	80 "
Acetate of soda .. ..	60 "
Distilled water .. ..	8 oz.

Dissolve the gold and uranium in a little water, add 30 gr. of bicarbonate of soda, and then the other ingredients. The fixing bath should be

Hypo .. ..	2 oz.
Salt .. ..	1 "
Soda .. ..	½ "
Water .. ..	20 "

The bath may be used as soon as mixed, and will keep for some time if filtered after use.

J. E. G.—There is no absolutely new photo-mechanical process; there have been several improvements in old ones. Do you refer to Sutton's process?

W. P. HIGU.—The fault is probably in your chimney. Lengthen the chimney, and you will most likely get over your difficulty. You can have no better oil than the best crystal white paraffin.

## Sale and Exchange.

### RULES.

**CHARGE.**—Twelve words or less for Fourpence. Every additional three words, one penny. The name and address of the sender must be paid for. (A single figure, or group of figures undivided by letter, space, stop, or words, counts as one word; compound words count as two words.)

**DEPOSITS.**—The money for goods forwarded on approval may be deposited with the Publishers of the AMATEUR PHOTOGRAPHER, who will hold the amounts deposited until they are satisfied that the transaction has been completed to the satisfaction of buyer and seller.

**ADVERTISEMENTS** can be inserted under a number, the name and address being registered, and letters forwarded for a fee of 8d. to cover postage.

**PAYMENTS** should be made in Postal Orders or Postage Stamps.

**ADDRESS.**—All advertisements (which can be received up to Tuesday mid-day) and other communications having reference to the "Sale and Exchange" column, must be addressed "Sale and Exchange, AMATEUR PHOTOGRAPHER, 1, Creed Lane, London, E.C."

**COMMISSION.**—A charge of 2½ per cent. will be deducted from all deposits whether a sale is effected or not. Minimum charge 1s.

**PAYMENT.**—All payments are to be by cheques or Postal Orders, made payable to Hazell, Watson, and Viney, Ltd., 1, Creed Lane, London, E.C.

**CARRIAGE** must be paid on all apparatus sent for report, and they will be returned carriage forward.

**REPORTING.**—Apparatus may be sent to the EDITOR, AMATEUR PHOTOGRAPHER, 1, Creed Lane, London, E.C., who will report upon the apparatus to the buyer for a minimum fee of 2s. 6d., or a commission of 2½ per cent., upon the sale price of the apparatus.

**Bicycles, Tricycles, etc.**—Cushion-tyred Safety bicycles, ball bearings throughout including steering, with lamp, bell, and all accessories, cost this year £12 10s., will exchange for good rapid rectilinear lens, whole or half plate, or other photographic goods, or sell £7.—Hilton, 286, Manchester Street, Oldham.

**Dark Slides.**—Dark slides, five half-plate Instantograph, with quarter carriers, 7s. 6d. each, 6s. 6d. without carriers; and four quarter Instantograph slides, 4s. 6d. each, quite perfect; approval.—Thomas, 2, Pelham Road, High Road, Ilford, E.

**Exposure Meter, etc.**—Watkins' exposure meter, new, 10s. 3d.; Lancaster's combination rectigraph lens, quarter-plate, 25s.—Norman Blake, Bedford.

**Hand-Cameras, etc.**—Swinden and Earp's hand-camera, cost £7 net, price £5, as new.—A. Bean, Snaith, Yorkshire.

**Hand-cameras.** A quite new No. 5 Eastman's Kodak, 7 by 5, with plate arrangements and a staff tripod for same, film for 40 exposures, only two or three used, cost £16 9s. 6d. & few months ago, £10; a Fallowfield's Facile, R.R. lens, and staff tripod, cost £6 5s., £3 10s.—Apply, 25, Lansdowne Crescent, Notting Hill.

Fallowfield's Facile, landscape lens, shutter, finder, carries 12 quarter-plates, 52s.—C. Fidler, jun., Friar Street, Reading.

**Lantern Apparatus.**—Pair (Newton's) quadplex lamps, equal new, 80s., or sell singly.—Iliff, 11, Martineau Street, Birmingham.

Lantern screen (Dyson's washable), 8 ft., price 15s.—Howard, 16, Perry Road, Acton.

For sale, 40 photographic slides for lantern, also double carrier. What offers?—Apply, 693, High Road, Lower Tottenham.

First-class brass lantern front, best lens, and 4½ in. condenser, 50s.; three best quality half-plate dark slides, 25s.; 12 by 10 wide-angle rectilinear, 70s.; half-plate rapid rectilinear, 22s. 6d.—59, Keppoch Street, Cardiff.

**Lenses, etc.**—Whole-plate rapid rectilinear lens, iris diaphragms, flange and cap complete, almost new, 30s.—Apply, H. M., 111, Shakespeare Road, Herne Hill, S.E.

**Sets.**—Lancaster's half-plate Instanto, three slides, lens, shutter, and stand, complete in bag, cost £5 19s., good as new, 70s.; Lancaster's best half-plate square bellows, five brass-bound slides, Dallmeyer R.R. lens, leather case, and stand, complete, cost £15 15s., sell £9; Burr's 12 by 10 W.A. doublet, 70s., worth double; Dallmeyer 6 by 5 R.R., 60s.; whole mahogany studio camera, leather bellows, one double, one single slide, cost £7 10s., sell 50s.; 12 by 10 landscape lens, rack and pinion, 'as new, 30s.; 10 by 8 Underwood's best square bellows camera, rack and pinion, two slides, R.R. lens, iris stops, and case, complete, £8, cost £14.—Parlby, Oradock Street, Swansea.

Quarter-plate Instantograph camera, lens, shutter, tripod, three double backs, focussing cloth, canvas case, 50s.—Harold Phoenix, 323, Shoreham Street, Sheffield.

£12 will purchase the following high-class apparatus: Watson's Acme camera, 13 by 13 cm. (7 by 5½), all possible movements, double extension, three double dark slides, turntable, three-fold tripod, stand, instantaneous and time shutter, Ross' whole-plate rapid symmetrical, whole-plate wide-angle lens, waterproof case, splendid condition, cost £21.—Address, Robert Teglio, Mevagissey, Cornwall.

Lancaster's International half-plate, two dark slides, stand, and splendid aluminium lens, Thornton-Pickard shutter and case, £5, or offers; also Lancaster first quality enlarging lantern, 6 in. condenser, achromatic, with rack and pinion movement, only been used once, £5 10s., or offers.—Temperton, 59, Corporation Street, Manchester.

**Sundries.**—Will exchange "Life of Lord Beaconsfield," five vols., new, handsomely bound, for Optimus R.R., 7 by 5, or for lens by any other good maker.—J. Pitman, Gosberton, Spalding.

## WANTED.

**Cameras, etc.**—Wanted, enlarging and reducing camera, principal use, copying pictures, must take up to 10 by 8 negatives.—H. F. Linging, 225, Beaconsfield Street, Newcastle-on-Tyne.

Wanted, Lancaster's quarter-plate Omnigraph, best pattern.—M., 7, Victoria Street, Barnsley.

**Lantern.**—Wanted, a good magic lantern in exchange for carte de-visite portrait lens, Presto camera, takes good photographs, and changing bag.—C. Edington, Castle Street, Thornbury, Glos.

**Lenses, etc.**—Wanted, lens by first-class maker for quarter-plate camera.—Hynes, Customs, Ramsgate.

Wide-angle 6 in. rectilinear or a 6 in. combination lens, iris diaphragms, for cash, on approval, must be cheap and good; also a leather case to hold half plate camera, three slides, two lenses.—Address, J. Tuxworth, 72, Annesley Street, Great Grimsby.

**Rollholder.**—Wanted, a 5 by 4 rollholder, must be modern and in excellent condition.—Brock, Winnington Park, Northwich.

It is unnecessary to send an advertisement for the "Sale and Exchange" column for more than one insertion, as the goods are usually disposed of when the first advertisement has appeared.

**Bargains in Hand Cameras.**—No. 5 folding Kodak, carries fifty-four films, rapid rectilinear lens and shutter, extending leather bellows, covered morocco, finder, etc., £9 9s., cost £13 13s.; Luzo hand-camera by Robinson, Regent Street, 100 films, rapid rectilinear lens, shutter, finder, in leather case, as new, £2 12s. 6d.; Optimus Minimus hand-camera, quarter-plate, for twelve plates, Optimus Eury scope lens, roller blind, shutter, two finders, bag changing, covered morocco, finest condition, £4 17s. 6d.; Talmer hand-camera, carries twelve quarter-plates, fine portrait or view lens, shutter, finder, bag hanging, etc., finest condition, 47s. 6d.; Key hand-camera, by Platinotype Company, rapid rectilinear lens, shutter and six slides, size quarter-plate, finest order, £4 12s. 6d.; C Daylight Kodak, rapid rectilinear lens, rotating stops, shutter, finder, etc., covered

morocco, carries 24 films, quite new, £3 15s.; No. 4 Kodak, as new, size 5 by 4, carries 100 films, fine rapid rectilinear lens, instantaneous shutter, in solid leather case, £7 7s.; No. 3 Kodak, as new, size quarter-plate, carries 60 films, rapid rectilinear lens, instantaneous shutter, take £5 7s. 6d.; Optimus Magazine, very finest order, Optimus rapid rectilinear lens, carries twelve quarter-plates, roller blind, shutter, focussing adjustment £5 5s.; Ronch hand camera, quarter-plate rapid rectilinear lens, roller behind shutter, bag changing, as new, £3 17s. 6d.; Blair's 5 by 4 hand-camera, good lens, time and instantaneous shutter, two finders, rack focussing, three double dark slides as new, £3 3s.; Kodak No. 1, best R.R. lens, carries 100 films, best order, in leather case, 40s.; Fallowfield's Facile, fitted rapid rectilinear lens, carries twelve quarter-plates, as new, £3 17s. 6d. All above are warranted as described. On view, City Sale and Exchange Rooms, 54, Lime Street, corner of Leadenhall Street, City (late Goy's Medium). Second hand apparatus bought, sold, or taken in exchange. Inspection invited.

**Bargains in Cameras and Sets.**—10 by 8 camera fitted all latest improvements, back and front extension, for wide-angle pictures, leather bellows, reversing back, rising and falling front, two double slides, grand condition, take £6 10s. lot; whole-plate Optimus Rayment camera, double extension, leather bellows, rising, falling, and brass fronts, three double dark slides, Optimus rapid rectilinear lens, Waterhouse stops, three fold stand and case, lot as new, £11 5s.; whole-plate camera (British), by Chapman, double extension, leather bellows, rising front, etc., very fine rapid rectilinear lens, Waterhouse stops, three double slides, folding stand and case, grand lot, as new, £3 5s.; half-plate camera by Houghton, Holborn, double extension, wide-angle movement, rising and falling front, leather bellows, etc., rapid rectilinear lens, iris stops, three double slides, three-fold stand and case, as new, £3 10s., warranted; half-plate Spanish mahogany camera, by Londale, Leeds, wide angle movement, double extension, leather bellows, etc., rapid rectilinear lens, Waterhouse stops, double dark slide, and folding stand, £4 10s.; Lancaster's half-plate 1892 instantograph camera, all latest improvements, double extension, leather bellows, etc., double slide, quarter carrier, very fine rapid rectilinear lens, iris stops, and folding stand, set complete, 75s.; half-plate camera, by Percy Lund, back extension, conical leather bellows, three double slides, rapid rectilinear lens, shutter, folding stand, and case, as new, take £4 10s.; quarter-plate Shew's Eclipse pattern camera (pocket), reversing back, leather bellows, etc., three double slides, rapid rectilinear lens, rotating stops, and roller blind, shutter, fine lot, as new, £2 12s. 6d.; quarter-plate instantograph camera, lens, iris stops, double slide, and folding stand, 27s. 6d.; quarter-plate Le Merveilleux set, by Lancaster, complete, 15s.; quarter-plate extending camera, best order, good lens, two double book-form slides, and folding stand, 17s. 6d. All above sets guaranteed in every detail as described. On view, City Sale and Exchange Rooms, 54, Lime Street, corner Leadenhall Street, City (late Goy's Medium). Second-hand apparatus bought, sold, or taken in exchange. Inspection invited.

**Bargains in Lenses.**—Optimus No. 3 B portrait lens by Perken, Son and Rayment, as new, Waterhouse stops, rack focussing, to cover whole-plate, take £6 15s.; Optimus portable symmetrical, size 9 by 7, rotating stops, covers well, works well, as new, 65s.; 9 by 7 Optimus rapid Eury scope lens, Waterhouse stops, moveable hood, grand definition, as new, £5 5s.; whole-plate portrait lens, Waterhouse stops, rack focussing, covers well, as new, 65s.; whole-plate Laverne wide-angle rectilinear, rotating stops, as new, 30s.; whole-plate rapid rectilinear lenses, by Parker, Holborn, covers well to edges, Waterhouse stops, moveable hood, as new, 45s.; quarter-plate Optimus detective camera lens, by Perken, Son and Rayment, Waterhouse stops, as new, 27s. 6d.; half-plate Lancaster's rectigraph lens, thorough order, covers well, Waterhouse stops, take 32s. 6d.; half-plate Lancaster Instantograph lenses, iris stops, and instantaneous shutter, 15s.; half-plate Ross rapid symmetrical lens, as new, fine definition, Waterhouse stops, £3 17s. 6d.; Ross No. 2 portable symmetrical, rotating stops, 4 in. focus, finest order, 42s.; Shew's C. D. V. portrait lens, rack focus, Waterhouse stops, finest condition, 17s. 6d.; Optimus quarter-plate portrait lens, rack focussing, Waterhouse stops, quite new, 21s.; 5 by 4 Optimus rapid rectilinear, by Perken, Son, and Rayment, Waterhouse stops, 27s. 6d.; Swift 5 by 4 wide-angle rectilinear, 5 in. focus, rotating stops, 32s. 6d.; ½-plate hand-camera lens, by Laverne, rapid rectilinear, adjustable focus, 15s., quite new. All above lenses are warranted as described.—On view, City Sale and Exchange Rooms, 54, Lime Street, corner Leadenhall Street, City (late Goy's Medium). Every description of apparatus bought, sold, or taken in exchange.

**Magic Lanterns and Slides.**—Walter Tyler's Helioscopic is perfection of all lanterns, supplied to Indian Government, School Boards, science classes, clergy, and exhibitors throughout the world. Impossible to have lanterns give better definition or

more satisfactory results; specially constructed lens which no other lantern possesses.—Walter Tyler, 48, Waterloo Road, London.

**Walter Tyler's Best Triples and Biunials** are unsurpassed, and perfect in every detail. Good biunials, mahogany bodied, brass fronts, and all improvements, £7 10s.; single lantern, with 4 in. condensers, portrait front lens, 4-wick lamp, complete, in case, 27s. 6d.—Walter Tyler, 48, Waterloo Road, London.

**Lantern Lenses.**—Specially constructed. Walter Tyler's new Helioscopic portrait combination lantern lens gives the most perfect definition and brilliancy, can be fitted to any lantern, and for excellence cannot be surpassed. No other maker has this lens, which is manufactured expressly for Walter Tyler, 48, Waterloo Road, London.

**Regulators and Gauges.**—Great reduction, in price. Either can now be had of Walter Tyler for 14s. each. The largest stock of gas cylinders in England. Best seamless steel, tested and valved, and all sizes at very low prices.

**Slides from Negatives and Pictures.**—Walter Tyler manufactures and colours slides on the premises, thus ensuring speedy delivery, and prices are most moderate.—Walter Tyler, 48, Waterloo Road, London.

**Biunial Lanterns.**—If you are in want of a really good biunial lantern, perfect in every respect, call and see Walter Tyler's entire brass fronted, mahogany-bodied, lined with Russian iron, and fitted with new best quality lenses, and sold at a most moderate price. The top lantern will take a 4-wick lamp. These are great bargains.—Walter Tyler, 48, Waterloo Road, London.

**Hire Department** is now perfect. Largest and best collection of slides in the world; over 200,000 always in stock. Temperance, travels, Scripture, educational, comic, tales, etc. Cheaper than any other house, no extra charge for coloured slides or effects. Special terms for large quantities.—Walter Tyler, 48, Waterloo Road, London.

**Lanterns and Slides.**—If you wish to hire, purchase, or exchange, you cannot possibly do better than go to Walter Tyler, who makes this business a speciality, and you will thus save dealer's and all intermediate profits.—Walter Tyler, 48, Waterloo Road, London.

**Second-hand Lanterns and Slides** at very moderate prices, also all kinds of apparatus. Send for large catalogue, 420 pages, with instructions for working lanterns of all kinds, and costing an immense sum to produce, sent free for 6 stamps. Small catalogue and second-hand list, post free.—Walter Tyler, 48, Waterloo Road, London.

**Bijou Enlarging Lanterns.**—Finest results with Hughes's patent rectangular condensers, half the size of ordinary make, superior definition, proper diffusion of light; scientifically constructed, not commercial; several whole and half-plate for sale, cheap.

**The Marvellous Pamphengos.**—Finest oil-lighted lantern, perfection, equals limelight, stood the test of over fourteen years against all imitations. Over 3,000 sold; supplied to the Government, School Boards, Science Teachers, the Clergy, and Institutions. Elegant solid brass fronts, high-class lenses, unequalled for definition and brilliancy, from £2 10s. each.

**Magic Lanterns.**—Largest assortment in the world, cheapest and best, nicely japanned lantern body, 4 in. double condensers, portrait front lenses, rack and pinion, four-wick lamp, in case, £1 7s. 6d. Others more elaborate, but cheap.

**The Docwra Triple Prize Medal**, highest award, supplied to Dr. H. Grattan Guinness, Capt. C. Selwyn, Madame Adeline Patti, and the Royal Polytechnic, etc.

**The Malden Triple**, supplied to B. J. Malden, Esq.; unparalleled results; Capt. Chas. Reade, R.N. **Fine Triple Lantern**; four set of large diameter lenses, £35, cost £60. Given away.

**Special Triple**; mahogany, entire solid brass fronts, £12 12s.; a really good lantern, unequalled.

**Elegant Mahogany Biunial**; brass fronts, £7 10s.; blow-through safety jets, 8s. 6d.; mixed gas jet, 12s. 6d.; Malden double dissolving tap, 12s. 6d.; a number of grand effects; particulars free, before purchasing. Send for Mr. Hughes's grandly illustrated catalogue, over 180 fine wood engravings, price 6d.; postage 3d.; separate list of 69,000 slides, price 6d.; postage 3d.; pamphlets free; second-hand lists of bargains.—W. C. HUGHES, Brewster House, Mortimer Road, Kingsland, London, N.E. 50 slides, all coloured, on loan for 3s., in special dispatch box.

THE CHESHIRE STUDIO, 5, WATER LANE, WILMSLOW.

**FOR IMMEDIATE DISPOSAL**, a snug little Photographic Business, good dwelling house, large garden, with studio, (portable) containing good stove backgrounds, and other accessories, apparatus, etc. Side entrance. Furniture of house, valuable negatives of the Cheshire "meets," mansions, and churches, specimen frames, etc. All to be sold at a sacrifice. For particulars apply as above.

**FOR SALE**, a Method to Manufacture Dry Plates, rendering it impossible, with slight attention, to mistake film side in absolute darkness.—Address, H. Nunn, St. John's Worcester.

## OUR VIEWS.

"To hold as 'twere the mirror up to nature."—*Shakespeare*.

The Editor is "At Home" on Monday Afternoons from 2 till 5 o'clock, and will gladly give advice upon all photographic matters; and on Thursday Mornings to Members of the Trade, etc, from 10 till 1 o'clock.

**OUR VIEWS.**—Our Lantern Screen—Societies' Reports—Temperature of Solutions—Payne Jennings' Experiments—An Extract—Blisters—A Remedy—Warm Hypo—Baron Rothschild's Collection—Stereoscopic Photography—Cheap Photographs—Artistic Work—Photographs as Pictures—Good Wishes—Durham Camera Club Show—Lombardi and Co.

**LEADERS.**—Winter Work—Rational Development.

**LETTERS.**—Packing of Plates (Anderson)—Enlarging (Dresser)—Speed Numbers (Watkins)—Moonlight Pictures (Huggins).

**ARTICLES.**—General and Photographic Chemistry (Conrad)—Study and Practice of Art in Field Photography (Hinton)—Construction of Twin Lens Hand Camera (Enn. Ess.)—Multiple Coated or Multiple Film Plates (Grant)—The Printing of Clouds (Bibby)—Winter Photography (Hodges)—On Silver Hemisulphate (Lee)—A Photographic Method of Mapping the Magnetic Field.

**SOCIETIES' MEETINGS.**—Brixton and Clapham—City of London College—Ipswich—Leeds—Newcastle—S. London.

**EDITORIAL DEPARTMENT.**—All Literary Contributions, Queries and Answers, Photographs for Competition or Criticism, Books or apparatus for Notice or Review are to be addressed to the EDITOR, AMATEUR PHOTOGRAPHER, 1, CREED LANE, LUDGATE HILL, LONDON, E.C. (All communications should reach the Editor on Tuesday.)

**TERMS OF SUBSCRIPTION.**  
UNITED KINGDOM..... Six Months, 5s. 6d. .... Twelve Months, 10s. 10d.  
POSTAL UNION ..... " " 6s. 6d. .... " " 13s. 0d.  
OUT OF POSTAL UNION - " " 7s. 9d. .... " " 15s. 3d.

**TRADE ADVERTISEMENTS** are received up to Tuesday morning.

**PUBLISHING DEPARTMENT.**—All letters containing Subscriptions, Orders, Remittances, SALE AND EXCHANGE Advertisements, or other business matters for the AMATEUR PHOTOGRAPHER are to be addressed to the Publishers, HAZELL, WATSON, AND VINEY, LD., 1, CREED LANE, LUDGATE HILL, LONDON, E.C. SALE AND EXCHANGE Advertisements (at the charge of Three Words for One Penny) must be received by Tuesday evening's post to ensure insertion in the same week's issue.

THIS should be "Our Lantern Screen" number, but unfortunately our printers tell us that, after working night and day in consequence of the annual rush at Christmas, it is absolutely necessary that the machines, both human and metal, should have a rest, and therefore they would be obliged if we could put off the supplement for a week. To this we have consented, as it will give our readers—beg pardon, we mean it will give us—a chance to get over the Christmas festivities easily.

Is it true? In our issue of the 9th inst. we state:—"We intimated last week that societies' meetings and exhibitions are always troublesome to deal with, and must be introduced at the expense of matter of more permanent and wide-spread interest. Probably all the photographic press will ere long recognise the necessity of reducing such items to a mere synoptical report. We are ourselves working in that direction, and believe our readers will not, in the end at least, disapprove."

Now our provincial contemporary follows suit. For once they follow our lead.

In "Dry-plates," the gratuitously circulated organ of the Cadett plates manufacturers, some attention is given to the subject of temperature in connection with dark-room operations. The writer says, "Our testing with Hurter and Driffield's instruments is now always done with the developer at a temperature of 65 deg. F., and we cannot answer for the speed numbers giving a correct result with our formula if the temperature of the developer be down to a low degree in a cold dark-room." Messrs. Cadett and Neall not only have the dark-room carefully heated, but use an otherwise unusually large portion of developer in order to avoid, as far as possible, a decreasing temperature in the solution itself.

Some interesting facts are recorded, including an experiment by Mr. Payne Jennings, in which the possible advantage to be gained by heating the developer to even 90 deg. F. in case of known under-exposure is pointed to. An article which appeared some weeks ago in *Photographic News* on this subject is reproduced in the print referred to above, and at the present season of the year is well worthy of notice.

We have, for instance, the following statement:—"We have known even experienced professional photographers to be misled on the first cold day at the approach of winter, by the slowness with which the normal developer acts at such a time. A plate has been exposed on a sitter, and as, after a time which had previously sufficed for the development of the image, very little is to be seen on the film, a change in the light is assumed, and under-exposure taken for granted. A second plate is therefore exposed for a considerably longer time. This time the

'Amateur Photographer' Monthly Lantern-Slide Competition, No. 44.—Latest day, January 14th.—Prizes: Silver and Bronze Medal, with ribbon and clasp. Two slides to be sent in. Entry forms, etc., on receipt of stamped envelope. Address: Editor, AMATEUR PHOTOGRAPHER, 1, Creed Lane, E.C. (Prizes will be announced and slides reproduced and criticised in the AMATEUR PHOTOGRAPHER Supplement, January 28th, 1893).

image comes up, but very weak. It is in short, an over-exposed picture, much under-developed." Possibly a great many of our readers have dark-rooms either detached from their dwelling-house or in some exalted or remote quarter of it, and hence the particular apartment is often very cold and devoid of any ready means of being artificially heated. This is a serious matter for attention, and some simple means of raising the cold air must be found. If the room is not large the burning of a paraffin lamp during the day will often be sufficient to "take the chill off," to say nothing of preventing the bursting of water pipes and bottles when a hard frost sets in. Good reader, take warning in time.

CLOSELY connected with the foregoing thought is the question of blisters on albumenised printing paper. This trouble of "blisters" has been a *bête noir* of the photographer for years past, and is only perhaps less heard of just lately because gelatino-chloride papers are being so largely used when albumenised papers were before the sole printing media employed.

Striving to combat the blister fiend recently, we found some assistance in a slightly heated fixing bath and washing water—not intentionally but by accident. It happened that for a short period we were compelled to work in an extemporised laboratory when the cold-water supply was drawn from a cistern in juxtaposition with a hot-water tank, which for certain purposes was kept at a high temperature. Our so-called *cold* water was therefore nearly always *tepid*, and some at first unaccountable results in work were subsequently traced to the use of the warmer water. A correspondent tells us that when prints blister after or during fixation he, after washing them, dries by heat in front of a fire, and immerses the prints in hot water immediately before mounting, and by this means all but the very largest bladder-like blisters are got rid of.

REMEMBER that hyposulphite of soda should, in cold weather, be always used warm, as the salt naturally lowers the temperature of the water in which it is dissolved.

Our modern advisers can put it much shorter  
Than earlier teachers, there isn't a doubt of it  
In winter photography use some *hot water*,  
At home in your family always keep out of it.

WE understand that Baron Albert de Rothschild, well known as an amateur photographer of no mean ability, is making a collection, for his own private use and enjoyment, of representative works of the more prominent artistic photographic workers. Thus, in the houses of the great, the picture gallery of the future may not be confined to the exhibition of ancient family portraits, grim and dark as the oak panelling around them, nor even to the paintings of modern as well as old masters, but may also find place for the photographic pictures of the new age which is ours. Then comes the thought, what will be the verdict on the best work of to-day when judged by the Davisons, Maskells, and Gales of half-a-century hence?

WELL done, Hackney! Many a pleasant evening and useful demonstration may your new biennial lantern give you. Out of the twenty societies which competed for the prize offered by our contemporary, *The Hand-Camera and Lantern Review*, Hackney with its nine competitors comes off victorious, and carries away the prize, a handsome biennial lantern—a very substantial and useful Christmas present from these nine contributors to their fellow-members.

NOTWITHSTANDING the able and well-intentioned efforts to

resuscitate the failing vitality of stereoscopic photography, it seems doubtful whether it is destined to ever become much more popular or more widely practised than it is at present. It has often seemed to us that those who have pleaded for stereoscopic pictures have taken up the wrong lines to advance its cause. It has been argued that because the stereoscopic effect imparts such a reality to the prints, and objects "stand out," so that you feel you could "pick them out," therefore, their pictorial claims are paramount. It must, however, be remembered that the work which astonishes and awakens admiration because of its wonderful similitude, owes its greatness rather to a clever craft akin to jugglery. Imitation may be "sincerest flattery," but it is not art. Stereoscopy is successful, or not, according to the way you look at it. By this we do not make reference to the fact of one's employing a binocular machine by which to view the pictures, but according as we regard it as the clever application of an interesting optical principle, or as one in the motley group of claimants to be called a pictorial art.

SPEAKING of the possibility of good photographs finding a permanent place in private picture galleries, prompts a suggestion on the subject of the commercial value of photographs. We mean those photographs which hope to be regarded as of artistic merit. Amateur photographers will, for some years to come, have themselves to blame for the cheap estimation in which photographs will be held.

THE popular notion is that a dozen photographs each of equal quality can be printed as easily as letterpress copies from type, whilst, as a matter of fact, if the conscientious worker succeeds in getting *one* print from a negative to his satisfaction, it is doubtful whether he ever gets another. Hence, if the particular photographer possess real ability, a finished print carrying his autograph, whereby he implies his approval, should possess for all time a distinct and individual artistic value. It is in this respect better than an artist's signed proof engraving—there will perhaps be some hundred or two engravings, but the photograph may be unique and a duplicate impossible. It follows from this that the signed photo print should be purchaseable only at a fair and not too depreciative figure. Give your photographs away or dispose of them for a few shillings apiece, and the world, which values all things by the price they fetch, will despise even your best work, be its real merit what it may. If your photographs are not worth a picture price, they are certainly not good enough to give away; and if they carry your name with them they will do yourself and your reputation harm.

If a photograph is sufficiently good to make its acquisition as a picture desirable, then it is worth paying for. If photo prints are to be sold as scraps, trade-prints, or mere illustrations, then they don't need to carry the artist's—we should say the producer's—name.

To all our readers who have so kindly remembered us this Christmas time with cards and good wishes, we return our hearty thanks, and we regret that it is not in our power to write and return them individually our hearty good wishes and greetings.

ELSEWHERE we give brief details of the open class of the Durham City Camera Club Exhibition, and the Secretary's address, from whom all particulars may be obtained. Other societies may well take a lesson from this club, and give free shows to workhouse inmates, etc.

ANOTHER well-known West End photographic business is offered for public subscription as a limited company, namely, Lombardi and Co. This old-established concern has been registered by Merriman and Co., 25, Austinfriars, E.C., with a capital of £10,000 in £1 shares. Object, to carry into effect an agreement, made December 7th, between P. Notcutt of the one part and this Company (by H. Ball) of the other part; generally, to carry on business as photographers, artists, etc., etchers, modellers, colour manufacturers, etc. P. Notcutt and Major C. H. Strutt are joint managers, their remuneration being £5 per week each.

It is not often that we see a Sale and Exchange advertisement before it appears in the complete paper, but one has been handed us for perusal this week which is striking at least. A gentleman offers to sell the secret of making dry plates so that it will be "impossible, with slight attention, to mistake film side in absolute darkness." Is this a Christmas joke?

### WINTER WORK.

THE Christmas holidays naturally suggest snow-pictures for some reason or other, and following our train of thought the proper development of them to give absolutely the best value will occupy a prominent position. We will premise that under-exposure is of frequent occurrence, if not usual, and latitude in development under the circumstances a necessity; this granted, we will go a step further and press the claims of eikonogen as the one developer on which to rely for the requisite assistance.

Professor Eder stated in the "Photographische Correspondenz," some few years ago, that "the action of eikonogen on gelatino-bromide of silver plates is to produce very delicate half-tones and beautiful gradations. It hardly ever fogs plates, and acts very beneficially in relation to their degree of sensitiveness." This was written when little was known of eikonogen as a developer, and experience proves without a doubt that Dr. Eder was right.

With rational use an eikonogen developer will give almost any result desired, a hard negative full of violent contrasts, or one so soft and replete with half-tones as shall satisfy the most exacting requirements of perfect technique. The particular formula we have in our mind is one which appeared in the AMATEUR PHOTOGRAPHER of July, 1890, contributed by Mr. Wilkinson, of the Liverpool Society, a formula we have put to very sincere tests on many occasions; it reads—

(1).

Eikonogen	..	..	..	..	240 gr.
Sulphite of soda	..	..	..	..	2 oz.
Water	..	..	..	..	to 30 "

(2).

Washing soda	..	..	..	..	1½ oz.
Water	..	..	..	..	10 "

For isochromatic plates take of No. 1, 9 drams; No. 2, 4 drams; adding 3 drams of water. Half a dram of 10 per cent. solution of carbonate of potash will hasten development and give more detail.

Extreme cold seems to have a paralysing effect on eikonogen, and it is well to warm it sufficiently to take off the chill before use in winter weather.

Develop slowly, *i.e.*, don't put in the full strength of accelerator at first, but when detail is well out make your bath up to full strength, avoiding too great density.

As to printing from negatives of snow-scenes, the matter of colour is an important factor. Without being dogmatic it may be said that certain colours for various classes of pictures are, if not necessary, desirable, and it is well to aim as nearly as possible, in printing, for the prevailing tone of the landscape and its sentiment we are endeavouring to represent. Not to put too fine a point upon it, the tone in this instance is grey, and he would be a daring picture-maker who would fix upon a red-toned print as the medium of picturesque expression. Then, after tone comes the method of representing it on paper, and, dismissing bromide, not so much on account of its conventionalism as its unsuitability, we find that a rough surface or grained paper will best convey the impressions we have brought away with us from the field, and we endeavour to fix upon the particular kind to give the most satisfactory result. Platinotype is very good, but there is a difficulty in preserving it free from damp and consequent muddiness in this climate of ours, and we turn to a paper that is less known but more suitable for the purpose. This is the "Mezzotype" of the Carlotype Company, a specially prepared rough drawing paper that prints rapidly and gives delightful velvety shadows, if we may use such a term. With this medium and platinum toning, absolute blacks may be secured if desirable, yet it better renders half tone than any other paper we have come across. Concise directions for its use were given in these columns three weeks ago, but subjoined is a formula particularly recommended for blacks and greys.

Dissolve fifteen grains of chloro-platinite of potassium in one ounce of water, and keep as stock solution. When toning take one dram of the above to every ounce of water, adding thereto one drop of nitric acid. Use the bath at about 80 deg. Fahrenheit, and *tone thoroughly*, say ten minutes, or longer when the bath gets weaker. Fix in the normal bath ten minutes. One further suggestion: if you want a strong print, it is a matter of printing deeply; if a grey, print lighter and tone longer, adding more nitric acid.

### RATIONAL DEVELOPMENT.

IN our issue of the 2nd inst. we published a paper read before the Birmingham Phot. Soc., which has attracted much attention from many of our readers, and so many have asked us how to adapt this to the fixed alkaline developers, that we are compelled to answer them in this short note.

For a typical plate, say a whole-plate, we require 3 oz. of developer. Then take 6 gr. of pyro, if dry, add a little sulphite, about 24 gr., and water 2½ ozs. Flood the plate with this; see that there are no air bubbles. Now measure out the normal quantity of alkali, which we will assume to be 15 gr. of carbonate of soda, add 2½ gr. of bromide, water ½ oz., pour the pyro solution into this, and return on to the plate, rock the dish, and allow development to proceed as far as it possibly will, as directed in the above cited paper. Then add a drachm of citrate of soda or potash solution, made as follows:—

Citric acid	..	..	..	..	720 gr.
Carbonate of potash	..	..	..	..	884 "
Distilled water	..	..	..	..	10 oz.

Or—

Citric acid	..	..	..	..	720 gr.
Carbonate of soda	..	..	..	..	1,440 "
Distilled water	..	..	..	..	10 oz.

To obtain the density, mix a solution as follows: carbonate of soda 1,600, bromide of potash 200 gr., glycerine 1 oz., water 6 oz., or carbonate of potash 924 gr., bromide of potash 200 gr., glycerine 1 oz., water 6 oz. All other manipulations are the same as described in Mr. Simkins' paper.

## Letters to the Editor.

### PACKING OF PLATES.

SIR,—I read with joy Mr. J. N. Williams' letter in your issue of the 16th inst., and heartily agree with him that something or other ought to be done as regards the plates being packed in packets of four or six each. This week I tried some new plates—not new in the market, but new to me—which were packed in a box in one packet. I opened the lid of my box, and seeing some paper ends sticking up, I pulled them. There was no sign of anything coming out, so I thought I must have had hold of a packet underneath. However, I got it out at last, and thinking that the packet was heavier than usual, I looked into the box and found it empty. The packet contained a dozen plates. Now, if by some accident I had dropped them they would most likely have all been broken, and my box-full ruined. If, as Mr. Williams suggests, makers would pack their plates in packets of two each, one could drop a packet without doing so much damage.

Another point I would draw the attention of your readers to is the fact that on some plate boxes you have the sensitometer number given, in others you do not, or perhaps the sensitometers are different, and you give much too long an exposure. I would advocate a council of all the first-class makers, who should decide a sensitometer between them, and who should affix the same number to all boxes on the label; calling their plates ordinary if the sensitometer, be between, say, 17 and 20, rapid if between 20 and 23, extra rapid if between 23 and 24.

I also agree with what Mr. Williams says about advocating any new operation.—Yours, etc., KENNETH ANDERSON.

\* \* \* \*

### ENLARGING.

SIR,—I note your article about my remarks on Enlarging, at Blackheath. I said as reported, but am not reported quite right, as what I really said was that when a lens was stopped down to *once* cover, stopping down further did no good, but, in fact, harm, as it caused beginners to under-expose and get hard, black and white enlargements; and when saying so, I was referring to a good lens, not the cheap 10s. to 15s. one put in many enlarging lanterns, as then one often had to stop down to a small stop, but that was the fault of the *lens*.

What I distinctly say, and can prove, is that, given a good lens, that covers the plate used (mostly quarter-plate), at  $f/8$  or  $f/11$ , then further stopping down did no good, as one was enlarging from a flat surface, and did not require depth of focus unless he had made a mistake in his focus.

All my enlargements this time of the year (when light is bad) are made with a Beck wide-angle rectilinear lens (7 in. focus), the largest stop being  $f/11$ , and I use it at that stop and get perfect definition.

I do not quite understand what you mean when you say I am wrong, so kindly state what you claim an advantage by *stopping down*, with a good lens, so that I can answer it, as it is easy to say one is wrong, when you have not to prove it.—Yours truly, A. R. DRESSER.

[If a lens has a curved field, and many good lenses have, stopping down will improve a marginal definition.—EDITOR.]

\* \* \* \*

### SPEED NUMBERS.

SIR,—The Britannia Works Company, in your issue of the 16th, find fault with a comparison of speed between their white label and medium isochromatic plates which was copied from a table issued by me.

These speeds were the results of tests made in the early summer, and may not *now* be correct, as medium isochromatic plates have since been lowered in price. I shall make further tests before a new edition of my instructions comes out. The Ilford makers proceed to ask users of their plates to "discredit entirely any speed numbers which may be applied to them by anyone, and to rely wholly on our published details of relative speeds."

This kind of advice has passed muster for a long time, but users of plates are no longer satisfied to open their mouths and shut their eyes and see what the plate makers will send them.

Allow me, as one who has made special tests of plates from makers all over the world, to say that it is utterly unsafe to trust to a maker's statement, even of the relative speed of his own plates, and to advise users to rely chiefly on their own tests. I

do not claim that the speed numbers I give represent anything more than my own test of the samples I have tried.

This variation does not arise from any wilful intention on the part of the makers, but simply from the difficulty in making different batches of emulsion exactly the same speed. The remedy, of course, is to mark each box from an actual test of speed, and my remarks do not apply to those makers who have adopted the Hurter and Driffield system, as these numbers are a fairly satisfactory guide to exposure, remembering always that they are no guide to the "density giving" capacity of the plate, and that a plate marked with very high H. and D. numbers may possibly give such a weak image as to be far inferior to a "slower" plate, even for shutter work.

I may mention that I have used the Ilford medium isochromatic plates with satisfaction for almost all my season's work. There can be no *absolute* ratio of speed between a given isochromatic and a given ordinary plate. It varies according to the light they are used in. This is pointed out in the Ilford Company's own book.—Yours truly, ALFRED WATKINS.

Hereford, December 24th.

### MOONLIGHT PICTURES.

SIR,—Kindly permit me to dissent from the opinion expressed in Editorial Notes of 16th inst. that moonlight effects are not legitimate photographic pictures.

The difference between moonlight and sunlight, I presume, is only the varying intensity of the light. If by shortening exposure, and suitable development and printing, we can secure a moonlight effect, why should we not? In what way is it more a fraud than masking part of a picture to print clouds to their proper apparent depth?

A good moonlight effect in photography is probably as true to nature as most photographs, and I cannot see why we should go beyond the effect to the means employed in order to justify the *tion*.

Surely it is not suggested that the case of a sham historic scene is a parallel? In such an attempt no school-boy could fail to be struck with a sense of fraud; in the other case an acquaintance with photographic procedure is necessary in order to know that it is not a real photograph of a moon-lit scene.

Personally, I hold most emphatically that any effect true to nature is justifiable where the object is a picture pure and simple, and that there is no reason whatever why the particular method employed to obtain such effects should be even commented upon.—Yours, etc., J. W. HUGGINS.

**Affiliation of Photographic Societies.**—Meeting of delegates, December 16th, Mr. W. Bedford (P.S.G.B.) in the chair. Two more societies—the Hackney Photographic Society and the Cheltenham Amateur Photographic Society—were announced as having become affiliated. Mr. Marchant (North Middlesex P.S.) brought forward the report of the sub-committee appointed to make recommendations with regard to the lectures on photogravure. The report contained a suggestion that a charge of one shilling for the course be made to members of affiliated societies, and five shillings to outsiders; and that the secretaries of the various societies should ascertain as nearly as possible how many of their members were likely to attend, so that arrangements could be made accordingly. Owing to circumstances that had transpired since the report was drawn up, the matter was referred back to the committee, who were instructed to arrange, if possible, to hold the lectures in the month of February, Friday being suggested as the most convenient day, and one which would not clash with any photographic meetings. It was proposed by Mr. Steele (Leeds P.S.), seconded by Mr. Mackie (North London P.S.), and carried, that the whole question of the lectures should now be left in the hands of the sub-committee to carry the matter through. Mr. Steele (Leeds P.S.) and Mr. Walker (Leeds P.S.) gave particulars of a lecture on photogravure delivered in Leeds; the former also suggested that it should be strongly urged upon the various societies, that they should provide a set of lantern slides for circulation. His society had taken the lead in this matter, although hostile critics had styled them fossilised, and he was rather surprised that some of the younger societies had not taken the matter up. He trusted that no opportunities would be lost of appealing to the secretaries to bring this matter up.

## General and Photographic Chemistry.—XIII.

By E. C. CONRAD, F.C.S.

### THE NON-METALLIC ELEMENTS AND THEIR COMPOUNDS.

(Continued from page 400.)

**HYDROCYANIC ACID**, Prussic Acid,  $\text{HCN}$  or  $\text{HCy}=27$ .—**M.**: The anhydrous acid can be prepared (1) by passing a series of electric sparks through a mixture of nitrogen and acetylene, Eq.:  $\text{N}_2 + \text{C}_2\text{H}_2 = 2\text{HCN}$ ; (2) by passing dry sulphuretted hydrogen gas over dry mercuric cyanide, gently heated, and collecting in a cold receiver; Eq.:  $\text{H}_2\text{S} + \text{Hg}(\text{Cn})_2 = \text{HgS} + 2\text{HCN}$ . An aqueous solution of this acid is best prepared by heating powdered potassium ferrocyanide with dilute sulphuric acid; Eq.:  $2\text{K}_4\text{FeCy}_6 + 3\text{H}_2\text{SO}_4 = 6\text{HCy} + \text{K}_2\text{Fe}_2\text{Cy}_6 + 3\text{K}_2\text{SO}_4$ . The flask in which the decomposition takes place must be connected with a Liebig's condenser supplied with a stream of cold water. **P.**: The anhydrous acid is the most powerful poison known; a few drops of the liquid or a little of its vapour producing instant death. It is a colourless volatile liquid of S.G. 0.7058, and boils at  $26^\circ\text{C}$ ., and freezes at  $-18^\circ\text{C}$ . It has a powerful characteristic odour resembling peach blossoms. The anhydrous acid soon decomposes, but it mixes with water and alcohol in all proportions, and its solution can be kept without decomposition for some time if not very strong and if mixed with a little hydrochloric acid. The strength of the prussic acid solution used in medicine is 2 per cent., and it is given in very small doses. Many vegetable substances produce prussic acid by fermentation, such as bitter almonds, kernels of plums and peaches, and the leaves of several plants. Hydrocyanic acid forms a large number of single and double salts called cyanides. Of these the salts of the alkali metals, the alkaline earths, and mercury cyanide are soluble in water. The cyanides of the heavy metals are insoluble in water, but mostly dissolve in solutions of potassic cyanide, forming double cyanides. **Tests.**—Many cyanides decompose on heating, or by the action of acids giving off cyanogen gas or hydrocyanic acid. A solution of the acid or a soluble cyanide gives a white precipitate with silver nitrate soluble in ammonia or potassic cyanide. Scheele's test is carried out by adding a few drops of ferrous sulphate solution to the liquid to be tested, and an excess of caustic potash, agitation, and exposing to the air for fifteen minutes (to oxidise some of the iron) and adding excess of hydrochloric acid, when Prussian blue is formed in the presence of a cyanide. The most important metallic cyanides are the following:—

**POTASSIUM CYANIDE**,  $\text{KCy}$ .—**Oc.**: This compound is often produced in considerable quantities in blast furnaces and whenever any organic substance capable of giving ammonia by destructive distillation is heated with potassium carbonate in a closed vessel. **M.**: Eight parts of potassium ferrocyanide are rendered anhydrous by gentle heat and mixed with three parts of dry potassium carbonate placed in a red-hot earthen crucible, and the fused mass stirred until gas ceases to come off, it is then allowed to rest, and the clear fluid portion decanted off and allowed to solidify. Eq.:  $\text{K}_4\text{FeCy}_6 + \text{K}_2\text{CO}_3 = 5\text{KCy} + \text{KCyO} + \text{Fe} + \text{CO}_2$ . The pure compound can be prepared by burning potassium in cyanogen gas, or by passing the vapour of hydrocyanic acid into an alcoholic solution of potash. **P.**: The pure salt occurs in colourless crystals, and the commercial variety in

white opaque lumps. The principal impurities contained in the latter are cyanate and carbonate of potash, which do not interfere with its general uses. Potassium cyanide smells of bitter almonds, is deliquescent, very soluble in water, but only slightly in alcohol. Its solution has an alkaline reaction, and gives off an odour of hydrocyanic acid in the air; it is decomposed by the carbonic acid of the air, and on boiling, is converted into potassium formate and ammonia.

Potassium cyanide is a most poisonous substance, and must always be used with great care; the symptoms of poisoning are said to be frothing at the mouth, rush of blood to the head, bleeding from the nose, giddiness, and partial blindness. The best antidote is a mixture of a solution of ferrous sulphate with one of ferric chloride, together with magnesia or sodium carbonate. An application of a stream of cold water to the spine may stimulate the system and give time for the antidote to act; emetics or the stomach pump should also be used, strong coffee and the use of smelling salts are also useful. **U.**: Potassium cyanide is largely used in electro-plating, gilding, etc. **U.P.**: As a fixing agent in the wet process, it acts by converting the silver halogens into soluble double cyanides. It is also used to reduce the density of negatives and silver prints. It is a solvent of gold and silver, and also acts on gelatine.

**POTASSIUM FERROCYANIDE**, yellow prussiate of potash,  $\text{K}_4\text{FeCy}_6$ .—**M.**: (1) By the action of ferrous hydrate on potassium cyanide, Eq.:  $\text{FeH}_2\text{O}_2 + 6\text{KCy} = 2\text{KHO} + \text{K}_4\text{FeCy}_6$ . (2) A solution of potassium cyanide with metallic iron gives the same compound, and if the air is excluded hydrogen is given off; Eq.:  $6\text{KCy} + \text{Fe} + 2\text{H}_2\text{O} = \text{K}_4\text{FeCy}_6 + 2\text{KHO} + \text{H}_2$ . Commercially, this compound is manufactured by heating, in iron pots, potassium carbonate and iron filings, and adding animal refuse such as feathers, hair, horn, or leather parings, etc.; potassium cyanide and oxide or sulphide of iron are formed, and by the addition of hot water, react to form the ferrocyanide.

(To be continued.)

**Hackney**—Ordinary meeting held on 20th inst., Mr. R. Beckett in the chair. Several new books were added to the library. The Hon. Sec. made an appeal for (voluntary) financial assistance for Weir, a professional photographer whose cause had been taken up by *Photography*, which was responded to. Some gummed labels, numbered, were shown and approved of, made by Vevers. The Hon. Sec. announced that the Society had become affiliated to the Photo. Society of Great Britain, and that the society had won first prize in the Competition of Societies, promoted by the *Hand-Camera and Lantern Review*. This was heartily received. Mr. W. L. Barker and Mr. Wire handed round work done on Paget print-out opals and plates respectively, fair results being obtained. Mr. Cross showed a negative which had black marks over it. The Chairman said these were due to metallic contamination, which Mr. Cross thought was the case. Mr. Hudson showed a taper-holder, marked in inches, which he used for burning magnesium ribbon. By this method he could mark off exactly the quantity of ribbon he wished to use. Mr. Paget, of Mr. C. A. Rudowsky's, then showed and explained the working of their electrical retouching apparatus. The vibration caused by the electricity made stippling over the film, which facilitated the retouching. Owing to the absence of a proper negative the full value could not be estimated, but it will later on be tried. Mr. Paget showed a flash-lamp Mr. Rudowsky was bringing out, in which the powder was blown through upwards, and a continuous exposure of twelve secs. could at will be obtained; after this negatives and transparencies on mica were passed round. They were not yet on the market, owing chiefly to their high price, but there was a great advantage, as, being so very thin, they could easily be printed from either side. In answer to questions, Mr. Paget said they would not chip. Hon. Sec. then announced that the next meeting would be on January 3rd, a smoking concert at club premises.

## Study and Practice of Art in Field Photography.

By A. HORSLEY HINTON.

### XII.—FIGURES IN THE FIELD, AND SOME CONCLUDING REMARKS.

WE can scarcely bring the present series of chapters to a close without some brief reference to that which if not actually belonging to landscape photography is yet oftentimes so closely connected with it as to be inseparable therefrom. We refer to the inclusion in the landscape picture of animals and human figures. In the field, though not of the field, figures will sometimes assist the sentiment of the landscape in an astonishing manner, but are equally capable of marring the effect, if not properly understood and managed.

Given a subject in which there are certain figures, such as "Haymakers," "Gleaners," and the like, the idea of the picture is probably chiefly dependent upon these, and the principal interest centres on them, and hence they should be of sufficient size to give them importance and escape insignificance, and, no matter how beautiful the surrounding scene, its beauty is wasted and thrown away, because interest and attention are absorbed in the characteristic figures and do not care to take notice of anything else. For this reason, therefore, it is desirable that if the figures (and the same applies in the case of a group of cattle or sheep) are comparatively near to the camera, and therefore of a size which gives them importance, then the landscape scene should be of a quiet and unobtrusive kind that shall in no way disturb the interest or lead the eye from the figures.

It must not, however, be supposed from this that the treatment and arrangement of the landscape can be lightly considered or disregarded, for if it does not rightly combine and harmonise, or if it contains any objectional feature or evidence of careless manipulation, it will, for this very reason, disturb attention and the fault or imperfection arrest the eye. We have, however, in an earlier chapter devoted some time to the consideration of a centre of interest, and the arrangement of lines and masses so as to lead towards it, and in the present case the figures become that centre of interest, and all that has been said aforetime now applies.

There is another aspect in which figures and animals must be regarded in landscape work, and one in which they come more legitimately within the scope of our subject proper. In the previous cases cited, such as "The Haymakers," the figures may be of such importance as to belong to that class of work known as genre or figure subjects, with which it is not our present business to deal, but it will often happen that a field subject will be selected and decided upon for its own sake, and would in itself, as a "pure landscape," be complete and satisfactory, and yet there shall be somewhere grazing in the distance the quiet flock of sheep, tiny rounded forms of lightish tone, mere insignificant spots of light; they might almost be round boulders scattered over the grass, and yet, all unimportant as they seem, they will have a use in the picture, carrying small spaces of light across the shadowy margin of the meadow, sometimes forming a winding line, singly or in small groups, giving the idea, by their diminishing size, of distance.

Amongst the fringe of darker rushes which skirt the river is seen, perhaps, a small light patch. It suggests the curve of a bending back of a stooping figure—may be, the light of a drab smock or coarse shirt—and although at the distance there is little form indicated, we presume it is a man landing a fish or tending his line and bait. It constitutes a quite important little matter in the picture, and yet it could hardly be disputed that the landscape would have been complete without him. But look again in another direction, where the land lies very flat,

and only, perhaps, a narrow belt of low trees or a slight rising ground separates a strip of water and swamp from the sky. Heavy clouds hang like a dark canopy, and their lower edges range in long horizontal darker lines one above another. Here and there the shadowy masses appear drawn down towards the earth, almost vertically, and show where rain is falling a mile or two away, and the whole scene is one of dreariness and solitude. Here no figure, no animal life is wanted. On the contrary, their presence would in probability destroy the impression and prevent the full realisation of the feeling of loneliness which the scene is felt to convey.

Figures as we meet with them in the field may overwhelm the landscape interest, and constitute "figure subjects;" secondly, they may directly and palpably assist the sentiment of the subject; thirdly, they may be of use, but so inapparently that their utility is hardly realised until they have been removed; fourthly, they may interfere with the feeling and mar the whole.

To include such items or to introduce them in just the right capacity to bring them nearer or leave them more remote, will require no small amount of discernment, practice, and knowledge on the photographer's part, and more errors are committed by their introduction than by their omission, so that we should recommend the student, if he feel uncertain as to the desirability of any certain figures, to resign himself to their loss, and leave them out of the picture altogether; in this connection a sin of omission is less fatal than of commission.

When figures are introduced in order to duly subserve and assist the landscape, it is a too common fault to exhibit a total indifference as to what the character of the figure may be, and the most conventional of men in modern costumes are often made to do duty as crossing a bridge, or opening a gate, or sitting on a stile, to say nothing of the barbarous custom of making our companion who has walked with us and helped carry the camera, or the lad whom we have hired for the same purpose, stand in such and such a position in order that we may introduce a figure. Even though the figure be only required small and inconspicuous, it should nevertheless be a matter of serious care that the dress of the figure and its entire character be such as we might expect to meet on the spot, and must be free from the taint of vulgar civilisation—a hansom cab in a country lane will not be more inappropriate than the well-cut clothes and hard hat of a conventional figure or a well-groomed carriage horse in a picture of water meadows and flowery fields. The figures must be picturesque and typical.

With the deliberate posing of the figures we need not here concern ourselves, because we are supposing that they are sufficiently small and subservient to the landscape that so long as their position is suggestive of doing something, occupied in some way, we need not be very careful. We may, however, suggest that as we are in no way dependent upon facial expression, a man's back will often serve our purpose quite as well as his face, and by directing his gaze quite away from ourselves and the camera, we shall evade many difficulties which might otherwise arise; but above all things do not be enticed into getting cows and sheep and rustic figures into your landscape picture merely for the sake of having them there. If you are intent upon landscape work—and it is a wide enough field to walk in for many a long day to come, admit life only when you feel you want it and that it will be helpful; know beforehand, if possible, the precise reason why you will drive the sheep into such a place, and what purpose you have in asking yonder rustic to stand or crouch here or there or in such and such a manner. Thus you will assume the intelligent command of your materials, but if you include the man or sheep simply because, happily or unhappily, they happen to be there, or only because you "like to get some life into a picture," then your circumstances and caprice are governing you, and successful pictorial result, if achieved, will be the outcome of chance.

In the foregoing chapters we have endeavoured to seize some

Now Ready, of all Booksellers. 740 pp. Cloth, 3s. 6d.

**HAZELL'S ANNUAL, 1893**, contains about 4,000 original articles, written by eminent specialists, on every topic of current and prospective interest, at home and abroad, in every department of human activity.

**HAZELL'S ANNUAL, 1893**, contains THE YEAR'S HISTORY IN ALL PARTS OF THE GLOBE.

**HAZELL'S ANNUAL** is every man's companion and guide. "When in doubt consult 'Hazell.'"—*Pall Mall Gazette*.

**PARLIAMENTARY SUBJECTS** include Complete Biographies of every member of the New House of Commons, the House of Lords, and of the Privy Council, with special articles on Parliamentary Procedure, party changes since 1886, the progress and present position of Home Rule, and a record of work of the last two Sessions.

**THE LABOUR MOVEMENT OF 1892** throughout the whole world is given in concise form, with the work of the Commission, a List of Trades Unions, and Articles on Land Nationalisation, Socialism on the Continent, State Pensions, etc.

**NEW ARTICLES** are included on Aërial Navigation, Anarchism, Bimetallism, Building Societies, Chicago World's Fair, Coal Supply of the World, the Chamber of Arbitration, London Teaching University, Metropolitan Water Supply, One Man One Vote, the Pamirs, Proportional Representation, the Referendum, Uganda, Vivisection, and Women's Suffrage.

**FOREIGN AFFAIRS.** Concise Histories of the year in every foreign country are given, and articles on Foreign Armies and Navies, with sketches of Foreign Political Parties.

**COMMERCE.** See Trade, English and Foreign, Agriculture, Banks and Banking, Insurance, Mercantile Marine, Stock Exchange.

Crown 8vo, 202 pp., bound in scarlet cloth, gilt, price 3s.

# STUDIES IN PHOTOGRAPHY.

By J. ANDREWS, B.A.

ILLUSTRATED WITH SIX COLLOTYPES.

**CONTENTS—**

Introduction—Artistic Photography—Art in Relation to Photography—Naturalistic Photography—Photography and Colour—Light—The Artistic Use of a Hand Camera—Composition—Light and Shade—Perspective—Photography and Science—The Study of Nature—The Study of Art—Portraits—Atmosphere—Five Photographic Factors—Round About Jersey with a Camera.

London: HAZELL, WATSON, & VINEY, LD., 1, Creed Lane, London, E.C.

## PHOTOGRAPHS OF THE YEAR.

THE BOOK CONTAINS

**TWELVE REPRODUCTIONS**

Mounted on 15 by 12 Boards, of

**NOTABLE PHOTOGRAPHS**

IN THE

*Pall Mall Exhibition of the Photographic Society of Great Britain,*  
With Descriptive Letterpress by A. HORSLEY HINTON.

Published at 10s. 6d. Carriage Free.

London: HAZELL, WATSON, & VINEY, LD., 1, Creed Lane, Ludgate Hill, E.C.

# PLATINOTYPE.

SIMPLEST, MOST ARTISTIC, AND PERMANENT PHOTOGRAPHIC PROCESS.

## New and Improved Paper.

### NO HEATING OF DEVELOPER REQUIRED.

**NO EXTRA COST.**

MADE IN THREE QUALITIES { AA—Smooth Paper of Medium Thickness.  
BB—Ditto ditto Thick, very strong.  
CC—Rough Surface Paper, strong.

**PRICE, 48/- PER QUIRE, 26 x 20 inches.**

**COMPLETE PRICE LIST ON APPLICATION.**

These Papers will be supplied in **Sealed Tin Tubes**, either in whole sheets (measuring 26 in. x 20 in.), or cut to photographic sizes.

### PLATINOTYPE PRINTING LAMP.

Platintype Prints Printed by  
this Lamp in a few seconds.  
Price £2 2s.

Used by the best scientific and  
Artistic Photographers,  
including

**CAPTAIN ABNEY,  
G. DAVISON,  
F. HOLLYER,  
R. KEENE,**

Etc., etc.

### IMPROVED KEY CAMERA.

Simplest and Best Hand Camera made. Measures only 8 x 4½ x 4 ins.

**PRICE, Quarter-plate, £7 7s., with 6 Double key Slides.  
Ditto ditto 2nd Quality, £5, with 3 ditto ditto.**

MAY BE SEEN AT THE OFFICE OF

## The Platintype Co.,

29, SOUTHAMPTON ROW. HOLBORN, LONDON, W.C.

salient features in possible landscapes, and show in what way they are desirable in pictorial effect. Very much has necessarily been omitted, and, on the other hand, it may be said that too great an emphasis has been laid on a feature or features which, while desirable enough in some instances, yet our remarks appear to insist that such a feature is an essential to every picture. We are aware that such an impression may have been sometimes conveyed, yet we have lost no opportunity of asserting that there can be no rule laid down, and what holds good in one composition may be wholly inapplicable in another, and so we think there will be no harm if we have been over-persistent in some matters, because it will have been more lastingly impressed on the student's memory, and a principle is best well learned before the learner's individuality may assert itself in contravening the maxims received and carving an original path for himself.

Most of our remarks have applied to landscape in more or less flat country, because we felt the impossibility in these few chapters of touching upon the many varied phases of field photography in the hill country or mountainous regions, and notwithstanding the apparently increasing popular appreciation of the subtle beauty of the marsh and fen, still it is possible that we have failed to awaken the sympathy of some who are most at home amidst the great hills, the noisy torrent, and the scarred and rugged mountain slope. May such an one bear with us and be assured that at other times we have made our temporary home and resting place amongst the wild mountains, and will never forget their lessons and their grandeur. Still, the fen country has a beauty too, all its own, and is not too humble or too simple or devoid of great teaching for our mountain lover if he will turn and have patience.

"The Study and Practice of Art!" In very truth, Art in any connection is not to be attained without long and sincere "study." If we would be successful in photography as an Art, beyond the mere capability of making photographic prints of certain definite objects, it is useless to suppose that it can be done by taking up the pursuit for an hour or two now, and a day or so next week, filling the interval with other interests and occupations. Only by persistent study, constant observation, hard work, and frequent practice shall we attain to anything above the merest mediocre results. Do this faithfully, striving to record the beauties of nature as you see them *yourself*, being true to yourself, never fearing but that your individuality will of itself be revealed, and your truthfulness and conscientious strivings will meet with recognition and reward, far greater and more lasting than if you work only to please public taste, or for the end that you may quickly win medal awards. The artistic faculty is not equally in all, but it may lie undeveloped in many unsuspected. Such faculty develops by cultivation, and there is probably enough of it in everyone to be worth cultivating and improving; and by increased culture we shall gradually lose our likings for much that we previously admired, and take greater pleasure in the refined, the harmonious, and the hidden beauties; and many things that our teachers called beautiful and good, but which to us were inexplicable, will then be understood and appreciated.

All this by way of pacification of the self confident and impatient. Study nature for artistic ends, and practice your art in and amidst the objects of nature: out in the broad fields, under the light of day, you will find channels for thought, materials for work, and ways of pleasantness of which you had not guessed.

**Rochester Naturalists' Club.**—Meeting on 20th inst, Mr. C. Bird in the chair. Mr. J. C. Boon gave a very instructive demonstration on the "Wet-plate Process," and explained the whole process in a manner that was most interesting to those present, and answered the questions put to him very fully. Mr. G. E. Randall offered to give a silver medal for the best print to be taken by the members in the neighbourhood of Rochester.

## Construction of Twin-Lens Hand-Camera.—II.

By ENN ESS.

THE method of adjustment of the mirror chamber having been discussed, the construction of a twin-lens hand-camera embodying the principles enumerated may now be considered, the following data being given to work on, viz.:

Quarter-plate size.

Lenses, R. R., of  $5\frac{3}{4}$  in. equivalent focal length.

Extension of  $2\frac{1}{2}$  in. to be arranged for.

A changing box, to contain a dozen plates in metal sheaths, to be used in lieu of dark slides, the exterior dimensions of the box being:

Width (back to front) .. .. .  $2\frac{3}{8}$  in.

Length (side to side) .. .. .  $4\frac{3}{4}$  "

Depth (top to bottom) .. .. .  $4\frac{1}{4}$  "

The mirror to be placed at an angle of 35 deg.

No button, millhead, or other such item to protrude beyond the outer surface of the camera.

Camera case to be made of wood, full  $\frac{1}{4}$  in. thick.

The first step towards carrying out the intention is to plan a box, or case, of the dimensions necessary to contain in the most compact form, both as regards bulk and means of manipulation, the whole of the working parts of the camera.

DIAGRAM III.

To this end a working drawing must be prepared, and to start with, the equivalent focal length of the lens, or, putting it in another way, the distance from the diaphragm of the lens to the face of the plate, in register for exposure—viz.,  $5\frac{3}{4}$  in.—is taken in hand. A horizontal line A B is laid off, measuring  $5\frac{3}{4}$  in. (fig. 3), and this may be termed the base line of operations.

Through the point A a line is drawn at right angles to A B, and on it are marked the points D E equidistant from A and  $3\frac{1}{4}$  in. apart, being the width of a quarter-plate.

From the point B the line A B is lengthened  $2\frac{1}{2}$  in. to C, representing the extension required.

The point B therefore represents the position of the lens diaphragm when at its equivalent focal length from the plate D E, and C that when the lens has been extended  $2\frac{1}{2}$  in. beyond it.

The point C is now connected with D and E, the connecting lines representing the extreme upper and lower rays of light passing through the lens that will touch the plate in the picture chamber when the lens is fully extended, and consequently the interior structure of the camera must be such as to offer no impediment in any form to their passage.

If from the point D a line at an angle of 35 deg to A B be laid out, it will be found to cut the line C E in F, and would represent the mirror, were such wanted here, as has been shown in figs. 1 and 2.

Through this point F, a line at right angles to A B is drawn, on which,  $\frac{1}{4}$  in. above its intersection with C D, the point H is marked, from which point and at an angle of 35 deg., a line drawn cutting E D, extended, in K, represents the position of the mirror required.

The point of intersection of a line drawn from H, parallel to EC, and from K, parallel to DC, viz., L, represents the diaphragm of the upper or mirror lens when fully extended, and these lines represent the extreme upper and lower rays of light that will touch the mirror, which, as in the case of the picture chamber, must not be interfered with by any interior structural portion of the camera.

The line LM, parallel to CA, represents the central ray of light striking mirror at M, and reflected in the direction MN to the ground-glass screen KO; the method of obtaining the position of which has been set out in figs. 1 and 2.

The distance CL being that from centre to centre of the two lenses, when attached to the lens board.

Thus far then the exact positions to be occupied in the camera by the lenses, mirror, focussing screen, and plate when in register for exposure, have been fixed in skeleton form.

From this point the structure of the camera becomes more observable.

On examination made of the changing box to be arranged for, it is found that the plate, when in register for exposure, lies back within the box to the depth of half an inch from its front face. The line DE, in fig. 3, representing position of plate, will therefore lie half an inch inside the changing box, consequently the outer face of the back frame of the picture chamber, with which the front of the changing box will be in close contact, must be fixed at that space nearer to the lens.

Measuring this distance from A, on line AB, in P, a line is drawn through this point at right angles to AB, 4 in. in length, i.e., 2 in. above and 2 in. below P. A second line parallel to and  $\frac{3}{8}$  inch inwards from it, and of the same length, being drawn, the position and thickness of the back frame of the picture chamber become fixed. The floor of the camera has now also become fixed, as the bottom of the frame above mentioned rests upon it.

The width of the changing box from back to front is  $2\frac{3}{8}$  in.,  $\frac{1}{8}$  in. must be added for pressure springs, necessitating  $2\frac{1}{2}$  in. distance required from outer face of picture chamber frame to inner side of back end of camera. Measuring this distance from P, in continuation of PA, a line perpendicular to AB is drawn, meeting the floor of the camera already fixed, and the well or chamber into which the changing box slides is obtained.

The line passing through the points FH assigns the position to the back face of a  $\frac{1}{4}$  in. thick central frame, fitting the interior of the camera, to the front face of which the bellows are affixed.

From the point H, a line drawn parallel to CD, meeting the inner face of the back frame of the picture chamber, and a second  $\frac{1}{8}$  in. below and parallel to the first, represent the division between the picture and mirror chambers.

Similarly a line from a shade below the point F, parallel to CE, and a second parallel to and  $\frac{1}{8}$  in. below it, indicate the bottom of the picture chamber.

The exterior measurement of the lens tube, plus the thickness of the flange, is  $1\frac{3}{8}$  in., the diaphragm being centrally placed. From the point B, indicating the position of the diaphragm of the lens, on line BA,  $\frac{1}{16}$  in. are marked off in point R; this fixes position of front face of  $\frac{1}{4}$  in. thick lens board, the length of which is  $4\frac{1}{4}$  in.; the centres of the holes which take the lenses being  $1\frac{1}{16}$  in. respectively from upper to lower ends. The space between lens board and central frame thus available for bellows measures  $\frac{1}{16}$  in.

From point B,  $\frac{1}{16}$  in. is laid off on line BC in S, which fixes position of front end of lens tube,  $\frac{1}{8}$  in. beyond which is the inner side of the front end of the camera.

The inner side of the top of the camera is placed  $\frac{1}{4}$  in. above the point K.

Between the bottom of the picture chamber, and the floor of the camera a small cell remains unappropriated; within this the mill-head of the screw, which extends the bellows, lies concealed, its rim being flush with the bottom of the camera in an orifice left, through which it may be reached by a finger. The screw passes through the bottom of the central frame, and works a cradle to which the lens board is affixed.

For the purpose of raising the changing box out of its well sufficiently to allow of it being handled from the top, a circular hole is pierced through the bottom of the camera, large enough to admit of the forefinger being pushed up through it.

The outcome of construction so far is that a camera case, measuring inside—

Length	.. .. .	8 $\frac{1}{4}$ in.
Depth	.. .. .	6 "
is found sufficiently capacious to contain all the working parts of the apparatus. The breadth must be the side to side measurement of the changing box, viz., 4 $\frac{1}{4}$ inches, plus sliding room $\frac{1}{8}$ inch, in all 4 $\frac{3}{4}$ inches. As $\frac{1}{4}$ inch wood is to be the thickness of the case, the outside measurements will be—		
Length	.. .. .	9 $\frac{1}{4}$ in.
Depth	.. .. .	6 $\frac{1}{2}$ "
Width	.. .. .	5 $\frac{1}{8}$ "

In consequence of the depth of the changing box being less than the height of the point K above the floor of the camera, the upper top corners of the camera case may be taken off at an angle of 45 deg. from 2 inches below the corner point. By so doing the manipulation of the changing box is greatly aided.

In examining the camera case, as delineated in fig. 2, the fact of the skeleton line KO, representing the position of the ground-glass screen, extending beyond the case is matter of no moment, the skeleton lines merely exemplifying the reasons for the several constructive lines.

When the camera is closed, the ground-glass screen falls within. This will be fully described when the details and measurements of the several working parts of the internal structure are discussed.

## Multiple Coated or Multiple Film Plates.\*

BY GREGOR GRANT.

IN speaking of multiple film plates it is at present impossible to do so in general, for one is compelled to discuss the merits and demerits of the only plate of the kind at present obtainable rather than to theorise upon the principles of multiple-coated plates generally.

For the purposes of this paper, and in order to obtain a basis upon which to work, it will be well to start with the two advantages claimed by the makers of the Sandell plates for their production, viz. :

- (1) Absence of halation.
- (2) Impossibility of being over exposed.

Taking these two qualities as being those—or two of those—of an ideal plate, it will be well, before passing on to determine how the Sandell plates fulfil these conditions, to first consider what attempts have been made to produce a plate that will be entirely free from that bugbear of photography halation, and in order to understand these attempts the better, it must be first determined what the cause and effects of halation are. To deal with this latter first—because most easily disposed of—we are all of us but too painfully aware of the visible results of halation. In landscape work, the blurring of the outline of foliage against a bright sky; in interior work, the halo which makes its appearance round a brightly lighted window, often not only obliterating the shafts and bars of the casement, but leaving only an irregular white blotch in that part of our picture where the window should appear.

As to the cause of halation, the first person to lay down any law on this subject was Captain Abney, and the theory first advanced by him has stood the test of time, and come to be universally accepted as the primary cause of what is known as halation. The theory is briefly this—that the rays of light from the brightly lit portion of the picture penetrate the film which supports the sensitive salt, and passing through the glass plate are reflected from its hinder surface back on to the film, and a moment's thought will show that the thicker the sheet of glass the greater will be the aberration of the reflected image from the original, and consequently the greater its interference with it. Though many attempts have been made to overcome or to minimise this reflection, such as grinding one or both surfaces of the glass plate, or backing the plate with either a dead surface or one with the same refractive index as the glass, and of non-actinic colour, only the latter can be said to have been adopted, and neither to be satisfactory, for, although the dead surface will absorb all the light rays which reach it, it obviously cannot affect those which are reflected from the back surface of the glass, and the only advantage that backing has over placing a sheet of black paper behind the plate is that by it optical contact is obtained.

Some ten years ago, Mr. W. K. Burton made and gave to the photographic world the results of some experiments in which he placed below the sensitive film a non-actinic one of gelatine, containing chromate of silver, which could be fixed out with hypo, leaving a clear printing negative. This was found to be fairly efficient, but so awkward to work as to be impracticable for general use.

\* A communication to the West Kent Amateur Photographic Society.

I believe that the experiment has been tried of coating a plate with a very rapid but poor emulsion, exposing in the usual way, and then coating the plate with a thick emulsion, which it was supposed would be affected symmetrically by the exposed portions of the under film, and yield on development a good image. Who made the experiment, and what the result was, I do not know and cannot say, but venture to think that the process would prove considerably more awkward to work than that of Mr. Burton.

It having been found that very little light penetrated an ordinary coated gelatine film during a moderate exposure, it was thought that if the film were thickened the chances of halation would be very materially reduced. This theory proved substantially correct, but the thick film presented difficulties and disadvantages. There was the expense of making so thick a film rich, and if it was poor—i.e., if the same amount of silver that would be contained by an ordinary film were spread over the greater thickness—then an insufficient number of particles of the sensitive salt (that is, only those near the surface) would be affected to give a good result. This difficulty, however, has been got over by Mr. Sandell, who hit on the plan of coating the plate twice—a process heretofore considered impossible—first with a slow emulsion and then with a rapid one, his contention being that while the shadows were properly exposed on the upper film the high lights would solarise it, and, penetrating to the lower, correctly expose that, and if the exposure were then increased, the high lights would entirely reverse the top film, converting it into a positive, and the greater the over-exposure the denser the positive would become, counteracting in its effects the fuller exposure of the under film; meanwhile if the shadows were not very dark they would, as they lessened the pluck of the “embryo” image of the upper film, form an under-exposed, and therefore plucky, one on the lower, and the weaker the one became the stronger would become the other, and the two together form a good negative.

Thus, on a correctly exposed plate with heavy contrasts in it (and it is for this kind of view that the Sandell plate is meant), there would be on the upper film shadows with the correct exposure and high lights solarised, and on the film beneath clear unaffected film below the correctly exposed shadows, and correctly exposed film below the solarised high lights; and, in the case of the “pseudo” over-exposed plate, the shadows would be rendered by a negative lacking in contrast above, and one with violent contrasts beneath, and the high lights by a positive above and a dense negative beneath; the combination of the two images, in each case, giving as a result a properly balanced negative of more or less density according to the amount of exposure the plate has received. In all cases, little or no light would go beyond the second layer of gelatine, and, therefore, none could be reflected from the back of the glass and cause halation.

This, then, being the theory of the Sandell plates—the only multiple film plates at present in the market—it now remains to be seen what they will do in practice, and I must be egotistical enough to commence with a description of my own experiments, but only because I am the best acquainted with them. They may be interesting to some here, because made by one who knew nothing and consequently committed every possible error of exposure, i.e., of giving too little, too much, and what proved more fatal than either—singularly though it may sound—a mean between the two.

On starting for my holiday this summer I determined to take a dozen ordinary Sandells with me, just to see what I could do with them. As I only got the plates the very day I started north, I was unable to make a single test exposure before starting, so had only the verbal advice of our accomplished president, Mr. Pringle, to go upon, and this I completely misunderstood, with the result that I went away under the belief that the correct way to treat a plate was to grossly—i.e., many times—over-expose it, so as to reverse the top film, which was afterwards to be got rid of by stripping. As a result of the misunderstanding I managed to secure nine good negatives out of my dozen plates, and might have had ten but for losing one through stripping when I ought to have reduced. This, it must be admitted, speaks very well for the plates. As a basis for my exposure I took what I considered a full exposure for a Thomas thickly-coated landscape plate and multiplied that by ten to make sure of over-exposing.

The first view I took was from a hill path looking back over the town below towards the mist-covered hills beyond; a bright morning sun shining over my shoulder was clearing the mist from the mountain peaks of the Trossachs, and the whole landscape was yet hazy. I considered that a T.C.L. would have stood half a second at  $f/16$ , so I gave five seconds. On development the upper film darkened all over at once, and development was continued for about three-quarters of an hour, when the image was distinctly and evenly visible on the back of the plate. I fixed, and then stripped the top film off and found a fully exposed negative on the lower. The second plate, which was an identically similar, though not the same view, but with only  $7\frac{1}{2}$  sec. at  $f/22$ , I treated likewise, but found the image on the lower film too under-exposed to be any good, but the

plate would probably have been saved had I reduced instead of stripping. As there were no great contrasts in either of these views, they were merely a test for length of exposure, and as such I will refer to them later on. As another test for length of exposure, I exposed two plates, a Cyclist and a Sandell, on the same subject—a group of old tombstones lying flat—under precisely the same conditions, giving the latter as many minutes as the former seconds—in each case one half, or a comparative ratio of 60 to 1. Between the two results you will see there is little to choose; the Sandell is the denser of the two, has more detail in the shadows, but is somewhat stained with the reducer. Three other views had dark foregrounds, a mountain distance, and clouds; in one the sun was in front of the camera, and shining between fir trees on either side of the picture, throwing their trunks into deep shadow; between them was a distant mountain peak, Ben Vhorlich, some eight miles off, and brightly lit clouds—in each case the clouds print well, and in this one the detail in the trunks of the fir trees is not lost. This, I think, shows the plates' capacity for rendering contrasts.

Two other views of the same kind I unfortunately lost through giving an exposure too much for the upper film, yet insufficient to penetrate it—which seems the only thing fatal to a Sandell. Yet I believe that had development been either proceeded with more cautiously or carried further, say, after stripping off the upper film, that a printable negative might have been obtained.

Still two others, which I exposed in a deep glen—one in which I believe a camera had never been before—with exposures that I considered sufficient to penetrate to the lower film, gave fully exposed but good images on the upper, which did not require reduction. All the plates were developed with Thomas's new developer, “Cyclol,” which I am told is a mixture of hydrokinone and eikonogen, and, with the exception of the two I lost and the two mentioned as taken in the glen, development was pushed till the image appeared well marked on the back, and reduced to the required density with ferricyanide of potassium and hypo.

I will now pass on to experiments not made by myself, but the results of which I have seen, and with this *modus operandi* of which I am quite familiar. The subject of one, which was conducted in the presence of Mr. Sandell himself, was a drawing room, facing south—a large window with lace curtains in the centre of the picture, and beyond it a glass passage and beyond that again the garden landscape, lawn and trees. It was found that the correct exposure for a Paget plate was two minutes—the Sandell was given 20 minutes—the room was darkly lit, the sun shining brightly outside. In result the Sandell showed a decided superiority over the other, there being complete detail in the interior, no trace of halation round the window, and the landscape without still clear and printable.

Another trial had for its subject one which might be said to have been made to give halation all over—the interior of a vinery with a blazing sun shining in patches through the openings between the leaves on to bunches of green grapes. Several exposures were made, varying from 2 sec. to  $4\frac{1}{2}$  min. Most of the resulting negatives were good, and none showed any trace of halation whatever.

From the foregoing experiments I think it may be held that with proper treatment the Sandell plates do meet the claims made for them by their manufacturers, viz., freedom from halation and capacity to stand an abnormal and almost indefinite amount of over-exposure.

Doubtless the question will be raised, “Does the Sandell plate possess any advantages under ordinary circumstances?” The answer is a simple one—most emphatically, No! But when you come to interior work, or views with great contrast in them, or where the required exposure is unknown, and cannot be guessed at with any degree of certainty, then as emphatically, Yes! for all that is necessary to ensure a good negative, is to be quite certain that a sufficient exposure is given. How much too much does not appear to matter in the slightest, for, provided the upper film has received sufficient light to correctly render the shadows, the quality of the resulting negative lies in the hands of the operator.

The Sandell plates are made in two qualities—the “General” with two films, and the “Especial” with three, the rapidity of the top film in each case being the same, and the required treatment exactly similar. The rapidity, however, has been very much over-stated—one authority contending that half-a-second at  $f/64$  under trees was sufficient. I am inclined to place it somewhere between that of an Ilford ordinary and a Thomas's E.R., or about Warnerke 20.

As to treatment, I cannot say more than to summarise my previous remarks in various parts of this paper.

The old wet collodion rule of “expose for the shadows, and let the high lights take care of themselves,” seems to apply well—give the exposure that you think would best render the shadows on a plate of moderate rapidity, the high lights will then accommodate themselves somewhere in the “substrata,” the great point to bear in mind being that if more exposure be given than the shadows will stand on the top film, then a great deal more must be given, or the plate will

be lost, by which is meant that if  $x$  represent the correct exposure then  $2x$  or  $3x$  will mean a flat and, what would ordinarily be termed, a hopelessly over-exposed plate, but if  $50x$  to  $100x$  be given, then there is every chance of securing a good image if development only be carried far enough.

As for the developer, hydroquinone, or eikonogen, or a mixture of the two, such as "Cyclol," or "Hintokinone," seems the best; "Cyclol" being recommended by the manufacturers and giving excellent results. Ammonia should be avoided—for as development is necessarily long—at any rate in comparison to the exposure—for part of the plate at least—it causes a fogging of the more sensitive film quite different to the increased density caused by other developers, consequent on excess of light action. Another great point to bear in mind is that the greater the exposure that has been given, the further must development be carried, not by strengthening the developer, but by patience, for it takes a long time for the developer to soak through to, and act upon, the lower film.

The question will doubtless be asked, How is it possible to tell which films have been affected by the exposure, and by what symptoms can development be regulated? This is not so difficult a matter as would at first appear. As with all other plates, it is best to commence cautiously, and with a developing solution of moderate strength; if the shadows remain fairly clear it is safe to conclude that the plate has not been over-exposed, and development should be carried on the same as with an ordinary plate, judging of the density of the appearance of the surface of the film, and by transmitted light, for nothing will show on the back of the plate except, perhaps, some very brightly lit portion—which should do so. If, however, the top film completely fogs over, the plate has been over-exposed, and development must then be continued for about half an hour, or until the image shows plainly on the back of the plate; by transmitted light it will then appear perfectly opaque.

The plate is then, in either case, fixed in the usual manner, care being taken that it is thoroughly fixed. The correctly-exposed plate now represents the appearance of an ordinary negative, but the other is still opaque, and must be reduced, or if before fixing the image appeared evenly all over the back of the plate, the upper film may be stripped off—that is, if the operator feel competent to do so successfully—for it will have received such an excess of exposure as to yield a complete negative on the lower film, and render the top one superfluous. But stripping is risky work, and its only advantage is that it obviates the danger of reduction stains.

A prominent theorist, Mr. Lyonel Clark, has suggested that a possible failing in the plate's action would be a break in the scale of densities, by which is meant that the upper film might be of the rapidity to correctly render the shadows and the lower the high lights, but the half-tones would act on both films and produce an area of undue density; this, however, is only a theoretical failing, for, as a matter of fact, half-tones are rendered with great beauty. Mr. Lyonel Clark further suggested that, to overcome this failing, a plate might be coated with a succession of films, each more rapid than the one below it, but this would on the face of it be useless, for no light would reach the lower films at all.

At a recent meeting of the Camera Club, Captain Abney described a modification of the Sandell plate to be used for spectrum photography, in which the upper film is isochromatic: the action, however, remaining to all intents and purposes unaltered.

The blue or chemical rays solarise the upper film, and are rendered by the lower, while the red rays act on the isochromatic film only, leaving the other untouched.

The scale rendering of plates thus quoted is said by Captain Abney to be exceedingly good, and if by multiple coating a plate can be produced that will render by one exposure all the different colour grades of the solar spectrum in their due gradation of tone, and not only those which are visible, but also the ultra-violet and ultra-red rays which are quite invisible to the eye, it must be admitted that the multiple film plate is a step in the right direction, and that by its invention Mr. Sandell has added one more stepping stone to those by which we photographers hope to cross the flood of difficulties that flows between us and the certain production of an ideal negative.

**R. N. E. College, Devonport.**—An exhibition of lantern slides took place on 16th inst. The slides consisted of a set lent by Mr. Tylar, of Birmingham, which were taken by himself on a visit to the Channel Islands. They are known as the "Tit-Bit" slides, and, although a comparatively small collection, they are well worth exhibiting, and are sure to be appreciated both by photographers and their uninitiated friends. After these slides had been shown, some of the more recent work of some members of the Club was shown.

## The Printing of Clouds.

By W. H. BIBBY.

FOR a long time after commencing to practise photography I looked upon the combination of suitable clouds with landscapes, seascapes, etc., as something beyond my reach. All the time I felt that a picture with a white sky was short of something; I thought that the sky wanted life—the life and motion we are accustomed to behold whenever we take our walks abroad. When I began to send in prints to your competitions, it was for educational purposes, and I soon found out, after perusing your short criticisms of the prints, that blank skies would not find much favour in the eyes of the judges. I therefore resolved to attack the apparently insurmountable mountain of difficulty, cloud printing. My early experiences in this branch of our beloved art—I make bold to call it art—would be amusing reading. I almost despaired of success. The articles by Mr. Hodges in recent issues reminded me of those troubles, because I tried the methods he advocates without any result beyond vexation of spirit. By painting on the backs of negatives I could never obtain a satisfactory junction of sky with horizon. I am sure Mr. Hodges and others can work this way with good results, but I fear the plan is difficult for very many workers like myself, who have had no training with the pencil and brush. I think all the plans suggested by Mr. Hodges are very difficult and troublesome to young workers. Not that I think anyone should shirk trouble; indeed, I am of Mr. Hodges' opinion, that the photographer who is afraid of taking pains will never produce anything worth looking at. I have great respect for Mr. Hodges' opinions and advice, and I have profited much by the attentive reading of his various articles. I feel it is something like presumption on my part to set up my opinion against his, but I have found the plan I finally hit upon, after many struggles, to work so well that I thought I would describe it for the benefit of anyone who experienced difficulty in the matter. I would not venture to recommend the plan I follow were it not so easy and simple, the only qualification required being a capacity for taking pains. It leaves the negative untouched, which, I think, is a great advantage, for I look upon the application of the pencil or brush to a negative as something akin to sacrilege. I proceed as follows:—I first obtain a piece of clean tissue paper, free from creases, and the same size as the negative. I place this in contact with the negative, and holding them up to the light I carefully draw a line along the edge of every object that belongs to the earth, whether it be hill, tree, or building. This done I next divide the paper along the line I have drawn, employing a sharp pair of scissors. I next prepare a sheet of thin cardboard the exact size of the top of the printing frame from edge to edge. In the exact centre of this I draw an outline the size of the negative. I now take one half of the divided tissue paper (either will do), and placing it at the top of the outline prepared for it on the card, I trace the uneven edge, and then neatly with the point of a sharp penknife divide the card along the tracing, separating the card by a straight cut at each side. I have now two pieces of card, one to block out the sky and the other to cover the land portion of the negative. Taking a printing frame, I put in the negative, and holding them up to the light I proceed to carefully adjust the card to block out the land portion. Being satisfied that each outline on the card corresponds with the outlines on the negative, I fix the former to the frame with ordinary tacks. Taking a second frame, and putting the negative in, I affix to it the card to block out the sky portion. I have now two frames prepared, one to print the landscape and the other to print the clouds or sky. Now I find it best to print the clouds first, because I think it is an improvement if the sky portion is faintly printed a little below the edge of the vignette, for then such things as tree tops, ships' masts, and chimneys, etc., will be printed on the top of the faint impression of the clouds. I, therefore, take the frame with the card to block out the land, and insert the selected cloud negative. The paper to be printed on should be the exact size of the negative, for it is important that both negatives are always placed in the frame at the corner which corresponds with the vignetting cards, and if the paper is the exact size it is impossible to make a mistake. Before putting out to print I always cover the top of the frame with a sheet of tissue paper, because I am saved the trouble of turning the frame round, and the resulting print is, I think, always better. The clouds being sufficiently printed, it only remains to transfer the print to the other frame with the cloud portion blocked out, and proceeding to print as with the clouds. This system applies to printing-out paper of any sort, and to paper that needs developing, as bromide paper, etc., but, of course, it is easier to manage a printing-out paper, as special calculations have to be made for exposing bromides. Other little details must be left to the common-sense of the worker. Since adopting this plan my prints have come out much higher in the competitions than they did before.

## Winter Photography,

AND

### HOW TO PHOTOGRAPH SNOW AND FROST SCENES.

BY JOHN A. HODGES.

WITH the great majority of amateurs outdoor work with the camera during the winter months is scarcely thought of, much less attempted. With the fall of the leaf the camera and its accessory apparatus is usually packed away until the bright green foliage of spring heralds the approach of the more voluptuous beauty and warmth of summer. But why photographers should thus voluntarily impose upon themselves this long period of inaction, the writer is at a loss to conceive, for the opportunities of successful picture-making in the winter are at least equally numerous, and the conditions generally far more favourable than in summer.

Some painters and art critics are accustomed to point to the false tonality—the untrue translation of the varying colours of nature in the monochromatic rendering of a landscape photograph—even though the examples criticised be from the hands of the cleverest and most skilful workers. Nor can the justice of the criticism be denied, for seldom are the varying shades of summer foliage rendered with even a semblance of truth, notwithstanding the advantages afforded by the use of colour-sensitive plates. Delicate tones and still more subtle half tones are too frequently represented by dull heavy masses of shadow; bright sunlit foliage, dancing and feathery, is replaced by that spotty distracting effect painfully familiar in many photographs.

But, in winter, when the trees are bereft of their summer clothing—when bare branches standing out in bold relief against the dull and wintry sky take the place of the waving masses of foliage which prove so alluring to the photographer—then the difficulties to which I have referred, in a great measure disappear, and the whole face of nature becomes, as it were, toned down and translated into monochrome. Indeed, with the majority of landscape subjects in winter there will be an almost entire absence of colour, so that in this class of work the photographer may compete with the painter on more equal terms, and with a far greater chance of obtaining, not only a successful, but a truthful result.

"Winter photography!" I fancy I hear some of my readers exclaim, "Oh! no, too dreary and monotonous for me!" Without agreeing that all winter subjects can be correctly so described, we will assume for the moment that under certain conditions a particular scene may be so described. Why not take advantage of the opportunity, reproduce the effect with all its dreariness, and secure perchance a photograph which is a *picture*? Winter photography, however, need not confine the student to such subjects, for even during an English winter there are many bright and sunny days, when pictures of a totally different type may be obtained.

But the possibilities of successful landscape photography in winter are perhaps greatest in times of frost and snow, when hill and dale alike are wrapt in nature's icy mantle. The difference which even a slight covering of snow will make on a most ordinary landscape, from a pictorial point of view, is really surprising. A commonplace subject with almost uninteresting surroundings will often be transformed into a delightful study. Nor is it necessary for dwellers in town to go far from the too familiar bricks and mortar, in quest of subjects, for some of the most charming pictures of this kind which I have ever seen were taken in Hyde Park and its vicinity. Neither should a slight fog or haze deter the reader from attempting to expose his plates, for I have frequently found that such apparently adverse conditions help rather than mar the effect, though under such circumstances subjects in which the principal object is in the foreground should be chosen.

A heavy snowfall certainly does seem to tempt even those who belong to the class to which I referred at the commencement of this chapter, to unearth their apparatus and endeavour to obtain some "snow scenes." But, judging from the quality of the prints which are frequently submitted to me for my inspection, and the many letters of inquiry upon the subject which our worthy Editor receives at this period, it would seem that uniformly successful results are by no means invariably obtained. Therefore, it is that I find myself engaged in the pleasant task of jotting down my own experiences in photographing snow scenery for the benefit of those who are not familiar with the work.

In the first place, and apart altogether from the photographic side of the question, a stout pair of strong boots should be regarded as indispensable; as to clothing, it should be warm but not heavy, for the exertion of carrying a heavy apparatus through deep snow is often very great. A thick pair of woollen gloves, a size or two larger than ordinarily used, will be found very useful to persons who, like myself, are not blessed with a quick circulation. My hands have sometimes become so completely numbed by carrying the apparatus, that when I have halted with the intention of taking a

view, I have been utterly unable to manipulate the camera. If working in a mountainous or lonely district, a flask of spirits should also be taken. This advice may appear to some people to be almost superfluous, but those who have had experience in this kind of work will know the necessity of paying attention to such details.

I shall never forget an expedition of my own to Burnham Beeches in the winter of 1880, during the great frost of that year. The weather was intensely cold, and a slight snow-fall occurring, I was tempted to take my whole plate camera thither in search of snow pictures. The Beeches were reached shortly after noon, and the two succeeding hours were spent in securing photographs. Just before starting for home a blinding snowstorm set in, accompanied by an intensely cold wind. When the common was reached matters became serious; not a trace of the path was visible, darkness was fast setting in, and the snow was beginning to drift to an extent which made progress extremely slow and difficult. The fatigue was far greater than those who have not been similarly situated would believe, and more than once I was almost tempted to relieve myself of the weight of the apparatus by leaving it behind. This little incident will prove the necessity for having regard to such matters of detail as those to which I have referred.

In photographing snow scenery a good deal of the success or otherwise of the work will depend upon accuracy in exposure, or rather I would say in giving a generous exposure, followed by careful development with a weak developer. A landscape with the ground covered with snow, against which dark tree trunks stand out in strong contrast, is not the easiest of subjects to make a good negative of. The contrasts of light and shade are usually strongly marked, and therein lies the chief difficulty of the work. The exposure must be always sufficiently full to secure detail in the shadows, which will, of course, necessitate the snow portion of the view being considerably over-exposed; a compromise must therefore be effected by skilful and suitable development. Half the failures of beginners are due to under-exposure and the use of a strong developer. The result of such treatment is the production of photographs literally "in black and white." A question was asked the other day as to the kind of lens most suitable for the work. It will be obvious to most people that the construction of the lens will have very little effect upon the result, and therefore it need scarcely be said that any of the lenses ordinarily in use may be employed. Not so, however, in regard to the plate, upon the selection of which I shall have a good deal to say anon.

## On Silver Hemisulphate.

BY M. CAREY LEA.

THE existence of those substances which I described some years ago under the name of photosalts of silver,\* necessarily implied the existence of the hemihaloids of silver also, as these latter entered into the composition of the photosalts. Similar inferences, though less definite, had long been drawn from the action of light on silver haloids. Two of these, the chloride and bromide, lost by the action of light their complete solubility in ammonia without becoming completely soluble in nitric acid. Evidently there was indicated an intermediate compound between the normal haloids and metallic silver. During the last ten or twelve years I have devoted much time to the attempt to isolate these lower compounds of silver, and to gain some certain knowledge as to the hemioxide, whose existence seemed almost a necessary inference from that of the hemihaloids. Some eight years ago I obtained a substance having all the properties which one would be disposed to ascribe to  $\text{Ag}_2\text{Cl}$ , and a large number of analyses made seemed to confirm the view. I hesitated, however, to publish a description of it, not feeling entirely certain that it might not be a mixture, as to which a concordance of the proportions found of  $\text{Ag}$  and  $\text{Cl}$  with theory gives no sufficient information. Since then M. Guntz has described a sub-chloride obtained by acting on silver hemifluoride with phosphorous pentachloride and a hemioxide derived from it. Up to the present time no combination of silver hemioxide with an oxyacid has been known.

Such a combination I have been able to obtain as a double salt of hemisulphate and normal sulphate containing one molecule of each. The new salt has a light-bright-brown colour, and exhibits a stability which, in view of its composition, is something remarkable. It has no tendency either to oxidation or to reduction. Nitric acid, unless very strong, has but little action upon it. Acid of 1.42 poured over it in large excess, and let stand for several days, gradually dissolves it completely, but the same acid diluted with

\* "The American Journal of Science, XXXIII., May and June 1887.

two or three times its volume of water has so little action that it forms a convenient means of purification. On the other hand, ferrous sulphate, which instantly reduces argentic sulphate, has no action whatever on the new substance, even with several days' contact. Hot strong sulphuric acid has no action. It might almost be expected that under its influence the argentous salt would gradually take up oxygen and be converted into argentic sulphate. But a specimen which was covered with a large excess of undiluted sulphuric acid in a flask, and was kept under boiling water for ten hours, was not altered thereby. Another strong proof of its stability is found in its resistance to heat.

The application of heat produces a somewhat curious succession of colours. The terra cotta or warm brown shade of the moist substance changes by drying above 100 deg. to pale lilac; at 165 deg.—170 deg. it becomes greyish; at a somewhat higher temperature, yellowish-green. Considerably below red heat it acquires a fine ruby-red colour. In cooling, this red darkens almost to black, then becomes lighter again, and when cold the colour is light olive-green. The changes are repeated as often as the substance is heated and cooled. No sulphuric acid vapours are disengaged even at a low red heat.

It was mentioned in a previous paper that when silver nitrate is reduced by solutions of phosphorus or hypophosphorous acid, or by acidified solutions of their alkaline salts, transient colorations were produced that seemed to suggest the presence of some form of allotropic silver. Since that paper was published this reaction has been taken up for further study. It soon appeared that when the silver salt was treated with a solution of alkaline hypophosphite, acidified with sulphuric acid, the result obtained was entirely different from that which presented itself under any other circumstances. It became clear that sulphuric acid did not act solely by setting free the hypophosphorous acid, but also acted on the silver with formation of a double sulphate.

A remarkable though limited analogy here presents itself between the substance just described and the photosalts of silver. The silver hemihaloids are very unstable substances, but acquire stability by uniting with the normal haloids. In the same way the hemisulphate, which is not known to be capable of separate existence, becomes perfectly stable by union with the normal sulphate. The limitation to this analogy lies in the fact that the last-mentioned combination occurs in definite proportions, which does not seem to be the case with the halogen compounds.

The new substance then is formed by the joint action of sulphuric and hypophosphorous acid on a silver salt. Hypophosphorous acid has but little action on silver sulphate already precipitated, but it is different when the silver sulphate is formed in presence of hypophosphorous acid.

Several silver salts may be used. I have at different times employed the nitrate, phosphate and carbonate. The latter is perhaps the best, because the action with the nitrate is too rapid, and with the phosphate too slow, and for other reasons.

A weighed quantity of silver nitrate is precipitated with an excess of alkaline carbonate and washed. The carbonate, as well as all the other reagents employed, must be absolutely free from chlorides, otherwise the product becomes contaminated with silver chloride which cannot be removed. The silver carbonate is then treated with a solution of alkaline hypophosphite acidified with sulphuric acid. All the alkaline hypophosphite of commerce contains much more than a trace of chloride; this is best got rid of by adding to its solution a little solution of silver nitrate, stirring well at intervals, letting stand for twenty-four hours and filtering. This filtrate with addition of sulphuric acid is to be poured over the moist silver carbonate and constantly stirred. The reaction is complete in twenty or twenty-five minutes, when a bluish-black film of reduced silver begins to form on the surface. Further action is then cut short by neutralizing the liquid with alkaline carbonate. The precipitate is next to be washed several times by decantation. Very pure distilled water is, of course, needed throughout.

Convenient proportions are: 40 grams silver nitrate precipitated with excess of alkaline carbonate. Of sodium hypophosphite, 100 grams, dissolved in 650 c.c. of water, are treated with a little silver nitrate, and after standing and filtering, 4 c.c. of sulphuric acid are to be added and the liquid poured over the silver carbonate. After a few minutes, 6 c.c. more of sulphuric acid, diluted with a little water, are added by degrees. With this second quantity of sulphuric acid the characteristic reddish brown colour of the substance first appears.

This process may be varied by precipitating with disodic phosphate (which must be perfectly free from chloride) instead of alkaline carbonate. The action is much slower, about twenty-four hours being needed. Silver nitrate itself may be used, but the action is too rapid and the product is less in quantity.

The crude product obtained in either way is to be purified with nitric acid. Acid of 1.42 is diluted with three times its volume of

water, and of this dilute acid a quantity is taken about double in volume to that of the precipitate and of the water left after decanting closely. After a time some effervescence takes place, but the mixture does not become warm. After standing for three or four hours over the precipitate, it is to be poured off and the precipitate washed. This treatment with acid is applied three times: the first removes a good deal of silver, the second a little, the third a trace. Each time the acid is left three or four hours in contact. The product is then washed by pouring on it a large quantity of boiling water. This is repeated four or five times, each time (except the first) placing the vessel in a water bath kept at 100 deg. C. for several hours.

The product is either dried in the air or (for analysis) at 100 deg. C. It forms a bright brown substance, permanent in the air, changing to violet when kept for some time at 160 deg. C. It has the peculiarity that when water is poured on it, it makes a sharp hissing noise. This takes place with the air-dried substance as well as that dried at higher temperatures, and as much with the former as with the latter.

The substance after purification has about one-half the weight of the silver nitrate taken.

These proportions and this mode of operating are those that I have found to give the best result. But the substance is formed under a great variety of conditions. It seems impossible to bring a silver salt in contact with alkaline hypophosphite acidified with sulphuric acid without producing more or less of it. Its presence is often completely obscured by reduced silver. But a mass that looks perfectly black and might be supposed to contain nothing but metallic silver will leave, when treated with nitric acid, a bright brown residue of the double sulphate. We have here, as before, an analogy with the photosalts. For it will often happen that a blackish mass, containing metallic silver and mixed or combined silver chlorides, will, when treated with nitric acid, resolve itself into bright purple or rose-coloured photo-chloride.

All the specimens of this new substance contain a little phosphoric acid which cannot be removed. Reckoned as phosphoric anhydride it amounts to a little over two per cent. Three determinations gave respectively; 2.30; 2.09; 2.18, mean, 2.19.

It is apparently united with silver, and this silver phosphate is united so firmly with the double sulphate that it cannot be detached. If it were not so united it would be dissolved in the nitric acid with which the substance is three times treated if it were normal phosphate, and if it were hemiphosphate it would be converted (if in a free state) to normal phosphate and dissolved.

Another attempt to remove this phosphate was made by heating the substance with sulphuric acid to 100 deg. C. for ten hours, followed by copious treatment with boiling distilled water to wash out the sulphate which it was hoped would be formed at the expense of the phosphate. It seems difficult to believe that a silver phosphate could resist this treatment, but a quantitative determination showed that the proportion of phosphoric anhydride is not even diminished by it.

Other modes of formation than those described here were experimented on with the view of obtaining the substance free from phosphate, but without good result.

It is possible that the silver phosphate may be combined in definite proportions and the approach to uniformity of composition somewhat favours this idea. But such a view would require the assumption of a large, perhaps too large, a molecule.

Mean 76.74

Mean 3.55

The determinations of phosphoric and of sulphuric anhydride

are placed opposite the silver determinations to which they belong. The oxygen determinations are distinct.

The most reasonable interpretation of these results is that we have to do with a double sulphate of silver hemioxide and protoxide in which a portion of sulphuric acid is replaced by phosphoric. The proportion of phosphoric acid seems to be nearly constant, three concordant analyses having given 2.09, 2.30, and 2.18, with a mean of 2.19. The proportions may be expressed by the formula—

The comparison of this formula, with results obtained, is as follows:—

	Calculated.	Found (Mean).
Ag ... ..	76.79	76.44
SO <sub>3</sub> ... ..	15.67	16.33
P <sub>2</sub> O <sub>5</sub> ... ..	1.98	2.19
O ... ..	3.80	3.29
H <sub>2</sub> O ... ..	1.76	1.78
	100.00	100.03

The large molecule results from the relatively small proportion of P<sub>2</sub>O<sub>5</sub>, and although the figures obtained for phosphoric anhydride are very concordant, it perhaps is better to consider the substance as a double sulphate in which part of the sulphuric acid is liable to be substituted by phosphoric. If the silver phosphate is taken as adventitious, the formula becomes simply Ag<sub>4</sub>SO<sub>4</sub>.Ag<sub>2</sub>SO<sub>4</sub>.H<sub>2</sub>O.

*Decompositions.*—The action of alkaline hydroxides is confirmation of the above conclusions, and also offers further proof of the great stability of the substance.

When the double salt is placed in contact with excess of dilute sodium hydroxide it blackens, being converted into a mixture of the hemioxide which is intensely black, and the normal oxide. This decomposition, however, takes place much more slowly than with the salts of the protoxide, so that (unless heat has been applied), if after ten or fifteen minutes the alkali is poured off and the oxides are dissolved with dilute nitric or sulphuric acid, a considerable residue is found of the red-brown double salt which has escaped decomposition.

With continued treatment with sodium hydroxide (that obtained from metallic sodium was used as being absolutely free from chlorine), the decomposition is complete.

The oxide thus precipitated was thoroughly dried at 160 deg.—170 deg. C., weighed and ignited. Five determinations of oxygen from various specimens gave 4.73; 4.63, and again 4.24; 4.19; 4.17 per cent. of oxygen respectively. A salt with the constitution already described should yield one molecule each of hemioxide and of normal oxide, and this mixed oxide should contain 4.68 per cent. of oxygen. We have then:

	Mean of 5 determinations.	Calculated.
Oxygen per cent. ... ..	4.39	4.68

The double salt is more readily decomposed by hydrochloric and hydrobromic acid or even by alkaline chlorides or bromides. Under their action it instantly blackens. That part of the silver that exists in the form of hemisulphate is converted into black hemichloride or hemibromide. The extreme instability of those hemihaloids causes them spontaneously to resolve themselves into metal and normal haloids. They rarely remain as hemihaloid for more than an hour or two, and often for much less time. The change is often quite sudden, and is easily observed by the alteration of colour, the black of the hemihaloid passing into the metallic gray colour belonging to a mixture of normal haloid with metallic silver. The hemibromide seems to be little less unstable than the hemichloride.

This instability does not render an analysis impossible, since both the products of the change are insoluble; but renders it somewhat more difficult, as the freshly-formed silver haloid tends to run through a filter. Sometimes, indeed, it seems as if traces of the silver chloride were for a few moments soluble in water with a yellow colouration. The appearance of this yellow colour in the water is apt to be the first indication of the splitting up of the hemichloride.

Two analyses were made, one of material obtained by acting on the brown salt with dilute hydrochloric acid; this contained 81.79 per cent. of the silver. One by decomposing it with sodium chloride; this gives 81.93 per cent. A substance having the formula already given should, by conversion into chloride, give a mixture in which two-thirds of the silver should exist as hemichloride, and one-third as normal chloride. We have then:—

	1	2	Mean.	Calculated.
Ag per cent. ... ..	81.79	81.93	81.86	82.35

a result sufficiently close to afford a confirmation of the constitution assigned.

When the brown salt is decomposed with dilute hydrobromic acid or an alkaline bromide, a corresponding result is obtained. By treatment with hydrobromic acid a mixed bromide resulted which proved to contain 66.06 per cent. of silver.

A general consideration of all the reactions which I have obtained seems to indicate that the action of sulphuric and sodium hypophosphite on silver carbonate does not lead directly to the production of the double salt which I have described, but that the hemisalt is produced in excess, often in large excess; that the nitric acid oxidizes this excess, being able to attack the *free* hemisalt, but not that portion which is combined with protosalt and so rendered stable. It follows that whatever has been the original relative proportion between the two salts the nitric treatment leaves always one molecule of each. If it were possible to control the formation, it is not improbable that a pure hemisulphate might be obtained. But the action of the hypophosphite tends so strongly to carry the reaction still further that reduced silver appears, and in removing this with nitric acid the double salt results. A confirmation of this is found in the fact that the treatment with nitric acid much reduces the deep terra-cotta colour of the original product. If this difficulty can be overcome we may yet obtain hemisalt isolated.

There is reason to suppose that numerous other compounds of silver hemioxide with oxyacids may exist. These compounds cannot be obtained by acting on the normal salts with sodium hypophosphite or with hypophosphorous acid, but it appears probable that they may be produced when the normal salts are formed in the presence of sodium hypophosphite. If to the last-named salt we add a solution of salt capable of a precipitating silver nitrate, and then further add silver nitrate, we obtain precipitates which after standing some hours with frequent stirring appear to contain compounds of silver hemioxide. But these products do not resist the action of nitric acid; consequently there appears to be no means of purifying them, and of deciding with certainty as to their nature.

When sodium citrate and hypophosphite are dissolved together and a little silver nitrate added to get rid of chlorides, then after standing and filtering more silver nitrate is added, a precipitate is obtained which after a time appears to contain silver hemicitrate in an impure form. When a little of this precipitate is put into much water containing a trace of ammonia (five or six drops to 100 c.c.), a fine rose-red solution results.

Most oxyacids of silver are darkened by light. In a paper published in this journal for July, 1887, I mentioned that films of these salts exposed to light and then treated with dilute hydrochloric or hydrobromic acid appeared to be converted into hemichloride or hemibromide, and argued therefrom that oxyacid hemisalts of silver must exist, and be formed by action of light on normal salts. I believe that I have been able to prove the existence of a hemisulphate with a strong probability that many other hemisalts may be formed, both by the action of light and also by purely chemical means. It is possible that at some future time we may succeed in obtaining some of these compounds in a state of purity.—*American Journal of Science.*

## A PHOTOGRAPHIC METHOD OF MAPPING THE MAGNETIC FIELD.

THE common method of obtaining a cross-section of the field of force of a magnet by means of iron filings is very satisfactory when only temporary representations of the field are desired, but there has been wanting a suitable method of making a permanent map. It occurred to the writer that by employing a photographic dry plate a negative could be obtained from which any desired number of prints could be made, and it would have the additional advantage of representing the figures in their true colours. For obtaining the field of a bar magnet, the magnet was placed upon a large card previously marked with concentric circles and parallel lines to facilitate the centring of the magnet. A photographic dry plate was placed, film side up, directly upon the magnet. Iron filings were held at a distance of a foot above the plate in a bag of loosely woven flannel, from which, by shaking the bag, they could be evenly distributed over the surface of the plate. The plate was then held at two points and tapped gently until the filings had arranged themselves along the lines of force. The room up to this point was, of course, only illuminated by non-actinic light, and the exposure was now made by turning the key of an electric lamp supported at a convenient distance directly above the centre of the plate; the position of the lamp is a matter of considerable importance, as light from one side of the plates will cause the filings to cast a shadow and give an incorrect representation of the lines of force. Where

an electric light cannot conveniently be used, nearly as good results may be obtained by holding a lighted match over the plate. After the exposure the plate is tapped so that the flings may slide off, and the few which still cling to the surface of the film are carefully removed by means of a fine camel's hair brush. The negative is then developed and fixed in the usual way. The plates employed should be of a sort to give the strongest possible contrast, and a slow plate, such as Carbutt's process plate, was found to give most satisfactory results, it requiring an exposure of about 20 seconds.

## Societies' Notes.

THE inaugural meeting of the Harringay Photographic Society will be held on Thursday, January 5th, at the Endymion Refreshment Rooms, adjoining Harringay Park Station (Midland Railway), commencing at eight o'clock, when Mr. Dudley Towers will take the chair. For further particulars apply to C. Frith, 8, Cavendish Road, N.

THE Durham City Camera Club will hold an exhibition of members' work on February 14th. One open class for a set of six lantern slides is also included, a silver and bronze medal being offered as prizes. Exhibits must be sent, with entrance fee of 1s., to R. Hauxwell, The Avenue, Durham, before February 3rd. Each competitor in the open class may send in twelve slides, and all exhibits will be retained for a few days to give the inmates of the Durham Workhouse and other charitable institutions an exhibition.

## Societies Meetings.

**Brixton and Clapham.**—An open night was held on 20th inst., when an exhibition of lantern slides of "Granada and the Alhambra," was given by Mr. F. P. Cembrano. The audience followed the lecturer throughout with rapt attention.

**City of London College.**—On the 21st inst., demonstration of flashlight photography. Several flashlight exposures were made by Mr. Fell, and developed by Mr. A. W. Cook. Prints and lantern slides by members were handed to the Secretary for exhibition at the college soiree, to be held on the 31st inst.

**Ipswich.**—The society held a meeting on 22nd inst. Mr. Webster first demonstrated printing platinotype by the oxy-hydro-magnesium light. About a hundred selected summer holiday slides were then shown with the lantern by Mr. Wiggin, contributed by Messrs. Curtis, Corder, Fry, Hill, Hughes, Joslyn, etc., some of the Scilly Island ones being much appreciated. The evening concluded with a lecturette by Dr. J. E. Taylor, illustrated by micro-photographs. About a hundred and fifty members and friends attended. Dr. E. Webster Adams and Mr. Benson were afterwards elected members.

**Leeds.**—On 12th inst. the following gentlemen were elected the officers of the society for the ensuing year:—President, Mr. J. H. Walker; Vice-Presidents, Messrs. E. H. Jacob, M.A., M.D., and S. A. Warburton; Hon. Secretaries, Messrs. Herbert Denison and Robert Steele; Hon. Treasurer, Mr. T. W. Thornton; Hon. Lanternist, Mr. H. P. Atkinson; Hon. Librarian, Mr. T. Butterworth. Mr. Godfrey Bingley introduced a discussion on Film Photography, first describing the composition of celluloid films, and their advantages over glass, on account of their lightness, non-liability to break, and the small space they occupy. But the chief part of his remarks applied to the Eastman films in the roll-holder and the Kodak. His experience had been rather unfortunate; while he got many good negatives, he had many with markings—electric, dark lines, and telegraph-wire-like lines across, some scratched, while others tore diagonally across while in the holder. Mr. Smith, representative of the Eastman Company, was present, and with his characteristic energy combated some of the complaints, and showed negatives and prints from their films, which were very fine. While admitting failures at times, he stated that they were always willing to compensate, when satisfied with defects complained of, by supplying new rolls in their stead. This was corroborated by Mr. Bingley. Mr. Smith also stated that improvements were being made, and that he expected their films in 1893 would be as near perfection as possible. Dr. Jacob, and Messrs. Walker, Warburton, Rodwell, Middleton, Denison, and Steele took part in the discussion.

**Newcastle.**—The monthly meeting was held on 20th inst., Mr. John Watson in the chair. Several new members were elected. The following gentlemen were nominated for election at the annual meeting next month, viz, President, J. Pattison Gibson; Vice-Presidents, M. Anty and H. G. Ridgway; Treasurer, Frederick Park; Secretary, Edgar G. Lee; Assistant-Secretary, James Brown; and Council. Mr. James Brown afterwards read an interesting paper, entitled "Some Hints on Landscape Work, what to Do, and what to Avoid," illustrated by over 100 lantern slides.

**South London Photographic Society.**—19th inst., ordinary meeting at Hanover Hall, Hanover Park, Peckham, the President, Mr. F. W. Edwards, in the chair. Mr. John Burgess, F.C.S., intimated that there were one or two points of difficulty with regard to his new process of colour printing, which he desired to clear up before describing the process before the Society, and therefore postponed his paper on the subject, and substituted for it "Hints on the Use of Magnesium." He said there was a great charm about the use of that substance, as it enabled persons to take portraits of their friends at home with their usual surroundings, and they were in no way dependent upon the weather in carrying out their intentions. He had for many years used magnesium largely for copying purposes, and his method of burning it was very simple. Sufficient magnesium ribbon was taken to produce the required amount of illumination, and cut into lengths—the greater the number the less time it took to burn. The lengths were fastened together at one end with carbon, and the whole inserted in a glass tube. On the outside of the tube a cork or piece of wood was fitted, for convenience of holding the same. A spirit lamp was then placed on the top of the back of a camera, and after the persons to be photographed were arranged and the adjustments of the camera carried out, the lamp was lighted. The glass tube was then taken, and one end placed close to the lighted lamp, while the lengths of magnesium were pushed forward from the opposite end by means of a taper, or something of that kind, into the flame, thus causing the magnesium to ignite and burn as it was pushed forward. The lecturer exposed two plates to illustrate his process, which were afterwards developed and handed round for the members' inspection. Various methods of using magnesium powder were described, and for illuminating a larger space the lecturer considered this was more useful than the ribbon, provided the powder was mixed with chlorate of potash. Some persons objected to the use of the latter by reason of its explosive character, but if two parts of castor sugar were added to one part of chlorate of potash, and afterwards mixed with the amount of magnesium to produce the required amount of light on burning, it would be found to consume quietly, and had the merit of being non-explosive. This mixture should be burned in a tin saucer, or other similar utensil. A simple method of igniting the above mixture was to take a small quantity of sulphuric acid on a glass rod, and allow it to drop on the powder, which would cause it to burst into flame. Magnesium produced the most active light known. Its intensity was increased by consuming in oxygen gas. The fumes arising from the combustion could be absorbed by passing them through a solution of hydrate of soda.

**Sutton.**—Meeting held on 6th inst., Mr. De Clifford in the chair. Many sets of prints were forwarded for the summer competition, the judges awarding the prize to Mr. J. P. Hoole for an exceedingly good set of twelve land and seascapes. A pleasant hour was afterwards spent in inspecting a number of prints, etc., kindly lent by the Editor of the AMATEUR PHOTOGRAPHER.

**The Benevolent.**—Meeting of committee held December 14th, Mr. W. Bedford in the chair. An application for a loan of £8 to pay arrears of rent, and redeem lenses from pawn was considered. The Secretary had corresponded with the applicant, who said he could not give reference; and as the case seemed very urgent, had made a preliminary advance of £2 on security of pawn tickets. The correspondence was carefully considered, the Secretary's action was confirmed, and he was instructed to redeem and forward the lenses, holding the pawn tickets for other goods as security, and to report to the applicant that the Benevolent could not grant further assistance without references. An application was read from a crippled photographer who had been previously assisted by the association, and who now applied for a grant to redeem from pawn a lantern bought for him by the association two years ago, which was his sole means of subsistence. An accident during the summer was the cause of his again getting into pecuniary straits. The sum asked for, £3, was granted as a loan. The Secretary reported that an application for immediate relief had been made to him at the office of the association, by a man, evidently a photographer, who stated that he was penniless and ill, and was walking from London to his home in the provinces, over a hundred miles away. The Secretary had offered him a good meal, and to pay his railway fare; an offer which he accepted with great profession of gratitude when he thought the money was going to be given to him, but rejected with scorn and anger when he found that the Secretary intended to personally purchase the ticket and see him into the train. The resignation of Mr. H. D. Atkinson, whose removal from London prevents his continuing on the committee, was accepted with regret, and Mr. R. Child Bayley was elected in his place. Six new members were elected.

## To Correspondents.

All communications for these columns are to be addressed to **The Editor, "Amateur Photographer," 1, Creed Lane, Ludgate Hill, London, E.C.**

## RULES.

1. Write clearly and distinctly on one side of the paper only.
2. Write each Query or Answer on a separate sheet of paper.
3. Write the name and address legibly on the back of each communication, and sign all Queries and Answers with name or *nom de plume*.
4. All matters for these columns MUST be received by **TUESDAY MORNING'S POST**.
5. The Editor does not undertake to answer questions by post.
6. In answering Queries, correspondents are requested to mention, in every instance the number and full title of the query referred to.

## QUERIES.

5904. **Hanover.**—Can anyone tell me if English plates and chemicals can be obtained in above town? Should also feel obliged for any hints as to what to photograph there, exposure, etc.—**DEUTSCH.**

Correspondents not seeing their queries inserted are requested to look for the same under "Editorial."

## QUERIES UNANSWERED.

- Nov. 25th.—Nos. 5880, 5881.  
 Dec. 2nd.—Nos. 5886, 5890.  
 „ 9th.—No. 5894.  
 „ 16th.—No. 5900.  
 „ 23rd.—Nos. 5892, 5903.

## ANSWERS.

5894. **Lens.**—A suitable lens for a small plate would be a Gem lens, which can be obtained from Lancaster and Sons, Colmore Row, Birmingham,

price 7s. or 9s. These are Petzval portrait lenses of 2 in. focus, working about  $f/4$ —**EDITOR.**

5875. **Acid Alum Bath.**—The action of this bath on negatives is good, hardening the film and preventing stains, etc. For bromide paper it acts well, except when ferrous oxalate is used as the developer, when ferric oxalate is liable to be formed, and the image disappears altogether. If a solution of sodium sulphite is made, about 1 in 4, and alum and citric acid added in the proportion of one-eighth the quantity of sulphite, and then this added to the fixing bath, there should be no precipitate. A precipitate shows that you are using too much alum and acid.—**EDITOR.**

5878. **Plate Numbers.**—A vexed question which was answered, so far as Ilford plates, in a letter in our issue of 16th inst., p. 445.—**EDITOR.**

5884. **Film Slide.**—Turnbull's film slides are satisfactory. To be obtained from England, 21, Charles Street, Notting Hill, W.—**EDITOR.**

5893. **Revolving Show Case.**—Fercy Lund and Co., Memorial Hall, Farringdon Street, E.C., could probably supply.—**EDITOR.**

5895. **Bromide Enlargements.**—(1) It depends entirely upon the light and negative; it is really impossible to answer such a question. (2) W. Watson and Sons, Holborn, sell green albumenised paper.—**EDITOR.**

5896. **Yellow Tinge in Platinotypes.**—This is probably a little solarisation, which might be avoided by manipulating the print with glycerine during development.—**EDITOR.**

5897. **Camera Bellows.**—Nigrosine or any soluble black aniline dye would stain the leather.—**EDITOR.**

5898. **Hydroquinone Developer.**—Increase of alkali and water will give softer effects. Beach's developer has rather a tendency to dense skies. See article p. 479 this issue.—**EDITOR.**

5899. **Chemicals.**—The most deliquescent chemicals used in photography are—ammonium citrate, iodide, sulphocyanide; barium bromide and iodide; cadmium chloride; calcium chloride and iodide; cupric chloride, gold chloride, ferric chloride, lithium chloride and iodide; magnesium chloride, platinum bichloride; potassium carbonate, acetate, cyanide, nitrite, citrate, chloroplatinite, sulphocyanide, caustic; sodium caustic, bromide, iodide, citrate, nitrite; strontium haloids; uranium bromide and nitrate; zinc haloids; chloride of lime.—**EDITOR.**

5901. **Painting Bromides.**—Coat them with a little size to which chrome alum has been added, or use ox-gall and spirit to mix your colours.—**EDITOR.**

## EDITORIAL.

**SPECIAL NOTICE.**—We are very pleased to find that replies in this column are so much appreciated, but we should be very grateful if those requiring

advice would send their letters to us BEFORE TUESDAY MORNING'S post if possible. The time occupied in replying in this column is very considerable, and owing to the often late receipt of letters, many matters have to be left over each week. This we much regret.—**ED. AM. PHOT.**

A. M. Z.—The reflector principle is very satisfactory! We have had one of the cameras in use for over two years, and are quite satisfied with it.

A. W. COOK.—You certainly may think yourselves lucky you got off without a mishap; we should say it was Providence and nothing else. The covers for the AMATEUR PHOTOGRAPHER are arranged to take a volume without advertisements; when half a sheet is literary matter and half advertisements, we should advise you to bind it in. It will make but little difference to the appearance.

ISIS.—(1) We have used the camera you name, and judging from our results it is very suitable for lantern slides and enlarging. (2) If you stick to the films sent out with the camera you will not do wrong, and our experience is that these films will keep at least twelve months after exposure without deterioration; longer than that we cannot speak of because we have not tried them. (B) The apparatus is thoroughly reliable, and the illumination perfectly even; we are so satisfied with it that we have got one for our own use. The ventilation will prevent the metal getting red hot. Many thanks for good wishes, which are reciprocated.

J. W. FORREST.—Always pleased to lend slides.

GRAVITY (BIRMINGHAM).—(1) What you want is a projection ocular, which costs about £2. These are much recommended now for photography. (2) The exposure is always a difficult matter, but, as a guide, when the magnification is fifty times, the exposure will be two minutes; when 100, 8 minutes; when 200, 20 minutes. (3) Rather thin, soft negatives are the best. (4) You can use no better paper than the one you are now using.

J. N. K.—If the bath is old and stale and acid, yellow whites are almost certain to appear. Fresh sulphocyanide should be added at intervals, and the bath tested for acidity.

P. ENNIS.—Thanks for paper, which will appear in due course.

MRS. CLEASBY.—The formula used was  
 Carbonate of soda .. .. 1 oz.  
 Carbonate of potash .. .. 1 „  
 Ferrocyanide of potash .. .. 1 „  
 Distilled water .. .. 10 „

About three drachms are required for a 7 by 5 plate.

F. J. THORNTON.—The negative is placed in position, and the outside screws tightened up so as to hold the same firmly; a daub of wax compound is placed at the four corners of the opal, which is then placed on the negative and the back shut down; this causes the opal to adhere to the back, so that it may at any time be lifted with the back for examination.

**W. H. PRATT.**—We have not found any great difficulty in seeing the image on the ground glass. We have nearly always found it possible to screen the image by shifting the camera into our own shadow. We can find no previous queries.

**J. THOMAS.**—Your plates received; and we will develop and return. We are sorry we cannot accede to your other request.

## Sale and Exchange

### RULES.

**CHARGE.**—Twelve words or less for Fourpence. Every additional three words, one penny. The name and address of the sender must be paid for. (A single figure, or group of figures undivided; y letter, space, stop, or words, counts as one word; compound words count as two words.)

**DEPOSITS.**—The money for goods forwarded on approval may be deposited with the Publishers of the **AMATEUR PHOTOGRAPHER**, who will hold the amounts deposited until they are satisfied that the transaction has been completed to the satisfaction of buyer and seller.

**ADVERTISEMENTS** can be inserted under a number, the name and address being registered, and letters forwarded for a fee of 8d. to cover postage.

**PAYMENTS** should be made in Postal Orders or Postage Stamps.

**ADDRESS.**—All advertisements (which can be received up to Tuesday mid-day) and other communications having reference to the "Sale and Exchange" column, must be addressed "Sale and Exchange, **AMATEUR PHOTOGRAPHER**, 1, Creed Lane, London, E.C."

**COMMISSION.**—A charge of 2½ per cent. will be deducted from all deposits whether a sale is effected or not. Minimum charge 1s.

**PAYMENT.**—All payments are to be by cheques or Postal Orders, made payable to **Hazell, Watson, and Viney, Ltd., 1, Creed Lane, London, E.C.**

**CARRIAGE** must be paid on all apparatus sent for report, and they will be returned carriage forward.

**REPORTING.**—Apparatus may be sent to the **EDITOR, AMATEUR PHOTOGRAPHER**, 1, Creed Lane, London, E.C., who will report upon the apparatus to the buyer for a minimum fee of 3s. 6d., or a commission of 2½ per cent., upon the sale price of the apparatus.

**Hand-Cameras, etc.**—Swinden and Earp's hand-camera, cost £7 net, price £5, as new.—A. Bean, Snaith, Yorkshire.

Hand-cameras. A quite new No. 5 Eastman's Kodak, 7 by 5, with plate arrangements and a staff tripod for same, film for 40 exposures, only two or three used, cost £16 9s. 6d. a few months ago, £10; a Fallowfield's Facile, R.R. lens, and staff tripod, cost £6 5s., £3 10s.—Apply, 25, Lansdowne Crescent, Notting Hill.

Facile hand-camera, R.R. lens, as new, and solid leather case, £3 15s. 6d.—F. C. Newland, Kingstown, Dublin.

**Lenses, etc.**—1½ 1/2 half-plate Instantograph lens, shutter, adjustable diaphragm, 15s.—Godley, Killegar, Killeshandra.

**Magic Lanterns and Slides.**—Walter Tyler's Helioscopic is perfection of all lanterns, supplied to Indian Government, School Boards, science classes, clergy, and exhibitors throughout the world. Impossible to have lanterns give better definition or more satisfactory results; specially constructed lens which no other lantern possesses.—Walter Tyler, 48, Waterloo Road, London.

**Walter Tyler's Best Triples and Bi-unials** are unsurpassed, and perfect in every detail. Good biunials, mahogany bodied, brass fronts, and all improvements, £7 10s.; single lantern, with 4 in. condensers, portrait front lens, 4-wick lamp, complete, in case, 27s. 6d.—Walter Tyler, 48, Waterloo Road, London.

**Lantern Lenses.**—Specially constructed. Walter Tyler's new Helioscopic portrait combination lantern lens gives the most perfect definition and brilliancy, can be fitted to any lantern, and for excellence cannot be surpassed. No other maker has this lens, which is manufactured expressly for Walter Tyler, 48, Waterloo Road, London.

**Regulators and Gauges.**—Great reduction, in price. Either can now be had of Walter Tyler for 14s. each. The largest stock of gas cylinders in England. Best seamless steel, tested and valved, and all sizes at very low prices.

**Slides from Negatives and Pictures.**—Walter Tyler manufactures and colours slides on the premises, thus ensuring speedy delivery, and prices are most moderate.—Walter Tyler, 48, Waterloo Road, London.

**Biunial Lanterns.**—If you are in want of a really good biunial lantern, perfect in every respect, call and see Walter Tyler's entire brass fronted, mahogany-bodied, lined with Russian iron, and fitted with new best quality lenses, and sold at a most moderate price. The top lantern will take a 4-wick lamp. These are great bargains.—Walter Tyler, 48, Waterloo Road, London.

**Hire Department** is now perfect. Largest and best collection of slides in the world; over 200,000 always in stock. Temperance, travels, Scripture, educational, comic, tales, etc. Cheaper than any other house, no extra charge for coloured slides or effects. Special terms for large quantities.—Walter Tyler, 48, Waterloo Road, London.

**Lanterns and Slides.**—If you wish to hire, purchase, or exchange, you cannot possibly do better than go to Walter Tyler, who makes this business a speciality, and you will thus save dealer's and all intermediate profits.—Walter Tyler, 48, Waterloo Road, London.

**Second-hand Lanterns and Slides** at very moderate prices, also all kinds of apparatus. Send for large catalogue, 420 pages, with instructions for working lanterns of all kinds, and costing an immense sum to produce, sent free for 6 stamps. Small catalogue and seco nd-hand list, post free.—Walter Tyler, 48, Waterloo Road, London.
